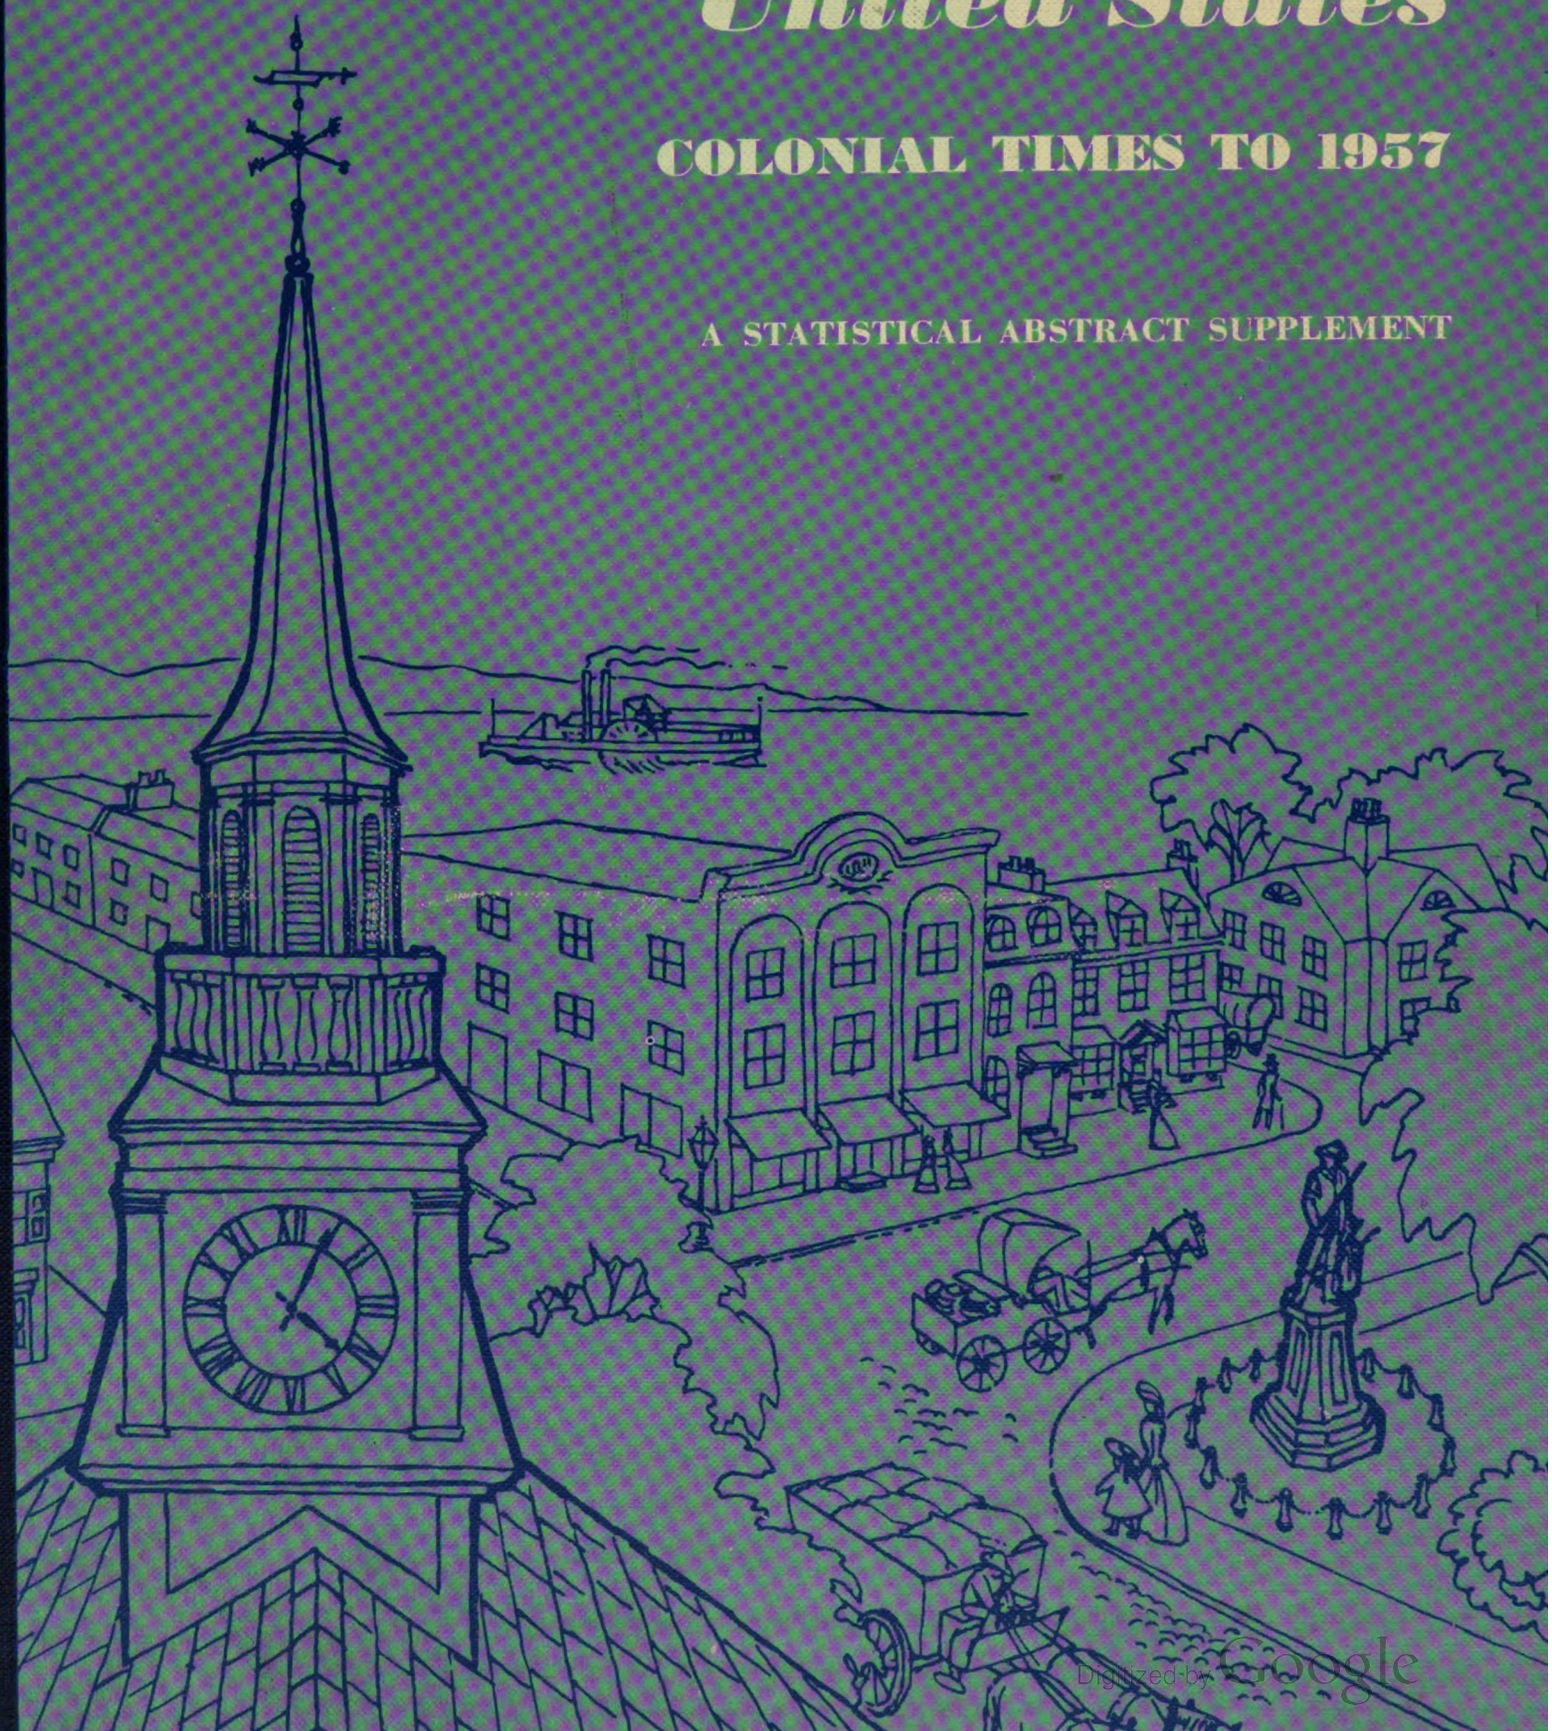
HISTORICAL STATISTICS of the United States

COLONIAL TIMES TO 1957

A STATISTICAL ABSTRACT SUPPLEMENT



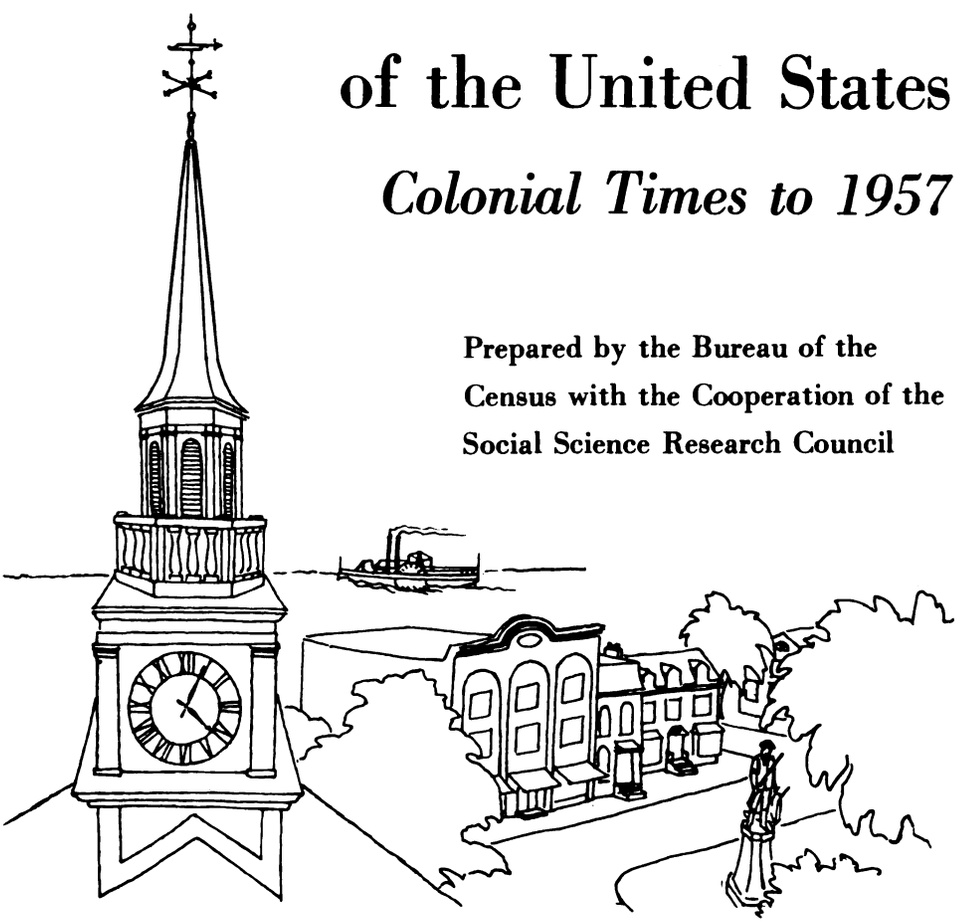
Digitized by Google

A STATISTICAL ABSTRACT SUPPLEMENT

HISTORICAL STATISTICS of the United States

Colonial Times to 1957

Prepared by the Bureau of the Census with the Cooperation of the Social Science Research Council



U.S. DEPARTMENT OF COMMERCE, Frederick H. Mueller, *Secretary*
BUREAU OF THE CENSUS, Robert W. Burgess, *Director*

Digitized by Google

Bureau of the Census

ROBERT W. BURGESS, *Director*
A. Ross Eckler, *Deputy Director*
Howard C. Grieves, *Assistant Director*
Conrad Taeuber, *Assistant Director*
Morris H. Hansen, *Assistant Director for Statistical Standards*
Lowell T. Galt, *Assistant Director for Operations*
Walter L. Kehres, *Assistant Director for Administration*
Calvert L. Dedrick, *Chief, International Statistical Programs Office*
A. W. von Struve, *Acting Public Information Officer*

HERMAN P. MILLER, *Historical Statistics Project Director*

This volume stems from a joint interest by the Bureau of the Census and the Social Science Research Council. It was planned, assembled, edited, and published by the Bureau, with the advice and assistance of the Committee on Historical Statistics appointed by the Council. Many other individuals and agencies cooperated and made significant contributions to this project. General acknowledgments for each chapter are presented on p. VII; other acknowledgments frequently appear in the text discussions of the various chapters.

The volume was prepared in the Bureau of the Census under the general direction of Edwin D. Goldfield, Chief, Statistical Reports Division. Herman P. Miller served as the Project Director and was primarily responsible for the planning, organizing, and supervising of all aspects of the compilation of the data. Dr. Miller also served as executive secretary of the Committee on Historical Statistics, handled liaison matters for the Committee, and participated in its selection of experts to serve as consultants. O. Halbert Goolsby acted as staff assistant.

Morris B. Ullman, who supervised the preparation of the previous volume, *Historical Statistics of the United States, 1789-1945*, was responsible for planning during the early stages of the project.

William Lerner, Assistant Chief, Statistical Reports Division, was primarily responsible for the planning and supervising of the publication aspects of the volume and for the review and editing of the text and tables. Dorothy M. Belzer was responsible for the tabular presentation of the data and preparation of the material for the printer. The Census Library Branch, Louise H. Clickner, Chief, also lent valuable assistance.

Social Science Research Council

The Committee on Historical Statistics appointed by the Social Science Research Council participated actively in the preparation of this volume, in the extension of the subjects to be added, and in planning the general procedures for securing expert assistance on each subject. As the project was developed the Committee, especially the Chairman, was primarily responsible for consideration of problems of data selection and format, for general appraisal of the quality of the series suggested for inclusion, and for the selection of consultant-specialists for the various subjects. The Committee as a whole, or through specially qualified members, reviewed the plans for inclusion of specific series and discussed areas of study which presented unusual problems.

Committee on Historical Statistics of the Social Science Research Council
(Advisory to the Bureau of the Census)

G. Heberton Evans, Jr., *Chairman*
Chairman of Department of Political Economy
The Johns Hopkins University

Herman P. Miller, *Executive Secretary*
Bureau of the Census

Otis Dudley Duncan
Associate Director of Population Research and Training Center
The University of Chicago

Solomon Fabricant
Director of Research
National Bureau of Economic Research, Inc.

Maurice I. Gershenson
Department of Industrial Relations
State of California

Richard M. Scammon
Director of Elections Research
Governmental Affairs Institute

Willard L. Thorp
Director of Merrill Center for Economics
Amherst College

Harold F. Williamson
Professor of Economics
Northwestern University

Paul Webbink, Vice President, Social Science Research Council, attended Committee meetings and acted as the Council's representative. Stanley Lebergott, Office of Statistical Standards, Bureau of the Budget, also participated in the meetings.

Contents

[The numbers following subjects are series numbers]

Chapter — Page

Acknowledgments for Chapter Contributions VII

Introduction IX

A. Population 1

Area and population (A 1–21)—Sex, color, age, residence, nativity, and race (A 22–122)—Population for States (A 123–180)—Urban and rural places (A 181–209)—Marital status and households (A 210–263).

B. Vital Statistics and Health and Medical Care

VITAL STATISTICS 17

Registration area and summary data (B 1–9)—Birth rates and reproduction rates (B 10–75)—Life expectancy (B 76–100)—Death rates (B 101–175)—Marriage and divorce rates (B 176–179).

HEALTH AND MEDICAL CARE 31

Physicians, dentists, and nurses; and schools, students, and graduates (B 180–194)—Hospitals and beds; and admissions to hospitals (B 195–274)—Reportable diseases (B 275–281).

C. Migration

INTERNAL MIGRATION 39

Native population, by place of birth and residence, by color (C 1–24)—Net intercensal migration, white and Negro, by States (C 25–73)—Movement of farm population (C 74–79)—Mobility status of civilian population (C 80–87).

INTERNATIONAL MIGRATION AND NATURALIZATION 48

Immigrants by country of origin, occupation, age, and sex (C 88–138)—Aliens admitted, deported, departing, and excluded (C 139–157)—Naturalization and citizenship status (C 158–184)—Nativity of foreign parents of native-white population (C 185–217)—Foreign-born population, by country of birth (C 218–283).

D. Labor

LABOR FORCE 67

Labor force status of the population (D 1–12)—Age, sex, color, and marital status of women (D 13–45)—Unemployment (D 46–47)—Industrial and occupational distributions (D 48–572).

HOURS, WAGES, AND WORKING CONDITIONS 79

Hours, wages, and earnings, by industry, occupation, profession, degree of skill, sex, and union status (D 573–707 and D 728–734)—Supplements to wages (D 708–727)—Union membership (D 735–763)—Work stoppages (D 764–778)—Labor turnover (D 779–784)—Work-injury frequency rates (D 785–792).

E. Prices and Price Indexes 101

Wholesale price indexes (E 1–100)—Wholesale prices of commodities (E 101–112)—Consumer price indexes (E 113–156)—Cost-of-living indexes (E 157–160)—Retail prices of foods (E 161–176)—Retail price indexes for utilities and fuel (E 177–185)—Rent indexes (E 186).

F. National Income and Wealth

NATIONAL PRODUCT AND INCOME 131

Gross national product in current and constant prices (F 1–9)—Value added, by industry group (F 10–21)—National income, by industrial origin and type of income (F 22–43 and F 49–66)—Gross domestic product, by major sector (F 44–48)—Gross and net national product, by type of product (F 67–157).

NATIONAL WEALTH AND SAVING 145

National balance sheet (F 158–196)—National wealth, by type of assets (F 197–251)—Gross private, personal, and Government saving (F 252–345).

G. Consumer Income and Expenditures

FAMILY AND INDIVIDUAL INCOME 159

Distribution of families and individuals and personal income, by income level (G 1–98)—Percent of income received by each fifth, and by upper income groups (G 99–117 and G 131–146)—Average family personal income before and after Federal taxes (G 118–130)—Median wage income, by characteristics of recipients (G 147–190).

CONSUMER EXPENDITURE PATTERNS 169

Personal consumption expenditures, by type of product (G 191–243)—Family expenditures, for urban and farm-operator families, by income class of family, by type of product (G 244–543)—Food indexes and nutrients available (G 544–551)—Per capita food consumption (G 552–584).

CONTENTS

Chapter — Page

H. Social Statistics

SOCIAL SECURITY AND WELFARE — 189

Social welfare expenditures (H 1–45)—Workers and payrolls covered by social insurance programs (H 46–67)—Benefits and beneficiaries under social insurance and related programs (H 68–114)—Old-age, survivors, and disability insurance (H 115–161)—Unemployment insurance, and workmen's compensation (H 162–185)—Public assistance, and old-age assistance (H 186–212)—Child health and welfare services (H 213–222).

EDUCATION — 202

Elementary and secondary schools: Enrollment, attendance, graduates, teachers, public and private, receipts and expenditures, and subjects taught (H 223–315)—Institutions of higher education: Number, faculty, enrollment, degrees conferred, income, expenditures, plant fund operations (H 316–373)—Enrollment and years of school completed (H 374–406)—Illiteracy (H 407–411).

CRIME AND CORRECTION — 215

Prisoners in, and released from, Federal and State institutions (H 412–431)—Prisoners executed (H 432–444)—Urban crime (H 445–451)—Lynching (H 452–454).

RECREATION — 219

National parks, monuments, and allied areas (H 455–470)—National forest lands (H 471–474)—State parks (H 475–487)—Municipal recreation (H 488–499)—Recreation expenditures (H 500–515)—Selected recreational activities (H 516–525).

RELIGIOUS AFFILIATION — 226

Church denominations, members, and edifices (H 526–530)—Membership of religious bodies (H 531–543).

J. Land, Water, and Climate

LAND AND WATER UTILIZATION — 231

Territorial expansion (J 1–9)—Public lands, revenues and receipts from public domain, timber sales, grazing, leases, land sales and grants (J 10–48)—Land utilization and ownership (J 49–79)—Drainage and irrigation (J 80–90)—Water use and water wells (J 91–108).

CLIMATE — 241

Temperature and precipitation, for benchmark stations (J 109–245)—Temperature and precipitation for long-record city stations (J 246–265).

K. Agriculture — 257

Farms: Number, acreage, value, and color and tenure of farm operators (K 1–52)—Farm mortgage status, and size of farm (K 53–72)—Farm employment, wages, man-hours, and productivity (K 73–97)—Crop acreage and production (K 98–103)—Supply-utilization of farm food (K 104–115)—Farm taxes and insurance, cash receipts, income, indexes of prices received and paid, and parity ratios (K 116–149)—Machinery, equipment, and fertilizer (K 150–161)—Debt, loans, interest, and country bank deposits (K 162–180)—Associations (K 181–189)—Livestock, meats, dairying, wool, and poultry (K 190–253)—Production, acreage, and price for specific crops (K 254–315); for fruits (K 316–328).

L. Forestry and Fisheries

FORESTS AND FOREST PRODUCTS — 305

National forests: Areas, purchases, timber cut, and receipts from, and payments to, States (L 1–22)—Lumber production, imports, exports, and new supply (L 23–60)—Timber products and prices (L 61–97)—Forest fires (L 98–109).

FISHERIES — 319

Yield and value (L 110–115)—Landed catches of principal species, by region (L 116–154)—Disposition of catch (L 155–163)—Production, imports, and value of fishery products (L 164–202)—Sponge sales, sealskins obtained, and whale production (L 203–206).

M. Minerals — 331

Summary (M 1–12)—Value and production of mineral products (M 13–77)—Consumption (M 78–87)—Fuels (M 88–177)—Nonmetals (M 178–194)—Metals (M 195–258)—Injuries and fatalities (M 259–274).

N. Construction and Housing

CONSTRUCTION — 373

Value of private and public construction (N 1–60)—Indexes of building activity (N 61–67)—Construction contracts awarded (N 68–84)—Cost indexes (N 85–105).

HOUSING — 387

Dwelling units started (N 106–115)—Units standing and in Federal programs (N 116–128)—Residential wealth (N 129–138)—Occupied dwelling units and tenure of homes (N 139–146)—Residential price indexes, mortgage debt, finance programs, and foreclosures (N 147–195)—Savings and loan associations (N 196–203).

P. Manufactures — 401

Summary (P 1–10)—Capital in major industries (P 14–133)—Form of ownership (P 134–137)—Wage earners (P 138–146)—Production, by industry and for commodities (P 11–13 and P 147–232)—Capacity of industries (P 233–249)—Value of output of commodities (P 250–306).

CONTENTS

Chapter — Page

Q. Transportation

RAIL TRANSPORTATION — 423
Intercity freight traffic (Q 1–11)—Transportation indexes (Q 12–14)—Summary of early railroads (Q 15–42)—Mileage and equipment (Q 43–65)—Passenger and freight operations (Q 66–94)—Capital, income, expenses, and tax accruals (Q 95–123)—Mileage in receivership, grade crossings, fuel received, and crossties (Q 124–137)—Pullman operations (Q 138–140)—Employment and accidents (Q 141–152).

WATER TRANSPORTATION — 438
Merchant vessels, by type and region (Q 153–190)—Persons entering by ship (Q 191)—Capacity of vessels entered and cleared (Q 192–203)—Waterborne imports and exports and domestic cargo (Q 204–229)—Freight on the Great Lakes and through canals (Q 230–244)—River and harbor expenditures (Q 245).

HIGHWAY TRANSPORTATION — 456
Rural and municipal mileage (Q 246–259)—Federal-aid highways (Q 260–264)—State and local highway finances (Q 265–309)—Motor vehicles, fuel usage, and travel (Q 310–327)—Gasoline tax rates (Q 328–329)—Public transit summary (Q 330–341)—Oil pipelines (Q 342–344).

AIR TRANSPORTATION — 465
Aircraft production and exports (Q 345–351)—Scheduled domestic and international air travel, revenues and expenses (Q 352–375)—Airports, aircraft, pilots, and miles flown (Q 376–383)—Accidents (Q 384–397).

R. Communications

TELEPHONE AND TELEGRAPH SYSTEMS — 471
Telephones, calls, and rates (R 1–13)—Bell System summary (R 14–27)—Independent companies summary (R 28–42)—Domestic telegraph industry, and rates (R 43–71)—International telegraph industry and rates (R 72–89).

RADIO AND TELEVISION — 487
Stations, sets, and families with sets (R 90–98)—Advertising, finances, and employees (R 99–119)—Safety and special radio stations (R 120–138).

POSTAL SERVICE, NEWSPAPERS, AND BOOKS — 493
Post Office finances, rates, and volume of mail (R 139–164)—Books (R 165–168)—Newspapers and periodicals (R 169–186).

S. Power — 501
Horsepower of prime movers (S 1–14)—Electric energy production (S 15–35)—Consumption of fuels (S 36–43)—Generating plants and installed capacity (S 44–69)—Residential service and average prices (S 70–80)—Use of electric energy, by type of user (S 81–93).

T. Distribution and Services — 513
National income originating, and persons engaged, in selected industries (T 1–22)—Retail sales and establishments, by kind of business (T 23–182)—Chain stores (T 183–187)—Retail margins (T 188–207)—Wholesale trade sales and summary, by kind of business (T 208–302)—Wholesale trade margins (T 303–309)—Selected services establishments and receipts (T 310–345)—Advertising (T 346–351)—Farm-to-retail price spread (T 352–358)—Index of department store sales and stocks (T 359–360)—Hotel operations (T 361–365)—Inventories (T 366–386).

U. Foreign Trade and Other International Transactions

FOREIGN TRADE — 529
Exports, imports, and duties (U 1–45)—Trade related to production (U 46–50)—Value of trade, by customs districts and economic classes (U 51–72)—Value of selected products (U 73–115)—Value, by destination and origin (U 116–151)—U.S. trade, as reported by Canada and Great Britain (U 152–167).

BALANCE OF INTERNATIONAL PAYMENTS AND INVESTMENT POSITION — 557
Balance of international payments (U 168–192)—International investment position of U.S. (U 193–207)—Direct investment in foreign countries (U 208–213).

V. Business Enterprise

BUSINESS POPULATION — 567
Firms in operation, new firms, failures, and turnover (V 1–19)—Firms and employment, by size of firm (V 20–29)—Mergers (V 30–31)—Corporations, by industry (V 32–44)—Distribution of corporate income (V 45–56)—Concentration in manufacturing (V 57–64).

CORPORATE ASSETS, LIABILITIES, AND INCOME — 574
Balance sheet and income items, by industry and by assets-size classes (V 65–127)—Electric utility industries (V 128–202)—Value of plant and equipment in regulated industries (V 203–216)—Large manufacturing corporations (V 217–237).

CONTENTS

Chapter — Page

W. Productivity and Technological Development

PRODUCTIVITY INDEXES — 593
Productivity per man-hour and per unit of labor and capital input (W 1–11)—Mining per man-hour (W 12–21)—Manufacturing per man-hour (W 22–38)—Transportation per worker (W 39–44)—Electric utility and distribution output (W 45–47)—Farm output (W 48–51).

COPYRIGHTS, PATENTS, AND TRADEMARKS — 603
Copyright registrations (W 52–65)—Patents filed and issued, by type (W 66–76)—Trademarks (W 77–78).

RESEARCH AND DEVELOPMENT — 609
Federal and private industry expenditures, by agency and industry (W 79–121).

X. Banking and Finance

BANKING — 615
Early State banks and Second Bank of the U.S. (X 1–19)—All banks (X 20–41)—National banks (X 42–63)—Nonnational banks (X 64–96)—All commercial banks (X 97–128)—Bank deposit insurance status (X 129–154)—Branch banking (X 155–164)—Banking suspensions (X 165–191)—Bank earnings and expenses (X 192–215)—Bank debits, deposit turnover, and clearings (X 216–229)—Savings and deposits (X 230–239)—Postal Savings System (X 240–244)—Federal Reserve banks (X 245–265).

MONEY SUPPLY AND GOLD — 644
Bank deposits and currency outside banks (X 266–283)—Currency stock and in circulation (X 284–298)—Gold stock (X 299–304).

MONEY RATES AND SECURITY MARKETS — 650
Short-term interest rates (X 305–313 and X 322–329)—Commercial paper and bankers' acceptances (X 314–321)—Bond and stock yields and prices (X 330–354)—Private and public security issues (X 355–372)—Stock exchange sales (X 373–377)—Margin requirements (X 378–380)—Market credit and brokers' loans (X 381–388).

CREDIT AND OTHER FINANCE — 661
Federal loans (X 389–402)—Credit unions (X 403–414)—Consumer credit (X 415–422)—Net public and private debt (X 423–434).

PRIVATE INSURANCE — 665
Life insurance in force and sales (X 435–444)—Finances of life insurance companies (X 445–468)—Medical care insurance (X 469–482)—Private pension plans (X 483–500).

Y. Government

ELECTIONS AND POLITICS — 679
Methods of electing presidential electors (Y 1–26)—Electoral and popular vote for President (Y 27–128)—Legislative activity (Y 129–138)—Political party affiliation (Y 139–145 and Y 201–204)—Vote for and apportionment in House of Representatives (Y 146–200).

GOVERNMENT EMPLOYMENT AND FINANCES — 694
Employment and payrolls (Y 205–253)—Federal Government receipts, expenditures, and debt (Y 254–263 and Y 350–383)—Internal revenue collections (Y 264–279)—Income taxes (Y 280–332)—Estate and gift taxes (Y 333–349)—Federal, State, and local governments revenue, by source, and expenditure, by character, object, and function (Y 384–714).

ARMED FORCES AND VETERANS — 731
Characteristics of Armed Forces, by war (Y 715–762)—Military personnel on active duty (Y 763–775)—Veterans in civil life, by war and by age (Y 776–800)—Expenditures for veterans, by war (Y 801–811)—Expenditures for veterans benefits, services, and pensions (Y 812–854).

Z. Colonial Statistics — 743
Population (Z 1–20)—Foreign trade: Value of trade, tonnage of ships, coal, fur, indigo, silk, iron, tobacco, tea, rice, slaves, timber products and timber (Z 21–311)—Whaling (Z 312–315)—Wages and prices (Z 316–354)—Money and currency (Z 355–381)—Taxes (Z 382–386)—Diets (Z 387–404).

Index — 775

Acknowledgments for Chapter Contributions

[See Introduction for description of consultants' responsibilities]

Chapter A. Population

Principal consultant—Population Division, Bureau of the Census
Review consultant—Irene B. Taeuber, Princeton University
Other contributor—Donald S. Akers, Bureau of the Census

Chapter B. Vital Statistics and Health and Medical Care

VITAL STATISTICS

Principal consultant—Robert D. Grove, National Office of Vital Statistics
Review consultant—Irene B. Taeuber, Princeton University
Other contributors—Joseph Schachter and Mildred L. McKinnon, National Office of Vital Statistics; Wilson H. Grabill, Bureau of the Census

HEALTH AND MEDICAL CARE

Principal consultant—Maryland Y. Pennell, Public Health Service
Review consultant—Antonio Ciocco, University of Pittsburgh

Chapter C. Migration

INTERNAL MIGRATION

Principal consultants—Everett S. Lee and Dorothy S. Thomas, University of Pennsylvania
Review consultant—Irene B. Taeuber, Princeton University
Other contributor—Anne S. Lee, University of Pennsylvania

INTERNATIONAL MIGRATION AND NATURALIZATION

Principal consultant—Edward P. Hutchinson, University of Pennsylvania
Review consultant—Niles Carpenter, The University of Buffalo
Other contributors—Helen F. Eckerson and Gertrude D. Krichefsky, Immigration and Naturalization Service

Chapter D. Labor

LABOR FORCE

Principal consultant—Seymour L. Wolfbein, Bureau of Labor Statistics
Review consultant—Clarence D. Long, The Johns Hopkins University

HOURS, WAGES, AND WORKING CONDITIONS

Principal consultants—H. Gregg Lewis and Albert Rees, The University of Chicago
Review consultant—Harry M. Douty, Bureau of Labor Statistics

Chapter E. Prices and Price Indexes

Principal consultant—Ethel D. Hoover, Bureau of Labor Statistics
Review consultants—Arthur H. Cole, Harvard University; Geoffrey H. Moore, National Bureau of Economic Research, Inc.

Chapter F. National Income and Wealth

Principal consultant—Richard A. Easterlin, University of Pennsylvania
Review consultant—Simon Kuznets, The Johns Hopkins University
Other contributor—Raymond W. Goldsmith, National Bureau of Economic Research, Inc.

Chapter G. Consumer Income and Expenditures

FAMILY AND INDIVIDUAL INCOME

Principal consultant—Selma F. Goldsmith, Office of Business Economics
Review consultant—Dorothy S. Brady, University of Pennsylvania

CONSUMER EXPENDITURE PATTERNS

Principal consultant—Faith M. Williams, Bureau of Labor Statistics
Review consultant—Rose D. Friedman, Chicago, Illinois
Other contributors—Joseph A. Clorety, Anna-Stina L. Ericson, Helen H. Lamale, Bureau of Labor Statistics; Marguerite C. Burk, Agricultural Marketing Service, and Jean L. Pennock, Agricultural Research Service

Chapter H. Social Statistics

SOCIAL SECURITY AND WELFARE

Principal consultant—Ida C. Merriam, Social Security Administration
Review consultant—Eveline M. Burns, Columbia University
Other contributor—George Rohrlich, Bureau of Employment Security

EDUCATION

Principal consultant—Emery M. Foster, Office of Education
Review consultants—Helen M. Walker, Columbia University; John Walton, The Johns Hopkins University
Other contributors—Henry G. Badger, W. Vance Grant, and Rose Marie Smith, Office of Education; Charles B. Nam, Bureau of the Census

CRIME AND CORRECTION

Principal consultant—Ronald H. Beattie, California Department of Justice, State of California
Review consultant—Thorsten Sellin, University of Pennsylvania
Other contributors—Benjamin Frank, Henry C. Lanpher, James A. McCafferty, Bureau of Prisons

RECREATION

Principal consultant—Marion Clawson, Resources for the Future, Inc.
Review consultant—Thomas C. Fichandler, The Twentieth Century Fund
Other contributor—George D. Butler, National Recreation Association

RELIGIOUS AFFILIATION

Principal consultant—Benson Y. Landis, National Council of the Churches of Christ in the United States of America
Review consultant—Edmund deS. Brunner, Columbia University

Chapter J. Land, Water, and Climate

LAND AND WATER UTILIZATION

Principal consultants—Ernst H. Wiecking and Hugh H. Wooten, Agricultural Research Service; Walter L. Picton, Business and Defense Services Administration
Review consultant—Marion Clawson, Resources for the Future, Inc.

CLIMATE

Principal consultants—Helmut E. Landsberg and J. Murray Mitchell, Jr., Weather Bureau
Review consultant—George S. Benton, The Johns Hopkins University
Other contributor—Milton L. Blanc, Weather Bureau

Digitized by Google

Chapter K. Agriculture

Principal consultant—Department of Agriculture (Earl E. Houseman, Coordinator)
Review consultant—Theodore W. Schultz, The University of Chicago

Chapter L. Forestry and Fisheries

FORESTS AND FOREST PRODUCTS

Principal consultant—Dwight Hair, Forest Service
Review consultant—William A. Duerr, Syracuse University

FISHERIES

Principal consultant—Harvey L. Moore, Fish and Wildlife Service
Review consultant—F. Heward Bell, International Pacific Halibut Commission
Other contributor—Edward A. Power, Fish and Wildlife Service

Chapter M. Minerals

Principal consultants—Sam H. Schurr and Elizabeth K. Vogely, Resources for the Future, Inc.
Review consultant—Vivian E. Spencer, Bureau of the Census
Other contributor—Robert E. Herman, Bureau of Mines

Chapter N. Construction and Housing

Principal consultant—Leo Grebler, University of California, Los Angeles
Review consultant—Raymond W. Goldsmith, National Bureau of Economic Research, Inc.

Chapter P. Manufactures

Principal consultant—Daniel Creamer, National Industrial Conference Board, Inc.
Review consultant—John W. Kendrick, George Washington University
Other contributor—John A. Waring, Washington, D.C.

Chapter Q. Transportation

Principal consultant—Thor Hultgren, National Bureau of Economic Research, Inc.
Review consultant—George R. Taylor, Amherst College
Other contributor—Bureau of Public Roads

Chapter R. Communications

Principal consultants—Hyman H. Goldin and Robert E. Stromberg, Federal Communications Commission
Review consultant—Melville J. Ulmer, American University

Chapter S. Power

Principal consultant—Lawrence D. Jennings, Federal Power Commission
Review consultant—Herbert B. Dorau, New York University

Chapter T. Distribution and Services

Principal consultants—Reavis Cox and Charles S. Goodman, University of Pennsylvania
Review consultant—Harold Barger, Columbia University

Chapter U. Foreign Trade and Other International Transactions

FOREIGN TRADE

Principal consultant—Herbert B. Woolley, New York University
Review consultant—Douglass C. North, University of Washington

BALANCE OF INTERNATIONAL PAYMENTS AND INVESTMENT POSITION

Principal consultant—Nancy F. Culbertson, Office of Business Economics
Review consultant—Walter S. Salant, The Brookings Institution
Other contributors—Douglass C. North, University of Washington; Matthew Simon, Pace College

Chapter V. Business Enterprise

BUSINESS POPULATION

Principal consultant—Morris A. Adelman, Massachusetts Institute of Technology
Review consultant—Irwin Friend, University of Pennsylvania

CORPORATE ASSETS, LIABILITIES, AND INCOME

Principal consultant—Sergei P. Dobrovolsky, Rensselaer Polytechnic Institute
Review consultant—Irwin Friend, University of Pennsylvania

Chapter W. Productivity and Technological Development

PRODUCTIVITY INDEXES

Principal consultant—Leon Greenberg, Bureau of Labor Statistics
Review consultant—John W. Kendrick, George Washington University
Other contributors—Robert T. Adams and Julian Frechtman, Bureau of Labor Statistics

COPYRIGHTS, PATENTS, AND TRADEMARKS

Principal consultant—Jacob Schmookler, University of Minnesota
Review consultant—Fritz Machlup, The Johns Hopkins University
Other contributor—P. J. Federico, Patent Office

RESEARCH AND DEVELOPMENT

Principal consultant—Kathryn S. Arnow, National Science Foundation
Review consultant—Irving H. Siegel, Council of Economic Advisers

Chapter X. Banking and Finance

BANKING, MONEY SUPPLY, MONEY RATES, AND CREDIT

Principal consultants—Susan S. Burr and Caroline H. Cagle, Board of Governors of the Federal Reserve System
Review consultant—Milton Friedman, The University of Chicago
Other contributor—Clark Warburton, Federal Deposit Insurance Corporation

PRIVATE INSURANCE

Principal consultant—Albert I. Hermalin, Institute of Life Insurance
Review consultant—James J. O'Leary, Life Insurance Association of America

Chapter Y. Government

ELECTIONS AND POLITICS

Principal consultant—Richard M. Scammon, Governmental Affairs Institute
Review consultant—V. O. Key, Harvard University

GOVERNMENT EMPLOYMENT AND FINANCE

Principal consultants—Jacob M. Jaffe, Bureau of the Census; James M. Jarrett, Internal Revenue Service; I. M. Labovitz, Library of Congress; and Flora M. Nicholson, Civil Service Commission
Review consultant—I. M. Labovitz, Library of Congress
Other contributors—Paul B. Trescott, Kenyon College; Paul P. Van Riper, Cornell University

Introduction

This volume is the second in the *Historical Statistics* series issued by the Bureau of the Census as a supplement to the annual *Statistical Abstract of the United States*. The first volume, *Historical Statistics of the United States, 1789-1945*, was published in 1949. It provided, in a single volume, a wide range of series quantifying various aspects of the economic and social development of the Nation. A *Continuation to 1952* was issued in 1954 to provide data for 1946 to 1952 for the series shown in the first volume.

Limited resources confined the scope of the first volume to those data most readily available, usually from governmental sources. Nevertheless, some 3,000 statistical time series were presented. Because of the huge and intricate task of inspection, evaluation, and selection of time series, the compilers recognized from the outset that the first volume would have to serve as a working document to break the ground and set a pattern for a subsequent more comprehensive and definitive volume. The present publication is intended to achieve the purpose foreshadowed in the original volume.

The *Historical Statistics* volumes are designed to bring together historical series of wide general interest and to inform the user where additional data can be found. All of the broad subject areas covered in the first volume have been included and expanded in this volume, and a number of new subjects have been added. The new subjects include consumer expenditure patterns, social security, education, crime and correction, recreation, religious affiliation, climate, communications, distribution and services, business population, corporate assets, research and development, private insurance, Armed Forces and veterans, and colonial statistics.

This volume also presents the results of a complete review of the subject matter shown in the earlier volume. In a number of cases, series in the latter have been replaced or supplemented. Finally, an attempt was made to reduce the unevenness in scope and quality which characterized the text materials in the earlier work. Critical notes have been added along with further bibliographic material, cross references to other statistical compendia, and previously unpublished data (in some instances).

Origin of *Historical Statistics of the United States*

The volume, *Historical Statistics of the United States, 1789-1945*, was formally initiated by a recommendation in 1945 by the Social Science Research Council that the Secretary of Commerce consider compilation and publication by the Bureau of the Census of a source book of economic statistics.

Earlier the same year, J. Frederic Dewhurst urged the development of a historical source book in a proposal to the American Statistical Association and the American Economic Association. A joint committee to explore the practical problems of preparing such a volume was named by these associations, joined by the Economic History Association. Dr. Dewhurst's proposal coincided closely with Bureau of the Census plans, then under consideration, to prepare a historical supplement to the *Statistical Abstract of the United States*. The formal decision in 1945 by the Bureau of the Census to compile and publish such a volume led to the reconstitution of the joint committee, which then became the Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census.

After the first volume was issued in June 1949, the Economic History Assocation, in response to a request from the Bureau of the Census, appointed an advisory committee in September 1950 to evaluate the volume and to make specific recommendations affecting the question of its revision. This committee, formally designated as the Committee of the Economic History Association on the Revision of *Historical Statistics of the United States, 1789-1945*, was under the chairmanship of G. Heberton Evans, Jr., The Johns Hopkins University, and included the following as members: Arthur H. Cole, Harvard University; Shepard Clough, Columbia University; T. C. Cochran, University of Pennsylvania; and Solomon Fabricant, National Bureau of Economic Research, Inc. In April 1952 the committee submitted a report to the Bureau of the Census entitled "On the Revision of *Historical Statistics of the United States, 1789-1945*." The conclusions and comments presented in this report were subsequently influential in getting underway the project for a revised volume.

Both *Historical Statistics* volumes have been prepared by the Bureau of the Census with the cooperation of the Social Science Research Council. A description of the relationship established for the first volume between the Bureau and the Social Science Research Council appears in the introduction to that volume. For the present volume, the Bureau designated a project director who served also as secretary of the Committee on Historical Statistics appointed by the Social Science Research Council to guide the Bureau in the program. The Bureau again assumed the responsibility for publishing the volume as a part of its *Statistical Abstract* program. The Social Science Research Council, in turn, obtained a grant from the Ford Foundation which provided funds for the procurement of services of experts in each field. More than 125 such specialists were engaged (although not all were paid) to serve as consultants. To make further use of the information assembled for this project, the Council also made arrangements with some of the consultants for the preparation of bibliographic essays on statistics in selected fields. Several of these essays have been published in the *Journal of the American Statistical Association*.

The Problem of Historical Statistics

Statistics are an indispensable adjunct to historical analysis. Few fields exist in which qualitative historical records cannot be clarified and enriched by quantitative data. For some time, however, it has been evident that users of historical data are faced with the paradox of overabundance and scarcity. On the one hand, a burdensome multiplicity of sources has frequently to be consulted in order to reconstruct one quantitative aspect of a particular subject. On the other hand, users are confronted just as often by a discouraging barrenness of data, discoverable only after much costly work and delay.

The scattered sources of historical statistics of the United States include the annual reports of the executive heads of the agencies of the Federal Government, reports of special Federal commissions, the volumes of the censuses of the United States, printed debates of the Congress, published reports of committees of the Congress and transcripts of hearings on important legislative measures, published reports and documents of the State governments, statistical publications of private research foundations and organizations and of the universities and colleges of the Nation, together with the great mass of statistical volumes printed by other private organizations and individuals.

It has been noted that on occasion compilers, desiring to save the time and effort required to obtain data directly from the original sources, make use of successive issues of the annual *Statistical Abstract of the United States* to construct long-term time series. The results of such a procedure are not always sound, since the space available in the *Statistical Abstract* for describing major revisions in time series may not permit adequate clarification. Of the many revised figures appearing

Digitized by Google

in each issue, most revisions apply to the immediate preceding years, but revisions of much earlier years are not uncommon. Moreover, the revisions shown have followed no systematic pattern and may be scattered irregularly over many issues.

Impediments to the use of historical statistics, then, include the initial difficulty of determining whether the data in fact exist, of identifying the public or private document in which the data may be found, of constructing time series where the data may not be arranged in suitable form, and of identifying and interpreting changes in concept and coverage. Definitions employed in published historical tables, moreover, may have to be sought in separate publications if, indeed, they have been published at all.

The objective of the *Historical Statistics* volumes is to provide a convenient reference source which has two functions, *collecting* and *referring*. The *collecting* function consists of assembling, selecting, and arranging data from hundreds of sources and making them available within a single source. The *referring* function consists of text annotations to the data which act as a guide to sources of greater detail. The annotations also define terms used in the tables and include essential qualifying statements.

Planning and Compilation

As a first step in the actual preparation of this volume, the Bureau of the Census, with the advice and cooperation of the Committee on Historical Statistics, prepared a working outline and statement of basic premises to guide the selection of material. After an agreement on a basic framework, responsibility for the duties of "principal" or "review" consultant for specific subjects was assigned either to a Government agency or to an individual specialist.

As stated previously, a number of subjects are included in this volume which were not included in the first. Principal consultants responsible for these subjects had to prepare their material from inception, advise on the series to be used, and prepare descriptive, analytical, and bibliographic notes to accompany the tabular data. All other principal consultants were required to examine the presentation of data in their fields in the first volume and to make detailed recommendations for additions, deletions, and other changes. The relative importance of the data in the first volume had to be judged in light of historical series made available from more recent studies. These studies often contained an abundance of data from which consultants had to select specific series for inclusion here. The accompanying text also had to be prepared. Principal consultants were also called upon to resolve problems that arose during the processing and editing of the material. Review consultants were responsible for critical review of the data and text to be included during each phase of their preparation.

Coordination, final processing, and editing of the materials were carried out by the Bureau of the Census. A multitude of source publications was assembled. Data were excerpted, reviewed, and arranged in appropriate form and sequence. Source citations; text, titles, headnotes, and footnotes were brought into a consistent style and reviewed for clarity. Problems that emerged during preparation and review of the material were resolved in consultation with consultants.

Technical Notes and Explanations

Arrangement of the data. Data are arranged by subject in lettered chapters and numbered series. Subject-listing under chapter titles in the table of contents, together with the index, will facilitate reference, chapter titles being necessarily somewhat arbitrary. Each series or tabular column is assigned a number, the first series in each chapter beginning with 1. Each series is further identified in the table titles and cross references by prefixing the chapter letter. Thus, the 44th series in the chapter on agriculture is designated K 44 to distinguish it from the 44th series in the chapter on transportation designated Q 44. Because of possible confusion with numerals, the capital letters I and O have been omitted in identifying chapters.

All series begin with the most recent year for which data have been obtained and run backward in time. This arrangement was selected because it lent itself to more compact, less space-consuming presentation than the alternative of beginning with the earliest year. Insofar as possible, there are uniformly placed spaces above every year ending in 0 or 5. No data are shown for years subsequent to 1957, because most of the 1958 figures were still unavailable or preliminary at the time this volume was in preparation. Figures for 1958 and later years for most of the current series are presented in the *Statistical Abstract of the United States* beginning with the 1960 edition.

Basic guidelines. Before work was begun on the volume, certain guidelines were established to aid the Census Bureau staff and the consultants in the selection and presentation aspects of the operation. These guidelines, however, were not always rigidly adhered to. The problems encountered because of the scope and the variety of the subject matter and the attempt to achieve a relatively balanced presentation between subject fields made it necessary to modify the rules in a number of places. The guidelines applied and the elements subject to application are discussed below.

Area coverage. Unless otherwise specified, data are for continental United States as of 1958 (i.e., excluding Alaska and Hawaii). In some instances, the sources used for data failed to specify the area covered. Where practicable, the data were examined and the appropriate qualifications were added.

Because of limitations of space, data are not generally shown for regions, States, or localities. Some exceptions were permitted, however, in the following instances: Where regional statistics are essential for correct interpretation of data, such as presentation of merchant marine statistics separately for each coast and for inland waters; where data in the subject field cannot (by definition) be summarized effectively for continental United States, such as internal migration data; where summary data for a given subarea or market are indicative of general trend or level, such as prices on the New York Stock Exchange or cattle prices at Chicago; where data for a given area effectively represent the national picture because of concentration of production, etc., as Pennsylvania anthracite; where data are available for only a given area as in the case of many series concerned with early American history which are limited to the Atlantic seaboard.

Time coverage. In general, only annual or census-period data which cover at least 20 years are presented. Exceptions were permitted primarily in the case of newly developed series of basic importance.

The general requirements as to time coverage were specifically designed to permit inclusion of "lapsed" series, particularly those falling within the nineteenth century. The lapsed series, which begin and terminate in the past, represent major fields of interest during various phases of American historical development; frequently they must be sought in out-of-print documents which are available in few libraries.

The identification of time-periods was complicated by failure of some sources to state whether the data were prepared on a calendar-year or on a fiscal-year basis; by shifts in time coverage from calendar to fiscal year during the period of the series, and, in some instances, by the lack of identification of the beginning or ending date of the fiscal year where this basis was used. In all such cases, particularly where time shifts seemed likely to have occurred, an effort was made to identify the correct basis.

Frequency of data. Annual data are given preference but certain series are presented only for census years (years in which a national census was conducted), and, in some instances (for example, telephone and telegraph rates), only for the few dates for which the data are available. Where both annual figures and decennial or quinquennial benchmark or census data exist, both series are sometimes shown.

Series linkage. No formal attempt was made to extend a single series back through time by linking it to another series which terminated at or near the date on which the first began. In a number of instances, however, such series are presented in adjoining columns, with an overlap for a period of years when available.

Digitized by Google

Unpublished figures. In general, only published materials or unpublished estimates from the files of a Government agency or from a responsible private organization like the National Bureau of Economic Research were used. Unpublished estimates of private scholars, with rare exceptions, are not included in the volume.

Subject detail. Because of space limitations, series selected are confined to those regarded as of major importance in each field. The criteria of selection varied broadly, depending upon the subject. Within each subfield, the amount of subject detail was held to a minimum. Generally, only summary measures are shown and detailed cross classifications and information of a highly specialized character have been avoided. Presentation of data in excessive detail, such as for specific commodities, was discouraged. Exceptions were allowed, however, where it was considered more meaningful to present long series for selected specific commodities than to present an aggregate which is difficult to interpret.

Presentation of absolute rather than derived data. Primary emphasis was placed on the presentation of absolute figures rather than on derived data since the absolute figures offer somewhat greater flexibility to the user. The major exception was the presentation of index numbers. In general, percentage distributions of absolute data already shown are not presented. Other percentage data, and averages, medians, ratios, and rates were used only where they resulted in a significant economy in space or where they facilitated interpretation. No attempt was made, in view of the technical problems involved, to convert various series of index numbers to a common base year or period.

Omissions of data, "blank" cells. The significance of dashes in tabular cells varies from series to series. In general, the presence of cell "leaders" or "dashes" indicates merely that no information was provided for this volume. Dash entries may mean that no information exists for the given year; that the entry, if shown, would be zero; the information was not available; or the information is believed to exist in published form but it was not practicable to do the research necessary to locate the appropriate source. The user will have to judge from the context which meaning is appropriate in each particular instance.

The practices of the various sources of information differ as to the meaning of dashes in cells, the extent to which they label material as "not available," the meaning of the term "not available," the use of the zero entry, etc. In general, the policy adopted in preparing this volume was to retain "not available" notations where they appeared for intermediate years in the series; to change them to dashes where they appeared at the beginning or end of the series. Where cells were left blank in the sources, they were filled with dashes in this volume.

Since series of varying length taken from different sources are frequently found in adjoining columns in a table, the stub listings for years necessarily encompass the earliest and latest date for which any of the series in the table are shown. In itself, this tends to create many additional blank cells since missing entries have been replaced by dashes in order to make it easier for the user's eye to trace the entries for a given year across the entire table.

Text. For every series used, the text presents the precise source of the data. Where possible, the text also includes the definition of the concepts used, and sufficient methodological and historical information to permit intelligent use of the data. For many series the text includes a reference to where more detail can be found. Unusual values in a series are explained and major changes which affect comparability are noted. Where adjusted or derived figures are used, the methods used are described, often with a reference to a more complete description.

Responsibility

Because of the multitude of sources and the varied subject matter covered, the Bureau of the Census cannot accept responsibility for the accuracy or limitations of data other than those which it collects. Every attempt has been made, within the limits of time and available personnel, to verify and correctly identify the material. Final responsibility for selection of the material, and for its accurate and proper presentation, rests with the Bureau of the Census, even though carried out with the cooperation of many individuals and agencies who devoted much time and energy in providing data and descriptions of series for this publication.

The information presented in this volume supersedes all similar information presented in *Historical Statistics of the United States, 1789-1945*, and in *Continuation to 1952 of Historical Statistics of the United States, 1789-1945*.

chapter A

Population

A 1–263. General note.

The principal source of population data is the Decennial Census of Population, a house-to-house enumeration made by the Bureau of the Census. In accordance with a Constitutional provision for a decennial canvass of the population, the first census enumeration was made in 1790. The primary reason for the Census of Population, as set forth in the Constitution, is to provide a basis for the apportionment of Members of the House of Representatives among the several States. Until 1902, the census organization was temporary. In 1902, the Bureau of the Census was established as a permanent agency of the Government charged with responsibility for the decennial census and for compiling statistics on other subjects as needed. Currently, this Bureau supplies intercensal data based on surveys and estimates in addition to making the comprehensive decennial census enumeration.

In accordance with Census practice dating back to 1790, each person is counted as an inhabitant of his usual place of residence or usual place of abode, that is, the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile, although, in the vast majority of cases, the use of these different bases of classification would produce identical results. Indians living in Indian Territory or on reservations were not included in the population count until 1890 and in earlier censuses large tracts of unorganized and sparsely settled territory were not covered by enumerators.

Most of the population data presented are based on complete counts. However, some of the 1950 data were obtained from representative samples of 20 percent or 3⅓ percent of the population. A few series also include 1940 data obtained on a sample basis.

Several series present statistics based on the Current Population Survey, conducted monthly by the Bureau of the Census. Until May 1956, the Survey covered a sample of approximately 21,000 interviewed households spread over a sample of areas throughout the United States. Since then, the sample has been expanded to approximately 35,000 interviewed households in a larger number of areas.

Exact agreement is not to be expected among the various samples, nor between them and the complete census count, but the sample data may be used with confidence where large numbers are involved, and may be assumed to indicate patterns and relationships where small numbers are involved. Detailed statements regarding the sampling errors are given in the original sources.

Many errors appear in the Censuses of 1790–1840. The data for these censuses were adjusted by county and color, and the revised estimates were published in the 1870 Census. Later, the data by sex and age in the 1790–1840 Censuses were adjusted to agree with the estimates published in 1870.

The Bureau of the Census has always been concerned about the degree of completeness of enumeration in the decennial censuses. Prior to 1950, the population counts were evaluated by indirect methods only since no method had been devised to give an over-all direct measure of the completeness of enumeration for the total population. For the most part, discussion in Census reports was confined to qualitative statements. In the 1950 Census, the population was reenumerated on a sample basis in a carefully conducted postenumeration survey, thereby providing a direct check on a case-by-case basis. The results of this survey indicate a net underenumeration in the census count of the total population of the United States of about 2,100,000, or 1.4 percent. It is also estimated that the net underenumeration was about 1.6 percent in 1940 and about 0.7 percent in 1930.

One of the indirect methods of evaluating the completeness of enumeration for censuses prior to 1950 is a comparison of rates of change with respect to consistency and reasonableness. On this basis, it is believed that the figures for the South show unreasonably low rates of increase for the decade 1860–1870 and abnormally high rates of increase for 1870–1880. The differences are so great that it appears evident that the enumeration of 1870 in these areas was seriously incomplete, undoubtedly as a result of the unsettled conditions of the reconstruction period. For the portion of the United States outside the South, the rate of increase for 1860–1870 was almost exactly the same as for 1870–1880. Therefore, the number initially enumerated in 1870 for the South was revised on the assumption that the rate of increase for these two decades was the same.

Comparisons of census data with independent counts of corresponding segments of the population are sometimes possible in the case of certain age-sex groups. For example, there have been several studies for both World Wars I and II relating figures for males of military age from the census to registration figures. Interpretation of the differences is complicated by the fact that there are no adequate measures of the Selective Service figures. Nonetheless, these studies do suggest an appreciable underenumeration of males in appropriate age groups, particularly among Negroes, in the Censuses of 1920 and 1940.

A 1–3. Estimated population of the United States, 1790–1957.

Source: 1790–1899, Bureau of the Census estimates based on linear interpolation between decennial census years; 1900–1957, Bureau of the Census, *Current Population Reports*, Series P–25, Nos. 71, 114, 173, and unpublished Census Bureau records.

Estimates for 1900–1909 are sums of State estimates prepared from local data indicative of population change. Estimates for 1910–1957 are based on decennial censuses and statistics of births, deaths, immigration, emigration, and Armed Forces. These estimates are as of July 1 and therefore may differ from other estimates in this section which are as of the date of the census.

A 17–21. Area and population of continental United States, 1790–1950.

Source: Reports of Fourteenth, Fifteenth, Sixteenth, and Seventeenth Censuses, *Population*, vol. I, and other reports and records. See also Sixteenth Census Report, *Areas of the United States, 1940*.

Area figures for each census year represent all continental area under the jurisdiction of the United States on the indicated date, including in some cases considerable areas not then organized or settled, and not covered by the census. Area figures for prior years have been adjusted to bring them into agreement with remeasurements made in 1940. For a further discussion of areas covered by the censuses, see *U. S. Census of Population: 1950*, vol. I, p. xi.

A 22–33. Estimated population, by sex, color, and age, 1900–1957.

Source: Bureau of the Census, *Current Population Reports*, Series P–25, Nos. 98, 114, 146, and 170.

These estimates are as of July 1 and therefore may differ from other estimates in this section, which are as of the date of the census.

The age estimates for 1900–1919 were prepared by mathematical interpolation for identical age groups within color-sex groups from five successive censuses. For the 1900–1909 decade, the 1880–1920 Censuses were used; annual estimates for 1910–1919 were based on the 1890–1930 Censuses. The estimates since 1920 are based on censuses and vital statistics; estimates of net migration and mortality rates were computed from life tables.

The classification of the population by color is not ordinarily based on replies to census questions asked by the enumerators, but rather is obtained by observation. This concept does not, therefore, reflect a clear-cut definition of biological stock. The nonwhite population consists of Negroes, American Indians, Japanese, Chinese, Filipinos, and some other groups. Persons of mixed parentage are placed in the color classification of the nonwhite parent. Persons of Mexican birth or ancestry who are not definitely Indian or of other nonwhite stock have been classified as white in all censuses except that of 1930. The data for 1930 used in these series have been revised to include Mexicans as white. For a more detailed discussion of the definition of color, see *U. S. Census of Population: 1950*, vol. II, part 1, Introduction.

A 34–50. Population, by sex, residence, and color, 1790–1950.

Source: See detailed listing below.

See also text for series A 22–33 for definition of color.

The Bureau of the Census has employed several definitions of urban population. According to the definition adopted for the 1950 Census, the urban population comprises all persons living in (1) places of 2,500 inhabitants or more incorporated as cities, boroughs, and villages, (2) incorporated towns of 2,500 inhabitants or more except in New England, New York, and Wisconsin, where the term "town" is used to designate minor civil divisions of counties, (3) the densely settled urban fringe, including both incorporated and unincorporated areas, around cities of 50,000 inhabitants or more, and (4) unincorporated places of 2,500 inhabitants or more outside any urban fringe. The remaining population is classified as rural. According to the definition used in 1940, the urban population was limited to all persons living in incorporated places of 2,500 inhabitants or more and in other areas classified as urban under special rules relating to population size and density. For a discussion of these different definitions of the urban population, see *U. S. Census of Population: 1950*, vol. I, pp. xv and xviii. The population is shown classified in accordance with the urban definition used in the 1940 Census for 1790–1950. Classification in accordance with the definition used in the 1950 Census is given only for 1950.

The first official publication of figures formally presenting the urban population was made following the Census of 1870 in the *Statistical Atlas of the United States*. The population of cities and towns of 8,000 inhabitants or more was presented as the "urban population." In the reports of the 1880, 1890, and 1900 Censuses, the urban population was variously defined as the population living in places of 4,000 inhabitants or more, or 8,000 inhabitants or more. The first publication in which the population of places having 2,500 inhabitants or more was officially designated as urban was the *Supplementary Analysis of the Twelfth Census (1900)*. This definition, with minor modifications, was used in later censuses up to and including 1940. For purposes of comparison, the data for 1950 were also tabulated in accordance with this urban definition.

In the *Statistical Atlas* for 1870, the rural population was defined as the population residing outside the cities or towns of 8,000 inhabitants or more, but the data were used simply to calculate the density of counties. A new definition of the rural population was presented in the reports of the Census of 1890. In that year, the rural population was obtained by subtracting from the total population, county by county, the population of "all cities or other compact bodies of population which number 1,000 or more." In the report of the Census of 1900, the rural population was presented as the population living outside incorporated places. For 1910–1940, the rural population was defined as all of the population not classified as urban.

For a discussion of the development of the urban-rural classification, see Bureau of the Census, *Current Population Reports*, "The Development of the Urban-Rural Classification in the United States: 1874 to 1949," Series P–23, No. 1.

The farm population for 1950 included all persons living on farms, as determined by the question in the 1950 Census of Population, "Is this house on a farm (or ranch)?" Persons on "farms" who were paying cash rent for their home and yard only were classified as nonfarm, as were persons in institutions, summer camps, motels, and tourist camps. The definition of farm population prior to 1950 differed somewhat, but remained a residence rather than an occupational classification and depended primarily upon the respondent's conception of what was meant by the word "farm." Consequently it reflected local usage rather than the uniform application of an objective definition.

Source: See detailed listing below.

See also text for series A 22–33 for definition of color.

A native is defined as a person born in continental United States, Puerto Rico, or the Territories or possessions, or born abroad to American parents. Persons for whom place of birth was not reported are included with the natives. The 1890 Census was the first to make the distinction between native and foreign parentage. Data on aliens are not shown for 1890, 1900, and 1910, because the information collected in those censuses was restricted to males 21 years of age and over.

A 59–70. Nonwhite population, by sex and race, 1820–1950.

Source: With the exception of series A 60 and A 66 (slaves, by sex), data are from following sources: 1820–1840, Fourth, Fifth, and Sixth Censuses, and unpublished Census Bureau records; 1850–1950, *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-88. Series A 60 and A 66 are from the following sources: 1820–1850, *The Seventh Census of the United States: 1850*, p. xxxvi and revisions on record; 1860, *The Eighth Census of the United States: 1860*, "Population Recapitulation," p. 595.

Data on the population classified by race (but not by sex) for 1790–1840 and estimates for 1870 appear in Fifteenth Census Reports, *Population, General Report: Statistics by Subject*, p. 32. Data for slaves (not by sex) for 1790–1860 appear in *Negro Population in the United States: 1790–1915*, chap. V, p. 53.

The classification of the population by race is not ordinarily based on replies to census questions asked by the enumerators, but rather is obtained by observation. This concept does not, therefore, reflect a clear-cut definition of biological stock. "All other races" include Filipinos, Koreans, Asian Indians, Indonesians, Polynesians, and other Asians. The Asian groups are identified largely in terms of country or area of origin. Persons of mixed nonwhite parentage are classified according to the race of the father, except that mixtures of Negro and Indian are classified as Negro unless the Indian stock is clearly predominant or unless the individual is accepted in the community in which he resides as an Indian.

The category Indian includes unmixed American Indians together with persons who are of mixed white and Indian ancestry if they are enrolled on an Indian reservation or agency roll. Persons who are part Indian are included as Indian if they are one-fourth or more Indian, or if they are regarded as Indians in the community in which they reside.

The Census of 1860 was the first in which Indians were distinguished from other classes in the population. Prior to 1890, enumeration of Indians was limited to Indians living in the general population of the various States; Indians in Indian Territory and on Indian reservations were excluded. In 1910, a special effort was made to secure a complete enumeration of persons with any perceptible amount of Indian ancestry. This probably resulted in the enumeration as Indian of a considerable number of persons who would have been reported as white in earlier censuses. There were no special efforts in 1920, and the returns showed a much smaller number of Indians than in 1910. Again in 1930 emphasis was placed on securing a complete count of Indians, with the results that the returns probably overstated the decennial increase in the number of Indians.

A 86–94. Median age of population, by color and sex, 1790–1950.

Source: 1790–1940, Sixteenth Census Reports, *Population*, vol. IV, part 1, p. 3; 1950, *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-92.

See text for series A 22–33 for definition of color.

The median age is that age which divides the population into two equal groups, one-half being older and one-half younger than the median. The median age is ordinarily 1 or 2 years younger than the average or mean age of the population. Medians have been computed on the basis of 5-year age intervals, except those for censuses earlier than 1840, where broader age groups were used.

I, pp. 1-8 and 1-9; for the boundaries of the States and Territories for 1790–1900, Twelfth Census Reports, *A Century of Population Growth, 1790–1900*, pp. 52 and 53.

A 181–194. Number of places in urban and rural territory, by size of place, 1790–1950.

Source: *U. S. Census of Population: 1950*, vol. I, pp. 1-6 and 1-7.

The number of places shown for 1790–1940 and for 1950, according to the urban definition used in the 1940 and prior Censuses (see text for series A 34–50), represents the number of incorporated places (cities, boroughs, villages, and, in certain States, towns) and the number of places urban under special rules. The number of places shown for 1950, according to the urban definition used in the 1950 Census, represents the number of incorporated places and those unincorporated places delineated by the Bureau of the Census for the 1950 Census which had 1,000 inhabitants or more.

A 195–209. Population in urban and rural territory, by size of place, 1790–1950.

Source: *U. S. Census of Population: 1950*, vol. I, pp. 1-6 and 1-7.

See text for series A 34–50.

A 210–227. Marital status of persons 14 years old and over, by sex, 1890–1957.

Source: 1890–1940, *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-179; 1947–1957, Bureau of the Census, *Current Population Reports*, Series P-20, Nos. 10, 23, 26, 38, 44, 50, 56, 62, 72, and 81.

Marital status (single, married, widowed, and divorced) represents the status of persons at the time of the enumeration. Persons classified as "married" include those who have been married only once, remarried after having been widowed or divorced, separated, and living in common-law marriages. Persons reported as never married or with annulled marriages are classified as single. Since it is probable that some divorced persons are reported as single, married, or widowed, the census figures may understate somewhat the actual number of divorced persons who have not remarried.

Percentages shown are standardized for age to offset the effect of changes in the age distribution of the population. Using the civilian population in March 1950 as a standard, the age-standardized proportions of each sex in each of the marital status categories were computed for the age groups 14–17 years, 18 and 19 years, 20–24 years, 25–34 years, 35–44 years, 45–54 years, 55–64 years, and 65 years and over. The age-specific proportions of persons in each marital status category during a given year were then each multiplied by the proportion of persons in that age group in the 1950 civilian population. The sum of the products is the standardized proportion of persons in the given marital status category.

A 228–229. Median age at first marriage, by sex, 1890–1957.

Source: 1890–1954, Bureau of the Census, *Current Population Reports*, Series P-20, No. 72; 1955–1957, Bureau of the Census and Department of Defense, records.

The median age at first marriage, as shown here, is an approximation derived indirectly from tabulations of marital status and age. (See source for detailed explanation of computation procedures.) These estimates differ from those based on annual marriage records or census questions on age at first marriage. Data on age at first marriage are available only for certain States and from census questions only for selected dates. Moreover, median age at first marriage based on records is affected by changes in the age distribution of the population, whereas the median age at first marriage shown here can be interpreted as applying to the cohort born "*n*" years earlier, where "*n*" is the median age at first marriage.

A 230–241. Households, by sex and age of head, 1890–1957.

Source: 1890 and 1950, *U. S. Census of Population: 1950*, vol. IV, Special Reports, *General Characteristics of Families*, p. 2A–10; 1930, Fifteenth Census Reports, *Population*, vol. VI, *Families*, p. 27, and Sixteenth Census Reports, *Population, Families—Size of Family and Age of Head*, p. 123, and unpublished Census Bureau records; 1940, Sixteenth Census Reports, *Population*, vol. IV, p. 28; 1956 and 1957, Bureau of the Census, *Current Population Reports*, Series P–20, Nos. 72 and 81.

According to the current Census Bureau definition, a household includes all the persons who occupy a house, an apartment, or other group of rooms, or a room that constitutes a dwelling unit. In general, a group of rooms occupied as separate living quarters is a dwelling unit if it has separate cooking equipment or if it constitutes the only living quarters in the structure. A household includes the related family members (the head of the household and others in the dwelling unit related to the head) and also the unrelated persons, if any, such as lodgers (if fewer than 5), foster children, wards, or employees who share the dwelling unit. A person living alone in a dwelling unit, or a group of unrelated persons sharing a dwelling unit as partners, is also counted as a household.

All persons not living in households are considered to live in quasi-households. A quasi-household is a group of persons living in quarters not classified as a dwelling unit, for example, in a house with at least 5 lodgers, or in a hotel, dormitory, institution, labor camp, or military barracks.

The figures for number of households are not strictly comparable from year to year. In general, the definitions of household for 1790, 1900, 1930, 1940, 1950, and 1957 are similar. Very minor differences result from the fact that in 1950 and 1957 dwelling units with 5 or more lodgers were excluded from the count of households, whereas in 1940 and 1930 dwelling units with 11 lodgers or more were excluded, and in 1790 and in 1900 no precise definition of the maximum allowable number of lodgers was made. The definition of household for 1850–1890, 1910, and 1920 differs slightly from that given above. For these years, no distinction was made between households and quasi-households, and thus the numbers include both households and quasi-households.

In 1950 and 1957 the number of households has been equal, by definition, to the number of occupied dwelling units enumerated for housing statistics. In 1940, the definition of household was not completely the same as that of occupied dwelling units. In that year there were 95,000 more households than occupied dwelling units.

A 242–244. Households, by residence, 1900–1957.

Source: 1900–1946, Bureau of the Census, *Current Population Reports*, Series P–20, No. 92; 1947–1957, *Current Population Reports*, Series P–20, Nos. 59 and 76.

See text for series A 230–241 for definition of household, and A 34–50 for definition of residence.

Data for 1900–1946 represent estimates of the number of married women with their spouse in their own household, and the number of household heads in the remaining population. These estimates were based on available census and survey data and on additional information on construction activity, vacancy rates, marriage rates, divorce rates, economic indexes, etc. Although the figures are shown as of a given date, they should be regarded as an approximation of the annual average number of households.

The estimates by residence were made by subdividing the total into farm and nonfarm components, using estimates of the average size of farm households in conjunction with annual estimates of the farm population (see joint report of Bureau of the Census and Bureau of Agricultural Economics, *Estimates of the Farm Population: 1910 to 1950*, Series Census–BAE, No. 16A). Since the annual changes in the number of households which are implied in these series may be in substantial error, caution should be used in the interpretation of small changes.

The farm household series for 1910–1946 relates to the total farm population, whereas that for 1947–1957 relates to the rural-farm population. There were 88,000 urban-farm households in 1940 and 96,000 in 1950.

A 245–247. Married couples with or without own household, 1910–1957.

Source: Bureau of the Census, *Current Population Reports*, Series P–20, Nos. 17, 59, and 76.

A married couple, as defined for census purposes, is a husband and his wife enumerated as members of the same household or quasi-household. The married couple may or may not have children living with them.

A 248–254. Population, by household relationship, 1910–1957.

Source: 1910, Thirteenth Census Reports, *Population*, vol. I, p. 1285, and unpublished Census Bureau records; 1930, Fifteenth Census Reports, *Population*, vol. VI, p. 10, *Current Population Reports*, Series P–20, No. 53, and unpublished Census Bureau records; 1940, Sixteenth Census Reports, *Population*, vol. IV, p. 26; 1947, Bureau of the Census, *Current Population Reports*, Series P–20, Nos. 10, 17, and 55; 1950, *Current Population Reports*, Series P–20, No. 55, and unpublished Census Bureau records; 1954 and 1957, *Current Population Reports*, Series P–20, Nos. 56 and 81.

See text for series A 230–241 for definition of household.

Prior to 1947, persons living in houses with 5 to 10 lodgers were classified as living in households rather than quasi-households. Thus, the figures for 1910, 1930, and 1940 include such persons in the total number living in households, whereas the figures for 1947, 1950, 1954, and 1957 include them as living in quasi-households.

Source: 1790–1880, computed from Twelfth Census Special Reports, *A Century of Population Growth, 1790–1900*, p. 80;

Digitized by Google

1890–1950, *U. S. Census of Population: 1950*, vol. IV, Special Reports, *General Characteristics of Families*, p. 2A-8. Population figures used in computing population per household for 1957 are from Bureau of the Census, *Current Population Reports*, Series P–25, No. 169.

These figures were computed by dividing the total population (the total free population for 1790, 1850, and 1860) by the number of household heads. As explained previously, the number of household heads for 1850–1890, 1910, and 1920 also include the heads of quasi-households. Since these are such a small fraction of the total number of household heads, the population per household is only slightly affected by the change in definition for these years.

[1] Excludes U. S. citizens temporarily abroad on private business, travel, etc.
[2] Estimates derived by extrapolation and interpolation of the censuses of 1903, 1918, and 1939. No figure shown for 1950 since Philippine Islands were granted independence in 1946.
[3] Estimate based on 20-percent sample of reports received.
[4] Includes population of Canton (272), Corn (1,304), Johnston (46), Midway (416), Swan (36), and Wake (349) Islands, and Trust Territory of the Pacific Islands (54,843).
[5] Census taken as of October 1 of the preceding year.
[6] Includes population of Baker, Howland, and Jarvis (10), Canton and Enderbury (44), Corn (1,523), Johnston (69), and Midway (437) Islands.
[7] Population for Midway Island.
[8] Population as of 1917 Census.
[9] Population as of 1912 Census.
[10] Population as of 1899 Census.
[11] Population as of 1901 Census.

1790			202	3,728								3,172	757	1,615		1,557	

[1] Residence for both sexes tabulated according to the old urban (or 1940) definition (series A 36–38) from 1790 to 1940, and for male and for female separately for 1930 and 1940. Tabulations of residence for male and for female from 1900 to 1920 are according to the definitions current at those censuses.

[2] See text for series A 34–50 for explanation of definitions.

[3] Figures for color by sex in 1930 revised to include Mexicans as white. Mexicans were classified as nonwhite in the 1930 reports.

[4] Adjustment for underenumeration in the South (see series A 20 above) shows a population of 39,818,000 of whom 34,337,000 were white and 5,481,000 were nonwhite.

Series A 51–58. White Population, by Sex and Nativity: 1850 to 1950

[Prior to 1920, citizenship figures restricted to males 21 and over]

Year	Male				Female				Year	Male			Female		
	Native		Foreign born		Native		Foreign born			Native			Native

1900	28,686,450	7,836,603	5,515,285		27,908,929	7,809,414	4,698,532								

[1] Includes those with first papers; excludes those with citizenship unknown, of which, for both sexes, there were 698,695 in 1950; 825,072 in 1940; 491,268 in 1930; and 790,823 in 1920.

[2] Based on 20-percent sample in 1950 and 5-percent in 1940. Comparable sample totals differ slightly from figures based on a complete count.

[3] Native white of foreign or mixed parentage, for both sexes, amounted to 8,274,867 in 1880 and 5,324,268 in 1870. (See *Fifteenth Census of the United States: 1930*, vol. II, p. 33.)

1820	898,892	786,022					872,764	752,000				

[1] Sex not reported before 1820. Total for both sexes from 1790 to 1810 is as follows: For 1810, total 1,377,808, slaves 1,191,362; 1800, total 1,002,037, slaves 893,602; and 1790, total 757,208, slaves 697,681.

[2] Includes persons of mixed white, Negro, and Indian ancestry in certain communities in eastern United States.

[3] Excludes Indians in Indian Territory and on Indian reservations.

[4] Adjustment for underenumeration in Southern States shows 5,892,172 Negroes for both sexes combined.

[1] Exclusive of Indian Territory and Indian reservations with a population of 325,464 not distributed by age, of whom 169,221 were male, 117,868 were white, and 18,636 were Negro. These areas were not enumerated prior to 1890.
[2] White males only. [3] 10 to 15 years old. [4] 16 to 25 years old. [5] 26 to 44 years old.
[6] Age detail partly estimated. [7] Under 16 years old. [8] 16 years old and over.
[9] Revised to include Mexicans classified as nonwhite in the 1930 reports.
[10] Based on 20-percent sample; figures for total white population in series A 71–85 based on complete count.
[11] Due to processing errors, the sum of the various ages of Negroes in 1950 (series A 71–85) will differ slightly from the number of Negroes shown elsewhere.
[12] Estimates based on total Negroes under 15 and age distribution of nonwhites.
[13] Nonwhite population. Age not tabulated for Negroes separate from other nonwhite races.

Digitized by Google

[5] 26 to 44 years old. [14] 10 to 23 years old. [15] 24 to 35 years old. [16] 36 to 54 years old. [17] Under 14 years old. [18] 14 to 25 years old.

Series A 86–94. Median Age of Population, by Color and Sex: 1790 to 1950

[In years. Because of change in computation procedure, medians for 1850 to 1930 differ slightly from those published in the population census reports for 1930 and previous years]

[1] Excludes persons (6,100 in 1840 and 5,318 in 1830) on public ships in the service of the United States, not credited to any region.

[2] Adjustment for underenumeration shows a total for the South of 13,548,098, of whom 8,611,124 were white and 4,932,974 were Negro.

Series A 123–180. Population, for States: 1790 to 1950

[Insofar as possible, population shown is that of present area of State. For U. S. total population, see series A 20. However, in 1830, series A 20 includes 5,318 persons on public ships in the service of the United States not credited to any State; the corresponding figure for 1840 is 6,100]

[1] Territory northwest of the Ohio River.
[2] 1810 includes population of area separated in 1816; 1800 includes 3,124 persons in those portions of Indiana Territory which were taken to form Michigan and Illinois Territories in 1805 and 1809, respectively, and that portion which was separated in 1816.
[3] Illinois Territory.
[4] Michigan Territory as then constituted; boundaries changed in 1816, 1818, 1834, and 1836.
[5] Includes that part of Minnesota northeast of Mississippi River.
[6] Includes that part of Minnesota lying west of Mississippi River and a line drawn from its source northwards to Canadian boundary.
[7] Dakota Territory.
[8] Those parts of Mississippi Territory now in present State.
[9] Those parts of present State included in Mississippi Territory as then constituted.
[10] Includes area taken to form part of Arizona Territory in 1863.
[11] Utah Territory exclusive of that part of present State of Colorado taken to form Colorado Territory in 1861.
[12] Nevada Territory as organized in 1861.
[13] Includes population of Idaho and parts of Montana and Wyoming.
[14] Parts of Oregon Territory taken to form part of Washington Territory in 1853 and 1859.

Series A 181–194. Number of Places in Urban and Rural Territory, by Size of Place: 1790 to 1950

[In 1930 each pair of the following was counted as a single place: Bluefield, Va., and Bluefield, W. Va.; Bristol, Tenn., and Bristol, Va.; Delmar, Del., and Delmar, Md.; Harrison, Ohio, and West Harrison, Ind.; Junction City, Ark., and Junction City, La.; Texarkana, Ark., and Texarkana, Tex. Texhoma, Okla., and Texhoma, Tex.; and Union City, Ind., and Union City, Ohio. In all other years they were counted as separate incorporated places. For description of urban definition, see text]

Vital Statistics and Health and Medical Care

VITAL STATISTICS (Series B 1–179)

B 1–179. General note.

Vital statistics, including statistics of births, deaths, marriages, and divorces, are compiled for the country as a whole by the National Office of Vital Statistics. Originally, the collection of these data was the responsibility of the Bureau of the Census. In July 1946, this function was transferred to the Federal Security Agency, which in 1953, was reconstituted as the Department of Health, Education, and Welfare. The National Office of Vital Statistics is a part of the Public Health Service in that Department.

The live-birth, death, and fetal-death statistics prepared by the National Office of Vital Statistics are based principally on copies of vital records received from registration offices of all States, of certain cities, and of the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. The marriage and divorce statistics are based on reports from State registration offices that maintain central registers of marriage or divorce, from local officials, and from the District of Columbia, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. Figures shown here, however, are limited to events occurring within continental United States; Alaska, Hawaii, Puerto Rico, and the Virgin Islands are excluded, as are births, deaths, marriages, and divorces of American nationals in other parts of the world. For States or areas for which numbers of marriages are not available, numbers of marriage licenses are used as the nearest approximations.

The annual report, *Vital Statistics of the United States*, presents final figures for continental United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. A series of national summaries, *Vital Statistics—Special Reports*, is also issued each year, containing data on particular subjects. Information regarding unpublished data is contained in each annual report under "Guide to Tabulations," which is a complete index to all tabulated statistics on live births, deaths, and fetal deaths for the year.

Although every State has adopted a law requiring the registration of births, deaths, and fetal deaths, these laws are not uniformly observed. One condition for admission to the national registration areas was a demonstrated registration completeness of at least 90 percent. On the basis of this criterion, all of the States were admitted to both the birth- and death-registration areas by 1933. It is recognized, however, that the methods then used in testing completeness were subject to considerable error.

Accurate measures of birth-registration completeness on a nationwide basis were obtained for the first time in 1940, when studies were made in connection with the population census of that year. They showed that, for the United States as a whole, birth registration was 92.5 percent complete. A corresponding study 10 years later indicated that registration had improved considerably, with 97.9 percent of the births in 1950 being recorded. Only in a few States was underregistration shown to be still a problem. The results of this study have been published in considerable detail and provide a basis for adjusting registered birth data for underreporting and for making estimates of registration completeness in postcensal years. Birth registration has continued to improve since 1930, and in 1956, 98.7 percent of the live births were registered. (See National Office of Vital Statistics, "Birth-Registration Completeness in the United States and Geographic Areas, 1950," parts I, II, and III, *Vital Statistics—Special Reports*, vol. 39, Nos. 2 and 4, and vol. 45, No. 9.)

Death registration is believed to be at least as complete as birth registration. However, quantitative information on the completeness with which deaths are reported is limited to that obtained years ago in applying the "90-percent" standard for entry into the death registration area and to information obtained from occasional local area studies. While underregistration for the country as a whole is negligible, local studies furnish evidence that in certain isolated places underreporting of deaths may still be a problem. Registration of fetal deaths is probably significantly incomplete in all areas.

In 1956 and 1957, pilot tests of the registration completeness of marriages and of divorces and annulments were undertaken, and in two States, Tennessee and Michigan, Statewide tests of marriage-registration completeness were undertaken. The final results of these tests have not been published but preliminary results indicate that marriage-registration completeness in both States is well above 95 percent.

Population statistics published or made available by the Bureau of the Census have been used in computing the vital rates shown here. Rates for 1940 and 1950 are in all cases based on the population enumerated in the censuses of those years which were taken as of April 1. With the exception of series B 10–18 and B 24–30, which are based on estimated population as of April 1 for 1941–1949, rates for all other years are based on the latest midyear (July 1) estimates of population made by the Bureau of the Census.

Except for 1941–1946, vital rates are based on the population residing in continental United States. In those years, the transfer overseas of several million men precluded the computation of birth and divorce rates strictly comparable with such rates for prewar years. For 1941–1946, the birth and divorce rates are based on the population including the Armed Forces overseas. (For a discussion of the interpretation of rates during wartime, see "Summary of Natality and Mortality Statistics, United States, 1943," *Vital Statistics—Special Reports*, vol. 21, No. 1, and "Marriage and Divorce in the United States, 1937 to 1945," *Vital Statistics—Special Reports*, vol. 23, No. 9.)

Vital statistics showing color and race are compiled from entries which appear on certificates filed with vital registration offices. The classification white includes persons reported as Mexican and Puerto Rican. The Negro group includes persons of mixed Negro and other ancestry. Other mixed parentage is classified according to the race of the nonwhite parent and mixtures of nonwhite races according to the race of the father.

B 1–5. Growth of birth- and death-registration area, 1900–1933.

Digitized by Google

of the historical development of the vital statistics system in the United States, see *Vital Statistics of the United States, 1950*, vol. I, chap. 1.

The first death statistics published by the Federal Government were for 1850 and covered the entire United States. These figures were based on the decennial census of that year. As an approximation of births in 1850, data on the population under one year old as reported in the 1850 Census were used. Although these reports were incomplete, similar data were collected in each census up to and including the Census of 1900.

In 1880, the Bureau of the Census established a national "registration area" for deaths. The original area consisted of only two States (Massachusetts and New Jersey), the District of Columbia, and several large cities having efficient systems for the registration of deaths. By 1900, eight other States had been admitted. For 1880, 1890, and 1900, mortality data were received from the States and cities included in this expanding area, but for other parts of the country death figures were still compiled from the census. Since relatively reliable mortality statistics are available for Massachusetts over a longer period than for the Nation, several annual series for that State are included here (see series B 76–91, B 113, and B 155–175).

The annual collection and publication of mortality statistics for the registration area began in 1900. In 1902, the Bureau of the Census was authorized to obtain, annually, copies of records filed in the vital statistics offices of those States and cities having adequate death-registration systems. The death-registration area for 1900 consisted of 10 States, the District of Columbia, and a number of cities located in nonregistration States. This original registration area included 40.5 percent of the population of continental United States (26.2 percent, excluding the reporting cities in nonregistration States), but it was predominantly urban and it had a high proportion of white persons. Between 1900 and 1933, the death-registration area was steadily expanded until, by 1933, all 48 States and the District of Columbia were included.

As it was more difficult to obtain accurate and complete registration of births than of deaths, the national birth-registration area was not established until 1915, and no birth statistics were published by the Bureau of the Census for 1900–1914. The original birth-registration area of 1915 consisted of 10 States and the District of Columbia. Beginning with 1933, the birth-registration area has included the 48 States and the District of Columbia.

B 6. Live births, 1909–1956.

Source: 1909–1934, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 33, No. 8; 1935–1956, *Vital Statistics of the United States, 1956*, vol. I, p. lxxvi.

B 7. Deaths, 1933–1956.

Source: 1933–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. xcvi.

B 8–9. Marriages and divorces, 1920–1956.

Source: 1920–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, pp. xxii, lxxi.

B 10–18. Birth rate, by live-birth order, for native white women, 1920–1956.

Source: 1920–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. lxxx.

For estimates for 1920–1939, as prepared by P. K. Whelpton, see *Vital Statistics—Special Reports*, vol. 33, No. 8.

Figures contain estimates for cases not reporting order of birth, including those in Massachusetts where birth-order reporting is not required. By limiting these rates to the native white group, it is possible to exclude the effect of the varying fertility patterns of foreign-born and nonwhite women.

B 19–21. Birth rate, by color, 1800–1956.

Source: Series B 19, 1820–1900, Henry D. Sheldon, *The Older Population of the United States*, John Wiley and Sons, New York, 1958, p. 145. Series B 20, 1800–1900, Warren S. Thompson and P. K. Whelpton, *Population Trends in the United States*, McGraw-Hill, New York, 1933, p. 263. Series B 19–21, 1910, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 33, No. 8, p. 141; 1920–1956, *Vital Statistics of the United States, 1956*, vol. I, p. lxxvi.

B 22–24. Birth rate, women 15 to 44 years old, by color, 1800–1956.

Source: Series B 22–23, 1800–1910, Warren S. Thompson and P. K. Whelpton, *Population Trends in the United States*, McGraw-Hill, New York, 1933, p. 263; 1910–1939, unpublished estimates prepared by National Office of Vital Statistics; 1940–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. lxxvii. Series B 24, 1920–1956, *Vital Statistics of the United States, 1956*, vol. I, p. lxxx.

Rates are computed by relating total births, regardless of the age of mother, to the female population 15 to 44 years old.

B 25–30. Birth rate, native white women, by age of mother, 1920–1955.

Source: 1920–1939, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 33, No. 8, p. 143; 1940–1955, unpublished estimates prepared by the National Office of Vital Statistics.

The age-specific rates shown here express the number of live births to native white women in a specified age group per 1,000 native white women in that age group.

B 31–36. Gross and net reproduction rates, by color, 1905–10 to 1956.

Source: 1905–10 to 1935–40, Bureau of the Census, Sixteenth Census Reports, *Differential Fertility, 1940 and 1910—Standardized Fertility Rates and Reproduction Rates;* 1935, National Office of Vital Statistics, *Vital Statistics of the United States, 1950*, vol. I, p. 87; 1940–1956, *Vital Statistics of the United States, 1956*, vol. I, p. lxxix.

The gross reproduction rate represents the number of daughters a hypothetical cohort of 1,000 women entering the childbearing period would have during their lives, if they were subject to the age-specific birth rates observed in a given time period, and if none of the cohort were to die before the childbearing period was completed. This rate is the sum of the age-specific birth rates of female infants per 1,000 women. It shows the maximum possible replacement of women that might be expected from the given set of age-specific birth rates. If no migration took place and if the gross reproduction rate remained below 1,000, no improvement in mortality alone could prevent the population from declining when a stable age distribution had been reached.

The net reproduction rate is based on the specific fertility and mortality conditions existing in a given time period. If the age-specific birth and death rates of a certain year (or years) were to continue until the population became stable, a net reproduction rate of 1,000 would mean that a cohort of 1,000 newly born girls would bear just enough daughters to replace themselves.

Reproduction rates are useful in the analyses of fertility and mortality conditions of a given period, but they are not indicators of future population growth. They do not take into account such factors as nuptiality, marital duration, and size

Digitized by Google

of family, and they assume the continuation of the age-specific rates in a given year throughout the lifetime of a cohort of women. Since the United States has experienced major changes in marriage and fertility rates over short periods of time, variations in reproduction rates should not be taken as indications of long-run movements in family formation and rates of fertility and mortality.

B 37-68. Number of children under 5 years old per 1,000 women 20 to 44 years old, by race and residence, by geographic divisions, 1800-1950.

Source: Series B 37-38, Bureau of the Census, *Forecasts of the Population of the United States, 1945-1975*, p. 16. Series B 39-68, 1800-1840 and 1910-1950, Wilson H. Grabill, Clyde V. Kiser, and Pascal K. Whelpton, *The Fertility of American Women*, John Wiley and Sons, New York, 1958; 1850-1900, Bureau of the Census, unpublished estimates.

Figures for series B 37-38 were adjusted for underreporting on the basis of factors obtained for 1925-1930. They have also been standardized for age (except for white women for 1800-1820) using the 1930 age distribution of women to offset the effect of changes in the age distribution of the female population. Therefore, the figures represent the fertility rates of women having the same age distribution as those in 1930. Rates for 1800-1860 are partly estimated.

For definition of geographic divisions, see text for series A 95-122.

The urban-rural classification is the one used by the Bureau of the Census in 1940. The urban population includes all persons living in incorporated places of 2,500 inhabitants or more and in other areas classified as urban under special rules relating to population size and density. The remaining area of the country is classified as rural. See also text for series A 34-50.

B 69-75. Percent distribution of ever-married women (survivors of birth cohorts of 1835-39 to 1900-04), by number of children ever born, 1910, 1940, and 1950.

Source: Conrad and Irene B. Taeuber, *The Changing Population of the United States, 1790-1955*, John Wiley and Sons, New York, 1957, pp. 255-256.

These data are based on an analysis of the 1910, 1940, and 1950 Censuses. In each of these censuses, women who had ever married were asked about the number of children they had ever borne. When these women are classified according to age, it is possible to suggest the trend of fertility among women who had completed their childbearing at each census. On p. 255, the source presents the following caution regarding the use of these data:

> There are many difficulties in the analysis and interpretation of data on numbers of children ever born to married women. The cumulative reproductive performance of the women can be related directly to age, marital status, urban or rural residence, migrant history, ethnic affiliation, and social and economic characteristics. However, the characteristics of the women are those of the time of the census rather than of the time when marriage occurred or children were born. There may be selective factors in memory as age advances, or there may be pride in achievement that leads to exaggeration. Marital status is correlated with social and economic status and with ethnic affiliation, so relations between marital status and fertility may be derivative. Illegitimate births are underreported and erroneously reported in unknown proportions. The possibility of selective associations between fertility, mortality, and migration become increasingly great as age advances.

B 76-91. Expectation of life at specified ages, by sex, 1850-1956.

Source: See detailed listing below.

The expectation of life at a specified age is the average number of years that members of a hypothetical cohort would continue to live if they were subject throughout the remainder of their lives to the mortality rates for specified age groups observed in a given time period.

B 76-83. Expectation of life at specified ages, white population (death-registration area), 1900-1956.

Source: 1900-02 to 1929-31, Bureau of the Census, *United States Life Tables, 1900-1931*, pp. 4-7, 20-23, 28-31, and 40-51; 1939-41 to 1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. xciii.

B 84-91. Expectation of life in Massachusetts, 1850 to 1949-51.

Source: 1850, 1878-82, 1893-97, Metropolitan Life Insurance Company, *Statistical Bulletin*, vol. 9, No. 3, March 1928, pp. 7-8; 1855, Edgar Sydenstricker, *Health and Environment*, McGraw-Hill, New York, 1933, p. 164; 1890, 1900-02, 1909-11, Bureau of the Census, *United States Life Tables, 1890, 1901, 1910, and 1901-1910*; 1919-20, Sydenstricker, *op. cit.*, and Bureau of the Census, *United States Abridged Life Tables, 1919-1920*, pp. 24-27; 1929-31, National Resources Committee, *Population Statistics 2, State Data*, p. 38; 1939-41 to 1949-51, Bureau of the Census and National Office of Vital Statistics, annual report, *Vital Statistics of the United States*, vol. I.

B 92-100. Expectation of life at birth, by color and sex (death-registration area), 1900-1956.

Source: 1900-1956, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 48, No. 6, p. 154.

Derivation of estimates is described in "Estimated Average Length of Life in the Death-Registration States," *Vital Statistics—Special Reports*, vol. 33, No. 9.

The expectation of life at birth is the average number of years that members of a hypothetical cohort would live if they were subject throughout their lives to the age-specific mortality rates observed at the time of their birth. This is the most usual measure of the comparative longevity of different populations. There is some objection to the use of the average duration of life as a standard of comparison because the method of calculating it gives great weight to the relatively large number of deaths occurring in the first year of life. This influence may be entirely eliminated by considering instead the average lifetime remaining to those members of the cohort surviving to age 1, or, in other words, the expectation of life at age 1. However, this objection is growing less valid as infant mortality decreases.

B 101-103. Fetal death ratio, by color, 1922-1956.

Source: 1922-1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. lxxxviii.

Lack of uniformity in requirements for registration and variation in completeness of registration influence the comparability of the data over the years, especially in the series based on all reported fetal deaths. Considering the probable total effect of these factors, as well as that of incompleteness of the registration area until 1933, it appears likely that the ratios understate any decline in fetal mortality. Changes in the regulations have more often been in the direction of broadening the base of fetal death reporting, than in the other direction. With respect to completeness of reporting, the situation has

Digitized by Google

probably improved because of the increases in the number of women receiving hospital and medical care at childbirth and also because of the general strengthening of the vital registration system.

B 104–106. Neonatal mortality rate, by color, 1915–1956.

Source: 1915–1929, National Office of Vital Statistics, *Vital Statistics of the United States, 1950*, vol. I, pp. 258–259; 1930–1950, *Vital Statistics—Special Reports*, vol. 45, No. 1, pp. 8–10; 1951–1956, *Vital Statistics of the United States, 1956*, vol. I, p. cxiv.

The neonatal mortality rate represents the number of deaths of infants under 28 days (exclusive of fetal deaths) per 1,000 live births.

B 107–109. Infant mortality rate, by color, 1915–1956.

Source: 1915–1950, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 45, No. 1, p. 7; 1951–1956, *Vital Statistics of the United States, 1956*, vol. I, p. cxiv.

The infant mortality rate represents the number of deaths under 1 year (exclusive of fetal deaths) per 1,000 live births. The rates have been computed by the conventional method in which the infant deaths occurring in a specified period are related to the number of live births occurring during the same period. Rates computed in this way are influenced by changes in the number of births and will not be comparable if the birth rate is fluctuating widely. Deaths under 1 year of age occurring during any calendar year are deaths not only of infants born during that year but also of infants born during parts of the previous year. An approximate correction of this error can be made by relating infant deaths during a specified year to the year in which those infants were born. See Bureau of the Census, "Effect of Changing Birth Rates Upon Infant Mortality Rates," *Vital Statistics—Special Reports*, vol. 19, No. 21.

B 110–112. Maternal mortality rate, by color, 1915–1956.

Source: 1915–1955, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 46, No. 17, p. 438; 1956, *Vital Statistics—Special Reports*, vol. 48, No. 15, p. 412. Rates prior to 1940, see also Bureau of the Census, *Vital Statistics Rates in the United States, 1900–1940*, pp. 574–575, 622, and 656–662.

The maternal mortality rate represents the number of deaths from deliveries and complications of pregnancy, childbirth, and the puerperium per 10,000 live births.

B 113. Infant mortality rate, for Massachusetts, 1851–1956.

Source: 1851–1900, *77th Annual Report of Vital Statistics of Massachusetts*, p. 132; 1900–1956, Bureau of the Census and National Office of Vital Statistics, annual report, *Vital Statistics of the United States*, vol. I.

B 114–128. Death rate, for selected causes (death-registration area), 1900–1956.

Source: All data except series B 116, 1900–1950, National Office of Vital Statistics, *Vital Statistics of the United States, 1950*, vol. I, p. 218; 1951–1956, *Vital Statistics of the United States, 1956*, vol. I, p. c. Series B 116, 1900–1920, *Vital Statistics of the United States, 1950*, vol. I, p. 218; 1921–1940, *Vital Statistics Rates in the United States, 1900–1940*, p. 266; 1941–1956, National Office of Vital Statistics, unpublished data.

Mortality data are classified according to the numbers and titles of the detailed International List of Causes of Death. A large proportion of the death certificates filed annually in the United States report two or more diseases or conditions as joint causes of death. General statistical practice requires that cases involving more than one cause of death be changed to a single cause.

In the French edition of the International List (1900), certain principles for determining the single cause to be selected from the joint causes given were incorporated as a part of the general classification scheme. As an outgrowth of practices in this country after 1902, definite relationships among the various conditions represented by items in the International List were put in concrete form in the *Manual of Joint Causes of Death*, first published in 1914, and revised to conform with successive revisions of the International List. This manual, which was developed for use in the United States, was followed until 1949, when an international procedure for joint-cause selection was adopted. The new international rules place the responsibility on the medical practitioner to indicate the underlying cause of death. This change, in conjunction with the Sixth Revision of the International List in 1948 and the Seventh Revision in 1955, has introduced rather serious breaks in statistical continuity.

Time-trend studies of causes of death would be facilitated if the International List were maintained without change over a long period of years. However, if the list were rigidly fixed it would be inconsistent with current medical knowledge and terminology. To obtain the advantages of frequent revision, and yet to retain a fixed list for a number of years, revisions are made at an international conference every 10 years. In the process of revision, discontinuities are introduced into the time trends of death rates for certain specific causes of death (see National Office of Vital Statistics, "The Effect of the Sixth Revision of the International List of Diseases and Causes of Death Upon Comparability of Mortality Trends," *Vital Statistics—Special Reports*, vol. 36, No. 10).

Improvement in diagnostic procedures and development of medical knowledge and facilities are other important factors in the study of changes in death rates for certain causes.

B 129–135. Death rate, by color and sex (death-registration area), 1900–1956.

Source: 1900–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. xcvi.

B 136–142. Age-adjusted death rate, by color and sex (death-registration area), 1900–1956.

Source: 1900–1956, National Office of Vital Statistics, *Vital Statistics of the United States, 1956*, vol. I, p. xcvii. See also *Vital Statistics Rates in the United States, 1900–1940*, p. 127, and Bureau of the Census, *Vital Statistics—Special Reports*, vol. 23, No. 1, p. 17.

The age-adjusted death rate is a convenient summary index that "corrects" for differences in age composition. These rates were computed by taking the age-distribution of the population in 1940 as the "standard" without regard to sex, color, or other characteristics. The age-specific death rates actually observed in a given year were applied to the age distribution of this standard population and a total death rate was computed. For a detailed description of the direct method by which these rates were computed, see *Vital Statistics Rates in the United States, 1900–1940*, pp. 66–69.

See also Commissioner of Labor, *A Report on Marriage and Divorce in the United States, 1867 to 1886;* Bureau of the Census, *Marriage and Divorce, 1867–1906; Marriage and Divorce, 1916;* and *Marriage and Divorce,* annual reports, 1922–1932; S. A. Stauffer and L. M. Spencer, "Recent Increases in Marriage and Divorce," *American Journal of Sociology,* vol. 44, No. 4 (for 1933–1936); Bureau of the Census, "A Review of Marriage and Divorce Statistics: United States, 1887–1937," *Vital Statistics—Special Reports,* vol. 9, No. 60; Bureau of the Census, "Estimated Number of Marriages by State: United States, 1937–1940," *Vital Statistics—Special Reports,* vol. 15, No. 13; Bureau of the Census, "Estimated Number of Divorces by State: United States, 1937–1940," *Vital Statistics—Special Reports,* vol. 15, No. 18. For exact population base figures, see *Vital Statistics—Special Reports,* vol. 46, No. 12, p. 330.

Marriage and divorce records are filed only at the county level in some States, but gradually the various States are requiring by law that such events be recorded at the State level. The completeness of reporting to the State offices varies, but there has been no nationwide test. A marriage-registration area covering 30 States and 5 independent areas, established by the National Office of Vital Statistics, became effective in January 1957. A major criterion for admission of a State to the registration areas was agreement with the National Office of Vital Statistics to conduct a test of marriage registration completeness. A divorce- and annulment-registration area with 14 States and 3 independent areas was inaugurated in January 1958.

The marriage and divorce rates shown in series B 177 and B 179 are based on those segments of the female population that may be considered as subject to possible marriage and divorce.

[1] For 1945–1956 includes only deaths for which the period of gestation was given as 20 weeks or more or not stated. For earlier years, includes all fetal deaths, regardless of gestation. In 1945 ratios based on all fetal deaths, regardless of gestation, were: Total, 26.6; white, 24.1; nonwhite, 44.6.

[2] Mexicans included with "nonwhite."

HEALTH AND MEDICAL CARE (Series B 180–281)

B 180–181. Physicians, 1850–1957.

Source: 1850, Superintendent of the U. S. Census, *Statistical View of the United States . . . a Compendium of the Seventh Census;* 1860, Superintendent of the U. S. Census, *Population of the United States in 1860;* 1870–1930 (decennial years), Bureau of the Census, Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870 to 1940,* p. 111; 1940 and 1950, *U. S. Census of Population, 1950,* vol. II, part 1, pp. 1-266 to 1-269; 1870–1934, R. G. Leland, *Distribution of Physicians in the United States,* American Medical Association, Chicago, 1936, pp. 7, 79; 1936–1957, the *American Medical Directory,* vols. 14–20 (a summary for 1906–1957 is shown in table 2 of the 1958 edition); 1950–1954, estimates prepared by Public Health Service.

The census data for 1940 and 1950 are for employed civilian physicians; figures for prior years are largely for gainful workers and may include physicians not in active medical practice. See text for series D 36–45 for explanation of difference between employed persons and gainful workers. The 1910 figure includes osteopaths; earlier figures include osteopaths, chiropractors, and healers (not elsewhere classified).

The *American Medical Directory* figures pertain to the total number of physicians, including those retired or not in practice for other reasons and those in the Federal service. They exclude graduates of the years concerned.

Population figures used to compute physician-population rate for census years, 1850–1930, include Armed Forces overseas; only the civilian population is used for 1940 and 1950. Rates for other years are based on the Census Bureau population estimates as of July 1, including Armed Forces overseas.

B 182–183. Dentists, 1810–1957.

L. Polk and Co., Chicago, 1928, pp. 9, 22, and prior editions; 1947–1957, *Distribution of Dentists in the United States by State, Region, District and County,* American Dental Association, Chicago, 1958, and prior editions.

The census data for 1940 and 1950 are for employed civilian dentists; figures for prior years are largely for gainful workers and may include dental students and dentists not in active dental practice. See text for series D 36–45 for explanation of difference between employed persons and gainful workers.

The 14 editions of *Polk's Dental Register and Directory of the United States and Dominion of Canada* list by State all dentists for 1893–1928. The *American Dental Directory,* first published in 1947, lists by State all dentists, including those retired or not in practice for other reasons and those in the Federal dental service. The figures for all dates include graduates of the years concerned.

The population figures used to compute the dentist-population rate are the same as those used for the physician-population rate. See text for series B 180–181.

B 184–185. Graduate nurses, 1910–1955.

Source: 1910–1950, Public Health Service, *Health Manpower Source Book 2, Nursing Personnel,* pp. 14–15; 1953 and 1955, American Nurses Association, *Facts About Nursing,* New York, 1956–57 edition, p. 8.

The estimates for 1910–1950 were obtained by subtracting student nurses from the number of nurses reported in the decennial censuses.

Census data for 1910–1930 are for gainful workers; for 1940 they include employed nurses and those seeking work; and for 1950 they include employed civilian nurses. See text for series D 36–45 for explanation of difference between employed persons and gainful workers.

The estimates for 1953 and 1955, were prepared jointly by the American Nurses Association, the National League for Nursing, and the Public Health Service. They are based partly on information supplied by hospitals, schools of nursing, public health agencies, boards of education, and nursing homes. Estimates of nurses in private duty, doctors' offices, industry, and other nursing fields were based on the American Nurses Association Inventory of 1951 adjusted according to trends observed in more recent State surveys of nursing needs and resources.

Population figures used to compute nurse-population rate for 1910–1940 include Armed Forces overseas. The 1950 rate is based on the civilian population. Rates for 1953 and 1955 are based on the Census Bureau population estimates as of January 1, 1954 and 1956, respectively, including Armed Forces overseas.

B 186–188. Medical schools, students, and graduates, 1810–1957.

Source: 1810–1840, *1956 American Medical Directory;* later years, annual reports of the Council on Medical Education and Hospitals of the American Medical Association as follows: 1850–1919, *Journal of the American Medical Association,* vol. 79, No. 8, pp. 629–633, August 1922; 1920–1930, *Journal of the American Medical Association,* vol. 105, No. 9, p. 686, August 1935; 1931–1957, Edward L. Turner, *et al., Journal of the American Medical Association,* vol. 165, No. 11, p. 1420, November 1957.

Data on the number of medical schools, students, and graduates prior to 1900 are fragmentary and of dubious accuracy. The first medical school in the United States was founded in 1765. In 1800 three schools graduated students, with the number of schools increasing steadily from 52 in 1850 to a maximum of 162 in 1906. From 1906 to 1929 the number of schools declined sharply, largely because of the inspection and classification system begun in 1904 by the American Medical Association Council on Medical Education. By 1929 only one unapproved school remained.

B 189. Dental schools, 1840–1957.

Source: 1840–1945, Harlan Hoyt Horner, *Dental Education Today,* copyrighted 1947 by University of Chicago, p. 30; 1946–1957, American Dental Association Council on Dental Education, *Dental Students' Register,* Chicago, annual publications.

Horner's data are compiled from Dorothy Fahs Beck, *The Development of the Dental Profession in the United States,* dissertation of the University of Chicago, 1932, and from

Digitized by Google

records of the Council on Dental Education of the American Dental Association. Additional data may be obtained from the following sources cited by Beck: W. J. Gies, *Dental Education in the United States and Canada*, Carnegie Foundation for the Advancement of Teaching, Bulletin No. 19, 1926, p. 42; *Polk's Dental Register and Directory of the United States and Canada*, R. L. Polk and Co., Chicago, 1925, p. 35; W. J. Gies, "Additional Remarks on a Reference to the Carnegie Foundation's Study of Dental Education," *Journal of Dental Research*, vol. 10, p. 32, February 1930; W. J. Greenleaf, *Dentistry*, Career Series, Leaflet No. 7, Office of Education, pp. 7–10. The Beck tabulation also appears in Frederick B. Noyes, "Dental Education, 1911–36," *Oral Hygiene*, vol. 26, p. 24, January 1936.

The first dental school in the United States was organized in 1840. Before that, all physicians practiced some dentistry, a few limiting their practice to this specialty. The dental practitioners who were not physicians learned their trade as apprentices or were self-taught. From 1840 to 1880 apprentice training was the chief source of supply, but by 1880 most States had enacted laws requiring graduation from a dental school.

B 190. Dental students, 1921–1957.

Source: 1921–1934, Frederick B. Noyes, *Oral Hygiene*, vol. 26, p. 28, January 1936; 1935–1957, American Dental Association Council on Dental Education, *Dental Students' Register*, annual publications. Sources cited by Noyes are: W. J. Gies, *Journal of the American Dental Association*, vol. 18, p. 593, April 1931; and Dental Educational Council of America, statistical reports.

B 191. Dental graduates, 1850–1957.

Source: See source for series B 189.

Annual figures for graduates for 1841–1924, are also presented in *Polk's Dental Register*, 1925, p. 34; but the figures for the early years far exceed those shown elsewhere in histories of dentistry as well as those shown here.

B 192–194. Nursing schools, students, and graduates, 1880–1957.

Source: 1880–1927 and 1931, Office of Education, *Biennial Survey of Education in the United States: 1934–36*, vol. II, chap. IV, p. 294; 1929 and 1932, The Committee on the Grading of Nursing Schools, *The Second Grading of Nursing Schools*, New York, 1932, p. 9; 1935–1939, The Nursing Information Bureau of the American Nurses' Association, *Facts About Nursing, 1946*, New York, 1946, pp. 32, 34; 1940–1956, *Facts About Nursing, 1957*, pp. 67, 71; 1957, *Facts About Nursing, 1958*, pp. 70, 74.

> Nursing education began in this country in 1873 with the opening of three schools. These schools offered students an opportunity to learn by doing, under the tutorship for 1 year of a superintendent who had been trained in one of the European schools . . . By 1893 about 70 schools were in operation . . . . As State licensing bodies came into existence, counts of State approved schools and of their students began to be available. Since only graduates of State approved schools could stand for licensure examinations, nonapproved schools tended to close as the effect of licensure became felt. Not until 1923 was machinery for approving schools in operation in every State. (Public Health Service, *Health Manpower Source Book 2, Nursing Personnel*, p. 33.)

B 195–208. Hospitals and beds, by type of service and ownership (AHA), 1946–1957.

Source: 1946–1954, Administrators Guide issue of *Hospitals, Journal of the American Hospital Association*, vol. 29, No. 8, August 1955, part II, pp. 7, 12; 1955–1956, Guide issue of *Hospitals*, vol. 31, No. 15, August 1957, part 2, pp. 348, 355; 1957, Guide issue of *Hospitals*, vol. 32, No. 15, August 1958, part 2, pp. 364, 366.

These figures may not be entirely comparable with those shown in series B 209–220 because the standards required for "listing" or "recognition" of hospitals by the American Hospital Association differ from those required by the American Medical Association. The American Hospital Association collects data annually from all hospitals which it accepts for listing, a basic recognition extended to hospitals and related institutions in accordance with official requirements adopted by its House of Delegates. The Guide issue of *Hospitals* also presents data on admissions, average daily census, births, assets, total expense, payroll expense, and total personnel.

Short-term hospitals have an average patient stay of 30 days or less; long-term, an average stay of longer duration. General hospitals accept patients for a variety of acute medical and surgical conditions, and, for the most part, do not admit cases of contagious disease, tuberculosis, and nervous and mental disease. Special hospitals are those devoted to the treatment of some particular disease or group of diseases or some particular group in the population. Among the former are orthopedic, contagious disease, chronic and convalescent, and eye, ear, nose, and throat hospitals; the latter include maternity, children's, and industrial hospitals. Psychiatric hospitals include those providing temporary or prolonged care for the mentally ill and institutions for the mentally deficient and epileptic. Tuberculosis hospitals include sanatoria or hospitals specifically for the care of tubercular patients.

Number of beds includes beds, cribs, and pediatric bassinets normally available for inpatients. It excludes newborn infant bassinets.

An additional source of information on civilian hospital beds since 1948 is the inventory contained in the comprehensive State plans for hospital and medical facility construction (see *Public Health Reports*, vol. 70, No. 5, May 1955, p. 488).

B 209–220. Hospitals and beds, by type of service (AMA), 1909–1953.

Source: 1909, 1914, 1918, and 1921, *American Medical Directory*, American Medical Association, Chicago, 1921 and prior editions; 1920 and 1923–1953, the following issues of the *Journal of the American Medical Association*, Hospital Number: 1920, April 1921 issue, pp. 1083–1103; 1923, 1927–1933, March 1934 issue, pp. 1008–1009; 1924, March 1925 issue, pp. 961–970; 1925, April 1926 issue, pp. 1009–1055; 1926, March 1927 issue, pp. 789–839; 1934–1953, May 1954 issue, pp. 9–10.

Until 1953, when it discontinued registration of hospitals, the American Medical Association collected data annually from all hospitals registered by it, and published them in the Hospital Number of the *Journal of the American Medical Association*. Registration was a basic recognition extended to hospitals and related institutions in accordance with requirements officially adopted by its House of Delegates. Although its annual census was begun in 1920, complete data on the number of hospital beds classified by type of service are available only from 1925. In addition to information on number of hospitals and beds, the Hospital Number of the AMA Journal presented statistics on admissions, average daily census, and births. For definition of type of service, see text for series B 195–208.

B 221–234. Hospitals and beds, by ownership or control (AHA), 1946–1957.

Source: 1946–1947, American Hospital Association, *American Hospital Directory*, 1947 and 1948 issues; 1948–1955, Administrators Guide issues for 1949–1956 of *Hospitals, Journal of the American Hospital Association;* 1956, Guide issue of *Hospitals*, vol. 31, No. 15, August 1957, part 2, p. 364; 1957, Guide issue of *Hospitals*, vol. 32, No. 15, August 1958, part 2, pp. 366–369.

Digitized by Google

Governmental hospitals include those operated by Federal, State, and local governments, the latter including county, city, city-county, and hospital district. Nonprofit hospitals are those operated not for profit by churches and by associations of citizens or fraternal organizations. Proprietary hospitals are operated for profit by individuals, partnerships, or corporations.

B 235–248. Hospitals and beds, by ownership or control (AMA), 1909–1953.

Source: The following issues of the *Journal of the American Medical Association*, Hospital Number: 1909, 1914, 1918, and 1934–1953, May 1954 issue, pp. 4, 7–8; 1923 and 1927–1933, March 1934 issue, pp. 1006–1007; 1924, March 1925 issue, pp. 961–970; 1925, April 1926 issue, pp. 1009–1055; 1926, March 1927 issue, pp. 789–839.

For definition of ownership or control, see text for series B 221–234.

B 249–260. Average daily census and admissions to hospitals, by type of service and ownership (AHA), 1946–1957.

Source: American Hospital Association publications, as follows: 1947, 1949, and 1951, Administrators Guide issue of *Hospitals*, vol. 29, No. 8, August 1955, part II, p. 7; 1946, 1948, 1950, 1952–1956, Guide issue of *Hospitals*, vol. 31, No. 15, August 1957, part 2, p. 355; 1957, Guide issue of *Hospitals*, vol. 32, No. 15, August 1958, part 2, p. 372.

Admissions refer to patients who enter a hospital during the course of a year, either as first admissions or readmissions. For definitions of type of service and ownership, see text for series B 195–208.

B 261–270. Average daily census and admissions to hospitals, by type of service (AMA), 1923–1953.

Source: The following issues of the *Journal of the American Medical Association*, Hospital Number: 1925, April 1926 issue, p. 1009; 1923, 1927, and 1929–1933, March 1934 issue, pp. 1008–1009; 1934–1953, May 1954 issue, pp. 9–10.

Admissions refer to patients who enter a hospital during a year, either as first admissions or readmissions. For definitions of type of service, see text for series B 195–208.

B 271–274. Admissions of patients to hospitals for mental disease, 1831–1956.

Source: 1831–1880, report of the Tenth Census, vol. xxi, *Report on the Defective, Dependent, and Delinquent Classes . . .*, pp. 166–171; 1890–1904, Census Office Special Report, *Insane and Feeble-Minded in Hospitals and Institutions, 1904;* 1910, Bureau of the Census, *Insane and Feeble-Minded in Institutions, 1910;* 1922–1946, same agency annual reports (varying titles), *Patients in Mental Institutions;* 1947–1956, Public Health Service annual reports, *Patients in Mental Hospitals.*

For 1923–1932, the annual enumerations of patients in mental institutions, conducted by the Bureau of the Census, were confined to State hospitals for mental disease and State institutions for mental defectives and epileptics. Since 1933, the annual censuses (conducted by the Bureau of the Census until 1946 and subsequently by the Public Health Service) have covered all types of hospitals and institutions caring for the mentally ill, mental defectives, and epileptics. For a discussion of these developments, see the *1947* issue, pp. 1–4, of the source cited above for 1947–1956. See the latter also for additional information on admissions, patients, personnel, and expenditures of institutions for mental defectives and epileptics, as well as for hospitals for mental disease, see the annual reports of the Public Health Service, *Patients in Mental Hospitals.*

The figures for admissions represent patients who enter hospitals (admissions or readmissions) which provide care solely for the mentally ill, as distinguished from the physically ill and from the mentally deficient and epileptic. These hospitals may provide care over an unlimited period of time or temporary care as in psychopathic hospitals. Hospitals included are those under control of State and local governments, nonprofit and proprietary organizations, the Veterans Administration, and the Federal Government in the District of Columbia (included here under State hospitals).

The rates are computed in relation to the total population of continental United States, as of July 1 of each year prior to 1940; in relation to the civilian population since then.

B 275–281. Specified reportable diseases, 1912–1956.

Source: 1912–1919, Public Health Service, *Public Health Reports*, various issues; 1920–1950, National Office of Vital Statistics, *Vital Statistics—Special Reports*, vol. 37, No. 9; 1951–1956, National Office of Vital Statistics, annual reports, *Vital Statistics of the United States*, vol. I.

The rates refer to the number of notifiable diseases occurring within continental United States per 100,000 population. Each State makes its own laws and regulations prescribing the diseases to be reported, the agencies and persons required to report, and penalties for failure to report. All States have entered voluntarily into a cooperative agreement to report to the Federal Government.

The notification of disease in the United States began in the Colonial period on a local basis, particularly in port cities. It was usually limited to periods when epidemics of pestilential disease threatened or were in progress. Statewide notification was not required until 1883, when Michigan passed a law requiring physicians and householders to report certain diseases to health officers or boards of health. During the next three decades all States made similar requirements.

In response to the need for nationwide statistical information on epidemic diseases, a law was passed in 1878 providing for the collection of such statistics. By 1912, data were supplied regularly by 19 States and the District of Columbia on diphtheria, measles, poliomyelitis, scarlet fever, tuberculosis, typhoid fever, and smallpox. State health authorities now report weekly on 25 diseases and annually on about 40. Most States require the reporting of additional diseases.

The Public Health Service has changed its form of reporting several times and some of the rates shown here do not appear in the published reports. Since the data were originally shown only for the individual States, a rate for the country was obtained for each disease by combining the information only for those States reporting it.

For trends of sickness and accident among groups of male and female industrial workers (1917–1950, for cases disabling for 1 day or longer, and 1921–1952, for cases disabling for 8 days or longer), see W. M. Gafafer, "Industrial Sickness Absenteeism Among Males and Females During 1950," *Public Health Reports*, vol. 66, No. 47, pp. 1550–1552, November 1951. See also "Rates for Specific Causes in 1952 for the Year and Last Two Quarters—Industrial Sickness Absenteeism," *Public Health Report*, vol. 68, No. 11, pp. 1052–1055, November 1953; and S. D. Collins, "Long-Time Trends in Illness and Medical Care," *Public Health Monograph*, No. 48, p. 32.

Civilian illness rates for the United States are not available for a long period. However, records of illness (admission to sick report) among the active-duty personnel of the Army are available back to 1819, and those for the Navy back to 1865. See U. S. Army, *Annual Reports of the Surgeon General on Medical Statistics*, and U. S. Navy, *Annual Reports of the Surgeon General on Medical Statistics.* For annual days sick per person, computed from Army and Navy data, see S. D. Collins, "Long-Time Trends in Illness and Medical Care," *Public Health Monograph*, No. 48, p. 37.

[1] Approved medical and basic science schools.
[2] For 1840 and 1926–1931, schools offering courses in dentistry; for 1850–1925, schools conferring degrees; for other years, schools in operation.
[3] Includes Puerto Rico.
[4] Includes Hawaii and Puerto Rico.
[5] Census estimate adjusted to exclude student nurses enumerated as graduates.
[6] Reflects enrollment of more than 1 class in some schools under accelerated program in operation during World War II.

Migration

INTERNAL MIGRATION (Series C 1–87)

C 1–73. General note.

Data concerning internal migration of the native population are based on information concerning State of birth and State of residence collected during the decennial censuses of population. Caution is required in the interpretation of these data because the migration measured by each census is the net movement from the time of birth to the census date. Migrants as defined here include only those persons who have moved from one State to another and are, on the census date, living in States other than those in which they were born. Persons who moved from their State of birth and then returned to it by the time of the census are classified as nonmigrants.

These statistics for migrants do not represent the total number of persons who have moved from the State or geographic division in which they were born to other States or divisions during any given period of time. Some of those who moved from one State to another died before the following census date. Some moved from and returned, between censuses, to their State of birth. Others moved to places outside continental United States.

A native is defined as a person born in continental United States, Puerto Rico, or the Territories or possessions, or born abroad to American parents. Persons for whom place of birth was not reported are included with the natives.

The classification of the population by color is not ordinarily based on replies to census questions asked by the enumerators, but rather is obtained by observation. This concept does not, therefore, reflect a clear-cut definition of biological stock. The nonwhite population consists of Negroes, American Indians, Japanese, Chinese, Filipinos, and some other groups. Persons of mixed parentage are placed in the color classification of the nonwhite parent. Persons of Mexican birth or ancestry who are not definitely Indian or of other nonwhite stock have been classified as white in all censuses except that of 1930. The lack of comparability introduced by this factor is substantial in the West South Central, Mountain, and Pacific Divisions. For revised 1930 figures for regions showing Mexicans classified as white, see series B 215–230 in *Historical Statistics of the United States, 1789–1945*.

C 1–14. Native population, by residence within or outside State, division, and region of birth, by color, 1850–1950.

Source: Special compilations made by the University of Pennsylvania Studies of Population Redistribution and Economic Growth from the following: 1850, *The Seventh Census of the United States: 1850*, pp. xxxvi–xxxviii; 1860, *Eighth Census of the United States: 1860*, table 5 for each State, pp. 10–589, various pages, and pp. 616–619; 1870, Ninth Census Reports, vol. I, pp. 327–335; 1880, Tenth Census Reports, *Population*, pp. 484–491; 1890, Eleventh Census Reports, *Population*, part 1, pp. 564–567 and 576–579; 1900, Twelfth Census Reports, *Population*, vol. I, part 1, pp. 686–693 and 702–705; 1910, Thirteenth Census Reports, *Population*, vol. I, pp. 730–744; 1920, Fourteenth Census Reports, *Population*, vol. II, pp. 626–640; 1930, Fifteenth Census Reports, *Population*, vol. II, pp. 153–167; 1940, Sixteenth Census Reports, *State of Birth of the Native Population*, pp. 20–39; 1950, *U. S. Census of Population: 1950*, vol. IV, Special Reports, *State of Birth*, pp. 4A-24 to 4A-43.

In 1860, persons who were born in territories and who were then residing in territories were assumed to be residing in the territory of their birth.

See general note for definition of color and nativity; see also text for series A 95–122 for definitions of division and region.

C 15–24. Native population born in each division, by division of residence, by color, 1850–1950.

Source: See source for series C 1–14.

See also general note for definition of color and nativity.

C 25–73. Estimated net intercensal migration of total, native white, foreign-born white, and Negro population surviving from the preceding census date, by States, 1870–1950.

Source: Everett S. Lee, Ann Ratner Miller, Carol P. Brainerd, and Richard A. Easterlin, *Population Redistribution and Economic Growth: United States, 1870–1950*, vol. I, Philadelphia, the American Philosophical Society, 1957, pp. 107–231.

See general note for definition of color and nativity.

The estimates of net migration were obtained by a residual method, using survival ratios derived from census data. The loss through mortality during an intercensal period was estimated on the basis of the ratios of appropriate age groups as enumerated in successive decennial censuses. The difference between the enumerated population at the end of the decennial period and the estimated survivors from the beginning to the end of the period was assumed to be net migration. Computations were by age groups for each sex, the figures presented in series C 25–73 being summations for ages 10 years and over at the end of each intercensal period. For the native population, the figures show the estimated amount of net internal migration. For the foreign born, the figures represent the estimated net change attributable to direct movement into the State from abroad and the net gain or loss in the exchange of foreign-born residents with other States.

C 74–79. Estimated annual movement of the farm population, 1920–1957.

Source: 1920–1954, Agricultural Marketing Service, *Farm Population, Migration to and From Farms, 1920–1954*, AMS–10, 1954; 1955–1957, *Farm Population, Estimated for (specific years)*, AMS–80, 1955, 1956, and 1957.

Estimates of the total farm population and of the annual changes in its components utilize data from the censuses of population and agriculture and the Current Population Survey conducted by the Bureau of the Census in addition to data from a questionnaire mailed by the Department of Agriculture to lists of crop reporters. Estimates of the components of change are derived from information supplied by the crop reporters

Digitized by Google

and adjusted for internal consistency with available birth and death figures and data on movements in and out of the Armed Forces. For a history of the procedures used and the successive revisions of the series, see Department of Agriculture, *Major Statistical Series of the U. S. Department of Agriculture*, vol. 7, Agricultural Handbook No. 118, 1957.

Farm population figures relate to the civilian population living on farms, regardless of occupation or source of income. The determination of whether a household is located on a farm has been made largely by the residents themselves. If the respondent in reply to the inquiry, "Is this house on a farm (or ranch)?" answers affirmatively, it is, in most cases, classified as a farm dwelling unit and the occupants as part of the farm population. Excluded are the following: Persons living on farmland who rent for cash a home and yard only; persons in summer camps, motels, and tourist camps; and persons in institutions on farmland.

C 80–87. Mobility status and type of mobility of the civilian population one year old and over, 1947–1957.

Source: Bureau of the Census, *Current Population Reports*, Series P–20, No. 82.

The civilian population was classified by mobility status on the basis of a comparison between the place of residence of each individual on the survey date and the place of residence one year earlier. Persons classified as movers include all those whose place of residence in the United States was different at the end of the period and at the beginning of the period.

For similar information for earlier years, see Donald J. Bogue, Henry S. Shryock, Jr., and Siegried A. Hoermann, "Subregional Migration in the United States, 1935–40," vol. 1, *Streams of Migration Between Subregions*, Miami, Ohio, Scripps Foundation Studies in Population Distribution, No. 5, 1957.

[1] Mexicans classified as nonwhite in 1930, as white in other censuses.
[2] Based on 20-percent sample of persons enumerated.
[3] Excludes population of Indian Territory and Indian reservations, specially enumerated in 1890, with a native population of 117,368 white, and 208,083 nonwhite, not distributed by State of birth.
[4] Free colored included with white.

Series C 15–24. Native Population Born in Each Division, by Division of Residence, by Color: 1850 to 1950

[Excludes persons born outside continental U. S. and persons for whom State of birth was not reported]

[1] Beginning 1940, includes persons going into or returning from Armed Forces, and includes changes through migration and in classification of residence. From 1930 to 1939, excludes entrance into or withdrawal from the farm population without migration. Comparability of figures for 1930–1939 with those for subsequent years may be obtained by adding net migration figures (series C 76) to figures showing change in classification of residence (series C 79).

[2] Changes resulting from cessation of or beginning of farm operations on places from which residents did not move.

INTERNATIONAL MIGRATION AND NATURALIZATION (Series C 88–283)

C 88–151. General note.

The continuous record of immigration to the United States began in 1819, under the Act of 1819, which required the captain or master of a vessel arriving from abroad to deliver to the local collector of customs a list or manifest of all passengers taken on board. This list was to designate the age, sex, and occupation of each passenger, "the country to which they severally belonged," and the number that had died on the voyage. Copies of these manifests were to be transmitted to the Secretary of State, who reported the information periodically to Congress. Subsequently, the Act of 1855 prescribed quarterly reports to the Secretary of State and annual reports to Congress. Later acts have continued to require the collection of such information.

Although the reporting of alien arrivals was required by the Act of 1798, which expired two years later, the number arriving before 1819 is not known. William J. Bromwell, in his *History of Immigration to the United States*, 1856 (pp. 18–19), estimated the number of passengers of foreign birth arriving here from the close of the Revolutionary War to 1819, at 250,000. This estimate was used by the Bureau of Statistics which later compiled the official statistics of immigration.

Immigration statistics were compiled by the Department of State for 1820–1870; by the Treasury Department, Bureau of Statistics, for 1867–1895; and since 1892, by a separate Office or Bureau of Immigration, now a part of the Immigration and Naturalization Service. For 1892–1932, the Bureau of Immigration issued annual reports. For 1933–1940, the data were summarized in the *Annual Report of the Secretary of Labor;* for 1941, they were issued in the *Annual Report of the Attorney General;* for 1942, no report was published; and for subsequent years, the statistics appeared in the *Annual Report of the Immigration and Naturalization Service.*

Since 1820 the official immigration data have undergone many changes in the reporting area covered. During the first decades only arrivals by vessel at Atlantic and Gulf ports were reported. Arrivals at Pacific ports were first included in 1850. During the Civil War the only Southern ports that reported were those controlled by the Federal Government. Later the reporting area was expanded to include arrivals at outlying possessions. Arrivals in Alaska were first reported in 1871, but only irregularly thereafter until 1904, after which Alaska was regularly included among the places of entry. Arrivals in Hawaii were first included in 1901, Puerto Rico in 1902, and the Virgin Islands in 1942.

Counting arrivals at the land borders was not required by the early immigration acts, and the counting of such arrivals did not approach completeness until after 1904. For 1820–1823, a few arrivals by land borders were included. Complete reporting was attempted in 1855 with only partial success, was interrupted for several years by the Civil War, and was discontinued in 1885. Beginning in 1894, European immigrants who arrived at Canadian ports with the declared intention of proceeding to the United States were included in the immigration statistics. Some immigration was reported at land border stations established in 1904. More stations were opened in the following years, but reporting of land border arrivals was not fully established until 1908.

The statistical treatment of Canadian and Mexican immigrants at times has differed from that of other immigrants. When reporting of arrivals by land borders was discontinued in 1885, regular reporting of Canadian and Mexican arrivals by vessel was also discontinued; however, a few Canadian and Mexican immigrants were reported in most of the following years. Arrivals of Canadians and Mexicans by land borders began to be reported in 1906, and reporting was fully established in 1908 under authority of the Act of 1907, which provided for the inspection of Canadians and Mexicans at the land borders.

Not all aliens entering via the Canadian and Mexican borders are counted for inclusion in the immigration statistics. Before 1930, no count was made of residents of a year or longer of Canada, Newfoundland, or Mexico who planned to remain in the United States less than 6 months. For 1930–1945 the following classes of aliens entering via the land borders were counted and included in the statistics of immigration:

(1) Those who have not been in the United States within 6 months, who come to stay more than 6 months; (2) those for whom straight head tax is a prerequisite to admission, or for whom head tax is specially deposited and subsequently converted to straight head tax account; (3) those required by law or regulation to present an immigration visa or reentry permit, and those who surrender either, regardless of whether they are required by law or regulation to do so; (4) those announcing an intention to depart via a seaport of the United States for Hawaii or insular possessions of the United States, or for foreign countries, except arrivals from Canada intending to return thereto by water; and (5) those announcing an intention to depart across the other land boundary.

These classes were revised in 1945 so that the statistics of arriving aliens at land border ports of entry for 1945–1952 included (1) arriving aliens who came into the United States for 30 days or more; and (2) returning alien residents who had been out of the United States more than 6 months. Arriving aliens who came into the United States for 29 days or less were not counted except those certified by public health officials, aliens held for a board of special inquiry, aliens excluded and deported, and aliens in transit who announced an intention to depart across another land boundary, or by sea.

Since 1953, all arriving aliens at land border ports of entry are counted and included except: (1) Canadian citizens and British subjects resident in Canada who were admitted for 6 months or less; (2) Mexican citizens who were admitted for 72 hours or less in the United States; and (3) returning residents who had been out of the United States for more than 6 months. Beginning with February 1956, residents returning from stays in Western Hemisphere countries of less than 6 months have not been counted. Because of changes in regulations in 1957, returning residents without reentry permits or visas who have been abroad for 1 year or less are not counted.

Persons who cross the land borders for brief periods (border crossers) are not included in the immigration and emigration statistics, but the Immigration and Naturalization Service publishes statistics on alien and citizen border crossers in the *Annual Report.*

Arrivals in and departures from the Philippine Islands were recorded in the port tables for 1910–1924, but were not included in the total immigration data. For 1925–1931, such arrivals and departures were obtained annually from the Bureau of Insular Affairs, War Department, and published in separate tables. The Immigration Service has no records since 1932 of arrivals in, or departures from, the Philippine Islands to foreign countries.

Data on aliens admitted to continental United States from insular possessions have been compiled since 1908 but are not included in the immigration totals. Aliens admitted from Hawaii and Puerto Rico have been reported continuously since 1908. Aliens admitted from the Philippine Islands were reported from 1908–1934, but since then all arrivals from and departures to the Philippine Islands have been included with data from other foreign countries. Aliens admitted from the Virgin Islands have been recorded since 1917. The departure of aliens from the mainland to Hawaii and Puerto Rico was first recorded in 1918. Records are available since 1918 of aliens passing between insular possessions. Data on aliens from Guam are available since 1929; Samoa, since 1932. Records of United States citizens' arrival in continental United States from insular possessions, and in insular possessions from continental United States and other insular possessions, are available since 1920.

Definition of terms. For 1820–1867, immigration totals (compiled by the Department of State) were shown as alien passenger arrivals, but may have included alien passengers who died before arrival, and did include, for 1856–1867, temporary visitors among arriving alien passengers. For the 12-year period, the temporary visitors constituted about 1½ percent of the alien passenger arrivals.

For 1868–1891, the Bureau of Statistics immigrant arrival figures (excluding temporary visitors), were reported. Since 1892, official immigration data have been compiled by the Office of Immigration (and its successors) and for 1892–1895 its totals were 7 to 8 percent lower than those for the Bureau of Statistics for that period. The difference is largely attributable to the limitation of the Office of Immigration figures to alien steerage passengers; cabin class passengers were not again included as immigrants until 1904. A further difference was that the Bureau of Statistics figures were for arrivals and those of the Office of Immigration were for admissions.

For 1895–1897, the Office of Immigration readopted arrivals and the figures include the 2,419 aliens debarred in 1895, the 2,799 in 1896, and 1,880 in 1897. In later years, the immigration data were further refined to exclude aliens in transit through the United States (1904), and resident aliens returning from a visit abroad (1906).

In 1906 arriving aliens were divided into two classes: Immigrants, or those who intended to settle in the United States, and nonimmigrants, or admitted aliens who declared an intention not to settle in the United States, and all aliens returning to resume domiciles formerly acquired in the United States.

The official record of emigration began in 1907. It was made possible by the Immigration Act of 1907, which required all steamship companies carrying departing aliens to furnish manifests similar to those required for arriving aliens.

For 1908–1932, aliens arriving in or departing from the United States were classified as follows: Arriving aliens with permanent domicile outside the United States who intended to reside permanently in the United States were classed as immigrants; departing aliens with permanent residence in the United States who intended to reside permanently abroad were classed as emigrants; all alien residents making a temporary trip abroad and all aliens residing abroad making a temporary trip to the United States were classed as nonimmigrants on the inward journey and nonemigrants on the outward. Permanent residence was defined as a residence of 1 year or longer. (*Annual Report of the Commissioner General of Immigration, 1908*, p. 6.)

Since 1933, aliens arriving in or departing from the United States have been classified as follows: Immigrants are nonresident aliens admitted to the United States for permanent residence; they are further classified as quota immigrants, or those admitted under established quotas from European countries, Asia, Africa, and the Pacific, and colonies, dependencies, and protectorates of European countries; and nonquota immigrants, i.e., natives from the independent countries of the Western Hemisphere, their wives and unmarried children under 18 years of age; wives, husbands, and unmarried children of citizens of the United States; ministers and professors who enter to carry on their professions, and their wives and children; and others. Since 1952 (Immigration and Nationality Act), professors have been removed from the nonquota classes. Husbands as well as wives of ministers and of natives of independent countries in the Western Hemisphere may be admitted as nonquota.

Nonimmigrants are alien residents of the United States returning from a temporary visit abroad, or nonresident aliens admitted to the United States for a temporary period. Included in this group are visitors, transients, treaty traders (treaty investors since December 1952), students, foreign government officials, officials to international organizations, wives and unmarried children of these groups, and agricultural laborers from the West Indies (and from Japan since 1957). Excluded are travelers between the United States and insular possessions, commuters and others who frequently cross the international land boundaries, and agricultural laborers from Mexico and Canada.

Emigrants are aliens who have resided in the United States for a year or longer and who are leaving the United States for a permanent residence abroad. Nonemigrants are resident aliens of the United States who are leaving the United States for a temporary period abroad, or nonresident aliens of the United States who have been in the United States for less than a year and who are returning to permanent residence abroad.

Except for returning alien residents, the definition of immigrants used in the statistical tables resembles the legal definition given above. Under the law, returning alien residents are classed as nonquota immigrants, whereas in the statistics they are defined as nonimmigrants.

The definitions of immigrant and emigrant, nonimmigrant and nonemigrant, have to some extent impaired the reliability of net immigration figures. While an immigrant is admitted for permanent residence, he may change his mind and depart prior to residence of 1 year, in which case he is counted as an immigrant on arrival and a nonemigrant on departure. An alien who comes for a temporary visit and fails to depart within a year is classed as a nonimmigrant on arrival and an emigrant on departure.

C 88–114. Immigrants, by country, 1820–1957.

Data prior to 1906 cover countries from which the aliens came; data for years following, countries of last permanent

Digitized by Google

residence. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. Under the provisions of the Immigration and Nationality Act, subquotas of 100 each were established for colonies or dependencies, to be charged against the quota of the mother country. Because of these provisions, since January 1953, statistics have been compiled for each colony or dependency having a subquota.

The principal changes in reporting immigrants by country since 1820 are shown in the detailed listing below.

See also general note for series C 88–151.

C 89–100. Immigration from Europe, 1820–1957.

Source: See source for series C 88–114.

Since 1820, territorial transfers in Europe have to a certain extent impaired the comparability of immigration statistics from that continent. Data for Austria-Hungary were not reported until 1861. Austria and Hungary have been reported separately since 1905. For 1938–1945, Austria is included with Germany. Bulgaria, Serbia, and Montenegro were first reported in 1899. In 1920 Bulgaria was reported separately, as was the Kingdom of Serbs, Croats, and Slovenes (identified as Yugoslavia since 1922). Prior to 1925 Northern Ireland was included with Ireland (Eire). The figures for Norway and Sweden were combined from 1820–1868, but since 1869 each country has been reported separately. Poland was recorded as a separate country for 1820–1898 and since 1920. During 1899–1919 Poland was included with Austria-Hungary, Germany, and Russia. There is no record of immigration from Rumania prior to 1880.

International transfers in territory following World War I resulted in the establishment of several countries. In 1920, Czechoslovakia, Finland, Poland, and the Kingdom of Serbs, Croats, and Slovenes (designated as Yugoslavia in 1925) were added to the immigration lists; in 1924, Albania, Estonia, Latvia, and Lithuania were added; in 1925, the Free City of Danzig and Luxembourg were added.

The Immigration Act of 1924, which established quotas for all independent countries in Europe, Asia, Africa, and the Pacific has effected a further change in the immigration lists of countries. This change, however, was not fully felt until 1931. In that year Andorra, Iceland, Liechtenstein, Monaco, and San Marino were added to the European countries, and the Russian Empire was classified into European Russia (designated as U.S.S.R. in Europe since 1947) and Siberia, or Asiatic Russia. The principal effect of the 1924 Act, however, was in the extension of the lists of Asian, African, and Western Hemisphere countries.

In 1950, Bessarabia and the northern portion of Bukovina were included in the U.S.S.R. instead of in Rumania. The Dodecanese Islands were included in Greece instead of Italy. The Free Territory of Trieste, formerly a part of Italy and Yugoslavia, was established as an independent country.

C 101–105. Immigration from Asia, 1820–1957.

Source: See source for series C 88–114.

China and India are the only countries in Asia for which the records of immigration to the United States date back to 1820. A few immigrants from Japan were recorded in 1861, 1866, and 1867, but complete records for Japan begin in 1869. Figures for Turkey in Asia are available since 1869. Data on some immigration from Arabia are recorded for 1876–1895; from Armenia for 1874–1895; and from Persia for 1871–1895. For 1896–1923, immigration from Asia included only China, India, Japan, Turkey in Asia, and "other Asia." In 1924, Syria was added, and in 1925 Armenia, Palestine, and Persia (Iran) were added to the lists of Asian countries. Since 1934 Armenia has been included in Russia. In 1931 Siberia, or Asiatic Russia, was separated from European Russia, and Iraq and Siam (Thailand) were added to the lists.

In 1945, the classification of country in the country-of-birth statistics (on which the Quota Law is based) was adopted for the immigration statistics. This change resulted in the addition to the immigration lists of Afghanistan, Arabian Peninsula, Bhutan, Muscat, Nepal, Saudi Arabia, and Asiatic colonies, dependencies, and protectorates of European countries. Since 1948, the following countries have been added to the immigration lists: (1948) Burma, Ceylon, Jordan, Korea, and Pakistan; (1949) Israel (formerly included with Palestine), Lebanon (formerly included with Syria), and Yemen; (1950) Indonesia; (1952) Bonin Volcano Islands, Ryukyu Islands, Cambodia, and Laos; (1957) Formosa.

C 106–109. Immigration from America, 1820–1957.

Source: See source for series C 88–114.

Prior to 1920 Canada and Newfoundland were recorded under country of last permanent residence as British North America. Combined figures are available for Canada and Newfoundland for 1920–1924; for 1925–1948 each was reported separately. Since 1950, Newfoundland has been included in Canada.

Statistics of European immigrants arriving in Canada en route to the United States have been available since 1894. For 1894–1906, the data refer principally to European aliens arriving at Canadian Atlantic and Pacific ports en route to the United States. Inspection of Canadians and Mexicans was first authorized by the Act of 1907, and 1908 is, therefore, the first complete year for which all immigration via the land borders was recorded.

Immigration from Mexico has been recorded for 1820–1885 and for 1894 to the present. Immigration statistics for the West Indies have been available since 1820. For 1820–1860 there was no classification of the West Indies, by country. For 1860–1898, some immigration was recorded from Antigua (1873–1895), Bahamas (1871–1895), Barbados (1869–1895), Bermuda (1861–1895), Cuba (1869–1898), Curacao (1873–1895), Haiti (1869–1895), Jamaica (1869–1895), Puerto Rico (1869–1895), Saint Croix (1871–1895), Saint Thomas (1872–1895), and Trinidad (1874–1895). For 1899–1924, there again was no classification by country of immigration from the West Indies. Immigration from Cuba has been separately recorded since 1925; from the British West Indies, Dominican Republic, Dutch West Indies, French West Indies, and Haiti since 1931; and from Bermuda since 1945. For detailed data, see *Annual Report of Commissioner General of Immigration* for each year, 1892–1932. Since January 1953, all countries in the West Indies have been reported.

Immigration from Central America has been recorded since 1820, but not by country during most of that period. Separate statistics are available for 1895–1898 for Guatemala, Honduras, Nicaragua, and Salvador; and for 1895–1897 for Costa Rica. British Honduras was also enumerated separately for 1874–1910. With the above exceptions, only figures for total immigration were available for Central America until 1925. Immigration has been reported separately from British Honduras since 1925, and from the Canal Zone, Costa Rica, Guatemala, Honduras, Nicaragua, Panama, and Salvador since 1931.

Immigration from South America has also been reported in total since 1820 but, with the following exceptions, not by country until 1925. For 1869–1895, separate enumerations were made for Brazil, Chile, Colombia, Ecuador, Guiana, Peru, and Venezuela; and for 1871–1895 for the Argentine Republic. Separate figures for Brazil have been again available since 1925;

Digitized by Google

and since 1931 for Argentina, Bolivia, British Guiana, Dutch Guiana, French Guiana, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, and Venezuela.

C 110. Immigration from Africa, 1820–1957.

Source: See source for series C 88–114.

Immigration from Africa has been recorded since 1820, but, with few exceptions, was not classified by country until 1931. There is record of some immigration from Liberia in 1829, 1839, 1844, and for 1857–1893; Algeria, 1872–1894; Egypt, 1869–1895; and South Africa, 1869–1895. For 1890–1924, only immigration for continental Africa was reported. Immigration from Egypt was again recorded in 1925. Immigration from Ethiopia (Abyssinia), Liberia, Morocco, and Union of South Africa, has been recorded since 1931. In 1945 "other Africa" was classified into Cameroons (British Mandate), Cameroons (French Mandate), Ruanda and Urundi (trust territory, Belgium), South-West Africa (Mandate of the Union of South Africa), Tanganyika (trust territory, United Kingdom), Togoland (British Mandate), Togoland (trust territory, France), and colonies, dependencies, or protectorates of Belgium, France, Great Britain, Italy, Portugal, and Spain.

Since 1945, the following countries have been added: 1953: Libya and Somaliland (Italian administration), and Southern Rhodesia. Eritrea, which was federated with Ethiopia, was included with Ethiopia. 1957: Ghana (composed of British territories, Gold Coast and British Togoland), Sudan, and Tunisia.

C 111–113. Immigration from Australasia, 1870–1957.

Source: See source for series C 88–114.

Immigration from Australia was recorded separately in 1822, 1839–1840, and for most of the years 1854–1898. For 1899–1924, a combined total was recorded for Australia, Tasmania, and New Zealand, and since 1925 Australia has been again reported separately. Separate figures for New Zealand are available for 1870–1890. For 1891–1893, New Zealand was included in "all other countries"; for 1894–1898 in "Pacific Islands, not specified," and for 1899–1924 with Australia and Tasmania. Separate figures for New Zealand have again been available since 1925.

The following countries were added to the immigration lists of the Pacific in 1945: Nauru (British Mandate); Territory of New Guinea including appertaining islands (Australian Mandate); Western Samoa (New Zealand Mandate); Yap and other Pacific Islands under Japanese Mandate; and colonies, dependencies, or protectorates of France, Great Britain, Japan, Netherlands, and Portugal. In 1952, the Pacific Islands (trust territory, U. S. administration) were added.

C 115–132. Immigrants, by major occupation group, 1820–1957.

Source: 1820–1890, Treasury Department, Bureau of Statistics, *Arrivals of Alien Passengers and Immigrants in the United States, 1820–1890*, pp. 42–49; 1891, Treasury Department, Bureau of Statistics, *Immigration into the United States Showing Number, Nationality, Sex, Age, Occupation, Destination, . . . from 1820–1903;* 1892–1898, Bureau of Immigration, *Annual Reports of Commissioner General of Immigration;* 1899–1944, Immigration and Naturalization Service, unpublished records; 1945–1957, *Annual Reports of the Immigration and Naturalization Service.*

The major occupation groups for 1820–1898 include the following categories: Professional—occupations which involve a liberal education or its equivalent and mental rather than manual skills; commercial—agents, bankers, hotelkeepers, manufacturers, and merchants and dealers; skilled—occupations requiring special training of a manual rather than mental nature. A "farmer" is one who operates a farm, either for himself or for others; a "farm laborer" is one who works on a farm for the man who operates it. The "no occupation" group includes dependent women and children, other aliens without occupation, and aliens whose occupations were not stated.

Although the data are shown in broad occupation groups, the instructions for compiling statistics specified that the occupation should be described as precisely as possible. For example, civil engineer, stationary engineer, mining engineer, brass polisher, steel polisher, iron molder, wood turner, etc., should be so described, and not entered simply as engineer, polisher, molder, turner, or other indefinite designation.

In 1945 the Immigration and Naturalization Service adopted the major occupation groups as shown in the *Sixteenth Census of the United States, Alphabetical Index of Occupations and Industries.* It also grouped occupations of immigrants for 1899–1944 (compiled in unpublished records) as closely as possible into the new groups. Since 1951, occupations have been coded and grouped in accordance with the definitions in *U. S. Census of Population: 1950, Alphabetical Index of Occupations and Industries.*

The occupation figures include all immigrants, those with and without work experience. The "no occupation" group includes housewives, unemployed, retired persons, students, children under 14 years of age, aliens with no occupation, and occupation unknown or not reported.

See also general note for series C 88–151.

C 133, 135–138. Immigrants, by age, 1820–1957.

Source: 1820–1897, Treasury Department, Bureau of Statistics, *Monthly Summary of Commerce and Finance of the U. S.*, No. 12, series 1902–1903, pp. 4358 and 4362; 1898–1932, *Annual Reports of the Commissioner General of Immigration;* 1933–1957, data are from Immigration and Naturalization Service, records.

Some of the published estimates have been revised because of apparent printing errors in the source.

The age groups used to classify immigrants have changed a number of times since 1820, thereby impairing to a certain extent their comparability. For 1820–1898, the classification was: Under 15 years, 15 to 40, and over 40 years. In addition, the age of nearly 250,000 immigrants, or 4 percent of the total, for 1820–1866 was not reported.

For 1899–1917 the age classification was: Under 14 years, 14 to 44, and 45 years and over; for 1918–1924 it was under 16 years, 16 to 44, and 45 years and over.

Although only three age groups were generally used before 1925, a more detailed classification was used for 1910–1924 for single females: 15 to 19 years, 20 to 24, 25 to 29, and 30 to 34 in 1910; 14 to 21 years, 22 to 29, 30 to 37, and 38 to 44 for 1911–1917; 16 to 21 years, 22 to 29, 30 to 37, and 38 to 44 for 1918–1924.

In 1925 the age classification was enlarged from 3 to 6 groups: Under 16 years, 16 to 21, 22 to 29, 30 to 37, 38 to 44, and 45 years and over. In 1940, it was enlarged to 12 groups, with a lower limit of under 11 years, 5-year age groups until 60, and an upper limit of over 60 years. In 1945, it was further enlarged into 5-year groups, with a lower age limit of under 5 years and an upper open-end limit of 100 years and over.

C 134. Percent male immigrants, 1820–1957.

Source: 1820–1910, Senate Doc. No. 756, 61st Congress, *Reports of the Immigration Commission*, vol. 3, pp. 6 and 7; 1911–1931, Bureau of Immigration, *Annual Report of the*

Digitized by Google

Commissioner General of Immigration, 1931, p. 238; 1932, *Annual Report of the Commissioner General of Immigration*, 1932, p. 58; 1933–1957, Immigration and Naturalization Service, records.

Although the Act of 1819 required that arriving immigrants be recorded by sex, these data were not satisfactorily compiled before 1869. (See Senate Doc. No. 756 cited above, p. 5.) The earlier reports of the Secretary of State to Congress contain partial data on this subject, and in 1911 the Immigration Commission compiled these data to show the approximate sex distribution for 1820–1867. Therefore the percentages given in series C 134 cannot be reduced to numbers. Moreover, the data are not complete, as in most years sex was not reported for a considerable number of immigrants; but on the whole the percentages may be accepted as fairly representative of the sex distribution in the years considered.

C 139–151. Annual quota and aliens admitted, by classes, 1925–1957.

Source: *Annual Reports of Immigration and Naturalization Service* and Presidential Proclamations on quotas.

For 1925–1929, the annual quota (series C 139) of 164,667 was based on 2 percent of the foreign-born residents in the United States as determined by the 1890 Census. The present "national origin" formula for determining quotas, which has not changed since 1929, provides that the annual quota equal one-sixth of one percent of the number of white inhabitants in continental United States in 1920, less Western Hemisphere immigrants and their descendants. The annual quota for any nationality for each fiscal year is the number which bears the same ratio to 150,000 as the number of inhabitants in continental United States in 1920 having that national origin bears to the number of inhabitants in continental United States in 1920, but the minimum quota for any nationality is 100.

Changes in quotas since 1929 have been due chiefly to changes in territorial boundaries of quota areas and to the establishment of new quotas for countries that have become independent.

The classes presented in these series are legal classes of admission, as defined in the Act of 1924, and the Immigration and Nationality Act of 1952. Returning resident aliens, who have been counted before as immigrants, are included with nonimmigrants.

In general, statistics on aliens admitted have been derived from manifests or entry documents. Changes in regulations extending documentary waivers for nonimmigrants entering via the Canadian or Mexican border, or from adjacent islands, have impaired comparability of the nonimmigrant statistics. For example, the figure on nonimmigrant admissions dropped in 1953 because beginning with 1953, the nonimmigrant figures have excluded, with certain exceptions, Canadian citizens and British subjects resident in Canada who were admitted for 6 months or less. In prior years the nonimmigrant figures excluded entries over the Canadian border for 29 days or less. The reduction in the number of returning residents in 1956 and 1957 may be attributed to changes in regulations extending documentary waivers to resident aliens returning from stays in Western Hemisphere countries of less than 6 months. The waiver has recently been extended further to returning residents who have been abroad less than 1 year.

See also general note for series C 88–151.

C 152–155. Aliens deported, voluntarily departing, and excluded, 1892–1957.

Source: *Annual Report of Immigration and Naturalization Service*, 1957, pp. 46, 50.

C 153, aliens deported. Undesirable aliens who have violated certain immigration laws may be expelled or deported under formal deportation proceedings. Deportation of alien contract laborers within one year after entry was authorized by the Act of 1888. Deportation statistics, however, have been compiled only since 1892, shortly after enactment of the Act of 1891, which provided for the deportation of all aliens who entered unlawfully. The classes of deportable aliens were extended by subsequent acts and are now defined in the Immigration and Nationality Act of 1952. The principal deportable classes are criminals (including violators of narcotic laws), immoral classes, mental or physical defectives, public charges, subversives, and those who entered illegally or failed to maintain or comply with the conditions of admission.

C 154, aliens voluntarily departing. An alien may concede deportability and be permitted to depart voluntarily at his own expense. Statistics on aliens voluntarily departing have been recorded only since 1927.

C 155, aliens excluded. Prior to 1882, various State laws were enacted excluding from admission to the United States undesirable aliens such as paupers, felons, and diseased aliens. The first Chinese exclusion law was passed in 1882. Lunatics, idiots, and persons likely to become public charges were first excluded by the Act of 1882.

Statistics on aliens excluded were first compiled in 1892, shortly after passage of the Act of 1891, which extended the classes of excludable aliens. Subsequent acts, principally the Immigration Act of 1917, and the Immigration and Nationality Act of 1952, extended these classes further. At present, the principal classes excluded are attempted illegal entries, criminals (including violators of narcotic laws), immoral persons, subversive or anarchistic persons, and mental or physical defectives.

C 156–157. Aliens departing, 1908–1957.

Source: 1908–1910, Bureau of Immigration, *Annual Report of the Commissioner General of Immigration*, 1931, pp. 213 and 239; 1911–1956, *Annual Report of the Immigration and Naturalization Service*, 1956, p. 48; 1957, *Ibid*, 1957 reports, p. 31.

For definition of terms, see general note for series C 88–151.

C 158–170. General note.

Prior to 1906, individual courts kept records of naturalizations, but no national data were compiled. The Act of 1906 required all courts conducting naturalization proceedings to file with a central Federal agency a copy of each declaration of intention and petition of naturalization filed and of each certificate of naturalization issued.

For 1907–1912 naturalization statistics were compiled by the Bureau of Immigration and Naturalization. For 1913–1932 they were compiled by the Bureau of Naturalization. For 1933–1940, they were given in the *Annual Reports of the Secretary of Labor* and for 1941 in the *Annual Report of the Attorney General*. No report was published in 1942. For subsequent years, the statistics appeared in *Annual Reports of the Immigration and Naturalization Service*.

C 158. Declarations filed, 1907–1957.

Source: 1907–1910, *Annual Report of the Secretary of Labor*, 1940, p. 115; 1911–1957, *Annual Report of Immigration and Naturalization Service*, 1957, p. 67.

See also general note for series C 158–170.

Section 331 of the Nationality Act of 1940 provided that an applicant for naturalization after reaching the age of 18 years must make under oath, not less than 2 nor more than 7 years prior to his petition for naturalization, a signed declaration of intention to become a citizen. This section contained substantially the requirements of the Basic Naturalization Act of 1906 concerning the declaration of intention. The Immigration

Digitized by Google

and Nationality Act of 1952, which repealed the Nationality Act of 1940, provides that a declaration of intention may be filed, but it is not a prerequisite to naturalization. In a number of States, in order to obtain employment, a license, etc., an alien applicant must prove that he intends to become a citizen. The law permits the filing of a declaration to show such intent.

Prior to 1930 the number of declarations of intention was far in excess of the number of aliens naturalized. This was due mainly to the failure of many aliens to file a petition for naturalization within the prescribed time limit, as well as the denial of a number of petitions for naturalization. In most of the years since 1930 the number of aliens naturalized has exceeded the declarations filed, because of the increasing number of persons who were exempted from the general requirements for a declaration of intention.

Since 1907, a number of laws have been passed exempting special classes of persons from the general requirement of a declaration of intention. Most of these laws were codified into the Nationality Act of 1940. Included among such exempted classes were noncitizen spouses of United States citizens; certain former citizens; noncitizens who, because of misinformation, erroneously exercised the rights of citizenship; noncitizens who, at the time of entering the United States, were under 16 years of age; certain noncitizens who served honorably in the United States Armed Forces or on certain vessels; and certain noncitizen children.

C 159. Aliens naturalized, 1907–1957.

Source: See source for series C 158.

"Aliens naturalized" are aliens upon whom naturalization was conferred in the United States by a naturalization court or outside of the United States by a representative of the Immigration and Naturalization Service. The total number of aliens naturalized includes both civilian and military naturalizations.

The statistics of aliens naturalized do not include the following groups: Repatriations under section 323 of the Nationality Act of 1940 of former citizens of the United States who lost citizenship by entering the armed forces of allied countries during World War I, and former citizens who lost citizenship of the United States by voting in a political election in a foreign state (other than a state at war with the United States during World War II); repatriations of women who were citizens at birth but who lost or were believed to have lost citizenship through marriage to an alien and whose marriages were terminated; repatriations under the Act of 1936, as amended, of native-born women who lost citizenship by marriage; and repatriations of persons who lost citizenship by voting in a political election or plebiscite in Italy (Act of 1951) and in occupied Japan (Act of 1954).

Separate statistics on these repatriations are compiled by the Immigration and Naturalization Service which also compiles statistics on certificates of derivative citizenship granted and denied, expatriations and certificates of naturalization revoked, and petitions for naturalization denied.

C 160–161. Aliens naturalized, by sex, 1923–1957.

Source: 1923–1932, Bureau of Naturalization, *Annual Report of the Commissioner of Naturalization*, 1923–1932; 1933–1940, *Annual Report of the Secretary of Labor*, 1933–1940; 1941–1957, *Annual Report of the Immigration and Naturalization Service* for 1949 and 1957.

See also general note for series C 158–170 and text for series C 159.

C 162–169. Aliens naturalized, by place of former allegiance, 1923–1957.

Source: 1923–1932, *Annual Report of the Commissioner of Naturalization;* 1933–1935, Immigration and Naturalization Service, records; 1936–1957, *Annual Report of the Immigration and Naturalization Service.*

See also general note for series C 158–170.

"Country of former allegiance or nationality" is the country of which the alien at the time was a citizen or subject. Data on the number of aliens naturalized, by country or region of former allegiance, have been compiled only from 1922. Owing to changes in the list of countries separately reported and to changes in boundaries, data for certain countries are not comparable throughout. The principal changes in reporting since 1923 are shown for individual series below.

C 162, Northwestern Europe. Includes the British Empire, Norway, Sweden, Denmark, Netherlands, Belgium, Luxembourg, Switzerland, France, and, beginning with 1948, Iceland. For 1924–1932, the figures for the British Empire were classified by country. Canada is shown separately for 1923–1932, and since 1948; for 1933–1947, Canada is included in the British Empire. Beginning with 1948, Ireland has been reported separately. Australia has been reported separately from 1951, and included in "all other" (series C 169). See text for series C 166, C 168, and C 169 for former British territories.

C 163, Central Europe. Includes Germany, Poland, Czechoslovakia, Austria, Hungary, Yugoslavia, and Montenegro. For 1938–1947, Austria was included with Germany. For 1923–1932, Yugoslavia was recorded as the Kingdom of Serbs, Croats, and Slovenes.

C 164, Eastern Europe. Includes the Union of Soviet Socialist Republics, Latvia, Estonia, Lithuania, Finland, Rumania, Bulgaria, and Turkey. For 1923–1928, Latvia and Estonia were included with Russia. For 1923–1927, Lithuania comprised portions of Russia and Germany. European and Asiatic Turkey are included in Eastern Europe.

C 165, Southern Europe. Includes Greece, Italy, Spain, Portugal, and, for 1929–1957, "other Europe," which comprises Albania, the Free City of Danzig, Liechtenstein, San Marino, Monaco, Andorra, and, since 1950, Trieste. For 1923–1928, "other Europe" was recorded under the "miscellaneous" group of countries and is included with "all other" (C 169).

C 166, Asia. For 1923–1927, Asia was included under "all other" (C 169). The Asian countries reported separately and the beginning dates are shown below:

Afghanistan (1929); Arabian Peninsula (1943); Bhutan (1945); Burma (1949); Ceylon (1948); China (1932); India (1948, British Empire formerly); Indonesia (1950); Iran (1929); Iraq (1929); Israel (1950, Palestine formerly); Japan (1932); Jordan (1948, formerly called Trans-Jordan and included with Palestine prior to 1948); Korea (1948, Japan formerly); Lebanon (1950, included in Syria formerly); Muscat and Oman (1945); Nepal (1945); Pakistan (1948, included in British Empire formerly); Palestine (reported separately 1929–1944 and since 1948; included in British Empire 1945–1947); Philippines (1929); Saudi Arabia (1945); Syria (reported separately 1928–1944 and since 1948; included in France, 1944–1947); Thailand (Siam, 1944); Vietnam (1952); Yemen (1950); and Formosa (1957).

Until 1953 racial restrictions upon naturalization limited the naturalization of aliens who were citizens or subjects of countries located in Asia. (See text for series C 170.)

C 167, Canada. For 1923–1932, and since 1948, Canada is shown separately; it is included in the British Empire for 1933–1947.

488910 O - 60 - 5

Digitized by Google

C 168, Other America. Includes Mexico, the West Indies, Central and South America. Figures for "other America" countries were not compiled separately in 1923. Figures for Mexico date from 1924; for the West Indies (Cuba, Dominican Republic, and Haiti separately) from 1929. For 1924–1928, the figures for Central and South America were combined. Separate figures have been compiled for independent countries in Central and South America beginning with 1929, except in 1933.

C 169, All other. Includes "miscellaneous" countries 1923–1928; repatriated Americans, 1924–1934; "stateless" nationals from 1945; Ethiopia from 1929; Liberia from 1929; and countries which were former territories. Former territories and the beginning dates of separate report are shown below:

Formerly French territory: Libya (1953); Tunisia (1957); Sudan (1957). Formerly British territory: Egypt, reported separately 1929–1944 and since 1948, included in British Empire, 1945–1947; South West Africa (1952); Southern Rhodesia (1953); Union of South Africa (1948); Australia (1951); Nauru (1952); New Guinea (1952); New Zealand (1952); and Western Samoa (1952). Formerly Italian administration: Somaliland (1953). Formerly international administration: Tangier (1953). Separate figures are available for the following United States possessions: American Samoa, Canal Zone, Puerto Rico, Virgin Islands, and Wake and Midway Islands (1945–1951 and since 1955); Hawaii (since 1955); Guam (1944–1951, and since 1955).

C 170. Petitions denied, 1907–1957.

Source: 1907–1921, *Reports of Commissioner of Naturalization* as follows: 1907–1917, *Report* for 1917, p. 5; 1918–1919, *Report* for 1919, p. 4; 1920, *Report* for 1920, pp. 5–6; 1921–1957, see *Annual Report of Immigration and Naturalization Service*, 1957, p. 72.

See also general note for series C 158–170.

Statistics on petitions denied have been compiled since 1907. The Basic Naturalization Act of 1906 and subsequent naturalization laws specified the eligibility requirements for naturalization. Petitions for naturalization of aliens who fail to meet the prerequisites for naturalization may be denied by the courts at the final naturalization hearing. Included among the reasons for denial are lack of knowledge and understanding of history, principles, and form of government of the United States, failure to establish good moral character, lack of attachment to the Constitution of the United States, inability to speak (read, write) the English language, failure to establish lawful admission to the United States or to meet residence requirements, etc.

In the early laws the right to become naturalized was limited to white persons, and petitions of persons of ineligible races were denied. Gradually such restrictions were removed with respect to Negroes, Filipinos, races indigenous to North and South America and adjacent islands, Chinese, and Guamanians. In 1952, the Immigration and Nationality Act removed all racial restrictions to naturalization. Japanese aliens in the United States were the largest class of aliens that benefited by this law.

C 171–184. Citizenship status of the population, 1890–1950.

Source: 1890–1940, total, native, and total foreign-born population, and 1930–1940, citizenship status of foreign born and persons 21 years old and over, Sixteenth Census Reports, *Population*, vol. II, part 1, pp. 19, 30–33; 1890–1920, data on persons 21 years old and over, and 1920, citizenship status of foreign born, Fifteenth Census Reports, *Population*, vol. II, p. 405; 1950, *U. S. Census of Population: 1950*, vol. II, part 1, pp. 1-178.

The classification of citizenship by the Bureau of the Census embraces the two major categories, citizen and alien. Citizens are subdivided into native and naturalized. Aliens are subdivided into those having first papers (that is, having made formal declaration of intention to become citizens of the United States) and those not having first papers. In addition to the citizen and alien categories, there is a third group made up of foreign-born persons for whom no report on citizenship was obtained, designated as "citizenship not reported" or "unknown citizenship." Since it is likely that most of these persons are aliens, they are often included in summary figures for total aliens. The population 21 years old and over is also given separately by citizenship, in order to show the number of potential voters.

These statistics relate to the citizenship status of the population at the date of the specified decennial census.

C 185–217. Native white population of foreign or mixed parentage, by country of origin of parents, 1900–1950.

Source: 1900–1940, Sixteenth Census Reports, *Population, Country of Origin of Foreign Stock*, p. 10; 1950, *U. S. Census of Population: 1950*, vol. IV, Special Reports, *Nativity and Parentage*, p. 3A-75.

A native is defined as a person born in continental United States, Puerto Rico, or the Territories or possessions, or born abroad to American parents. Persons for whom place of birth was not reported are included as native. The nativity of parents was defined in the same way as it was for the individual.

Persons of foreign parentage are allocated to the country of birth of the foreign parent. The classification by country of birth of parents is, of course, subject to the same limitations and may be presumed to be less accurate than the classification of the foreign born by country of birth.

The definition of country of birth of parents is similar to that used in series C 218–283, below, with several important exceptions. The classification by country of birth of parents for 1930 and later years is made on the basis of boundaries existing at the date of the specified decennial census. The 1920 data on country of birth of parents, however, are based on pre-World War I boundaries because of the difficulty of obtaining correct replies on the basis of postwar boundaries for parents of persons enumerated. The procedure differs from that used for series C 218–283 where the boundaries used for 1920 and for all other years were those in existence at the time of the census.

For definition of color, see text for series A 22–33.

C 218–283. Foreign-born population, by country of birth, 1850–1950.

Source: 1850–1930, total foreign born, Fifteenth Census Reports, *Population*, vol. II, p. 233; 1910–1940, foreign-born white, Sixteenth Census Reports, *Population*, vol. II, part 1, p. 43; 1950, foreign-born white, *U. S. Census of Population: 1950*, vol. IV, Special Reports, *Nativity and Parentage*, p. 3A-71.

The foreign-born population comprises all persons born outside the United States or any of the outlying possessions, except certain persons whose parents at the time of their birth were American citizens. Persons born in any of the outlying Territories or possessions, and American citizens born abroad or at sea, are regarded as native.

The statistics on country of birth are generally based on the political boundaries of foreign nations existing at the date of the specified decennial census. Because of boundary changes following World War I and World War II, accurate comparisons over the entire period, 1850–1950, can be made

Digitized by Google

for relatively few countries. These countries include England, Scotland, Wales, Norway, Sweden, Netherlands, Switzerland, Spain, Portugal, Canada (total of Canada-French, other, and Newfoundland), and Mexico. For several other countries, as for example, Italy, France, and Belgium, the figures are slightly affected by boundary changes; but these changes have not been so great as to destroy entirely the value of comparative figures. The boundaries of other countries, as for example, U.S.S.R., Austria, Hungary, Rumania, and Greece, have been so changed that comparisons over time are subject to a large margin of error.

Statistics on country of birth of the foreign born have generally been restricted to those countries which had at the time of the census a separate political entity. For 1860–1900, however, an exception was made in the case of Poland. Although Poland was not restored to its original status as an independent country until the end of World War I, its historical position was such that Polish immigrants generally reported Poland as their country of birth regardless of the political sovereignty over their birthplace. For 1860–1890, persons reported as born in Poland were so tabulated without qualification. In the Census of 1900 an attempt was made to distinguish Austrian, German, and Russian Poland, and separate statistics for each were presented. In the Census of 1910, persons reported as born in Poland were assigned either to Russia, Germany, or Austria. The figures for 1910, however, have been adjusted on the basis of mother tongue data, to conform as nearly as possible to the conditions in 1930.

Since World War I, the greatest difficulties encountered in the tabulation of country-of-birth statistics has been the classification of persons born in the former Austro-Hungarian Empire. Many persons born within the prewar boundaries of this Empire could not or did not give to the enumerator the information needed for the determination of their country of birth on the basis of postwar geography. It is therefore quite possible that some persons were assigned to Austria who were really born within the present areas of either Czechoslovakia or Yugoslavia, and that persons were assigned to Hungary who were born within the present areas of Rumania or Yugoslavia. Similarly, it is possible that some persons born in Latvia, Estonia, or Lithuania were assigned to Russia. Persons for whom Austria-Hungary was reported in the 1950 Census were allocated on the basis of surname to the various countries created out of the territory of the old empire after World War I. Even with this procedure, however, there appears to be some indication that Austria and Hungary are overreported at the expense of Yugoslavia and Czechoslovakia. In 1950 the situation was further complicated by the fact that, although there were extensive de facto boundary changes as a result of World War II, only a small number of these changes were officially recognized by the United States at that time.

For definition of color, see text for series A 22–33.

[1] For 1820–1867 excludes returning citizens; therefore for those years, does not agree with series C 115 and C 133.
[2] Comprises Eire and Northern Ireland.
[3] Comprises Norway, Sweden, Denmark, and Iceland.
[4] Comprises Netherlands, Belgium, Luxembourg, Switzerland, and France.
[5] Includes Austria, 1938 to 1945.
[6] Between 1899 and 1919, included with Austria-Hungary, Germany, and Russia.
[7] Comprises Czechoslovakia (since 1920), Yugoslavia (since 1920), Hungary (since 1861), and Austria (since 1861, except for the years 1938–1945, when Austria was included with Germany).
[8] Comprises U. S. S. R. in Europe, Latvia, Estonia, Lithuania, and Finland.
[9] Comprises Rumania, Bulgaria, and Turkey in Europe.
[10] Comprises Spain, Portugal, Greece, and other Europe, not elsewhere classified.

[1] No record of immigration from Turkey in Asia until 1869.
[2] No record of immigration from Japan until 1861.
[3] Philippine Islands are included in "Other Asia" in 1952 (1,179), 1953 (1,074), 1954 (1,284), 1955 (1,598), 1956 (1,792), and 1957 (1,874). From 1934 to 1951, inclusive, they are included in "All other countries."
[4] Prior to 1920 Canada and Newfoundland were recorded as British North America. From 1820 to 1898 the figures include all British North American possessions.
[5] Includes 32,897 persons returning to their homes in the United States.
[6] Included in "All other countries."
[7] No record of immigration from Mexico for 1886 to 1893.

[1] No record of immigration from Turkey in Asia until 1869.
[2] No record of immigration from Japan until 1861.
[3] Philippine Islands are included in "Other Asia" in 1952 (1,179), 1953 (1,074), 1954 (1,284), 1955 (1,598), 1956 (1,792), and 1957 (1,874). From 1934 to 1951, inclusive, they are included in "All other countries."
[4] Prior to 1920 Canada and Newfoundland were recorded as British North America. From 1820 to 1898 the figures include all British North American possessions.

[1] Listed as Holland prior to 1910.
[2] Persons reported in 1910 as of Polish mother tongue born in Austria, Germany, and U. S. S. R. have been deducted from their respective countries and combined as Poland.
[3] For 1950, Turkey in Europe included with Turkey in Asia; for 1850–1900, Turkey in Asia included with Turkey in Europe.
[4] Albania included with Turkey in Europe for 1910; for 1930 and 1940, included with "Other Europe."
[5] Includes persons born in Serbia and in Montenegro, which became part of Yugoslavia in 1918.
[6] Armenia included with "Other Asia."
[7] Newfoundland included with Canada prior to 1910 and for 1950.
[8] Excluding possessions of the United States.

Labor

LABOR FORCE (Series D 1–572)

D 1–35. General note.

The conceptual structure and techniques for measurement of current labor force data were developed during the late 1930's by the Work Projects Administration (see John N. Webb, "Concepts Used in Unemployment Surveys," *Journal of the American Statistical Association*, March 1939). However, prior to 1940, especially during the 1930's, the economically active sector was differentiated on the basis of its ability and willingness to work. Thus, most surveys during the 1930's counted as unemployed those persons not working but "willing and able to work." Willingness and ability, however, turned out to be extremely subjective in practice, and since these concepts were dependent on the attitudes of the persons involved, it was difficult to compile data on a comparable basis from place to place and from time to time.

The 1929–1939 estimates shown here have been prepared on as comparable a basis as possible with the concepts used since 1940. For the techniques used in preparing these data, see their source (as stated in the text for series D 1–12). On the other hand, the decennial census data shown here are not directly comparable with annual data because of differences in collection techniques, time reference, and other factors.

For another set of labor force estimates, 1890–1950, see Clarence D. Long, *The Labor Force Under Changing Income and Employment*, National Bureau of Economic Research, New York, 1958, appendix tables A-4, A-6, and A-20.

The concepts and procedures used since 1940 are based principally upon an individual's actual activity, that is, whether he was working, looking for work, or doing something else during the time reference of the survey. (At present, the Census Bureau's *Monthly Report on the Labor Force* collects its information for the week containing the 12th of each month.) Instead of questions about a person's attitudes with respect to his labor market status (e.g., "Are you able to work?" or "Are you willing to work?" or "Do you want work?"), the present concept makes labor market participation depend on the more overt test of working or actively seeking work. Thus, in the surveys and censuses conducted by the Bureau of the Census since 1940, persons are classified with regard to employment status into the following categories.

Employed. Includes all persons who, during the week of reference (1) did any work for pay or for profit, on or off a farm, or worked at least 15 hours as an unpaid family worker in a business or on a farm operated by a member of the family; and (2) those who neither were at work or actively sought work, but who did have jobs from which they were temporarily absent because of such reasons as illness, bad weather, vacation, labor management dispute, etc. Volunteer work for religious or charitable institutions, as well as work around the house, is excluded.

Unemployed. Includes all persons (1) not at work during the survey week but actively seeking work within the preceding 60 days (efforts to find employment include registration at an employment office, writing letters of application, applying at the factory gate, running a situations-wanted ad in the newspaper, etc.); and (2) not at work but waiting to be called back to a job from which they had been laid off, or waiting to report to a new wage or salary job to start in the next 30 days (and not in school during the survey week), or who would have been actively looking for work except that they were temporarily ill or believed there was no work in their line available in their community.

Labor force. The civilian labor force is the sum of the employed and the unemployed. It is confined to persons 14 years of age and over, since labor market participation by persons under that age is relatively small. Information on the size of the Armed Forces is obtained from official sources and added to the civilian labor force to provide the total labor force figures.

Not in the labor force. Includes all persons 14 years of age and over not classified as employed, unemployed, or in the Armed Forces.

Current labor force data are produced by the Current Population Survey of the Bureau of the Census on the basis of a scientifically designed sample of households in 330 areas, with coverage in every State and the District of Columbia. The present size and composition of the sample dates from May 1956. From January 1954 through April 1956 the sample covered 230 areas, all of which were continued in the new and expanded sample. Prior to 1954, the interviewed households were concentrated in 68 sample areas. Household interviews totaled about 21,000 until the currently expanded sample beginning in May 1956 raised the total to about 35,000.

The household interview method (population approach) involves direct enumeration and interrogation of individuals to obtain information on employment activity from workers or members of workers' households. Each employed worker is counted only once, even though he may have held two or more jobs during a given period. This approach encompasses direct enumeration of all employed and unemployed persons including the self-employed, unpaid family workers, domestic servants, and others who do not ordinarily appear on the payrolls of any establishment. For a more detailed description of the concepts, techniques, estimation procedures, and adequacy and reliability of these data, see Bureau of the Census, *Current Population Reports*, Series P-23, No. 5.

D 1–12. Labor force status of the population, 1890–1957.

Source: Annual data, 1929–1939, population, Bureau of the Census, *Current Population Reports*, Series P-25, No. 114 (figures adjusted to include Armed Forces overseas); labor force, "Labor Force, Employment and Unemployment, 1929–39: Estimating Methods," *Monthly Labor Review*, July 1948, p. 50.

Annual data, 1940–1957, population and labor force, Bureau of the Census, *Current Population Reports*, Series P-50, Nos. 2, 13, 19, 31, 40, 45, 59, 67, 72, and 85. The population estimates are adjusted to include the institutional population; both population and labor force data for 1940–1952 are also adjusted to include about 150,000 members of the Armed Forces stationed outside continental United States in 1940 and

IV, Special Reports, *Employment and Personal Characteristics*, p. 1A-100; percents, 1920–1940 based on labor force data from Durand and population data from Bureau of the Census, Sixteenth Census Reports, *Population*, vol. III, part 1, p. 25, and *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-179.

D 36–45. Gainful workers, by age, sex, and farm-nonfarm occupations, 1820–1930.

Source: Sixteenth Census Reports, *Comparative Occupation Statistics for the United States, 1870–1940*, pp. 93, 100, and 142.

The gainful worker concept differs radically from current labor force concepts as described in the general note for series D 1–35. The primary purpose of the gainful worker statistics was a count of occupations. The data were based on a question relating to occupational status and not to employment status as currently defined. Thus, census enumerators were instructed to find and enter the occupation of each person 10 years of age and over who followed an occupation in which he earned money or its equivalent, or in which he assisted in the production of marketable goods. In sum, gainful workers were people for whom a gainful occupation was entered in response to this question.

The question as posed by the enumerator made no reference to time. The response thus varied substantially with the individual. Many persons who were retired or permanently disabled and who had not worked for some time reported their former line of work and were counted as gainful workers. On the other hand, many employed persons did not enter themselves as gainful workers, because they considered themselves as students or housewives and their current employment as only temporary.

These and other factors made for incomparabilities among different age and occupational groups from one decennial census to the next. The gainful worker statistics, however, are considered as a generally reliable measure of long-term trends during the time period covered.

For a more detailed discussion of the gainful worker concept and the data themselves, see John D. Durand (see source for series D 1–12), p. 191 *et seq.*; John D. Durand, "Development of the Labor Force Concept, 1930–40," *Labor Force Definition and Measurement*, appendix A, Social Science Research Council, Bulletin 56, 1947; and Sixteenth Census Reports, *Population*, "Estimates of Labor Force, Employment, and Unemployment in the U. S.: 1940 and 1930."

D 46–47. Unemployment, annual averages, 1900–1957.

Source: 1900–1928, Stanley Lebergott, "Annual Estimates of Unemployment in the United States, 1900–1954," *The Measurement and Behavior of Unemployment*, National Bureau of Economic Research, New York, 1956, pp. 213–241; 1929–1957, see source for annual data on labor force for series D 1–12.

Prior to 1940, these figures represent estimates of unemployment on as comparable a basis to current labor force concepts as is presently possible. There have been many estimates of unemployment for these years prepared by such agencies as the National Industrial Conference Board and by authors such as Paul Douglas in *Real Wages in the United States, 1890–1926* (these are discussed and compared in the sources of pre-1940 figures cited above). In all of these, including the series presented here, unemployment is calculated as a residual. That is, estimates are first made of the civilian labor force, then of employment; the difference between the two provides the estimates of unemployment. The figures for decennial census years are used as benchmarks, with interpolations made for intercensal years from a variety of available sources.

D 48–56. Employees in nonagricultural establishments, by major industry division, 1919–1957.

Source: Bureau of Labor Statistics, *Employment and Earnings*, vol. 5, No. 8, p. 1.

These data are compiled from monthly reports made by employers, i.e., businesses or industrial establishments, to the Bureau of Labor Statistics. The "establishment approach" permits data on wages, hours worked, labor turnover, and industrial affiliation to be more accurately obtained from employers' records than from inquiries directed to a worker or a member of his household (the "population approach"). Workers appearing on more than one payroll for the same time period are counted more than once in establishment statistics. For a discussion of labor force data obtained by the "population approach," see general note for series D 1–35.

The data summarized in these series are available in considerable industrial detail (estimates are provided for about 400 different industries each month). For a discussion of available historical data, see Bureau of Labor Statistics, *Guide to Employment Statistics of BLS*, 1954; for an analysis of historical trends, see Seymour L. Wolfbein, "Changing Patterns of Industrial Employment," *Monthly Labor Review*, March 1956.

D 57–71. Industrial distribution of gainful workers, 1820–1940.

Source: Solomon Fabricant, "The Changing Industrial Distribution of Gainful Workers: Some Comments on the American Decennial Statistics for 1820–1940," *Studies in Income and Wealth*, vol. 11, National Bureau of Economic Research, New York, 1949, p. 42.

The data are based almost entirely on estimates in the following monographs which were prepared mainly from data collected in the decennial censuses of population: P. K. Whelpton, "Occupational Groups in the United States, 1820–1920," *Journal of the American Statistical Association*, September 1926; Sixteenth Census Reports, *Comparative Occupation Statistics for*

Digitized by Google

the United States, 1870 to 1940; and Daniel Carson, "Industrial Composition of Manpower in the United States, 1870–1940," *Studies in Income and Wealth*, vol. 11.

D 72–122. Major occupation group of the economically active population, by sex, 1900–1950.

Source: David L. Kaplan and M. Claire Casey, *Occupational Trends in the United States, 1900–1950*, Bureau of the Census, Working Paper No. 5, 1958.

These data constitute primarily an updating by Kaplan and Casey of the material in Sixteenth Census Reports, *Comparative Occupation Statistics in the United States, 1870–1940.* Separate series developed by Alba M. Edwards in the above report were brought together and a number of new estimates were prepared to fill gaps. The appropriate figures were then adjusted to conform to the definitions used in the 1950 occupational classification system. Except where there was firm evidence to support a change, Edwards' basic assumptions and estimates were utilized throughout.

The source cautions that the data, particularly those for 1900, are approximations only. The estimates for 1900 "were included mainly for the purpose of rounding out a half-century of information, despite some obvious deficiencies. Particularly prior to 1910, there is little information available on the exact definitions used for the several occupational categories. And, even for fairly recent years, there is often only meager statistical intelligence on which to base adjustments for comparability with the 1950 definitions."

The universe covered in the series is described as the "economically active population." Prior to 1940, this refers to civilian gainful workers 10 years old and over; for 1940 and 1950, it refers to persons 14 years old and over in the experienced civilian labor force (all employed and unemployed workers with previous work experience). Two incomparabilities should be noted. First, there are important differences between the gainful worker and labor force concepts (see general note for series D 1–35, and text for series D 36–45). Second, there is the difference in age limitation. The inclusion of the 10-to-13 group prior to 1940, and their exclusion in 1940 and 1950, follows the census practice in those years.

D 123–572. Detailed occupation of the economically active population, 1900–1950.

Source: David L. Kaplan and M. Claire Casey, *Occupational Trends in the United States, 1900–1950,* Bureau of the Census, Working Paper No. 5, 1958.

1820	2,880	2,070	[4]	[4]	350			[4]				[4]			460

[1] Comparable with 1940.
[2] Difference between number of persons not reporting industrial affiliation (1,335,000), and excess of the "gainful worker" total over the "labor force" total (1,190,000).
[3] Comparable with data for earlier years.
[4] Comparable with data for later years.
[5] Figure corrected for apparent error in source; components now add to total, series D 57.
[6] Not available.

chapter D

HOURS, WAGES, AND WORKING CONDITIONS (Series D 573–792)

D 573–577. Daily hours and indexes of daily wages in all industries and in building trades, January 1860–1891.

Source: U. S. Congress, "Aldrich Report," Senate Report No. 1394, 52d Congress, 2d Session, part I, pp. 173–180.

The Aldrich Report is the leading source of data on average wages and hours for 1840–1891. The only other large body of data relating to this period covers 1860–1880 (Joseph D. Weeks, *Report on the Statistics of Wages in Manufacturing Industries*, Tenth Census, vol. 20).

The basic wage data of the Aldrich Report were collected in 1891 and 1892 from the records of wages by occupation in 88 establishments in the Northeast, including Maryland. Those occupational wage series going back to 1860 were combined into industry indexes. Series starting after 1860 were not used in the indexes.

D 573–575 cover 21 industries including railroads, building trades, groceries, dry goods, city public works, illuminating gas, sidewalks, and 14 manufacturing industries. The source also contains data for the same period on wages in the coal, iron, glass, and pottery industries, and on teachers' salaries in certain areas.

In computing the weighted averages for series D 573 and D 574, shifting employment weights based on occupational data from the censuses of population were used.

Data for 1840–1859 for series D 573–577 are shown in the source, but the coverage is so inadequate that they are of little value.

The Aldrich Report indexes have been severely criticized by A. L. Bowley, Wesley C. Mitchell, and others, on several grounds including the failure to use the wage data for July of each year, the use of simple averages to combine occupations, and the overweighting of industries for which data were scanty. Mitchell's alternative processing of the wage data is shown in series D 578–588; however, it extends only to 1880. For 1880–1891, the Aldrich Report indexes are the only published summary of these wage data that covers all years. For certain industries and years, alternative indexes are presented in A. L. Bowley, "Comparison of the Rates of Increase of Wages in the United States and in Great Britain," *Economic Journal*, vol. V, 1895, pp. 368–383.

D 578–588. Indexes of average daily wages in all industries, in selected industries, and by degree of skill, January and July, 1860–1880.

Source: Wesley C. Mitchell, *Gold, Prices, and Wages Under the Greenback Standard*, University of California Press, Berkeley, 1908, pp. 120, 145–152.

The data underlying these indexes are from the Aldrich Report (see text for series D 573–577). The source also presents indexes of the medians and deciles of wages for most of the industries in series D 578–586, some indexes of means by sex, indexes of medians and deciles by occupation, and indexes of means, medians, and deciles by initial wage level. In addition, the source contains a similar processing of the wage data of the Weeks Report (see text for series D 573–577).

D 578–586 are weighted arithmetic means of wage indexes by occupation for all industries covered in the Aldrich Report and for establishments in each industry. The weights are the number of workers included in each series at each date.

D 587 is an index of the median of wage indexes by occupation for unskilled men in all industries, excluding one establishment (Establishment 35, City Public Works, New York) that included about half the total number of unskilled men covered in the Aldrich Report.

D 588 is an index of the median of wage indexes by occupation for skilled men, excluding foremen and overseers and helpers of craftsmen.

D 589–602. Hours and earnings in manufacturing, in selected nonmanufacturing industries, and for "lower-skilled" labor, 1890–1926.

Source: Paul H. Douglas, *Real Wages in the United States, 1890–1926*, Houghton Mifflin Company, New York, 1930.

D 589–590 are weighted averages of series D 591 and D 593 and series D 592 and D 594, respectively. The union scales of wages are substantially higher and less flexible than the wages of all workers in the "union" industries. Since the weight of the "union" industries in the all-manufacturing average is based on the total number of skilled and semiskilled workers in the industries, the total manufacturing average is too high (see Leo Wolman, "American Wages," *Quarterly Journal of Economics*, XLVI, 1932, pp. 398–406).

D 591–592, beginning in 1907, are weighted averages of trade union scales for occupations. The weights are union membership by crafts. The series are extrapolated back to 1890 by use of payroll data from the sources of series D 593 and D 594.

D 593–594, average hours and earnings for "payroll" manufacturing industries, are averages weighted by employment data from employer payrolls (see text for series D 618–625), given in various Bureau of Labor Statistics (BLS) bulletins and in the *Nineteenth Annual Report of the Commissioner of Labor*. Until 1913, the original data are for selected occupations only, and exclude most laborers and some other unskilled workers. Therefore, for 1890–1913 the series are extrapolations backward from the 1914 level.

Differences between series D 591–592 and D 593–594 are not necessarily reliable indicators of differences in wages and hours between workers in union and nonunion industries. Because the biases in series D 591–592 are probably much greater than those in series D 593–594, it may sometimes be desirable to use only the latter to represent all manufacturing.

D 595, average hours in bituminous coal mining, is estimated from union contracts and their coverage for 1890–1903; after 1903, it is based on data from the U. S. Geological Survey.

D 596, average hourly earnings, was obtained by dividing series D 612, average annual earnings, by average days

Note. The series on wages and earnings in this section are in "current" (or money) dollars rather than dollars of fixed purchasing power. Although the current dollar is the proper unit for measuring wages and earnings for many purposes, it often tends to be a misleading indicator of purchasing power. If information is desired on the changes in purchasing power of earnings, money wages or earnings should be converted to real terms by dividing them by an appropriate index of consumer prices. Several such indexes are given in chapter E.

Digitized by Google

worked, as reported by the U. S. Geological Survey; the resulting series was divided by daily hours worked.

D 597, average full-time earnings on railroads, is based on average daily wages by occupations, 1895–1914; for 1914–1926, it is based on average hourly wages as reported by the Interstate Commerce Commission and estimated daily hours.

D 598–599, average hours and earnings in the building trades, were obtained in the same way as series D 591–592.

D 600, average hours for postal employees, is based on nominal hours as set by law, adjusted (after 1920) for sick leave.

D 601, average hourly earnings, is estimated by dividing series D 615 by 52 to obtain weekly earnings and then by dividing again by series D 600 to obtain hourly earnings.

D 602, average full-time weekly earnings for "lower-skilled" labor, is reproduced in the source from Whitney Coombs, *The Wages of Unskilled Labor in Manufacturing Industries in the United States, 1890–1924*, Columbia University Press, New York, 1926, p. 99. It is based on the wages of the least skilled or lowest paid occupations reported for each industry in BLS bulletins and in the *Nineteenth Annual Report of the Commissioner of Labor*, except that the figure for 1920 is based on the data of the National Industrial Conference Board. Since these sources exclude most laborers before 1914, the series is labelled here as "lower skilled," though it is called "unskilled" by Coombs and by Douglas.

D 603–617. Average annual earnings in all industries and in selected industries and occupations, 1890–1926.

Source: See source for series D 589–602.

D 603–604, all industries averages, are weighted averages of series D 605–617 and an additional series beginning in 1902 for anthracite coal. The weights change annually and are based on decennial census employment estimates. Interpolations of weights for intercensal years are based on State employment data when available; elsewhere they are linear.

The weights for decennial census years and 1926 are shown in the source, p. 390.

D 605, wage earners in manufacturing, is based on data from the census of manufacturers for census years (total wages paid and wage earners). Figures for intercensal years are interpolated using similar data from the labor bureaus of a number of States. Census data for 1890 are adjusted to eliminate the hand trades.

D 606, wage earners of steam railroads, is based on Interstate Commerce Commission data since 1905, and extrapolated back to 1890 using data from several State railroad commissions.

D 607, street railways, is based on the Eleventh Census (1890) and the censuses of electrical industries. Figures for intercensal years are interpolations based on data from several State railroad and public utility commissions and State labor bureaus.

D 608–609, telephone and telegraph industries, are based on censuses of electrical industries. Figures for intercensal years are interpolations based on data published by the Pennsylvania Department of Internal Affairs.

D 610, gas and electricity, is based on the censuses of electrical industries (electricity) and on the censuses of manufactures (gas). Figures for intercensal years are interpolations based on data for New York City, Wisconsin, Illinois, and Pennsylvania, from State sources.

D 611, clerical workers in manufacturing and steam railroads, is based on: Average earnings of salaried workers in manufacturing computed from the censuses of manufactures for census years, with data from 3 States used to interpolate for other years; and beginning in 1895, earnings of salaried workers in railroads from the Interstate Commerce Commission, with data from 2 State railway commissions and 1 railroad used to extrapolate back to 1890.

D 612, bituminous coal mining, is based on aggregate wage payments from the censuses of mines and quarries of 1889, 1902, 1909, and 1919 as revised in the Fourteenth Census (1920), divided by employment figures reported by the U. S. Geological Survey. Figures for intercensal years are interpolations based on data from the State labor bureaus or departments of mines of 5 major coal-producing States.

D 613, farm labor, is based on the Department of Agriculture series of daily wages of farm labor without board and of monthly wages of farm labor without board. Data for 1900–1909 are linear interpolations covering from 1 to 3 years each.

D 614, Federal employees, covers employees of Federal executive departments in Washington, D. C., only. The data are from the *Official Register*, adjusted to include bonuses paid during 1917–1924.

D 615, postal employees, covers letter carriers and, beginning in 1906, postal clerks in first and second class post offices. The data are from the *Annual Reports of the Postmaster General*, adjusted to calendar years.

D 616, public school teachers, covers teachers, principals, and supervisors in public elementary and secondary schools. The data are from the *Annual Reports of the U. S. Commissioner of Education*, adjusted to a calendar-year basis. Data for some years after 1915 are interpolations based on studies of the National Education Association.

D 617, ministers, covers salaries of Methodist and Congregational ministers as reported in the *Methodist Year Book* and the *Annual Congregational Gray Book*.

D 618–625. Indexes of wages, hours, and earnings in manufacturing and in the building trades, 1890–1907.

Source: Department of Commerce and Labor, *Bulletin of the Bureau of Labor, No. 77*, 1908, p. 7; Leo Wolman, "Hours of Work in American Industry," *Bulletin 71*, National Bureau of Economic Research, 1938, p. 2.

Beginning in 1900, the Bureau of Labor of the Department of Commerce and Labor undertook, in somewhat modified form, a continuation of the Aldrich Report (see text for series D 573–577). The *Nineteenth Annual Report of the Commissioner of Labor*, 1904, contains the results of the studies for 1890–1903. Somewhat similar surveys were made for 1904–1907 and the information for the entire period was summarized in *Bulletin No. 77*, cited above. The *Nineteenth Annual Report* and the subsequent *Bulletins* (Nos. 59, 65, 71, and 77) show the basic wage, hour, and employment averages for each of the individual occupations and industries and for selected occupations by States and for large cities.

The Bureau of Labor figures (series D 618–620) include the building and other hand and neighborhood trades. Wolman's figures (series D 621) exclude the building and hand trades.

The data in the *Nineteenth Annual Report* are based on information obtained from 3,475 establishments in 67 industries, covering 519 occupations. Agents of the Bureau of Labor collected wages, hours, and employment data separately by occupation and sex from the records of each establishment. Such data were taken only for what were judged principal occupations in each industry and only for the period within each year that was judged "normal" for the establishment. By and large, the basic data for each occupation (separately

Digitized by Google

by sex) were for establishments whose records were complete enough to supply the data for each year 1890–1903.

For 1890–1903, average hourly wages and average full-time weekly hours, weighted by employment, were computed for each occupation, separately by sex. Each of the occupational series was converted to an index number with the average for 1890–1899 as the base. Within each industry, simple arithmetic means of the individual occupational indexes were then computed. Series D 622 and D 624 are unweighted means of the occupational indexes in the building trades. The "all manufacturing" index numbers (series D 618 and D 620), however, are weighted means of the indexes of the 67 separate industries included, each industry weighted by the payroll of that industry as estimated from the 1900 Census. Series D 619 is the product of series D 618 and D 620. Similarly, series D 623 is the product of series D 622 and D 624.

For 1904–1907, the procedures used by the Bureau of Labor were similar to those used for 1890–1903, with the following exceptions: (1) Some small industries covered in 1890–1903 were dropped although the number of establishments covered was increased; and (2) the indexes were chain-linked to those for 1890–1903.

Series D 621 and D 625, for average full-time weekly hours, are based on Wolman's reworking of the basic data for series D 620 and D 624. Series D 621 shows the index numbers computed from the weighted average of the hours figures in the *Nineteenth Annual Report* for 456 occupations in 48 manufacturing industries and excludes the building trades and other hand and neighborhood trades covered in the report. The weight for each occupation in each year is the number of employees covered in the survey of that occupation in the year. Series D 625 is the index number calculated from the similarly weighted average computed by Wolman for the 19 building trades occupations. For the building trades, Wolman expressed the opinion that the hours data in the *Nineteenth Annual Report* were those established by unions.

Wolman's report is a basic source of information of hours of work in American industry. It contains 15 summary tables of historical data on hours of work in manufacturing, building construction, steam railroads, and coal mining for various dates, 1890–1937.

D 626–634. Hours and earnings for production workers in manufacturing, 1909–1957.

Source: 1909–1946, Bureau of Labor Statistics, *Handbook of Labor Statistics*, 1950 edition; 1947–1957, *Monthly Labor Review*, various issues.

The figures for 1909–1931 represent estimates based largely on periodic wage and hour surveys conducted by the Bureau of Labor Statistics during that period for a narrow list of manufacturing industries. These figures are an extension of, and are adjusted for comparability with, the figures for 1932–1957. For a discussion of the methods and data used to derive the figures for 1909–1931, see the *Monthly Labor Review*, July 1955, pp. 801–806.

The estimates of average weekly earnings for 1909–1931, based primarily on census data, tend to be more accurate than those for average hourly earnings, and average weekly hours. It is likely that the hourly earnings figures are overstated and the weekly hours understated because the BLS surveys of wages tended to sample large firms more heavily than small firms.

For 1932–1957, the underlying employment, payroll, and man-hour figures are obtained by means of a mail questionnaire sent monthly to cooperating establishments. Each establishment reports the following information: (1) The number of production workers or nonsupervisory employees who worked or received pay for any part of the payroll period ending nearest the 15th of the month; (2) the total gross payrolls for these employees before such deductions as Social Security taxes, withholding taxes, union dues, etc. (the payroll figures include pay for overtime, shift premiums, sick leave, holidays, vacations, and production bonuses, but exclude payments in kind, retroactive pay, nonproduction bonuses, employer contributions to private welfare funds, insurance and pension plans, and similar fringe payments); and (3) total man-hours paid for these employees including hours paid for vacations, holidays, sick leave, travel time, lunch time, etc.

Within each detailed industry the payroll, employment, and man-hours figures for reporting establishments are aggregated, and average hourly earnings, average weekly hours, and average weekly earnings are computed. The average hourly earnings and average weekly hours for a group of industries are weighted arithmetic means of the corresponding averages for the industries within the group. The weights used for earnings are estimates of aggregate production-worker man-hours and those used for hours are estimates of aggregate production-worker employment. Average weekly earnings for the group is the product of the average hourly earnings and the average weekly hours for the group.

Average weekly hours worked or paid for differ from average full-time or standard hours (before payment at overtime premium rates) and from average hours worked per week. During periods of substantial unemployment, average weekly hours paid for often may be considerably below the full-time level of hours or the level at which premium payments for overtime begin. On the other hand, during periods of relatively full employment, overtime hours tend to raise the average weekly hours above the full-time level.

Until the 1940's, the distinction in most industries between hours paid for and hours worked was relatively unimportant. The widespread adoption of paid vacations of increasing length and of an increasing number of paid holidays (and in some industries paid travel time, lunch time, etc.), however, has raised average weekly hours (which are hours paid for) above average hours worked by increasing amounts. By 1957, the difference may have grown to as much as 5 percent in manufacturing industries on the average; in some industries, such as bituminous coal mining, the difference was substantially larger. Since the middle 1940's, figures for weekly hours tend to understate the downward movement of hours worked per week.

Average hourly earnings figures exclude such fringe payments as employer contributions to private health, welfare, and insurance funds and include premium payments for overtime and for night work.

D 635–637. Hours and earnings for bituminous coal mines, 1909–1957.

Source: Bureau of Labor Statistics, *Employment and Earnings*, and *Hours and Earnings* (multilithed releases).

For 1909–1931, estimates are based on a variety of sources including special studies by the BLS and data collected by the Bureau of the Census, the Bureau of Mines, and reports of various State coal commissions. For 1932–1957, figures are strictly comparable in concept and method of estimation with those for manufacturing in series D 626–634. See text also for same series regarding hours paid for in contrast to hours worked and the exclusion from average hourly earnings of

Digitized by Google

fringe payments which are particularly applicable to coal mining.

Before 1945, lunch time was not paid for in the mines. Beginning April 1945, mine operators paid for 15 minutes of lunch time per day; in July 1947, the lunch time paid for was increased to one-half hour. Similarly, before November 1943, working time was computed on a "face-to-face" basis. From November 1943 to April 1945, inside mine workers were paid for 45 minutes of travel time per day at two-thirds of the regular rate. Since April 1945, inside workers have been paid for all travel time at the applicable hourly rate.

Data published by the Bureau of Mines (*Minerals Yearbook*, 1946, p. 81) show that in 1944 travel time amounted, on the average, to 10–15 percent of total time paid for. Therefore, average weekly hours figures since 1945 may have a serious upward bias if used to measure hours actually worked, and the average hourly earnings figures may have a correspondingly serious downward bias if used to measure average earnings per hour actually worked.

Average hourly earnings figures exclude contributions of coal mine employers to the miners' health and welfare fund. These contributions have increased from 5 cents per ton in 1946 to 40 cents per ton in 1952 and later years. In 1953 wage supplements in bituminous coal mining, chiefly employer contributions to the health and welfare fund in the industry, amounted to 16 percent of total wages and salaries in the industry.

D 638–641. Hours and earnings for Class I steam railroads, 1921–1957.

Source: Bureau of Labor Statistics, *Employment and Earnings*, and *Hours and Earnings* (multilithed releases); BLS, *Handbook of Labor Statistics*, 1947 and 1950 editions; and Interstate Commerce Commission, *Wage Statistics of Class I Railroads in the United States*, various issues.

Figures for Class I railroads are based on their monthly reports to the Interstate Commerce Commission. Until 1951, the figures covered all hourly rated employees of Class I railroads excluding (except in 1921–1927) Class I switching and terminal companies. Since 1951, the figures cover all employees (excluding switching and terminal companies) except executives, officials, and staff assistants. Although the figures since 1951 are not strictly comparable with those for earlier years, the difference is not large.

Average hourly earnings are computed by dividing the total compensation of covered employees by total man-hours paid for. Average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Average weekly hours equal total man-hours paid for (during a month) reduced to a weekly basis, divided by the full-month count of employees on the payroll. The full-month count generally tends to be somewhat larger than a count for the payroll period ending nearest the 15th of the month, which is used for other industries. For this reason both the weekly earnings and the weekly hours figures tend to be slightly lower than they would be if computed on the latter basis.

For 1921–1927, straight-time average hourly earnings (series D 641) are computed by dividing compensation for straight time actually worked by hours of straight time actually worked. For 1928–1950, figures are ratios of compensation for straight time paid for to hours of straight time paid for. Since 1951, the figures have been computed from the ICC's *Wage Statistics*, which provides monthly and annual data on employment, man-hours, and compensation by detailed occupation as well as by major occupational groups.

D 642–653. Indexes of union hourly wage rates and weekly hours, for building and printing trades, 1907–1956.

Source: Bureau of Labor Statistics, *Union Wages and Hours: Building Trades*, July 1957, pp. 5 and 14; and *Union Wages and Hours: Printing Industry*, July 1956, pp. 6 and 15.

Studies by the Bureau of Labor Statistics of union scales of wages and hours prior to 1936 included at various times building and printing trades, barbers, linemen, longshoremen, and workers employed in breweries, laundries, metal trades, millwork, restaurants, soft drink production, theaters, baking, trucking, and local transit. Since 1936, the studies have been confined to the printing and building trades, trucking, local transit, and baking. The baking study was discontinued in 1953.

For each trade, the local union is asked to submit data on the minimum union wage rate, the weekly hours (before overtime becomes effective), and the number of active union members working or available for work on a single specified date (recently July 1) each year.

The earliest studies covered 13 journeymen and 7 helper and labor classifications in building construction, and 7 book and job and 4 newspaper classifications in the printing trades in 39 cities. The most recent study covered 24 journeymen and 9 helper and labor classifications in the building trades in 52 cities of over 100,000 population, and 12 book and job and 8 newspaper classifications in the printing trades in 53 such cities.

Indexes for all years were computed by the chain-link relative method, except 1921–1929, which were based on weighted arithmetic means for each year. The figures reflect minimum union contract scales and exclude premium pay for overtime. During periods of unemployment, the contract rates may be higher than the actual wage rates paid. Wage rates above contract scales may be paid during periods of high employment or rapid inflation. Thus, the union figures tend to have smaller cyclical fluctuations than actual wage rates paid to union employees. Furthermore, since overtime pay is excluded, union wage rates fluctuate less cyclically than average hourly earnings.

The hours figures also reflect union contract straight-time hours. They do not measure hours actually worked, which vary for the building trades with climatic conditions and the amount of construction work available.

D 654–668. Hours and earnings, for production workers in 25 manufacturing industries, by sex and degree of skill, 1914–1948.

Source: National Industrial Conference Board, *The Economic Almanac for 1950*, New York, 1950, pp. 336–344.

The underlying data were collected by the National Industrial Conference Board (NICB) from a sample of companies representing 25 industries (durable and nondurable goods) by means of a monthly mail questionnaire. The number of firms included in the sample, as well as the distribution of these firms by size and geographical location, varied somewhat from time to time. In 1936, the sample included 1,886 firms employing about one-third of all wage earners in the 25 industries covered and about one-fifth of all wage earners in all manufacturing industries. The average firm in the sample (in most of the 25 industries) was substantially larger (in terms of employment) than the average firm in the population from which the sample was taken. Although some tendency toward an upward bias in the level of earnings of the sample firms may exist, it is not clear that this bias also had a trend or varied with the business cycle.

Digitized by Google

Within each industry, average hourly earnings was obtained by dividing the aggregate payroll for reporting companies by the aggregate man-hours. Average weekly hours and average weekly earnings were obtained in a similar manner. The averages for all industries taken together were weighted means of the separate industry averages with fixed employment weights estimated for each industry with the help of the 1923 Census of Manufactures.

The distinction in classification between unskilled males and other male workers was not precisely stated by NICB and the classification was made by the reporting firms.

D 669–684. Hours and earnings, for production workers in selected nonmanufacturing industries, 1932–1957.

Source: Bureau of Labor Statistics, *Employment and Earnings*, and *Hours and Earnings* (multilithed releases); and *Handbook of Labor Statistics*, 1947 edition, pp. 80–86.

See text for series D 626–634.

D 685–695. Average annual compensation per full-time employee, by major industry, 1919–1929.

Source: Computed from Simon Kuznets, *National Income and its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941, pp. 314–315.

These data were obtained by dividing Kuznets' estimates of aggregate employee compensation for each major industry division by the corresponding estimates of number of full-time equivalent employees. The source also presents similar compensation and employment data for 1930–1938, and for industry groups within the major industry divisions.

Employee compensation figures include wages and salaries, and government relief payments. In addition, bonuses, commissions, gratuities, payments in kind, pensions, and compensation for injuries were included for industries in which they were a significant proportion of total compensation and could be estimated from available data.

Kuznets' employment estimates include both wage earners and salaried employees and are stated in full-time equivalent units (the number of persons that would have been employed if each had worked full-time for a full year), or, in effect, the number of full-time positions filled. In practice, Kuznets used estimates of employment similar to those used by BLS; namely, annual averages of monthly figures, based on a payroll count for a single payroll period in each month, except in a few industries in which part-time work was important and for which he derived full-time equivalent employment by dividing aggregate wage payments by estimates of annual earnings for full-time workers.

D 696–707. Average annual earnings per full-time employee, by major industry, 1929–1957.

Source: 1929–1945, Office of Business Economics, *National Income: 1954 Edition*, pp. 200–201; 1946–1957, *U. S. Income and Output, 1958*, table VI-15.

These estimates are ratios of aggregate wage and salary payments, by industry, to the aggregate number of full-time equivalent employees, by industry (the sources also present estimates for industry groups within major industries). Wages and salaries include executives' compensation, bonuses, tips, and payments in kind, and exclude those sources of labor income appearing in series D 708–727 as "supplements to wages and salaries."

Full-time equivalent employment measures man-years of full-time employment of wage and salary earners and its equivalent in work performed by part-time workers. For a discussion of the concept of full-time equivalent employment and the methods of estimation involved in converting part-time work to its full-time equivalent, see the *Survey of Current Business*, June 1945, pp. 17–18.

The difference between the Kuznets' figures for average annual earnings (series D 685–695) and these Office of Business Economics figures is slight prior to World War II. Kuznets' compensation figures include both wages and salaries and some "supplements to wages and salaries." For 1919–1938, however, supplements were a small fraction of wages and salaries in most industries. The concept of full-time equivalent employment used by Kuznets also was essentially the same as that used by the Office of Business Economics.

The employment and payrolls estimates were derived by combining separate estimates for those industries covered by Social Security programs and those not covered by such programs. For 1929–1938, for those industries covered (as of 1957) by Social Security programs, the employment and payrolls figures are extrapolations backward from 1939, based on sources and methods similar to those for series D 685–695.

Since 1939, for those industries (virtually all industrial and commercial employment) covered by Social Security programs, estimates of aggregate wages and salaries were obtained as follows (employment estimates came from essentially the same sources). Figures for payrolls covered by Old-Age and Survivors Insurance (OASI) or the Railroad Retirement Act came from the records of the State Unemployment Insurance programs and from the Interstate Commerce Commission's *Statistics of Railways*, and provide employer-reported data by industry for about 95 percent of total payrolls covered by Social Security. Payrolls of firms covered by OASI but not by State Unemployment Insurance were estimated from periodic special tabulations of OASI data for these firms. Similarly payrolls covered by the Railroad Retirement Act but not reported to the Interstate Commerce Commission were estimated from Railroad Retirement Board data.

This general method was followed except for categories for which more reliable data were available from other sources or where the proportion of firms not covered by Social Security programs was large: Agricultural services, forestry, and fisheries; banking (before 1943); water transportation (before 1947); medical and other health services; and legal services. Data for these were obtained from various population and industry censuses, the Maritime Commission, governmental banking regulatory bodies, and special surveys made by the Department of Commerce.

Estimates of employment and payrolls not covered by Social Security programs, accounting for roughly one-fifth of total wages and salaries, are based on a variety of sources, chief among which are: (1) For the Federal Government, reports of the Civil Service Commission, records of the armed services, and (for 1933–1943) records of the Federal work relief projects; (2) for State and local governments, reports of the Bureau of the Census, the Office of Education, etc.; (3) for farms, the Census of Agriculture and estimates of the Department of Agriculture; (4) for private households, the Census of Population. For further details, see *National Income: 1954 Edition*, pp. 70–72.

D 708–719. Average annual supplements to wages and salaries per full-time employee, by major industry, 1929–1957.

Source: Computed from the following: 1929–1945, Office of Business Economics, *National Income: 1954 Edition*, pp. 183 and 196–197; 1946–1957, *U. S. Income and Output, 1958*, tables VI-3 and VI-13.

These figures have been computed by dividing estimates by industry of aggregate supplements to wages and salaries by the corresponding estimates of the aggregate number of full-

Digitized by Google

time equivalent employees. For discussion of estimates of full-time equivalent employees, see text for series D 696–707; for discussion of supplements to wages and salaries, see text for series D 720–727.

D 720–727. Average annual supplements to wages and salaries per full-time equivalent employee, by type of supplement, 1929–1957.

Source: Computed from the following: 1929–1945, Office of Business Economics, *National Income: 1954 Edition*, pp. 196–197 and 210–211; 1946–1957, *U. S. Income and Output, 1958*, tables I-8, III-6, and VI-13.

These figures have been computed by dividing estimates by type of aggregate supplements to wages and salaries by estimates of full-time equivalent employees in all industries. For discussion of estimates of full-time equivalent employees, see text for series D 696–707. The source presents figures for a more detailed classification of supplements.

The averages shown for the different types of supplements may tend to be somewhat lower than they should be because the employment figures used to obtain the averages include employees for whom no contributions or payments were made and who would not therefore be recipients of supplemental compensation.

Data for items under "employer contributions for social insurance" (series D 721–724) have a high degree of reliability since they are obtained almost exclusively from the accounting records of the agencies administering the programs. Estimates for items under "other labor income" are less reliable.

Data on supplements to wages and salaries are obtained from a variety of sources. Reports filed by employers with the administrative agencies or with the United States Treasury are the sources of figures for employer contributions under old-age and survivors insurance, State unemployment insurance and cash sickness compensation, railroad retirement and unemployment insurance, and the Federal unemployment tax. Payments made by the Federal Government to its civilian employee retirement systems are obtained from Treasury Department records and the records of the administrative agencies. Estimates of Federal Government contributions made to Government life insurance programs are based on monthly reports of the Veterans Administration.

Contributions to State and local retirement systems are based on data supplied, since 1936, by the Department of Health, Education, and Welfare. Estimates for 1929–1935 are extrapolations from the 1936 figure based on a sample survey of State and local government units.

Estimates of compensation for injuries are based on data in the annual *Insurance Yearbook* (Spectator Company) and on reports of State insurance funds, and on information furnished by State accident compensation commissions.

Employer contributions to private pension plans are estimated for 1945–1956 chiefly from tabulations prepared by the Internal Revenue Service. Contributions to health and welfare funds are estimated from data obtained from the Amalgamated Clothing Workers of America, the International Ladies' Garment Workers' Union, the United Mine Workers of America, and the American Telephone and Telegraph Company, and from data appearing chiefly in Bureau of Labor Statistics publications.

Employer contributions for group insurance (series D 726) are based upon studies made by the Department of Health, Education, and Welfare and the National Industrial Conference Board and upon reports from life insurance companies, Blue Cross and Blue Shield, and other sources.

Data on the pay of military reservists have been obtained from the armed services or from the annual *Budget of the United States Government* and data on Federal payments to enemy prisoners of war were obtained from the Department of Defense. Other items in "other labor income" have always been small in amount.

D 728. Annual salary of public school teachers, 1930–1954.

Source: Office of Education, *Biennial Survey of Education in the United States*, various years.

Estimates are based on biennial reports made to the Office of Education by the departments of education in the 48 States and the District of Columbia. Average annual salary is the ratio of salary expenditures for principals, supervisors, and teachers to the number of such staff members. It is not possible to determine precisely from the *Biennial Surveys*, particularly in the earlier years, the extent to which number of teachers is number of teaching positions rather than number of teachers on the payroll. In recent years the concept used presumably is number of teaching positions. To the extent that the surveys have shifted from a payroll to a position count, average salaries in recent years tend to be overstated relative to those of earlier years. For additional information and longer series, see Chapter H, general note for series H 1–89, and series H 12, H 13, and H 14–16.

D 729. Annual salary of college teachers, 1929–1952.

Source: George J. Stigler, *Trends in Employment in the Service Industries*, Princeton University Press, Princeton, 1956, p. 134.

These figures refer to college teachers in large public institutions. The average annual salary is the weighted arithmetic mean of median salaries estimated separately for the four categories: Instructors, assistant professors, associate professors, and professors.

For 1929–1932, the median salaries by rank are based on Viva Boothe's *Salaries and the Cost of Living in Twenty-seven State Universities and Colleges, 1913–1932*, Ohio State University Press, 1932.

For 1935–1942, 1950, and 1952, Stigler estimated median salaries by rank from data in various reports of the Office of Education. The weights used in calculating the weighted mean of the median salaries by rank were the relative numbers in each of the ranks in public universities, colleges, and professional schools in New York State as shown in annual reports of the University of the State of New York.

For 1943–1949, the figures were interpolated by Stigler on the basis of expenditures on resident instruction per teacher.

Figures for 1908–1928 approximately comparable to those shown here and for median salaries for each of the four college teaching ranks for 1908–1942 appear in George J. Stigler, *Employment and Compensation in Education*, National Bureau of Economic Research, New York, 1950.

D 730. Annual net income of nonsalaried lawyers, 1929–1954.

Source: 1929–1946, William Weinfeld, "Income of Lawyers, 1929–1948," *Survey of Current Business*, August 1949, p. 18; 1947–1954, Maurice Liebenberg, "Income of Lawyers in the Postwar Period," *Survey of Current Business*, December 1956, p. 27.

Nonsalaried lawyers are those who engage in private practice as entrepreneurs. The average shown is the arithmetic mean. For some of the years, the sources also give median net income. Net income is excess of gross receipts from legal practice over the total of the payroll, rent, and other costs of

Digitized by Google

legal practices. Part-year incomes have been converted to full-year equivalents.

The estimates are based on a series of sample mail surveys of the legal profession made by the Department of Commerce. The results of the various surveys are reported in the *Surveys of Current Business* for April 1938, August 1943, May 1944, August 1949, July 1952, and December 1956. These reports, particularly those of August 1949 and December 1956, contain for selected years mean and median net income figures and detailed frequency distributions by size of income not only for nonsalaried lawyers but also for salaried and part-salaried lawyers. Tabulations by various other characteristics are also shown in the sources.

D 731. Annual net income of nonsalaried physicians, 1929–1951.

Source: 1929–1949, William Weinfeld, "Income of Physicians, 1929–49," *Survey of Current Business*, July 1951, p. 11; 1950–1951, "Incomes of Physicians, Dentists, and Lawyers, 1949–51," *Survey of Current Business*, July 1952, p. 6.

A nonsalaried physician is one whose sole source of medical income is from independent practice. The average shown is the arithmetic mean. For some of the years, the sources also give estimates of median net income. Net income is the gross receipts from medical practice less the total of payroll, rent, supplies, equipment depreciation, and other expenses of medical practice. Part-year incomes have not been converted to full-time equivalents.

The estimates of mean net income are based chiefly on a series of sample mail surveys of the medical profession made by the Department of Commerce. The results of the various surveys are reported in the *Surveys of Current Business* for April 1938, October 1943, July 1951, and July 1952. These reports, particularly July 1951, show for selected years mean and median net and gross incomes and income distributions by size of income not only for nonsalaried physicians but also for salaried and part-salaried physicians. Tabulations by various other characteristics are also shown in the sources.

D 732. Annual net income of nonsalaried dentists, 1929–1951.

Source: 1929–1948, William Weinfeld, "Income of Dentists, 1929–48," *Survey of Current Business*, January 1950, p. 9; 1949–1951, "Incomes of Physicians, Dentists, and Lawyers, 1949–51," *Survey of Current Business*, July 1952, p. 6.

Nonsalaried dentists are those who engage in private practice as entrepreneurs. The average shown is the arithmetic mean. Medians are given in the source for some but not all of the years. Net income is gross receipts from dental practice less the total of the payroll, rent, and other costs of dental practice. Part-year incomes have not been converted to full-year equivalent incomes.

The estimates of average annual net income are based on a series of sample mail surveys made by the Department of Commerce. The 1938 survey of dental incomes is reported in Herman Lasken, *Economic Conditions in the Dental Profession, 1929–37*, Department of Commerce, September 1939; the 1942 survey in the *Survey of Current Business*, April 1944, and the 1949 survey in the *Survey of Current Business*, January 1950.

These reports contain, for selected years, mean and median net and gross incomes and detailed income distributions by size of income not only for nonsalaried dentists but also for salaried and part-salaried dentists. Tabulations by various other characteristics are also shown in the sources.

D 733. Median base monthly salary rate, engineers, 1929–1953.

Source: David M. Blank and George J. Stigler, *The Demand and Supply of Scientific Personnel*, National Bureau of Economic Research, New York, 1957, pp. 114 and 116.

The estimates for 1929, 1932, and 1934 were based on data obtained by the Bureau of Labor Statistics from a 1935 survey of all professional engineers in the United States who could be located. The survey placed heavy reliance on membership lists of engineering societies for its mailing list. Approximately 173,000 questionnaires were mailed and about one-third were returned with usable data.

The estimates for 1939, 1943, and 1946 are for all engineers, both graduate and nongraduate, who were members of the 6 engineering societies of the Engineers Joint Council in May 1946. The Council obtained income data from a mail questionnaire sent to 87,000 member engineers. Approximately 47,000 questionnaires were returned. The basic tabulations made by the Council were based on returns from engineers who had maintained residence as civilians in the United States continuously during 1939–1946.

The estimate for 1953 is for graduate engineers only and is the monthly equivalent of the annual rate given in the source used by Blank and Stigler. It is based on data obtained by the Engineers Joint Council from a sample survey of graduate engineers employed in industry and government.

Blank and Stigler give not only median monthly salary rates, but also first and third quartile monthly salary rates. In addition, other tables, particularly in appendix A, provide average income data for selected years (in some cases as far back as 1890) for engineers classified by years of experience and engineering specialization.

D 734. Annual pay and allowances, U. S. Regular Army commissioned officers, 1929–1952.

Source: George J. Stigler, *Trends in Employment in the Service Industries*, Princeton University Press, Princeton, 1956, pp. 134–135.

The figures are weighted averages of average annual earnings, computed according to specified years of cumulative service for each rank. The weights used throughout were fixed weights derived from the distribution of Army officers by rank in 1941. Stigler's basic sources were: *Official Army Register*, Adjutant General's Office, 1930, 1933, 1947, and 1950 and the *Annual Report of the Secretary of the Army*, Department of the Army, 1941.

D 735–740. Labor union membership, by affiliation, 1897–1934.

Source: Bureau of Labor Statistics, records, and Leo Wolman, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936.

The data are based on reports and statements made by unions in their official journals, reports, and convention proceedings; on correspondence of the compilers of the series with union officials; and on per capita dues payments of national and international unions to over-all federations. Different unions define membership differently. Some include and others exclude unemployed members, retired members, apprentices, members involved in work stoppages, and members in the Armed Forces. Because of such variations, different series estimating the membership of the same groups of unions can differ substantially.

The figures include Canadian members of unions with headquarters in the United States, and some other members outside continental United States. Wolman estimates the number of Canadian members at 255,000 in 1920, and 203,000 in 1930.

D 735–736. Total union membership, 1897–1934.

Source: See source for series D 737–740.

Series D 735 is the sum of series D 738 and D 740; series D 736 is the sum of series D 739 and D 740.

D 737–740. Unions and membership of American Federation of Labor, and membership in independent or unaffiliated, 1897–1934.

Source: *Proceedings*, 65th Convention of the American Federation of Labor, 1946, p. 43; Lewis L. Lorwin, *The American Federation of Labor*, Brookings Institution, Washington, 1933, p. 488; *Proceedings* of the A. F. of L. Conventions of 1897, 1898, and 1933–34; and Leo Wolman, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936.

D 738 represents "total paid membership of the affiliated national and international organizations and directly chartered trade and federal labor unions" based on "the actual per capita tax" remitted by affiliated unions. Such per capita tax payments can and frequently do cover either fewer or more members than the affiliated union reports in its own statements.

Total membership in series D 739 differs from that in series D 738 because series D 739 uses the direct reports of affiliated unions where available in preference to the membership indicated by per capita tax payments.

D 740, membership of independent and unaffiliated unions, covers national and international unions not affiliated with the A. F. of L. It excludes independent unions that are purely local in character or whose jurisdiction is confined to the employees of a single employer. In most years about half the workers covered by this series were members of the four brotherhoods of workers in the railroad train and engine service. This series is from Wolman, cited above, pp. 138–139, adjusted in 1929–1934 to include the membership of the Trade Union Unity League. For 1932 and 1934, the membership of the Trade Union Unity League has been interpolated from figures for adjacent years.

For Wolman's estimates of union membership by industry, see series D 746–763. Annual estimates of the membership of individual national and international unions for 1897–1934 may be found in Wolman's book cited above and in his *The Growth of American Trade Unions, 1880–1923*, National Bureau of Economic Research, 1924.

D 741–745. Labor union membership and membership as percent of nonagricultural employment, 1930–1956.

Source: Bureau of Labor Statistics, "Union Membership as a Proportion of Labor Force, 1930–1956," January 1958 (mimeographed release).

See also text for series D 735–740.

D 741, total union membership, is a continuation of series D 735. For 1935–1947, the membership of A. F. of L. unions included is based on per capita taxes; the membership of independent unions included was estimated by BLS from fragmentary data. For 1948, 1949, and 1950, the figure shown is the midpoint of an estimated range of 14,000,000 to 16,000,000. For 1951 and 1952 the figure shown is the midpoint of an estimated range of 16,500,000 to 17,000,000. These ranges are based on membership data from surveys of national and international unions made by BLS. The level of the series may be more accurate during 1948–1952 than during 1939–1947. Prior to 1947, the series seems to include substantially inflated membership claims of some unions (see the alternative figures for 1939 below). The year-to-year movement of this series from 1947–1953, and in particular the drop in membership from 1947–1948, should not be considered as reliable.

Starting in 1953, the estimates are based on biennial surveys of national and international unions. See *Directory of National and International Labor Unions in the United States, 1957*, BLS Bulletin No. 1222, and the 1955 *Directory*, Bulletin No. 1185. The figures also include the members of directly chartered local labor unions affiliated with the major national federations and members of local unaffiliated unions.

Estimates of union membership by affiliation (A. F. of L., CIO, and independent) for 1934–1950 appear in BLS, *Handbook of Labor Statistics*, 1950 edition, p. 139. For 1954 and 1956 such estimates are given in the directories cited above (the 1956 estimates are for the merged AFL-CIO and for independent unions). The directories also give the membership of individual national and international unions, membership by sex, and detailed data on membership reporting practices. The 1957 directory gives data on membership by industry and distributions of unions by percentage of white-collar workers.

D 742, Canadian membership of U. S. unions, is from the Department of Labour of Canada, except for 1954 and 1956 which are from the BLS directories cited above.

D 743, union membership excluding Canada, is obtained by subtracting series D 742 from D 741. The year-to-year movement for 1947–1953 is unreliable for the reasons given above. A better estimate might be obtained for these years by holding the percentage in series D 745 constant at 34.0 and by applying this figure to series D 744.

D 745, union membership (excluding Canada) as a percent of employees in nonagricultural establishments, is computed from series D 743 and D 744. Wolman has also estimated for three decennial census years the number of trade union members exclusive of Canada as a percentage of the total number of nonagricultural employees. These percentages are 9.9 in 1910, 19.4 in 1920, and 10.2 in 1930. The percentage shown for 1930 in series D 745 is larger than the corresponding percentage given by Wolman because Wolman's estimated union membership figure exclusive of Canada (3,190,000) is smaller than that shown in series D 743, and also because Wolman's nonagricultural employment estimate (30,247,000), based on census data, is larger than the number of employees in nonagricultural establishments shown in series D 744. Wolman's figure excludes many salaried professional and managerial workers included in series D 744, and includes domestic servants, excluded from series D 744.

Independent estimates of union membership for 1939 and 1953, both including and excluding Canadian membership, are available in Leo Troy, *Distribution of Union Membership Among the States, 1939 and 1953*, National Bureau of Economic Research, New York, 1957, pp. 3–5. Troy's estimates of total union membership, including Canadian members, are 6,730,000 for 1939 and 17,147,000 for 1953. The corresponding estimates, excluding Canadian members, are 6,518,000 for 1939 and 16,217,000 for 1953.

Troy's estimates are based mainly on financial reports and other records supplied by approximately 200 national unions. Although his coverage of unaffiliated unions was admittedly incomplete, the discrepancies between his estimates and those of BLS for 1939 are too large to be accounted for by such incompleteness of coverage. The work by Troy includes estimates of union membership by major industry, by State and region, and by affiliation (A. F. of L., CIO, unaffiliated).

D 746–763. Labor union membership, by industry, 1897–1934.

Source: Leo Wolman, *Ebb and Flow in Trade Unionism*, National Bureau of Economic Research, New York, 1936, pp. 172–193.

These figures were obtained by classifying national and international unions into industrial categories and totalling the membership of the unions in each category in each year.

In the latter part of the period, series D 763, "Miscellaneous," consists largely of two unions, the Firemen and Oilers and the Operating Engineers. The Industrial Workers of the World is included from 1905–1914, and is the largest union in the series for some years. The Horseshoers are important in the early years, declining rapidly in the 1920's. Unions affiliated with the Trade Union Unity League in 1929–1934 are excluded.

Some errors of classification arise when a union has membership in more than one category. For example, the Meat Cutters and Butcher Workmen, classified in food, liquor, and tobacco had many members in retail meat stores; the Operating Engineers, classified as miscellaneous, had many members in building construction. These problems are less important in 1897–1934 than they would be in recent years.

The source gives annual estimates of the percentage distribution of union membership by industrial categories. For 1910, 1920, and 1930, it gives estimates of the percentage of employees organized in each of the industrial categories shown here, and in more detailed categories.

D 764–778. Work stoppages, workers involved, man-days idle, major issues, and average duration, 1881–1957.

Source: Bureau of Labor Statistics, various bulletins, especially *Analysis of Work Stoppages, 1957*, Bulletin No. 1234, and *Strikes in the United States, 1880–1936*, Bulletin No. 651.

Work stoppages include strikes and lockouts. A strike is defined as a temporary stoppage of work by a group of employees in order to express a grievance or to enforce a demand. A lockout is defined as a temporary withholding of work from a group of employees by an employer (or a group of employers) in order to enforce acceptance of the employer's terms. Most work stoppages are strikes rather than lockouts.

The individual strike or lockout is the unit counted regardless of the number of unions or employers jointly involved in the controversy. Excluded, however, are strikes involving fewer than 6 workers or lasting less than a full shift, strikes of American seamen in foreign ports, and strikes of foreign crews on foreign ships in American ports.

Figures for workers involved include all workers made idle in the establishment where the stoppage occurs, even though they may not all be participants in the controversy. The figures exclude indirect or secondary idleness in other establishments which suspend or curtail operations because of shortages of materials or services resulting from a stoppage. The number of workers involved is the number on the day of maximum idleness; however, the figures for man-days idle (series D 767) take into account variations in the number idle during the strike and include all days on which work was scheduled.

The duration of stoppages (series D 774) is counted in calendar days rather than working days. Strikes that are never formally settled are considered ended when a majority of vacant jobs are filled, whether by former strikers or by others, or when the establishment affected is permanently closed.

The classification of causes of strikes (series D 771–773 and D 776–778) necessarily lacks precision, since many strikes involve more than one issue. In particular, strikes for union organization often involve demands concerning wages or hours.

Beginning in 1951, the number of employed workers used as a base for the percentages in series D 766 is the BLS series on employment in nonagricultural establishments. Before 1951, the base is "all workers except those in occupations and professions in which strikes rarely occur." The excluded groups were the self-employed, domestic workers, employees on farms with fewer than 6 employees, most managerial and professional workers, employees of Federal and State governments, and elected and appointed officials of local governments. The change in base affects the series by less than one-tenth of a percentage point in most years. The estimated working time used as a base for the percentages in series D 768 is the base for series D 766 times the number of days worked by most employees, excluding Saturdays when customarily not worked, Sundays, and established holidays.

Unions are involved in the great majority of work stoppages. Thus in 1956 only 42 of 3,825 work stoppages, accounting for 3,280 of the 1,900,000 workers involved, did not involve any union. For some purposes, therefore, workers involved in strikes as a percent of union membership is a more useful statistic than workers involved as a percent of all workers.

Data for 1881–1886 were first published in the *Third Annual Report of the Commissioner of Labor, 1887*. This report also gives fragmentary data for earlier years. Data for 1887–1894 are given in the *Tenth Annual Report, 1894*; for 1895–1900 in the *Sixteenth Annual Report, 1901*; and for 1900–1905 in the *Twenty-first Annual Report, 1906*. References to strikes and lockouts during 1881–1905 were located by the Bureau of Labor by examination of the daily and trade press. Agents of the Bureau then collected data from the parties involved.

No government agency collected data on work stoppages for 1906–1913. For 1914–1915 BLS collected data on the number of stoppages and major issues. For 1916–1926 the count of stoppages was made from press notices, and questionnaires were sent to determine the number of workers involved. This number was reported for only about two-thirds of the known stoppages.

Methods of compiling the series have been fairly uniform since 1927. Information on the existence of a stoppage is obtained from press clippings from a large number of newspapers throughout the country and from reports from unions, employers, and a number of Federal and State agencies. Improvement in the sources of these "leads," especially through State employment security agencies, increased the number of strikes reported over previous years by about 5 percent in 1950 and by about 10 percent in 1951 and 1952. The increase from this source in the reported number of workers involved and man-days idle was about 2 percent in 1950 and 3 percent in 1951 and 1952. When the existence of a strike is known, a questionnaire is mailed to the parties reported as involved to obtain data on the number of workers involved, duration, issues, etc. In some instances, field representatives of the BLS call on the parties.

D 779–784. Average monthly labor turnover rates in manufacturing, by class of turnover, 1919–1957.

Source: Bureau of Labor Statistics, *Monthly Labor Review*, July 1929, pp. 64–65; BLS, *Employment and Earnings*, June 1957, p. 95; and Office of Business Economics, *Business Statistics*, 1957 biennial edition, p. 69.

The figures for 1919–1929 are those of the Metropolitan Life Insurance Company which pioneered in collecting labor turnover data on a regular basis, beginning in January 1926. Subsequently, the Company secured data that enabled it to estimate turnover rates monthly back to January 1919.

The Company obtained its turnover data by means of a mail questionnaire sent monthly to reporting firms. (The sample

Digitized by Google

of reporting firms, 160 in November 1926, had grown to 350 by mid-1929.) Each firm was asked to report each month: (1) The daily average number of employees on the payroll, and the total number of (2) accessions, (3) voluntary quits, (4) discharges, and (5) layoffs during the month. The accession rate for each company was computed by dividing the total number of accessions during the month by the daily average number on the payroll during the month. The composite or average accession rate for all reporting firms was the unweighted median of the accession rates computed for individual firms. The annual average was the arithmetic mean of the 12 monthly median accession rates. Discharges, quits, and layoffs were handled in a similar fashion. (The total separation rate, however, was computed as the sum of the median discharge rate, the median quit rate, and the median layoff rate.)

The figures for 1919–1929 are stated as equivalent annual rates rather than monthly rates. They have been converted in series D 779–783 to monthly rates by dividing by 12.

In July 1929, BLS took over the work of the Metropolitan Life Insurance Company. At that time there were approximately 350 large manufacturers employing 700,000 workers in the sample of reporting firms. Over the years the list of cooperating firms has grown greatly, the amount of industry detail has expanded, and methods of computation have been somewhat changed.

BLS turnover rate estimates are based on reports made monthly on a mail questionnaire by a sample of cooperating firms. In 1957, the sample covered approximately 10,000 establishments in manufacturing employing nearly 6,000,000 employees, 120 metal minining establishments with 57,000 workers, 220 coal mining establishments with 77,000 workers, and telephone and telegraph establishments employing about 690,000 workers. The reporting firms are considerably larger on the average than all firms within the population sampled. This large-firm bias may cause underestimation of turnover rates. Furthermore, the BLS sample of manufacturing firms and its estimates of turnover for manufacturing exclude printing, publishing, and allied industries (since April 1943); canning and preserving fruits, vegetables, and seafoods; women's and misses' outerwear; and fertilizers. The last three industries tend to have exceptionally high turnover rates seasonally. Plants experiencing work stoppages are excluded.

Each cooperating firm is asked to report each month: (1) Total accessions, (2) total separations, (3) total quits, (4) total discharges, (5) total layoffs, (6) total military separations, (7) total miscellaneous separations, and (8) the total number of employees who worked or received pay for any part of the payroll period ending nearest the 15th of the month. Prior to 1940 "miscellaneous" separations were included with "quits." Since January 1943 the labor turnover rates pertain to all employees; before that date the rates were for production workers only. Furthermore, before October 1945 the employment base was the average of the number of employees on the payroll the last day of the preceding month and the last day of the current month. The effect of changing the employment base to the number on the midmonth payroll was negligible.

Discharges are terminations of employment by management for cause (incompetence, laziness, etc.). Layoffs are terminations of employment for more than a week, initiated by management, without prejudice to the worker. Quits are terminations of employment initiated by employees; they include unauthorized absences of more than a week. Miscellaneous separations are terminations of employment for military duty of over 30 days and other separations than those itemized (deaths, retirements, etc.). For January 1942–June 1944, the military separation rate was published separately.

D 785. Work-injury frequency rates in manufacturing, 1926–1956.

Source: Bureau of Labor Statistics, *Handbook of Labor Statistics*, 1950 edition, p. 179; and *Monthly Labor Review*, various issues.

The Bureau of Labor Statistics' first continuing compilation of injury-rate statistics began in 1910 for the iron and steel industry. In 1925, the injury-rate compilations were expanded to cover 24 industries. By 1952, the compilations covered over 200 manufacturing and nonmanufacturing industry classifications.

Efforts to standardize the compilation of work-injury statistics were initiated by BLS in 1911 and resulted in 1920 in the first standardized procedures. In 1926 the American Engineering Standards Committee, later the American Standards Association, undertook a revision of these procedures. Their work led to the publication in 1937 of the first American Standard Method of Compiling Industrial Injury Rates. This standard was again revised in 1954.

The standard injury-frequency rate is the average number of disabling injuries per million man-hours worked. A disabling injury is an injury incurred in the course of and arising out of employment, which results in death or permanent physical impairment, or renders the injured person unable to perform any regularly established job, open and available to him, during the entire time interval corresponding to the hours of his regular shift on one or more days after the injury.

The BLS annual injury-rate estimates are based on a sample mail survey conducted once a year. Cooperating firms are asked to report for all employees (1) average employment, (2) aggregate man-hours worked by all employees, (3) aggregate number of disabling work injuries by extent of disability, and (4) time lost because of disabilities. The manufacturing sample covers approximately 50,000 establishments. The injury-rate series for manufacturing excludes petroleum refining, smelting and refining of nonferrous metals, cement and lime manufacturing, and coke production, which are covered in similar surveys conducted by the Bureau of Mines (see text for series D 786–790).

Prior to 1936 the data in series D 785 are based on surveys covering only wage earners in 30 manufacturing industries. Since 1936 the data refer to all employees in all manufacturing industries. Separate injury-frequency rates have been computed since 1936 for component industries by dividing aggregate injuries by aggregate man-hours in reporting establishments. In computing the average rate for all manufacturing the separate averages for the component industries are weighted by estimated total employment in these industries. Before 1936 the weights implicitly were aggregate man-hours in the reporting firms in each industry.

D 786–790. Work-injury frequency rates in mining, 1924–1956.

Source: Bureau of Mines, *Minerals Yearbook*, 1956 and earlier annual issues.

Except for coal mining since 1941, the Bureau of Mines estimates of work-injury frequency rates in "mining" industries are based on reports made voluntarily by mining establishments. Coal mining firms since 1941 have been obliged by Federal law to report work-injury and related data to the Bureau of Mines.

D 791–792. Work-injury frequency rates on Class I railroads, 1922–1956.

Source: Interstate Commerce Commission, *Accident Bulletin*, various issues.

Both series exclude work injuries suffered by employees of Class I switching and terminal companies after 1932. They are based on monthly accident reports that the Class I railroads are required by Federal law to make to the Interstate Commerce Commission. The two series thus result from essentially complete censuses of man-hours worked and of reportable work injuries.

Before 1936 a reportable work-injury was either a fatality or a nonfatal injury to an employee "sufficient to incapacitate him from performing his ordinary duties for more than 3 days in the aggregate in the 10 days immediately following the accident." Series D 792 includes only such work-injuries. Beginning in 1936 the railroads have been required to report work-injuries incapacitating employees for 1–3 days immediately following an accident as well as more serious injuries. Series D 791 is series D 792 plus the average work-injury frequency rate for "1–3 day" injuries.

The concept of "disabling injury" underlying series D 785–790 is essentially the same as that underlying series D 791. Series D 792, which excludes "1–3 day" injuries, is not comparable to series D 785–790 in level, and series D 791 also tends to have a downward bias in trend relative to series D 785–790. It has been included to indicate at least crudely the trend in the average injury-frequency rates on Class I railroads before 1936.

Both series cover all employees of Class I railroads. The man-hour base of both series is the aggregate number of straight-time hours actually worked and overtime hours paid for in millions of man-hours. Days worked by daily-rated employees have been converted to man-hours worked by multiplying days worked by 8. The average injury-frequency rate is the ratio of the aggregate number of work-injuries to the man-hour base.

[1] Figures for 1947 and earlier refer only to on-site workers on privately financed construction; figures for 1948 and later cover both on-site and off-site workers on both private and public projects.
[2] Data for 1937 and earlier years not strictly comparable with those for later years. Data for later years, but not those for 1937 and earlier, exclude supervisory employees.
[3] Data for 1938 and earlier years not strictly comparable with those for later years.
[4] Figures for 1947 and later years include only companies engaged exclusively in producing and distributing electricity; figures for 1946 and earlier years also include combined gas and electric utilities whose income results primarily from sale of electricity.
[5] Data for 1947 and later years are for "insurance carriers"; figures for 1946 and earlier years for "insurance."
[6] Average hourly earnings times average weekly hours.
[7] Not available.
[8] These figures bear the same ratios to the 1934 figures as the corresponding figures for 1932 and 1933 as shown in the *Handbook of Labor Statistics* (1947 edition) bear to the 1934 *Handbook* figures.

[1] "Employed wage earners" include all workers except those in occupations and professions in which strikes rarely if ever occur.

[2] Estimated working time computed by multiplying the average number of "employed wage earners" each year by the days worked by most employees during the year.

[3] Figures are for stoppages beginning in calendar years 1881–1927 and 1947–1957. For 1928–1946, figures are for those ending in calendar years.

[4] Wages and hours were important issues in many of these stoppages also.

[1] Excludes petroleum refining, smelting and refining of nonferrous metals, cement and lime manufacturing, and coke production.

[2] Includes anthracite coal mining, coke production, and metallurgical plants, not shown separately.

[3] Includes lignite.

[4] Copper, gold-placer, gold-silver, iron, lead-zinc, and miscellaneous.

[5] Barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulphur, and miscellaneous. Excludes stone quarries.

[6] Granite, limestone, marble, sandstone, slate and traprock quarrying, and cement and lime manufacturing.

[7] For 1922–1932, includes switching and terminal companies; excluded thereafter.

[8] Includes fatalities and nonfatal injuries incapacitating employees for at least 1 day in 10 days immediately following date of injury.

[9] Includes fatalities and nonfatal injuries incapacitating employees for more than 8 days in 10 days immeditely following date of injury.

Prices and Price Indexes

E 1–186. General note.

An early interest in the statistics of prices is evident at the beginning of the 19th century, with the appearance in 1806 of Samuel Blodgett, Jr.'s *Economica: A Statistical Manual for the United States of America*, which included a collection of prices for 16 important commodities in 5 markets for 1785–1805. Many other contemporary accounts contained references to prices, but the first serious attempt to summarize comprehensive price data for the United States in the form of index numbers was made by Horatio C. Burchard, Director of the Mint. His report to the Secretary of the Treasury in 1881 contained wholesale prices for many individual articles and an index number (which contains some serious inadequacies). In 1886, a special report containing retail prices of about 60 "necessaries of life" was included in volume 20 of the Tenth Census, *Report on the Statistics of Wages in Manufacturing Industries*, by Joseph D. Weeks (usually called the *Weeks Report*). No summary figures were included in this volume.

In 1891, a Senate Resolution led to the collection of a voluminous body of data which covered wholesale prices for 1840–1891 and retail prices for a 28-month period ending September 1891, for more than 200 commodities. The information assembled was summarized by Roland P. Falkner, whose indexes have been widely used as evidence of price changes for 1840–1891. These indexes were prepared as estimates of changes in wage earners' cost of living, but, in actuality, they were indexes of wholesale prices for one month of each year. Their technical adequacy was the subject of considerable controversy at the time, but the deficiencies in the indexes do not detract from the historical value of the basic price data collected for the Senate Committee and published in the "Aldrich Reports," including *Wholesale Prices, Wages, and Transportation* (4 parts), Senate Report No. 1394, 1893, and *Retail Prices and Wages* (3 parts), Senate Report No. 986, 1892.

In 1900, Roland Falkner extended his indexes to 1899 with quotations for 142 articles collected by the Department of Labor, with some adjustments in his methods. The results are published in Department of Labor Bulletin No. 27, *Wholesale Prices: 1890 to 1899*, pp. 237–313. In 1902, the Department of Labor began publication of its index of wholesale prices, which has continued since without interruption.

Interest in price measurements following the upturn in prices after 1897 led to the preparation of a number of wholesale price indexes for the United States, in addition to the official Department of Labor index series. John R. Commons published an index of wholesale prices of 66 commodities for 1878–1900 in the *Quarterly Bulletin of the Bureau of Economic Research* for July and October 1900. Bradstreet's indexes of wholesale prices of about 96 commodities were established in 1897 and carried back to 1890. Dun's index numbers of wholesale prices for about 350 commodities were published in *Dun's Review* on a continuous basis beginning in 1901 and gradually extended back to 1860. These last 2 series were expressed as sums of actual prices rather than in the conventional index number form. Several other relatively short-lived series were also compiled during the next 10 to 20 years.

After 1902, when the Department of Labor's wholesale price index was continuously available, additions to wholesale price index numbers were mainly to obtain a better historical perspective. In 1932, the series of wholesale price indexes for 1720–1932 were completed by G. F. Warren and F. A. Pearson (see series E 1–12). Part of this work was done under the auspices of the International Scientific Committee on Price History referred to below.

Walter B. Smith and Arthur H. Cole computed wholesale commodity price indexes covering 1792–1862 for *Fluctuations in American Business, 1790–1860*, Harvard Economic Studies, Harvard University Press, Cambridge, 1935. The series include wholesale commodity price indexes for Boston, 1792–1820; for Boston, New York, and Philadelphia, 1815–1845; and New York (primarily), 1843–1862.

Wholesale prices in Cincinnati were assembled from newspapers for 1844–1914 and an index for this market was published by Henry E. White in *Wholesale Prices at Cincinnati and New York*, Cornell University Agricultural Experiment Station, *Memoir 182*, Ithaca, 1935.

The most extensive historical price investigations, however, were undertaken under the auspices of the International Scientific Committee on Price History. The results of these research projects for 6 important marketing centers were summarized by Arthur H. Cole in *Wholesale Commodity Prices in the United States, 1700–1861*, Harvard University Press, Cambridge, 1938. The historical indexes are given in series E 68–100.

Wholesale price indexes were compiled by Frederick C. Mills for commodities grouped according to economically significant factors. Mill's studies of price relationships and price movements contain a number of special indexes which he derived by recombining price relatives for commodities in the BLS indexes. These indexes include some special commodity groupings not used by BLS, e.g., crops, as well as classifications by stage of processing and by durability. Some series were first published for 1890–1931 in *Economic Tendencies in the United States*, National Bureau of Economic Research, No. 21, New York, 1932, pp. 584–588. Additional indexes for 1913–1935 appeared in *Prices in Recession and Recovery*, NBER, No. 31, New York, 1936, pp. 491–547. Indexes through June 1943 were included in an appendix to *Prices in a War Economy*, NBER, Occasional Paper No. 12, October 1943, and through March 1948 in *The Structure of Postwar Prices*, NBER, Occasional Paper No. 27, July 1948.

The volume of information available for wholesale prices is not matched at the retail level, especially for the early years. The official Consumer Price Index of the BLS was initiated in 1904 with a food index. The *Eighteenth Annual Report of the Commissioner of Labor, 1903: Cost of Living and Retail Prices of Food* contained an index of retail prices of food for 1890–1903 weighted by family consumption in 1901. This food index was continued until the end of World War I, when it became one component group of a comprehensive "cost-of-living" index, originated as part of a study of cost of living in shipbuilding cities in 1918 and 1919. Supplementary price information had been collected by the BLS over the years, and a comprehensive index was compiled back to 1913. Since

488910 O - 60 - 8

Digitized by Google

World War I, the index has undergone a number of changes in coverage and methodology, most of them in the direction of improvement in the quantity and quality of data. At present, the index is issued monthly under the official title Consumer Price Index, in mimeographed releases and in the *Monthly Labor Review* (see text for series E 113–147).

The National Industrial Conference Board also compiled a Consumer Price Index from 1918 to 1958. This index was similar to the BLS Consumer Price Index but the collection of data was primarily by mail instead of by personal visit. A description of the NICB index as it was compiled before discontinuance is included in the August 1954 issue of *Management Record*.

The index numbers of prices received and paid by farmers compiled by the Department of Agriculture were also initiated after World War I; see chapter K, series K 122–138.

Prior to 1913, except for the data in the *Weeks Report* and the *Aldrich Reports*, readily available retail price data are extremely spotty and inadequate. As a result, many of the indexes widely used to approximate changes in retail prices, rest entirely or partially on changes in wholesale prices. A serious limitation in these indexes is that allowance was not made for the slow-moving rents and services nor was account always taken of the difference in movement between wholesale and retail prices of commodities. Falkner's indexes referred to above, for example, were calculated entirely from wholesale price information. Adjustments to wholesale price movements combined with available BLS retail prices formed the basis for Douglas' index of the cost of living (series E 159). The only "cost-of-living" indexes now available for any years before 1913, computed from retail price data, are Wesley C. Mitchell's *Relative Cost of Living for 1860 to 1880*, the *Consumer Price Index for 1851 to 1880* compiled by Ethel Hoover (series E 148–156), and Rees' cost-of-living index, 1890–1914 (series E 160). The cost-of-living index computed by Wesley C. Mitchell for *Gold, Prices, and Wages Under the Greenback Standard*, University of California Publications in Economics, vol. 1, Berkeley, March 1908, p. 91, utilized a portion of the retail data in the *Weeks Report* for 1860–1880. The Mitchell series was included as one of the links in the cost-of-living index estimate of the Federal Reserve Bank of New York (series E 157). The Hoover Consumer Price Index for 1851–1880 was based largely on a summarization of all of the usable retail price information from the *Weeks Report*, with some additions from other sources. The Rees' cost-of-living index utilized some components of the Douglas' index, but most of the data were compiled from mail-order catalogs, newspapers, and other sources.

Over the years there has been considerable improvement in the quality of the price reporting, in the scope of the data, and in the construction of index numbers. The lists of commodities that are now included in the price collection program cover a wider range of goods in the market, and services are represented in the "cost-of-living" indexes. Commodities and services are now defined fairly precisely and the current collection methods give the opportunity of securing supplementary data on discounts, terms of delivery, and other necessary information to measure price change. Data for weighting systems for index numbers can now be taken from the greatly improved expenditure studies, censuses, and other official statistics.

As the indexes and price reports were extended to earlier years, many of these advantages making for better price measures were not present. The range of commodities and services for which information could be obtained from surviving records was very limited. At the wholesale level, the commodity coverage was limited primarily to raw materials and goods in the early stages of processing. The limited coverage of finished goods, especially after the Civil War, is an important factor in the interpretation of price changes. At retail, the available price data were relatively scant and the emphasis was on food and dry goods prices, with little information for other less important commodities and for rents and services. The perennial problem of changes in qualities, which is still present to some extent in the current indexes, becomes accentuated as price comparisons are made over longer periods of time.

The newspapers and other sources from which prices were assembled for the early years give only brief or vague descriptions for the commodities quoted and the compiler could not always be assured that quotations over time were for the same quality. Incomplete files, nominal prices, and nonpublication in some issues were among the many other problems encountered. Data obtained from records of surviving firms raise the further question of how well these surviving firms represented the movement of prices for all firms for the period under consideration.

E 1–100. General note.

Wholesale price indexes are compiled from prices in primary markets; that is, prices pertaining to the first major commercial transaction for each commodity. The quotations are usually selling prices of manufacturers or producers, or prices quoted on organized exchanges or markets. They are not prices received by wholesalers, distributors, or jobbers.

In addition to the indexes presented here, brief descriptions of the coverage and calculation techniques for other indexes may be found in G. F. Warren and F. A. Pearson, *Wholesale Prices for 213 Years, 1720–1932*, Cornell University Agricultural Experiment Station, *Memoir 142*, Ithaca, 1932, pp. 167–196; and in BLS Bulletin No. 284, *Index Numbers of Wholesale Prices in the United States and Foreign Countries*, 1921, pp. 115–175. This bulletin also contains Wesley C. Mitchell's "The Making and Using of Index Numbers."

E 1–12. Wholesale price indexes (Warren and Pearson), by major product groups, 1749–1890.

Source: George F. Warren and Frank A. Pearson, *Prices*, John Wiley and Sons, New York, 1933, pp. 11–13, 25–27.

The indexes are also presented in *Wholesale Prices for 213 Years, 1720–1932* (see general note, series E 1–100), part 1, pp. 7–10 and 84–111. The "all-commodities" index for 1749–1889, converted to the base of 1926, is included in BLS Bulletin No. 572, *Wholesale Prices, 1931, 1933*, appendix, pp. 111–114.

The primary aim of Warren and Pearson was to present monthly comprehensive index numbers for the 19th century corresponding to those of BLS for 1890 and later years. The full series constitutes the longest index now available for 1720–1932. For 1890–1932, Warren and Pearson used the BLS indexes (series E 13–24) converted to the base 1910–14. Their work covered the period 1797–1890, and the index was extended back to 1720 by Herman M. Stoker.

The bulk of the prices on which the index is based relate to New York City and were obtained from newspapers, supplemented with prices published in the *Report of the Secretary of the Treasury on the State of the Finances* (usually referred to as the *U. S. Finance Report*) for 1863. The number of products included in the all-items index numbers for 1797–1890 varied from a low of 113 in 1830 to 146 in 1880. For the extension back to 1720, Stoker encountered some serious

Digitized by Google

gaps in the available source materials, especially for years prior to 1749. For 1720–1748, the price data were scarce and irregular, and an index could be computed only for certain months in each year. For 1749–1782, the number of commodities included generally varied from 11 to 19; and for 1783–1796, 71 series were available for most years.

The index numbers for 1797–1890 are weighted arithmetic averages of relatives, computed first on the 1876–91 base then converted to the 1910–14 base using the relationship with BLS index numbers for 1890–1893. When one commodity was substituted for another, a linking procedure was employed. Two all-commodity indexes were prepared, one with fixed group weights throughout the whole period, and one with varying group weights. The latter is presented here as series E 1.

Separate subindexes (series E 2–12) were computed by Warren and Pearson for the 10 groups of commodities formerly used by BLS with a supplemental index for spirits. Within each group, weights representing the importance of the priced commodities in the total trade of the United States were varied over the years to represent, insofar as possible, changes in importance. (Specific mention should be made of the reduction in the importance of cotton during the Civil War period. Cotton was scarce and prices very high so weights were based on the amount available for consumption for 1861–1866 and on production for 1867–1871.) Censuses, imports, exports, and similar official figures were used as weighting factors. However, data were meager for the early years and some arbitrary weight assignments were necessary.

For 1787–1800, Stoker constructed a "71-commodity index" with the same commodity group classification and methods of calculation as those employed by Warren and Pearson. These all-commodity and group indexes were linked to the Warren-Pearson indexes. His "15-commodity index" for 1720–1787 based on the 11–19 items (practically all farm products and foods) was in turn linked to the 71-commodity index.

There are discrepancies between *Prices* and *Memoir 142* for farm products (series E 2) for 1807, 1808, and 1827. The figures shown in series E 2 are averages of monthly data in *Memoir 142*.

E 13–24. Wholesale price indexes (BLS), by major product groups, 1890–1951.

Source: 1890–1950, BLS, *Handbook of Labor Statistics*, 1950 edition, p. 118; 1951, 1951 supplement to the *Handbook*, p. 42.

Since 1902, when BLS began regular publication of wholesale price indexes, there have been a number of changes in lists of items, weighting factors, base periods, and methods of computing the indexes. Detailed descriptions of the early unweighted index numbers, and later the weighted indexes, are included in various annual bulletins on wholesale prices beginning with Bulletin No. 39, issued in March 1902. The figures shown in series E 13–24 are weighted index numbers of the fixed base weighted aggregative type.

In 1914, BLS recalculated its series back to 1890 using as weights the quantity of each priced item marketed in 1909 but retained the base 1890–99. The system of classification for group indexes was generally according to origin rather than end use and each commodity was included in only one group index. For 1914–1921, the index series were continued with little change except for expanding the list of priced items and rebasing the indexes several times. In 1920, the year 1913 was adopted as the base period in order to provide a prewar standard for measuring price changes.

In 1921, a revision of the indexes extended the commodity coverage to include about 400 items as compared with 250 to 325 in previous years. The weighting factors were changed to represent the quantity of each priced item marketed in 1919. At this time an important change was made in the method of grouping commodities. Articles properly classified in more than one major group were included in the appropriate groups with their total weights but, in the all-commodities index, the weights for such articles were counted only once. In addition, a rearrangement of commodities within groups was made to provide separate indexes for 37 subgroups.

When the 1926 base period was adopted in 1927, the indexes were recalculated back to 1913 with new sets of weights (see BLS Bulletin No. 473, *Wholesale Prices, 1913 to 1927*, pp. 2–5). The figures for 1890–1912 were converted, not recalculated in detail.

In subsequent years, the weighting factors were brought up to date from time to time. Major additions to the lists of priced items in 1931 and again in 1940 provided better coverage of manufactured articles than in earlier indexes. By 1951, when these indexes were discontinued, the number of subgroups for which separate series were available had been enlarged to 49.

Because of changes in the list of commodities and in the weighting factors, the indexes were calculated by the chain relative method. In this way, comparisons between any two periods were based on the same commodities with the same weights. Throughout the whole period, the weight used for each priced commodity was the quantity marketed for that class of commodity. Classes of commodities not represented by an item in the list priced were not represented in the weighting factors.

Table I contains a summary of the number of commodities and the weights used for the indexes in series E 13.

Table I. Number of Price Series and Weighting Factors Used in BLS Wholesale Price Index (All Commodities, Series E 13): 1890 to 1951

Year	Number of series	Weights used
1949–1951	900–947	Quantities marketed 1929 and 1931
1940–1948	881–890	
1938–1939	813	
1934–1937	784	
1932–1933	784	Quantities marketed 1927 and 1929
1931	784	Quantities marketed 1925 and 1927
1930	550	
1926–1929	404–550	Quantities marketed 1923 and 1925
1924–1925	526–528	
1922–1923	450–478	Quantities marketed 1921 and 1923
1920–1921	390–450	Quantities marketed 1919 and 1921
1914–1919	296–371	Quantities marketed 1914 and 1919
1913	252	Quantities marketed 1909 and 1914
1890–1912	251–261	Quantities marketed 1909

The price quotations on which the indexes were based were obtained by mail from leading manufacturers or selling agents or from such other sources as standard trade publications, reports of boards of trade, and produce exchanges. Before 1913, most of the data referred to the New York market but after 1913, quotations were obtained in several major markets for a number of important commodities.

For articles subject to frequent fluctuations in price, monthly averages were made up of quotations for one day in each week and for a portion of the period from daily quotations. For other articles, monthly, quarterly, or semiannual quotations were secured.

Digitized by Google

Considerable attention was devoted to obtaining descriptive details so that price comparisons were based on the same or comparable commodities. By 1931, BLS had developed a specification for each commodity in the index. These specifications defined quality as precisely as possible, including the principal price-determining characteristics, terms of sale, and other details. These specifications were refined and improved over the years.

The prices used in the index were usually net cash prices, f.o.b., for the article described by the specification. Delivered prices were included only when it was customary for an industry to quote on the delivered basis.

See also general note for series E 1–100.

E 25–41. Wholesale price indexes (BLS), by major product groups, 1913–1957.

Source: BLS Bulletin No. 1235, *Wholesale Prices and Price Indexes, 1957*, p. 26.

The current (1958) BLS wholesale price indexes on the 1947–49 base period were begun in 1952 but calculated to 1947, using new samples of items and new weights. However, the 1947–49 base period index is the official index beginning with January 1952, and does not replace the 1926 base series as the official index for 1947–1951. The new series of indexes was spliced to the former series (converted) by linking as of January 1947. Indexes shown for 1913–1946 are conversions of series E 13–24. The former group indexes were spliced with the new ones when the value aggregate of commodities in the former group represented 50 percent or more of the value of shipments in 1947 for all commodities (priced and unpriced) in the group.

With the revision in 1952, the conceptual definition of the index was not altered, but major changes in coverage and methods were adopted. The list of priced commodities was expanded from 947 to approximately 1,800, embracing nearly 5,000 separate series. The weighting factors for each commodity represented the value of shipments for the specific commodity priced and for all others in the same group which were known (or assumed) to have price movements similar to those for the commodity priced. By this method of weighting, values for all commodities in a group are accounted for and the group automatically has its proper representation in the all-commodities index. The weight universe includes the net selling value of all commodities included in the producing and processing sector of the economy *including* sales for exports and imports for consumption but *excluding* interplant transfers, military goods, construction, real estate, transportation, securities, printing and publishing, and transactions for services.

The indexes are calculated as averages of relatives weighted by values of shipments. This is algebraically equivalent to quantity weighted aggregative indexes but allows for more flexibility in processing. As in all the official indexes, the linking process is used when there are changes in lists of commodities, changes in weighting factors, or other changes making for noncomparability. In the case of quality changes, adjustments are made to obtain month-to-month relatives for the same quality insofar as possible. If the change in description is minor, direct comparisons are made between the price of the old and the new items. For major quality changes, efforts are made to secure from the producer an estimate of the proportion of the gross price change due to quality differences and to a price change. When such information cannot be obtained, the new quality is linked into the index, thus assuming th[illegible] full price change is due to quality change.

Since the revised index was initiated, there have been two changes in the weighting factors. Value of shipments in 1952 and 1953 were introduced in 1955 and only relatively minor changes were made in the list of items priced. Another revision in the weighting factors to represent value of shipments in 1954 was introduced beginning January 1958.

Most of the prices in the index are collected by mail directly from the manufacturer or other producer. A few are reported by trade associations or organized exchanges and some are obtained from authoritative trade publications or from other government agencies that collect price data for their regular work.

Before 1952, prices used were monthly averages of 1-day-a-week prices. Thereafter, prices have been for the most part those of the Tuesday of the week which includes the 15th of the month. However, for some commodities another day may be used as a more representative day.

Whenever possible, prices are obtained at the production point or at the central marketing point. Delivered prices are used only when it is the practice of the industry to quote prices on this basis. Prices obtained from manufacturers or other producers are subject to the applicable trade and quantity discounts. Cash discounts are deducted from the price when it is determined that most buyers avail themselves of the reduced prices. Excise taxes are excluded from the price. Closeout sales prices are usually not used. Free deals or allowances are used when possible in arriving at the net price to be used for index calculation. Nominal prices are used when they are indicative of the market situation and no other price is available.

For a complete description of techniques used in the Wholesale Price Index, see BLS Bulletin No. 1168, *Techniques of Preparing Major BLS Statistical Series*, 1954, chap. 10.

See also general note for series E 1–100.

E 42–55. Wholesale price indexes (BLS), for economic sectors, by stage of processing, 1913–1957.

Source: 1913–1946, series E 42, 43, 47, and 53, BLS Bulletin No. 1235, *Wholesale Prices and Price Indexes, 1957*, p. 26; (these series on a 1926 base appear in the following publications: 1913–1941, BLS, *Handbook of Labor Statistics*, 1941 edition, p. 733; 1942–1946, BLS Bulletin No. 947, *Wholesale Prices, 1947*, p. 6); 1947–1957, BLS Bulletin No. 1235, *op. cit.*, p. 27.

Although the basic weights, the price data, and the calculation methods for these indexes were the same as those used for the regular indexes, the series shown comprise two parts, one for 1913–1946 and the second for 1947–1957. Prior to the revision of the regular Wholesale Price Index (WPI) in 1952 (which was carried back to 1947), each commodity in the WPI was classified in one of three groups: Raw, semimanufactured, or manufactured. The prices were weighted using quantities as specified for series E 13–24. The list of commodities included in each classification is shown in BLS Bulletin No. 473, p. 62.

The more refined economic sector classification used for 1947–1957 required adjustments to these procedures. Many commodities were considered to fall appropriately in more than one category. The base weight for each such article was, therefore, distributed among the economic sectors on the basis of percentage distributions by end use, derived from the BLS interindustry studies for 1947. The same price series was used in several sectors when a commodity was classified in more than one sector. It was recognized that this procedure had some disadvantages, but it was believed to have little effect on the measurement of price trend.

Digitized by Google

In splicing the two parts, the index for "raw materials" was considered as most nearly comparable with the new "crude materials for further processing"; "semimanufactured" with "intermediate materials, supplies, and components"; and "manufactured" with "finished goods."

E 56–64. Wholesale price indexes (BLS), by durability of product, 1947–1957.

Source: BLS Bulletin No. 1235, *Wholesale Prices and Price Indexes, 1957*, pp. 32 and 33.

These indexes were constructed by recombining commodity segments of the regular BLS Wholesale Price Index according to durability. The basic weights, the price data, and the calculation methods were the same as for the regular indexes (see text for series E 25–41). The commodity groups included in each of these special indexes are listed in the source, pp. 12–14.

Manufactured commodities were generally classified on the same basis as that used by the Federal Reserve Board for its Index of Industrial Production. The classification of the "raw or slightly processed goods" was based for the most part on that used by Frederick C. Mills in *Prices in Recession and Recovery*, National Bureau of Economic Research, New York, 1936, pp. 472–474.

E 65–67. Wholesale price indexes (BLS), by 2 levels of processing, for identical commodities, 1890–1926.

Source: BLS Bulletin No. 440, *Wholesale Prices, 1890 to 1926*, pp. 28–29.

These series were calculated for the first time in 1915, were extended back to 1890, and continued through 1926. The items in each of the indexes were selected from those included in the BLS regular wholesale price index (see series E 13). The indexes are fixed weight aggregative indexes, derived by weighting the price series with the estimated quantity of each article marketed in 1919. Similar figures for 1890–1914 on the 1914 base, using 1909 quantity weights may be found in BLS Bulletin No. 181, *Wholesale Prices, 1890–1914*, pp. 28–29.

E 68–100. General note.

The inadequacy of the available statistics on commodity-price and wage movements over long periods of time led to the formation of the International Scientific Committee on Price History in 1929. In the United States, the attention of this Committee was directed to providing long series of prices for important commodities for pre-Civil War years. Price history research was initiated or expanded for 6 important markets—Philadelphia, Charleston, S.C., Cincinnati, New Orleans, New York City, and Boston. Information is presented here only for the first 4 of these markets.

The results of the investigations in all 6 areas were summarized in the form of wholesale price index numbers by the individual research directors and presented by Arthur H. Cole in *Wholesale Commodity Prices in the United States, 1700 to 1861*, Harvard University Press, Cambridge, 1938. A statistical supplement to Cole's report contains the actual monthly quotations for approximately 45 commodities for the years covered in each market.

The source materials for the price data included newspapers, merchants price lists, account books, and similar records that could be located. Differences in the availability of price and weighting data from area to area contributed to differences in the indexes derived, particularly with respect to the appropriate base periods, the length of the series, and the classifications of commodities for subindexes.

E 68–81. Wholesale price indexes (Bezanson), for Philadelphia, unweighted geometric average, 1784–1861.

Source: Anne Bezanson, Robert D. Gray, and Miriam Hussey, *Wholesale Prices in Philadelphia, 1784–1861*, part I, University of Pennsylvania Industrial Research Study No. 29, Philadelphia, 1936, p. 392.

See also general note for series E 68–100.

Records of prices for Philadelphia provided continuous price reports for 186 series covering 140 different commodities for 1784–1861 and 205 series for 157 commodities for 1819–1861. Monthly relative prices for the individual commodities and changes in the description of the commodities quoted are included in part II of the source, published as Industrial Research Study No. 30. Bezanson and her associates have also computed indexes for 1852–1896, corresponding to those for the earlier part of the century, which are available in a BLS pamphlet, *Wholesale Price Indexes for Philadelphia, 1852–96: Annual Group Totals.*

Indexes for all commodities and for subindexes using different modes of classification were computed as unweighted geometric averages of price relatives. Two all-commodities indexes were prepared, one based on 140 commodities (series E 68) and one for a more limited period for 157 commodities.

In addition to the subindexes selected for inclusion here, other subindexes for commodity groupings generally comparable to those of the BLS were also calculated. All indexes are available on a monthly basis.

E 82. Wholesale price indexes (Bezanson), for Philadelphia, unweighted arithmetic average, 1720–1861.

Source: See source for series E 68–81.

For the colonial period, Bezanson and her associates obtained some price data for 82 series. Because of the gaps in the data, however, indexes for the early years were based on prices for many fewer commodities.

Indexes for 1720–1861 were computed as unweighted arithmetic averages of relatives of prices for the same 12 commodities for the full period. The source also includes an unweighted geometric index of 20 commodities for 1731–1861.

E 83–89. Wholesale price indexes (Taylor), for Charleston, S. C., 1732–1861.

Source: Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861*, Harvard University Press, Cambridge, 1938, pp. 153, 155–157, and 159–167.

See also articles by George Rogers Taylor, "Wholesale Commodity Prices at Charleston, S. C., 1732–1791," *Journal of Economic History*, February 1932, pp. 356–377, and "Wholesale Commodity Prices at Charleston, S. C., 1796–1861," August 1932 supplement to the *Journal*, pp. 848–868.

See also general note for series E 68–100.

Taylor's research in commodity prices was summarized in separate index numbers for 8 different periods. The choice of time periods was made partly to reflect business conditions in Charleston and partly to take account of availability of data. Newspapers and original manuscript materials produced price series for a maximum of 32 items for 1818–1842 and a minimum of 6 for 1732–1747. Gaps were relatively frequent and no quotations at all appeared for 1792–1795.

Indexes for each period were weighted arithmetic averages of price relatives, with weights representing the approximate importance of each commodity in South Carolina commerce. The weights were unchanged for all years within each time period but were changed from period to period. An all-commodities series was made up of prices for 6 articles for

Digitized by Google

1732–1747, 10 articles for 1748–1761, and 16 articles for 1762–1775. In each period, rice represented 50 to 64 percent of the total weight. For the 5 later time intervals, weighted subindexes were combined with group weights based on the following total number of price series: 1780–1791, 20; 1796–1812, 18; 1813–1822, 13; 1818–1842, 32; 1843–1861, 20. During these years, the importance of rice declined from about 37 percent of the total weight to 5 to 7 percent, while the importance of cotton increased from zero in 1791 to almost 35 percent in 1843–1861.

The all-commodity series (E 83) was obtained by splicing the indexes for the separate periods.

E 90–92. Wholesale price indexes (Berry), for Cincinnati, 1816–1861.

Source: Series E 90, 1816–1860, Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861*, Harvard University Press, Cambridge, 1938, p. 185 (averages of the monthly data were computed from the source); 1861, estimated by Ethel Hoover from series E 91 and E 92 with weights shown in Cole (cited above), p. 81. Series E 91–92, Thomas S. Berry, *Western Prices Before 1861*, Harvard University Press, Cambridge, 1943, p. 564.

See also general note for series E 68–100.

These indexes were weighted arithmetic averages of price relatives, computed for 3 separate time periods which were spliced to obtain the continuous series. For 1816–1825, prices for 21 commodities were assembled, 13 "identified with northern agriculture" and 8 "not identified with northern agriculture." For 1824–1846, the total was 37 with 20 in the first category and 17 in the second. For 1846–1861, the total was 50, with 29 for northern agriculture, and 21 for other. The weighting factors for the first period were estimated from New Orleans receipts in 1825, while those for the 2 later periods were based on receipts at Cincinnati for 1845–1848 and 1852–1856. Berry's analysis is accompanied by many tabulations of supplementary data, including actual prices for individual articles.

E 93–95. Wholesale price indexes (Berry), for Ohio River Valley, 1788–1817.

Source: Thomas S. Berry, *Western Prices Before 1861*, Harvard University Press, Cambridge, 1943, pp. 563–564.

See also general note for E 68–100.

In his study of Cincinnati prices, Berry encountered considerable difficulty in obtaining price information for years before 1816. He enlarged his geographical coverage for the market to include Lexington and Louisville, Ky., and Pittsburgh, Pa., and was successful in constructing 14 commodity price series for 1788–1816 from data in "account books of backwoods merchants" and from local journals.

The indexes were computed as unweighted averages of price relatives. The annual prices used to obtain the relatives were medians of all Ohio Valley quotations for each item each year.

E 96–100. Wholesale price indexes (Taylor), for New Orleans, 1800–1861.

Source: Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861*, Harvard University Press, Cambridge, 1938, pp. 170–179.

See also general note for series E 68–100.

A considerable difference was found in the volume of information available for New Orleans from decade to decade. Therefore, New Orleans indexes were prepared for 4 separate time periods. Data for 8 commodities, primarily agricultural, were combined into an index for "Louisiana" products for 1800–1812 (July). For a part of this period, 1804–1812 (April), 2 series were constructed, 1 for 29 domestic products and the other for 15 imported goods. For 2 later periods, the volume of data was sufficient to set up 3 subindexes, classifying the commodities by origin. The number of articles included was: For 1815–1842, 5 Louisiana products, 34 other domestic products, and 11 foreign imports; for 1840–1861, the corresponding numbers of articles were 4, 37, and 8.

All of the index numbers were calculated using the method of weighted averages of relatives. The weights in the several time periods represented the importance of the various commodities in the trade of New Orleans.

The all-commodities index (series E 96) was obtained by splicing the "all-commodities" indexes for the different periods.

E 101–112. General note.

From among the several hundred commodities for which wholesale prices have been published in various reports, 12 were selected for publication in the form of actual prices. Generally, consideration was given to representation of commodities in different product groups, importance in U. S. trade, and the length of the series available.

The descriptions for each commodity insofar as they could be determined and the sources from which the prices were compiled are shown below in the detailed notes for each series. When annual averages were not available in the original source, they were computed for this publication. If 12 monthly figures were presented, a simple average was calculated, but if only quarterly figures were given, straight line interpolation was used to estimate missing months.

It was not possible to obtain one continuously comparable series for the full period. The data were assembled from several sources for each commodity and there were, frequently, changes in the basis of quotation even in the same source. Two prices are shown for each year in which a change in the series occurred, if it was possible to obtain the information. In some instances, mostly prior to 1890, changes in the basis of quotation occurred and no overlapping prices were available. Such changes are noted in the text.

Prices for earlier years for some commodities are available in the same sources as those indicated for 1800, and in other publications. Because of limitations of time and space, however, figures prior to 1800 were not included in this chapter. For example, prices of wheat back to 1700 may be found in the publication by Cole cited as the source for wheat prices for 1800–1825. Wheat prices in the New England colonies at 10-year intervals for 1630–1750 are included with prices for several other commodities in BLS Bulletin No. 604, *History of Wages in the United States From Colonial Times to 1928*, p. 19.

The *Annual Report of the Director of the Mint*, cited as the source for practically all series for some part of the period for 1825–1880, was used despite the lack of commodity descriptions. The prices included in this report were summaries of the New York prices included in the *U. S. Finance Reports* of 1863, 1873, and 1874 which had been compiled from the newspaper, *The New York Shipping and Commercial List*. Prices for 1875–1880 were also compiled from this source. Such descriptions as appear in the notes for each series when prices were taken from *U. S. Finance Reports* were obtained from the report for 1863.

An alternate source for many of the price series included in the *Aldrich Reports* (cited for data prior to 1890) is *Monthly Summary of Commerce and Finance in the United States*, 57th Congress, 2d Session, House Doc. No. 15, part 1, 1902, pp. 59–100. This summary covers not only the years included in

Digitized by Google

the *Aldrich Reports*, but also extends the data through July 1902.

E 101. Wheat, 1800–1957.

Source: A.—1800–1825, Arthur H. Cole, *Wholesale Commodity Prices in the United States, 1700–1861*, Statistical Supplement, Harvard University Press, Cambridge, 1938; B.—1825–1880, *Annual Report of the Director of the Mint to the Secretary of the Treasury for the Fiscal Year Ended June 30, 1881*, p. 50; C.—1880–1890, *Wholesale Prices, Wages, and Transportation*, Senate Report No. 1394, 52d Congress, 2d Session, part 2, 1893, p. 61 (one of the reports usually referred to as the *Aldrich Reports*); D.—1890–1957, compiled from Bureau of Labor Statistics records.

For 1800–1825, prices are for Philadelphia (commodity description not available). For 1825–1880, prices are for New York, "Northern" wheat; the *1863 U. S. Finance Report* (from which these prices were partially compiled) shows prices for "genesee" for most years, 1825–1863, but for a few years prices refer to "North River," "prime white," "western," "western red," or "mixed and red." For 1880–1890, prices are for "wheat No. 2, Winter, Chicago." For 1890–1913, prices are for Chicago "Range No. 1 Northern Spring and No. 2 Red Winter" in carlots. For 1913–1948, prices are for Kansas City, "No. 2, hard (ordinary)" in carlots. For 1949–1957, prices are for Kansas City, "No. 2, hard winter, closing spot market price, carlots, f.o.b. track."

See also general note for series E 101–112.

E 102. Wheat flour, 1800–1957.

Source: See sources cited for series E 101; 1800–1825, source A; 1825–1870, source B; 1870–1890, source C, p. 79; 1890–1957, source D.

For 1800–1825, prices are for Philadelphia, "Superfine" flour, per barrel of 196 pounds. For 1825–1870, prices are for New York, "Superfine" flour, per barrel. For 1870–1890, prices were provided by a New York firm (commodity description not available). For 1890–1913, prices are for "winter straights, f.o.b., New York," per barrel. For 1913–1943, prices are for "Straights, hard winter, white, in carlots, f,o.b., Kansas City," per barrel. During 1943, the basis of quotation was changed from per barrel to flour in sacks, per 100 pounds. For 1950–1957, prices are for "hard winter, bakery, short patents, plain or enriched, in 100-pound sacks, carlots, f.o.b. mill, Kansas City," per 100 pounds. During 1918 and a part of 1946, prices were quoted on the standard provided under government regulation.

See also general note for series E 101–112.

E 103. Sugar, 1800–1957.

Source: See sources for series E 101; 1800–1825, source A; 1825–1860, source B; 1860–1890, source C, p. 114; 1890–1957, source D.

For 1800–1825, prices are for the Philadelphia market. Prices for 1800 refer to "Muscovado, brown"; 1801–1802 (October), "Muscovado"; 1802 (November)–1813 (October), "Muscovado, first quality"; 1813 (November)–1815 (April), "Muscovado, unspecified"; 1815 (May)–1825, "Muscovado, prime." For 1825–1860, prices are for New York, "Cuba" sugar; the *1863 U. S. Finance Report* (from which the data were compiled) quoted "Muscovado" for 1825–1829 and 1845–1860, "Cuba Muscovado" for 1830–1836 and "Cuba" for 1837–1844. For 1860–1890, prices are for "Refined, granulated" sugar (no market specified). For 1890–1946, prices are for New York, "Granulated" sugar. Prices were quoted for sugar in barrels until 1955 when the basis of quotation was changed to 100-pound paper bags. For 1947–1957, the description was amplified to "granulated, domestic, cane, refined, New York," per pound. Prices for 1934–1957 include the excise tax of 53½ cents per 100 pounds, effective in May 1934.

See also general note for series E 101–112.

E 104. Cotton, raw, 1800–1957.

Source: 1800–1890, Mathew B. Hammond, *The Cotton Industry, an Essay in American Economic History*, American Economic Association, New Series No. I, Macmillan, New York, 1897, p. 358; 1890–1957, see source D for series E 101.

For 1800–1890, prices refer to "Middling uplands" cotton for the New York market and are available back to 1790. For 1800–1820, prices are estimates made by merchants or government officials. For 1821–1890, prices were taken from James L. Watkin, *Production and Price of Cotton for One Hundred Years*, published by the Department of Agriculture, 1895. For 1890–1941, prices are for New York, "Upland, Middling" cotton, spot. In 1936, "7/8 inch" was added to the description. For 1941–1954 (July), prices are for "Middling, 15/16 inch," 10 spot market average. For 1954 (July)–1956 (August), the number of markets included in the average was increased from 10 to 14. The July 1954 average for 10 markets was $0.342 per pound and for 14 markets, $0.341 per pound. For 1956 (August)–1957, prices are for "Middling, 1-inch," 14 spot market average. In August 1956, the average for 15/16-inch staple was $0.348 per pound and for 1-inch staple $0.357 per pound.

See also general note for series E 101–112.

E 105. Wool, 1813–1957.

Source: See sources cited for series E 101; 1813–1825, source A; 1825–1850, source B, p. 60; 1850–1890, source C, p. 387; 1890–1957, source D.

For 1813–1825, prices are for Philadelphia, "Merino clean" wool except for 1819 and 1820 when description was "Merino" wool. For 1825–1850, prices are for New York, "Merino" wool. For 1850–1890, prices are for Boston, "Ohio, fine fleece, scoured." For 1890–1913, prices are for, "Domestic, Ohio, fine fleece (x and xx grades), scoured"; for 1913–1945, for Boston, "Domestic, Territory, staple, fine and fine medium, scoured"; for 1946–1949 for Boston, "Domestic, Territory, staple, fine combing, graded, scoured." For 1950–1957, the description was changed with no difference in price level to "Domestic, fine, good French combing and staple, clean basis."

See also general note for series E 101–112.

E 106. Cotton sheeting, 1800–1957.

Source: See sources cited for series E 101; 1800–1847, source A; 1847–1890, source C, p. 155; 1890–1957, source D.

Prices are for Philadelphia, "Russian, unspecified" for 1800–1804, "Russian, brown" for 1805–1814 and 1824–1847, and "Russian, half bleached" for 1815–1823. Prices were shown "per piece" (approximately 100 yards). For 1847–1890, prices are for "sheeting, brown, 4-4, Atlantic A," per yard (no market specified). For 1890–1912, prices are for "brown, Indian head, 4-4, 2.85 yards to pound, factory." For 1913–1941, description same except that the width designation was changed in 1913 to "36-inch" instead of "4/4," and "48x48, carded yarn" was added in 1923. For 1941–1943 (May), prices are for "Unbleached, 36-inch, 48x48, 2.85 yards per pound, Class A, nonfeeler, f.o.b. mill." For 1943 (May)–1947, description same except for change from "48x48" to "48x44." For 1948–1957, prices are for "Unbleached (series 1), 40-inch, 48x48, 2.85 yards per pound, Class A, nonfeeler, f.o.b. mill." The January 1948 price for the former description (36-inch, 48x44) was $0.279 and of the new description (40-inch, 48x48) was $0.289 per pound.

See also general note for series E 101–112.

E 107. Coal, anthracite, 1800–1957.

Source: See sources cited for series E 101; 1800–1825, source A; 1825–1833, source B; 1890–1957, source D. For 1833–1890, American Iron and Steel Association, *Statistics of the American and Foreign Iron Trades for 1896*, Philadelphia, 1897, p. 91.

Prices are for Philadelphia, "Virginia" coal for 1800–1811 and 1814–1825, and "Domestic" for 1812 and 1813. There was no description for 1826–1833. For 1825–1833, prices are for New York, "anthracite coal (Schuylkill)." For 1833–1890, prices are for "Schuylkill white ash lump" coal, by the cargo, at Philadelphia, per gross ton. For 1890–1957, prices are for "Pennsylvania anthracite, chestnut," but the basis of quotation was changed several times. For 1890–1928, the basis was "New York Tidewater," per gross ton; for 1928–1931, "destination on tracks," per gross ton; for 1931–1947, per net ton (2000 pounds); and 1947–1957, "f.o.b. cars at mine" per net ton.

See also general note for series E 101–112.

E 108. Steel rails, 1847–1957.

Source: 1847–1890, American Metal Market and Daily Iron and Steel Report, *Metal Statistics*, 1921, p. 91. For 1891–1957, see source D for series E 101.

For 1847–1867, prices are for "Iron rails, Eastern Pennsylvania mill" (production of steel rails did not exceed production of iron rails until 1877). The source also shows prices of iron rails of this description for 1868–1882. For 1867–1870, prices are for New York "Steel rails, Bessemer," per gross ton. For 1871–1890, prices are for "Steel rails, Pennsylvania mill." For 1891–1913, prices are for "Bessemer, Standard, f.o.b. mill, Pittsburgh," per long ton; for 1913–1946, for "Open hearth, standard, f.o.b. mill"; for 1947–1953 (April), for "Standard, heavier than 60 pounds, No. 1 open hearth, f.o.b. mill" (refinement of previous specification and quoted per 100 pounds—no break in series); and for 1953 (May)–1957, for "Standard, carbon steel, No. 1 open hearth, 115 pounds per linear yard, control cooled, base quantity, f.o.b. mill."

See also general note for series E 101–112.

E 109. Nails, 1800–1957.

Source: See sources cited for series E 101; 1800–1828, source A; 1828–1834, source B, p. 54; 1890–1957, source D. For 1835–1890, see source for series E 107, 1833–1890, p. 87. (For 1835–1849, prices were compiled from the *Report of the Secretary of the Treasury*, 1849; for 1850–1859, by the American Iron and Steel Association from the books of the Duncannon Iron Company; and for 1860–1890, by an official of the Duncannon Iron Company.)

For 1800–1828, prices are for the Philadelphia market. For 1814–1827, prices are for "Cut nails, all sizes"; for other years, "assorted sizes." For 1828–1834, prices are for New York, "Nails, cut." For 1835–1890, prices are for "Cut nails." For 1890–1953, prices refer to "wire, 8 penny, fence and common, 100-pound keg, f.o.b. Pittsburgh." "Base price" was added to the description in 1926 and fence nails were not included after 1947. For 1953–1957, prices refer to "wire, carbon steel, 8 d, common, carload lots, f.o.b. mill." The April 1953 price for former specification was $7.41, and for the new specification was $7.33 per 100 pounds. "Packed in fiberboard boxes" was added to description in 1955.

See also general note for series E 101–112.

E 110. Copper, 1800–1957.

Source: See sources cited for series E 101; 1800–1825, source A; 1825–1860, source B, p. 52; 1890–1957, source D. For 1860–1889, see source for series E 108, 1847–1867, p. 299.

For 1800–1825, prices are for the Philadelphia market. Prices are for "Copper in sheets," 1800–1801 (April) and 1805 (June)–1809 (June); "Sheathing unspecified," 1801 (May)–1802 (December), 1809 (July)–1818 (April), and 1824 (September)–1825; "Sheathing, cold rolled," 1803–1805 (May); and "Sheeting unspecified," 1818 (May)–1824 (August). For 1825–1860, prices are for New York, "Sheathing." For 1860–1889, prices are for New York, "Lake Copper." Price shown for 1890 is the same as that in *Metal Statistics, 1921*. For 1890–1907, prices are for New York, "Lake Copper"; for 1907–1927, for "Copper ingot, electrolytic, early delivery, refinery in New York"; for 1927–1953, for "Copper, electrolytic, delivered, Connecticut Valley"; and for 1954–1957, for "Copper ingot, electrolytic, producers' prices, delivered, f.o.b. cars, U. S. destination."

See also general note for series E 101–112.

E 111. Turpentine, 1800–1957.

Source: See sources cited for series E 101; 1800–1825, source A; 1825–1840, source B, p. 56; 1840–1890, source C, p. 240; 1890–1957, source D.

For 1800–1825, prices are for the Philadelphia market per barrel (31½ gallons per barrel). No description was available, but a comparison of prices indicates that they may be for "soft" turpentine. For 1825–1840, prices are for the New York market (no description is available). For 1840–1890, prices are for New York, "Spirits of turpentine." For 1890–1942, prices are for "Southern, barrels, at New York." The description was amplified in 1936 by the addition of "carlots, ex dock, gum spirits." For 1942–1951, prices refer to "Gum spirits, bulk, f.o.b. Savannah, Ga." For 1952–1956 (October), quotations are for "Spirits of turpentine, tank cars, at New York." The January 1952 price for the former specification (Savannah) was $0.80 per gallon and for the new (New York), $0.76 per gallon. For 1956 (November)–1957, prices are for "gum, tank cars" at New York. The October 1956 price for the former specification (spirits) was $0.640 per gallon and for the new (gum), $0.635 per gallon.

See also general note for series E 101–112.

E 112. Brick, 1849–1957.

Source: See sources cited for series E 101; 1849–1890, source C, p. 222; 1890–1957, source D.

For 1849–1890, prices are for "common domestic building" (market not indicated). For 1890–1933, prices are for "Common, Red, Domestic, at New York"; 1933–1947, for "Common building, f.o.b. plant" (composite of approximately 50 firms); for 1947–1957, for "Building brick, f.o.b. plant or New York dock" (composite of approximately 25 firms). Changes in list of firms from time to time did not result in any significant differences in the annual average prices.

See also general note for series E 101–112.

E 113–160. General note.

An appropriate name for indexes of retail price changes has been the subject of considerable discussion. Most indexes that have at some time been called "cost-of-living" indexes measure changes in retail prices for the goods and services families buy. Insofar as possible, the retail prices are for the same list of items in the same localities, the same qualities, and the same quantities from one period to the next. The indexes, therefore, measure changes in costs for living in the same way and in the same place.

Generally, people tend to think of the amount of money they spend for commodities and services as their cost of living. Changes in total expenditures reflect changes in costs resulting from differences in the place or manner of living, such as

Digitized by Google

shifts in the kinds of goods and services bought, and may represent a better or a worse standard than at some earlier date.

The term "Consumer Price Index" was adopted by the Bureau of Labor Statistics and the National Industrial Conference Board after much controversy during World War II regarding the BLS *Cost of Living Index*. For a discussion of differences in concept and measurement of the cost of living, see the *Report of the President's Committee on Cost of Living*, Office of Economic Stabilization, 1945.

E 113–139. Consumer price indexes (BLS), by major groups and subgroups, 1890–1957.

Source: BLS, *U. S. Consumer Price Indexes (1947–49 =100); Historical Series A–1 to I–1.*

See also general note for series E 113–160.

The BLS Consumer Price Index measures changes in retail prices of the goods and services bought by city wage earners and clerical workers. It was originated on a comprehensive basis at the end of World War I when data were in demand for wage negotiations in shipbuilding cities. A Department of Labor study of the cost of living in 92 shipbuilding and other industrial centers was made in 1918–1919, as reported in BLS Bulletin No. 357, *Cost of Living in the United States*. The first publication of changes in the "cost of living" was in the *Monthly Labor Review* for October 1919 and regular publication has continued since February 1921. The frequency of publication was increased from semiannually to quarterly in 1935. Since September 1940, the index has been computed and published monthly in mimeograph releases and in the *Monthly Labor Review*.

The present index (1958) is based on prices of about 300 individual items. The list of goods and services priced for the index are those important in family expenditures and were chosen to represent price trends for all goods and services bought by families of wage earners and clerical workers. The selection was made on the basis of a detailed study of expenditures of 8,000 families in 1950 and studies of price trends for many individual items to determine items with similar price fluctuations. The average size of the families covered by the index was estimated to be about 3.3 persons and their average family income after taxes was estimated at about $4,160 in 1952.

The sample of 46 cities on which the index is based was chosen to represent all urban places with population of 2,500 or more in 1950. Characteristics of different city types which affect the way families spent their money were taken into account, including size, climate, density of population, level of income, and distance to market center (for small cities). Prices for foods and fuels and some services are obtained monthly in all cities. Prices for most other goods and services are obtained monthly in the 5 largest cities and quarterly on a rotating cycle in 41 cities. Separate indexes are computed for 20 large cities.

All retail price data are collected with the use of specifications to ensure comparisons from period to period of prices for the same or similar qualities insofar as possible. These specifications include the quality factors associated with price differences and other physical characteristics needed for identification from store to store and from one pricing period to the next. A discussion of the use of specifications is contained in BLS Bulletin No. 1182, *Average Retail Prices: Collection and Calculation Techniques and Problems*. Every effort is made to obtain the prices paid by the customer, not list prices from which discounts are normally given. Sales taxes are reflected wherever applicable.

Food prices are obtained from about 2,000 food stores, including all important types of food retailers in each city. Rent figures are collected from tenants for approximately 30,000 rental units selected from block listings of the total rental housing market in each city. Prices for other goods and services are obtained from about 4,000 retail and service establishments patronized by wage earner and clerical families and including department stores, specialty shops, etc., with a minimum of 4 quotations per item per city in most cases. For most cities, the samples of reporters are located in the city limits, but for rents, data are obtained from the "urbanized areas" as defined by the Census Bureau.

Price collection for the majority of goods and services is made by personal visit of BLS full-time field representatives. Food prices are collected by local part-time agents while for some items mail collection is supplemented by occasional personal visits.

The indexes are calculated using a variation of the base quantity weighted index formula. In practice, the aggregates are obtained by applying price relatives to "value weights" representing the cost of 1951–1952 quantities as determined from the 1950 family expenditure study. The importance of each item in the index represents the expenditure for the item and in addition the expenditure for all items it represents. City indexes are computed using the expenditure weights for each city. National indexes are calculated by combining city data with weights representing their 1950 population.

For a more complete description of the current index see *Techniques of Preparing Major BLS Statistical Series*, BLS Bulletin No. 1168, chap. 9.

A number of changes in coverage, methodology, classification, and base periods have been made since these indexes were first issued in 1919 with index numbers back to 1913. Until 1935, the "cost-of-living" indexes were calculated using quantity weights derived from the BLS family expenditure study in 1917–1919. The weights related to the individual items priced and to geographic areas rather than to individual cities. Group indexes were combined with percentages representing the importance of the group in total expenditures. The goods and services included were described in general terms only. The measurement of price change for comparable articles was accomplished by careful attention on the part of the field representative in obtaining price quotations for the same quality from one period to the next from the same respondents.

A major improvement in the index calculation method was introduced in 1935 and is described in Faith M. Williams, Margaret H. Hogg, and Ewan Clague, "Revision of Index of Cost of Goods Purchased by Wage Earners and Lower-Salaried Workers," *Monthly Labor Review*, September 1935, pp. 819–837. In the 1935 revision, consumption weights for individual cities were derived from the 1917–1919 expenditure study, and population weights (average population in 1920 and 1930) were used to combine city data. At this time, indexes back to 1913 were recalculated based on the prices collected for the former indexes. "Specification pricing" was also introduced in 1935; see John H. Cover, *Retail Price Behavior*, University of Chicago Press, 1935.

Another revision was completed in 1940 to take into account the results of a study of family expenditures in 1934–1936. At this time, indexes back to 1935 were recalculated with weights derived from this study. Indexes for earlier years were not recalculated completely, but the former group indexes were recombined with revised weights. Other improvements introduced are described in *The Bureau of Labor*

Statistics' New Index of Cost of Living, Serial No. R. 1156, reprinted from the August 1940 issue of the *Monthly Labor Reveiw*.

Table II. Number of Cities Included in BLS Consumer Price Index for All Items (E 113) and for Foods (E 114–115), and Weights Used: 1913 to 1957

Period	Number of cities		Weights used	
	All items	Food	Family expenditures in—	Population in—
1913–1917	19	40–45	1917–19	none
1918–1924	32	45–51	1917–19	1920 and 1930
1925–1930	32	51	1917–19, [1] 1934–36	1920 and 1930
1930–1934	33	51	[1] 1934–36	1930
1935–1942	33–34	56–64	1934–36	1930
1943–1949	34	56	1934–36	May 1942
1950–1952	34	56	[2] 1947–49	1950
1953–1957	46	46	[3] 1950	1950

[1] Individual item weights for 1913–1935 were derived from the 1917–19 study. Group weights as shown.
[2] Family expenditures in 7 cities.
[3] Adjusted to 1952 for price change.

During World War II, shortages and rationing imposed many measurement problems. The adjustments made by BLS in weights and in pricing are described in Faith M. Williams, "Bureau of Labor Statistics Cost of Living Index in Wartime," *Monthly Labor Review*, July 1943.

Prior to the comprehensive revision in 1953, when present index procedures and coverage were introduced, an "interim adjustment" was made in 1951. This adjustment included a correction for "new unit bias" in the rent index (resulting from wartime rent controls) for 1940–1950 and the introduction of revised commodity weights based on expenditure surveys in 7 cities during 1947–1949. The revised commodity weights were used to recalculate indexes back to January 1950 but not earlier years. A description of the adjustment is in BLS Bulletin No. 1039, *Interim Adjustment of Consumer Price Index*. The "interim adjustment" resulted in the publication of two index series for 1940–1952—the "old series" and the "adjusted series." When the comprehensive revision was completed in 1953, the revised indexes were linked to the "adjusted series."

In the 1953 revision, the city sample was changed to include small and medium-sized cities and the expenditure concept was broadened to include the purchase price of a house. (See February and April 1956 issues of *Monthly Labor Review* for a discussion of housing costs in the CPI.) Pricing of restaurant meals and home repair and maintenance items was begun and several other items were added. Items were regrouped into 8 major groups.

The BLS Consumer Price Index has been the subject of extensive analysis and investigation. A comprehensive review made by a committee of the American Statistical Association in 1933 led to the 1935 revision. During World War II, the effect of such factors as quality deterioration, "black market" prices, disappearance of special sales prices and low-end merchandise, and similar wartime developments was estimated by the President's Committee on the Cost of Living to have produced an understatement of the rise in retail prices from January 1941 to September 1944 by a maximum of 3 to 4 index points. The Committee also estimated that if small cities were included in the national average, an additional half point would be added. The various reports submitted to and by the President's Committee are included in its report cited in the general note for series E 113–160. The continuation of wartime conditions was taken into account in December 1945 when the Office of War Mobilization and Reconversion estimated that for the full period January 1941 to September 1945, the understatement amounted to a total of 5 index points for large and small cities combined.

In 1949, the Joint Committee on the Economic Report reviewed BLS methods in the compilation, composition, and presentation of the Consumer Price Index; see *The Consumers Price Index: Report of the Joint Committee on the Economic Report*, Joint Committee Print, 80th Congress, 2d Session, 1949.

In 1951, a Special Subcommittee of the House of Representatives held extensive hearings and concluded that the Consumer Price Index was generally adequate for the purpose for which it was intended. See *Consumers Price Index—Report of a Special Subcommittee of the Committee on Education and Labor*, House of Representatives, 82d Congress, 1st Session, Subcommittee Report No. 2, 1951.

E 140–147. Consumer price indexes (BLS), for special groups, 1935–1957.

Source: 1935–1946, BLS, *Consumer Price Index: Price Indexes for Selected Items and Groups*, July 1956, p. 2, March 1957, p. 9, and mimeographed historical tables; 1947–1957, *Monthly Labor Review*, April 1958, p. 468.

These indexes are based on a reclassification of the items priced for the Consumer Price Indexes (series E 113–139). The goods and services included in each series are listed in footnotes in the April 1958 issue of the *Monthly Labor Review*. The basic weights, price data, and calculation methods were the same as those used for the regular CPI.

E 148–156. Consumer price index (Hoover), 1851–1880.

Source: Ethel D. Hoover, "Prices in the 19th Century," *Studies in Income and Wealth*, vol. 24, Princeton University Press (forthcoming).

See also general note for series E 113–160.

The basic price data for these series are from Joseph D. Weeks, "The Average Retail Prices of Necessaries of Life," *Report on Statistics of Wages in Manufacturing Industries*, Tenth Census, vol. 20, 1886. Averages of retail prices for 58 commodities were calculated by making simple averages of the prices reported for each item by one or two storekeepers in approximately 40 cities. The consistency of price movement and price level between prices identified as of "June 1" and those as "year" averages led to the inclusion of all prices to calculate an all-city average for each year. In calculating the relative prices for each commodity, a comparability procedure was used; that is, for each year two average prices were calculated—one comparable with the preceding year and the other comparable with the following year. Data for these 58 commodities were supplemented with estimates of price change for services (shoe repairs and medical care) as well as some additional items important in family spending estimated from other sources. The number of price series included in each of the index groups was food, 40; clothing, 12; rents, 2; fuel and light, 5; and other, 7.

Relative prices for the individual commodities were combined with value weights derived from the study of family expenditures in Massachusetts in 1875, supplemented by detailed expenditures of 232 families as given in the *Aldrich Reports* (*Wholesale Prices*, part 1, pp. 62–63). The formula for calculation of the index was the algebraic equivalent of the Laspeyre index.

E 157. Cost-of-living indexes (Federal Reserve Bank of N.Y.), 1820–1913.

Source: Federal Reserve Bank of New York, *Index of Estimated Cost of Living in the United States* (1938 revision mimeographed).

Indexes for 1820–1952 converted to the 1947–49 base and figures showing purchasing power of the dollar "in terms of retail prices" for the same period are available in a mimeographed release with same title dated March 17, 1953.

See also general note for series E 113–160.

This index was obtained by splicing together parts of indexes already available to approximate a continuous series. No adjustments were made to the original series other than those necessary to convert to a common base period. Indexes for 1820–1839 were taken from Alvin H. Hansen's cost-of-living indexes which were based on wholesale prices for these years. For 1840–1859, the indexes used were also obtained from Hansen's index which had in turn utilized the weighted index of wholesale prices (assuming all unpriced items moved with all priced items) computed by Roland P. Falkner for the Senate Committee on Finance. The Falkner indexes for 1840–1891 may be found in Senate Report No. 1394 (*Aldrich Report*), *Wholesale Prices, Wages, and Transportation*, U. S. Senate Committee on Finance, 1893, p. 93. For 1860–1879, the Federal Reserve Bank used the relative cost-of-living series prepared by Wesley C. Mitchell, who calculated his index from retail price data for 60 of the "necessaries of life" included in the *Weeks Report*. The original series may be found in Mitchell's *Gold, Prices, and Wages Under the Greenback Standard*, University of California Publications in Economics, vol. 1, Berkeley, March 1908, p. 91. For 1880–1889, the indexes were those of W. Randolph Burgess in *Trends of School Costs* (see series E 158). For 1890–1909, Paul Douglas' "Most Probable Index of the Total Cost of Living for Workingmen" (see series E 159) as published in *American Economic Review*, March 1926 supplement, p. 22, was used. Indexes for 1910–1912 were derived from the cost-of-living index for Massachusetts appearing in the Department of Labor and Industries of the Commonwealth of Massachusetts, *Report of the Commission on the Necessaries of Life*, February 1920, p. 118.

E 158. Cost-of-living index (Burgess), 1841–1920.

Source: *The Review of Economic Statistics*, February 1934, vol. XVI, No. 2, p. 26.

Original data in dollars are shown in W. Randolph Burgess, *Trends of School Costs*, Russell Sage Foundation, New York City, 1920, p. 54.

See also general note for series E 113–160.

To determine changes in the purchasing power of teacher's salaries for his study of *Trends in School Costs*, Burgess compiled the series, "Cost of Living Per Week for a Small Family Using the Same Amount of the Same Commodities Over the Entire Period." This series is based on prices for 10 foods important in wage earners' spending. Quantity weights, derived from BLS 1901–1902 consumer expenditure studies, were used to combine prices of the 10 foods. On the assumption that other less important items fluctuated with food prices, the total food cost was adjusted upward to approximate the total weekly cost for all items for a typical wage earners' family of man, wife, and two children. The factor used for adjustment was based on the ratio of food costs to total costs in 1901. The source of the price data is indicated by general reference to BLS, the Massachusetts Bureau of Statistics of Labor, the *Aldrich Reports*, records of purchases by the Army and Navy, and miscellaneous publications.

E 159. Cost-of-living index (Douglas), 1890–1926.

Source: Paul H. Douglas, *Real Wages in the United States, 1890–1926*, Houghton Mifflin Company, Boston and New York, 1930, p. 60.

See also general note for series E 113–160.

This index was called the "Most Probable Index of the Movement of the Total Cost of Living for Workingmen" by Douglas, who constructed the series for his study of real wages during this period. The all-item indexes are available for two base periods, 1890–1899 and 1914.

For 1890–1914, the sources of the price data were BLS wholesale and retail reports. The available retail prices for foods were supplemented with wholesale prices for additional foods. These wholesale data were adjusted for the variation in movement between retail and wholesale prices for identical foods. Wholesale prices were also adjusted to approximate retail prices for clothing, fuel and light, furniture, tobacco, and spirits. The combined index for all items is a weighted arithmetic average of price relatives, using weights derived from the BLS consumer expenditure study of 1901–1902. No estimates were made for rent movements because of lack of data. For 1913–1926, the individual city indexes in the BLS "Cost-of-Living Index" were combined with city population weights.

E 160. Cost-of-living index (Rees), 1890–1914.

Source: National Bureau of Economic Research, *Thirty-eighth Annual Report*, New York, May 1958, pp. 59–60.

Rees' cost-of-living index was based largely on retail prices. Douglas' estimates were adopted for food at retail, and tobacco and spirits at wholesale prices (see text for series E 159), but retail data were assembled to compute new components for fuel, rent, clothing, and housefurnishings. Prices for gas obtained from utility companies, and retail prices of kerosene as used for the New Jersey State cost-of-living index, were included in fuels. Wholesale prices of coal were included before 1907 and for kerosene before 1898. Rents for six cities were compiled from newspaper advertisements. Prices for clothing and housefurnishings were compiled from mail-order catalogs.

The index is a weighted average of price relatives, using weights derived largely from the BLS consumer expenditure study of 1901–1902.

E 161–176. Retail prices of selected food in U. S. cities (BLS), 1890–1957.

Source: 1890–1922, BLS Bulletin No. 396, *Retail Prices, 1890 to 1924*, pp. 8–10; 1923–1934, BLS Bulletin No. 635, *Retail Prices of Food, 1923–36*, pp. 77–89; 1935–1939, Serial No. R. 1172 (August 1940), *Retail Prices*, pp. 28–35; 1940–1957, annual or biennial bulletins, *Retail Prices of Food* (including Serial No. R. 1264, and Bulletin Nos. 707, 799, 899, 938, 965, 1032, 1055, 1141, 1183, and 1217).

While there were scattered statistics of prices of many individual commodities in various publications, it was not until 1901, when BLS began the collection of food prices on a regular basis, that a regular price collection program was initiated by the Federal Government. At that time, information was secured from dealers' books for 1890–1901. Since then, retail prices of food have been obtained by BLS, first at annual intervals, then monthly or semimonthly.

As the pricing program was expanded to other commodities and services purchased by families for daily living, the available resources and review of data requirements for the over-all

Digitized by Google

Consumer Price Index resulted in sampling and methodology changes for foods. The growth in importance of some foods and declines for others, changes in kinds and sizes of packages, different methods of preparation of foods for retail stores, and similar developments were taken into consideration in the adjustments made to the list of foods priced. Of the many foods included for most of the period since 1890, only 16 were selected for publication here.

The list of cities in which food prices were collected changed over the years. In the main, the cities covered were industrial localities in 30 to 40 States up to 1952. Beginning in 1953, the collection of food prices was restricted to the 46 cities included in the CPI.

The number of stores in each city reporting food prices, after the initial collections through 1904, generally ranged from 25 in the larger cities to 15 in the smaller cities until 1932. Average prices for the United States were obtained by making simple averages of quotations from the total number of firms reporting for each food for 1915–1932. Average relative prices for each commodity were applied to prices in 1915 to estimate national averages for 1890–1914. Some chain stores were added to the samples as their sales volumes became significant in each city.

During 1932–1934 the store samples were expanded, particularly in the larger cities, and the method of averaging prices was adjusted to reflect food sales by chain and independent stores in each city. National averages were obtained by combining weighted city averages with the use of consumption and population weights. Refinements to the sampling and the weighting system have been introduced from time to time (see "Store Samples for Retail Food Prices," *Monthly Labor Review*, January 1947).

During the revision of the CPI in the late 1930's, comparable revised national averages were calculated back to 1923. The national averages shown here are those estimated by price relatives for 1890–1915, simple averages of quotations from all cities for 1916–1922, and weighted city averages beginning with 1923.

Food price data were collected by use of mail schedules and occasional personal visits until 1934. Since that year, all prices have been collected by personal visit of BLS representatives. Changes in descriptions for the foods priced, the cities covered, sizes and designs of samples of stores, and methods of processing introduce some noncomparabilities into the series. However, the only change, which is significant on a national basis, is the change in the description of the commodity.

The BLS publications have regularly included actual prices for individual nonfoods only for fuels, gas, and electricity. For review of retail prices available for articles other than foods and fuels, see BLS Bulletin No. 1182, *Average Retail Prices: Collection and Calculation Techniques and Problems*, pp. 90–105.

E 161, flour. Prices are for general all-purpose white wheat flour. The size of package on which quotations were secured were: 1890–1928, 1/8 or 1/4 of a barrel although some smaller units were also included; 1929–1938, 12 or 24 lb. sack; 1939–1942, 5-12 lb. sack; 1943–1957, 5 lb. sack.

E 162, bread. Prices are for white bread, pan style excluding all specialty type bread. For 1913–1936, prices were obtained from bakeries for 16 or 18 ounces in the dough and converted to 16 ounces baked weight. Both wrapped and unwrapped breads were included. Beginning in 1937, prices have been obtained primarily from grocery stores for the volume-selling size loaf of wrapped bread. The baked weight as given on the wrapper or reported by the store was converted to 16 ounces.

National averages have not been computed for 1890–1913. Prices for individual firms are available in the early retail price bulletins.

E 163, round steak. For 1890–1939, the averages include quotations for the best cut of the best grade handled in each store for whole round or top round, mostly bone-in. For 1940–1957, prices were for top round, bone-in, U. S. choice grade (comparable to U. S. good grade prior to the changes in grades by the Department of Agriculture in 1950).

E 164, chuck roast. For 1913–1939, quotations were reported for the best cut of the best grade handled in each store and include both bone-in and boneless. Since then, all quotations have been for "bone-in" roasts. The grade priced for 1940–1957 was the same as for round steak. Beginning in 1951, the more precise description of the cut was "blade pot-roast cut from upper part of shoulder before rib roast and behind neck, U. S. choice, bone-in."

National averages have not been computed for 1890–1913. Prices for individual firms are available in the early retail price bulletins.

E 165, pork chops. For 1890–1935, quotations were for loin chops of the best grade handled. Rib chops and chops from the thick end of the loin were excluded. Beginning in 1935, prices were obtained for center cut loin chops of U. S. No. 1 grade.

E 166, bacon. Most of the quotations included in the average were for sliced bacon for all years. In the early years (probably before 1930) bacon was sliced when sold and prices for slab bacon may be included. Sliced and packaged bacon has been priced since about 1930 in 1 pound or two ½ pound packages of cellophane or similar material. Grade descriptions were: 1890–1942, best but not fancy grade; 1943–1945, first quality or fancy grade; 1946–1957, standard Grade A.

E 167, butter. All prices refer to creamery butter, 92 to 93 score or better for 1890–1942 and 92 score for 1943–1957. Tub or print butter was priced up to 1940, roll or print in 1941 and 1942, package of 4 sticks or quarters for 1943–1946, and package print or roll, including quarters for 1947–1957.

E 168, eggs. Averages are for fresh eggs for all years. For 1890–1942, prices are for the highest grade sold in volume in each store; for 1943–1944, U. S. extras or Grade A; for 1945–1952, the highest grade and size sold in volume in each store; since 1953, large Grade A eggs in most cities, although some ungraded eggs included in some small cities.

E 169, milk, delivered. Until 1935, prices are for fresh fluid milk, raw or pasteurized, no grade designation, in quart bottle or in bulk, delivered to homes; for 1935–1946, raw or pasteurized milk of the dominant grade in each city in quart bottles or cartons; for 1947–1949, same grades, but sizes included 1-quart, 2-quart, and 4-quart containers in many cities; for 1950–1956, pasteurized milk, homogenized or nonhomogenized, without Vitamin D, of the volume-selling grade in each city in quart or half-gallon cartons or bottles; for 1957, pasteurized, homogenized milk with Vitamin D added, 3.25 percent or over butterfat content in quart or half-gallon cartons or bottles.

E 170, oranges. California and Florida oranges of the variety and size constituting the bulk of sales each month were quoted from 1919 to about 1935. After that time, the size range was narrowed to include only size 176–222 in standard box of U. S. No. 1 grade (good quality).

E 171, potatoes. White or Irish potatoes, excluding large baking types, have been priced consistently for all years in

Digitized by Google

the quantities in which sales have customarily been made. The designation of U. S. No. 1 grade was added in 1935.

E 172, tomatoes, canned. The volume selling brands of canned tomatoes, standard grade, in No. 2 can were priced for 1919–1954. For 1955–1957, the description was expanded to specify "small and large pieces, with a maximum of 50 percent liquid, standard grade (C)" and the can size was changed to No. 303. Prices for 1919–1954 have been converted to No. 303 can.

E 173, navy beans. Dried beans, white, navy, or pea beans, No. 1 choice, hand picked, packaged or bulk were priced for 1915–1957. For 1949–1952, California small white beans were also included and for 1953–1957, Great Northern beans.

E 174, coffee. For 1913–1956, whole bean or ground roasted coffee was priced. Bulk or packaged coffee was quoted up to 1938. For 1939–1955, coffee in cans, glass, cardboard, or paper containers were averaged. For 1956 and 1957, prices are for ground roasted coffee in airtight cans only.

E 175, margarine. Prices are for uncolored oleomargarine, animal and vegetable, in 1-pound cartons for 1919–1948. For 1949 and 1950, uncolored vegetable margarine in 1-pound carton was quoted. For 1951–1957, averages are for colored vegetable margarine in 1-pound cartons.

E 176, sugar. Prices are for white granulated cane or beet sugar but the size package has varied over the years. For 1890–1916, prices for the volume-selling quantity were quoted; for 1917–1928, 1 pound; for 1929–1942, 10 pounds; and for 1943–1957, 5 pounds. For a short period during World War II, the 2-pound unit was the only one available.

E 177–185. General note.

The collection of retail prices for fuel and light was initiated in 1911 with coal and gas data for 1907–1911. After that time, the program was expanded to include gas, electricity, and the heating fuels used in important quantities in the cities covered. Prices were collected semiannually up to 1920, and at quarterly or monthly intervals from 1920 on.

The number of cities for which prices for this group have been compiled has varied widely. Before 1947, the city coverage had gradually been extended until prices for fuels and utility rates were obtained in 51 cities. In 1947, this program was cut back to the 34 cities in the CPI. The revision of the CPI in 1952 resulted in changing the city sample and enlarging the number to 46 cities.

The changing importance of particular kinds of fuel in particular localities, coupled with the over-all change in the city sample over the years, produced many changes in the volume of data for the indexes. The amount of supplementary information for deriving weights has also varied. In order to produce continuous index numbers, all changes in samples and methods of averaging were handled by the linking process.

All prices have been collected by mail from retailers and utility companies in each city, except that reports for electricity have been secured through the Federal Power Commission since 1987.

The terms of sale for the quotations were net cash payment basis, delivered to the residential consumer in specified quantities. Charges for special services were excluded but all applicable sales taxes were included. Annual averages were computed using standard BLS procedures.

The following bulletins contain the history of the collection and publication of prices for this group: BLS Bulletin No. 664, *Changes in Retail Prices of Electricity, 1923–38*, pp. 17–19; BLS Bulletin No. 628, *Changes in Retail Prices of Gas, 1923–36*, pp. 48–52; BLS Bulletin No. 950, *Residential Heating Fuels: Retail Prices, 1941–48*, pp. 1–4. These reports contain references to earlier bulletins and include other index and price series.

E 177. Indexes of retail prices of electricity for household use, composite, 1913–1957.

Source: BLS, *Retail Price Indexes of Fuels and Electricity, January 1935–December 1957* (issued September 1958).

See also general note for series E 177–185.

This composite is an extension backward of a current BLS series. For 1913–1934, the index is based on the average price per kilowatt-hour for the average amount of electricity used by families in each of the 32 cities included in the CPI. Average prices for the 32 cities were combined as simple averages.

In 1938, a new method of computation for the revised CPI was inaugurated, and data were extended back to 1935. Net monthly bills for typical residential services were calculated from rate schedules for each city. The number of cities in the composite included 34 cities for 1935–1952, and 46 cities for 1953–1957. Some changes were also made in the typical services. For 1935–1952, bills were based on 25, 40, 100, and 250 kilowatt-hours. Since December 1952, 3 services have been priced, 40, 100, and 200 kilowatt-hours.

The net monthly bills for the typical services above were first combined into an index for each city by using weights approximating the importance of each of the services in that city. The city indexes were then combined with the consumption and population weights of the CPI.

E 178. Indexes of retail prices of electricity for household use, 100 kilowatt-hours, 1923–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

This index is based on net monthly bills for one of the typical services included in the composite, series E 177. When the new method of calculation was inaugurated in 1938, net monthly bills were obtained from rate schedules supplied by the companies or in BLS files. The indexes were originally calculated on the 1923–25 base and converted to later base periods when the CPI was revised.

For 1923–June 1947, the cities in the series totaled 51 (including the 34 CPI cities). Thereafter, only CPI cities were included. The weights used for 1923–June 1947 represented the number of residential customers as of December 31, 1935. Since July 1947, the weights were the CPI consumption and population factors.

E 179. Indexes of retail prices of gas for household space heating, 1935–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

The use of gas for home heating grew in importance as additional pipelines made natural gas available to more and more cities. Although gas for space heating was not included in the CPI before 1953, a special study in 1943 provided information on the volume of sales for space heating as of 1940 and rate schedule data back to 1935 for cities in which gas was an important heating fuel. The number of cities included varied from 27 of the 51 cities for 1935–1946 to 16 of the 34 CPI cities for 1947–1952, and 28 of the 46 CPI cities for 1953–1957.

The price for each city was calculated as an average of the rates per therm in all of the heating rate blocks of the rate schedule, weighted by the total number of therms sold by the gas company in that rate block for residential heating. For 1935–1952, the average rates per therm for the various cities

Digitized by Google

were then combined, using total thermal sales for residential heating in each city as weights. After 1952, they were combined with consumption and population weights in the CPI.

E 180. Indexes of retail prices of gas for household uses other than space heating, all types, 1935–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

In 1935, BLS adopted the method of computing net monthly bills based upon a definite number of heat units (therms of 100,000 BTU each) for each of 4 selected services—10.6, 19.6, 30.6, and 40.6 therms. These 4 typical services were continued through 1952. For 1953–1957, net monthly bills for 10 and 25 therms were used. This method of calculating prices has provided a better measure of price changes since differences in heating values over time could be taken into account.

Indexes based on 10.6 and 30.6 therms back to 1923 and a description of the methods adopted in 1935 are included in BLS Bulletin No. 628, *Changes in Retail Prices of Gas.*

For the number of cities included and methods of combining monthly bills used, see text for series E 177.

E 181. Indexes of retail prices of manufactured gas for household uses, 10 therms, 1907–1956.

Source: 1907–1913, unpublished data compiled by BLS; 1935–1957, see source for series E 177.

See also general note for series E 177–185.

When price collection for gas was begun by the BLS in 1911, the majority of cities were served with manufactured gas. As a result of the increasing trend to the use of straight natural gas, the number of cities for which BLS obtained prices for manufactured gas declined from 35 out of 39 cities in 1911 and 42 of 51 cities in 1923, to none of the 46 cities in the CPI in 1957.

For 1907–1922, the index was based on simple averages of net prices per 1,000 cubic feet (approximately 5.3 therms) based on consumption of 3,000 cubic feet. For 1923–June 1947, the net monthly bill for 10.6 therms was computed for each city, and cities were combined using the number of residential customers as of December 1934. For July 1947–1956, prices were obtained for 10 therms and city averages were combined with the consumption and population weights of the CPI.

Annual averages were estimated from April figures for 1907–1920 and from quarterly figures for 1921–1951. Prices were collected monthly beginning in 1952.

E 182. Indexes of retail prices of natural gas for household uses, 10 therms, 1913–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

The increase in distribution of natural gas is reflected in the number of cities for which BLS obtained prices over the years. In 1913, 8 or 9 of 50 cities were using natural gas, 18 of the 50 were reporting natural gas prices by 1935, and by 1957, 33 of 46 cities then covered were being served with natural gas.

For 1913–1923, the index was computed from simple averages of net prices per 1,000 cubic feet (approximately 10 therms) based on consumption of 5,000 cubic feet. Net monthly bills for 10.6 therms were used for 1923–1952 and for 10 therms for 1953–1957. For the frequency of collection and the methods employed to combine city data, see text for series E 181.

E 183. Indexes of retail prices of Pennsylvania anthracite, stove size, 1913–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

Data for the early years by type of coal for each firm reporting were published in BLS Bulletin No. 105, *Retail Prices, 1890–1911.* Similar data for 1912–1917 are included in later issues of *Retail Prices.* Since the first collection, BLS has continuously obtained retail prices for all locally important fuels.

This index is based on average prices per net ton delivered at the curb or in the bin if there was no extra charge. Prices from dealers in each city have always been combined as a simple average for each city. For 1913–1928, city averages were also combined on an unweighted basis. Through a revision of method in 1936, city average prices for 1929–1952 were weighted by fixed weights based on anthracite shipments to each city by rail during the year ending July 1936. Beginning 1953, the city averages were combined with consumption and population weights of the CPI.

Cities for which anthracite prices were obtained varied partly because of change in consumer demand and partly due to CPI revisions. Generally the number of cities has declined until, at the end of 1957, only 8 of the 46 cities in the CPI were reporting prices for anthracite. (For complete listing through 1948, see BLS Bulletin No. 950, *Residential Heating Fuels*, p. 2.)

E 184. Indexes of retail prices of bituminous coal, all domestic sizes, 1913–1957.

Source: See source for series E 177 and E 183.

See also general note for series E 177–185.

For methods of collection and averaging of prices, see text for series E 183. Generally, the index was based on unweighted averages of all prices for all sizes and types of bituminous coal for 1913–June 1947, and on city averages weighted with CPI weighting factors for July 1947–1957.

E 185. Indexes of retail prices of No. 2 fuel oil for household use, 1935–1957.

Source: See source for series E 177.

See also general note for series E 177–185.

Retail prices of petroleum fuels were first collected in 24 cities beginning in 1937 and data were obtained back to 1935. Thereafter the number of cities was increased as fuel oil for heating became more important. Beginning in 1947, the city coverage was restricted to those included in the CPI and since that time has usually covered about 20 cities.

The prices from which the index was computed refer to prices per 100 gallons delivered in "the amount usually delivered at one time." No. 2 fuel oil has been priced continuously and for 1939–1947, No. 3 oil was also priced and included. Average prices for each city were simple averages of quotations from a sample of dealers. For 1935–1938, city averages were combined with CPI consumption and population weights. For 1939–1946, weighting factors to combine city averages were obtained from 1941 shipments to each city as measured by OPA rationing authorities. CPI weights were again employed after 1946 to obtain the U. S. averages.

E 186. Rent indexes (Warren and Pearson) for dwelling units in 5 large cities, 1860–1880.

Source: George F. Warren and Frank A. Pearson, *Prices*, John Wiley and Sons, New York, 1933, p. 267.

See also G. F. Warren and F. A. Pearson, *Wholesale Prices for 213 Years, 1720–1932*, Cornell University Agricultural Experiment Station, *Memoir 142*, Ithaca, New York, 1932, p. 27.

The method of calculating this index was not indicated. The rental data were obtained from the special report by J. D. Weeks, "Report on the Average Retail Prices of Necessaries of Life in the United States" in volume 20 of the Tenth Census of the United States, pp. 104–107.

National Income and Wealth

NATIONAL PRODUCT AND INCOME (Series F 1–157)

F 1–157. General note.

In broad terms, national product or its equivalent, national income, is a comprehensive measure of the Nation's total annual production of commodities and services. Only the end products of a year's economic activity are included. For example, since the output of bread is included, the output of wheat used in producing the bread is excluded. At any given time, national product may be measured as the sum of the value added in various forms of economic activity (agriculture, mining, manufacturing, etc.); as the total of the incomes accruing to persons supplying different productive factors (wages and salaries, profits, including undistributed corporate profits, etc.); or as the aggregate value of the final products of the economy (food, clothing, shelter, etc.). While each of these approaches yields the same total (given a consistent scheme of valuation), the component detail illuminates different facets of the process of production, distribution, and consumption of the Nation's output, and, hence, serves different uses. These three approaches, of course, do not exhaust the possibilities.

Changes in national product may be measured either in current prices or in prices of a given year. In the latter case, the change ideally reflects only the change in the real volume of commodities and services. Each of these two forms of valuation has its particular uses. For example, in a study of financial developments or market trends, the current price series is often preferable, while for analysis of consumer levels of living or national productivity, the constant price series is more appropriate.

It may be useful to indicate briefly some of the more general conceptual limitations of national product estimates. First, national product is primarily a measure of the output of the market economy. Only a few items of "income in kind" are included. The most important are the value of food and fuel produced and consumed by farm families and the rental value of owner-occupied dwellings. No account is taken of items such as the value of the housewife's services or of home repairs, home dressmaking, or noncommercial recreation. Since economic growth generally involves a progressive commercialization of such activities, the increase of national product reflects to some extent a transfer of production from the nonmarket to the market sector rather than a real growth in the total volume of production.

Second, there is no complete agreement on all of the goods that may properly be considered end products of the economy. National product, as ordinarily constituted, includes, among other things, all items of consumer expenditure. This leads to the inclusion of such things as expenditures on transportation to work and payments to labor unions, which the consumer may not consider end products in themselves, but rather a necessary means under modern industrial organization to secure the money income needed to obtain goods that do constitute the goal of economic activity, such as food, clothing, and recreation. Also, since national product typically includes all government expenditure for commodities and services, criticism has been voiced regarding the inclusion of war and defense goods and government services to business, such as police and fire protection for factories and warehouses. If this argument is accepted, national product measures would be viewed as overstating the growth of the final product of the economy over time, since these items tend on balance to increase in relative importance as the economy develops.

Third, because of the techniques used in adjusting for price changes, national product in constant prices fails to reflect fully changes in the quality of goods during economic growth. In contrast to the foregoing limitation, this one would tend to understate the growth of national product, since on the average, quality of products probably tends to improve over time.

Finally, national product may fail to measure accurately changes in the material level of living provided by economic activity, even when placed on a per capita basis, since the aggregate figures do not reflect changes in the distribution of income between rich and poor, in consumption needs arising from changes in the age composition of the population, or in man-hours spent in economic activity.

Despite these shortcomings of national product measures for historical analysis, there are wide areas of agreement on the proper means of constructing and interpreting such measures. Their usefulness in providing insights into the nature and growth of the economy is attested to by the wide acceptance of the figures.

Most of the series presented here are based on recent work. The principal works of comprehensive nature used are: Office of Business Economics, *U. S. Income and Output*, 1958, *National Income: 1954 Edition*, *A Supplement to the Survey of Current Business*, and *Survey of Current Business*, July 1957; Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, National Bureau of Economic Research, New York (forthcoming), and "Long-Term Changes in the National Income of the United States of America Since 1870," in International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure*, Income and Wealth Series II, Bowes and Bowes, Cambridge, 1952; John W. Kendrick, *Productivity Trends in America*, National Bureau of Economic Research, New York (forthcoming); and Raymond W. Goldsmith, Dorothy S. Brady, and Horst Mendershausen, *A Study of Saving in the United States*, vol. III, Princeton University Press, Princeton, 1956. Earlier works of historical nature are: Robert F. Martin, *National Income in the United States, 1799–1938*, National Industrial Conference Board, New York, 1939; Simon Kuznets, *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941, and *National Product Since 1869*, National Bureau of Economic Research, New York, 1946; *Enterprise and Social Progress*, National Industrial Conference Board, New York, 1939; Willford I. King, *The Wealth and Income of the People of the United States*, Macmillan, New York, 1915. A basic source for discussion of conceptual issues in the field is Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vols. 1-24, National Bureau of Economic Research, New York.

The extent of detail presented was limited by space requirements; greater detail is frequently available in the original source. No attempt was made to utilize estimates of

Digitized by Google

contemporaries available for the 19th century, since these figures have not yet been subjected to critical review in the light of modern concepts and techniques. (See George Tucker, *Progress of the United States in Population and Wealth in Fifty Years*, Press of Hunt's Merchants' Magazine, New York, 1843; Ezra C. Seaman, *Essays on the Progress of Nations*, Charles Scribner, New York, 1868; *Annual Report of the Commissioner of Patents for the Year 1848;* David A. Wells, *Our Burden and Our Strength*, Loyal Publication Society, New York, 1864; Edward Atkinson, *The Distribution of Products*, New York, 1885; and Michael G. Mulhall, *Industries and Wealth of Nations*, Longmans, Green, London, 1896.)

F 1–5. Gross national product, total and per capita, in current and 1929 prices, 1869–1957.

Source: Series F 1 and F 2, 1869–1873 to 1928, John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, New York (forthcoming); 1929–1945, Office of Business Economics, *Survey of Current Business*, July 1957, pp. 8–9; 1946–1957, Office of Business Economics, *U. S. Income and Output*, 1958. Series F 3, 1869–1945, John W. Kendrick (cited above); 1946–1955, computed by applying Kendrick's implicit price index for 1946–1955 to the revised gross national product figures in *U. S. Income and Output*, 1958. Series F 4, computed by dividing gross national product by population estimates in series A 1–2. Series F 5, computed by dividing Kendrick's current price series of gross national product by the constant price series.

Gross national product, as defined by the Department of Commerce, is the market value of the output of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for business and institutional consumption of durable capital goods. Other business products used up by business in the accounting period are excluded. The Nation's economy in this context refers to the labor and property supplied by residents of the Nation. Gross national product comprises the purchase of goods and services by consumers and government, gross private domestic investment (including the change in business inventories), and net foreign investment.

The current dollar estimates for 1929–1957 are the official estimates prepared by the Department of Commerce. For the years prior to 1929, the underlying estimates are those of Simon Kuznets, but they have been adjusted for 1889–1928 by John W. Kendrick to the same conceptual basis as the Commerce figures. The estimates for years before 1889 are in terms of the somewhat different Kuznets concept of gross national product. As is clear from the overlap values for 1889–1893, however, the quantitative difference between the two series is less than 5 percent for these early years. The specific nature of the conceptual differences is indicated below in connection with the discussion of series F 104–130. The constant dollar estimates at all dates are basically those of Simon Kuznets (see text for series F 131–157), but have been adjusted to the Department of Commerce concept for 1889–1955 by Kendrick, who prepared constant dollar estimates for the reconciliation items between the two series.

With regard to statistical reliability, the Commerce estimates are considered to be "subject to only a small percentage of error." The same is very likely true of the estimates for 1919–1928, but for the years prior to 1919 the margin of error widens noticeably. For further discussion of the margin of error in the early estimates, see text for series F 104–130.

F 6–9. Net national product, national income, personal income, and disposable income, in current prices, 1897–1957.

Source: 1897–1928, computed by adjusting the gross national product totals in series F 1 by the estimated values of the items accounting for the difference between gross national product and the given aggregate. (See the reconciliation among the aggregates in table I below.) The values of the reconciliation items are given in Raymond W. Goldsmith, Dorothy S. Brady, and Horst Mendershausen, *A Study of Saving in the United States*, vol. III, Princeton University Press, Princeton, 1956, pp. 435 and 441; 1929–1945, Office of Business Economics, *Survey of Current Business*, July 1957, pp. 10 and 11; 1946–1957, Office of Business Economics, *U. S. Income and Output*, 1958.

The following are definitions used by the Department of Commerce:

Net national product is the market value of the net output of goods and services produced by the Nation's economy. All business products used up by business in the accounting period are excluded. Net national product comprises the purchases of goods and services by consumers and government, net private domestic investment (including the change in business inventories), and net foreign investment.

National income (sometimes called national income at factor cost) represents the aggregate earnings of labor and property which arise from the current production of goods and services by the Nation's economy. Thus, it measures the total factor costs of the goods and services produced by the economy. Earnings are recorded in the forms in which they accrue to residents of the Nation, inclusive of taxes on those earnings. As such, they consist of the compensation of employees, the profits of corporate and unincorporated enterprises, net interest, and the rental income flowing to persons.

Personal income represents the current income received by persons from all sources, inclusive of transfers from government and business but exclusive of transfers among persons. Not only individuals (including owners of unincorporated enterprises), but also nonprofit institutions, private trust funds, and private pension, health, and welfare funds are classified as "persons." Personal income is measured on a before-tax basis, as the sum of wage and salary disbursements, other labor income, proprietors' and rental income, interest and dividends, and transfer payments, minus personal contributions for social insurance.

Disposable income is the income remaining to persons after the deduction from personal income of personal tax and nontax payments to general government.

The precise relations among the various national accounts aggregates for 1957 are presented below in table I.

Table I. Relation of Gross National Product, Net National Product, National Income, Personal Income, and Disposable Income: 1957

[In billions of dollars]

Item	1957
Gross national product	440.3
Less: Capital consumption allowances	37.7
Equals: Net national product	402.6
Plus: Subsidies minus current surplus of government enterprises	1.3
Less:	
Indirect business tax and nontax liability	37.6
Business transfer payments	1.6
Statistical discrepancy	.7
Equals: National income	364.0
Less:	
Undistributed corporate profits	9.4
Corporate profits tax liability	21.6
Corporate inventory valuation adjustment	—1.5
Contributions for social insurance	14.2
Excess of wage accruals over disbursements	
Plus:	
Net interest paid by government	6.2
Government transfer payments	19.9
Business transfer payments	1.6
Equals: Personal income	347.9
Less: Personal tax and nontax payments	42.7
Equals: Disposable personal income	305.1

Digitized by Google

Theoretically, net national product and national income are superior to gross national product as measures of the final output of the economy, since some duplication is involved by the inclusion in the latter of the production of fixed capital which serves merely for replacement purposes. However, the depreciation charges, taken as an approximation of the value of capital currently consumed in deriving net national product and national income, are largely in terms of original cost, and hence are on a basis of valuation not comparable to that of the gross production of fixed capital (see *National Income: 1954 Edition*, p. 43). In practice, therefore, the measures of the net product of the economy which are obtained are not fully satisfactory.[1]

While net national product and national income are both measures of current national production (ideally, free from the duplication involved in gross national product), they differ in the manner in which this production is valued. Conceptually, in net national product, current production is valued at market prices, while in national income, it is valued at factor costs, that is, at the cost of the capital and labor used in producing it. In practice, as table I shows, the principal difference between these two forms of valuation is indirect business taxes.

Personal income, which measures the actual current income receipts of persons from all sources, differs from the national income in that it excludes certain types of income which accrue in production but are not received by persons (for instance, the undistributed part of corporate profits) and, on the other hand, includes certain types of income which do not arise in current productive activity but constitute personal receipts (such as relief and unemployment benefits). Hence personal income, unlike the national product and national income aggregates, is not a measure of national production. Personal income net of taxes (i.e., disposable income) is the closest over-all statistical approximation to consumer purchasing power derived from current incomes.

The Department of Commerce figures (1929–1957) are believed to be subject to only a small percentage error. Personal income figures are more reliable than those for national income because the major items included in personal income (but not in national income) are reliable, and the exclusions either do not affect reliability or actually increase it.

Since the estimates for the period prior to 1929 were derived by adjusting the gross national product estimates in series F 1, the remarks concerning the reliability of the gross national product figures for this period apply to the present series also. The estimates for the items needed to move from gross national product to the other aggregates were made in a manner and from sources as closely comparable as possible with the Department of Commerce current figures. However, the estimates for these adjusting items "are probably affected by a larger margin of error for the period before 1929 than the Department of Commerce figures for the same items. . . . In addition, two adjustments were ignored altogether for the period before 1929 because no reasonable estimates could be made for them, viz, subsidies less current surplus of government enterprises and business transfer payments" (*A Study of Saving . . .*, vol. III, p. 424). However, these items are quite small at the present time, and were probably relatively less important prior to 1929.

[1] Unofficial estimates of depreciation valued on a basis comparable to that of the gross production of fixed capital are available for most years shown in these series. Cf. Raymond W. Goldsmith, Dorothy S. Brady, and Horst Mendershausen, *A Study of Saving in the United States*, vol. III, p. 437.

F 10–21. Value added by selected industries, and value of output of fixed capital, in current and 1879 prices, 1839–1899.

Source: Robert E. Gallman, "Commodity Output in the United States, 1839–1899," Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, New York (forthcoming).

Value added in agriculture, mining, manufacturing, and construction, though narrower in scope than national product, is the most reliable output series of fairly comprehensive coverage for the period prior to 1870. "Value added" is the value of output, at producers' prices, less the value of commodities consumed in production, at delivered prices. Viewed from the income side, it comprises for any given sector the sum of payments to factors of production (net income originating), payments made to noncommodity producing firms (including government, but excluding transportation), and depreciation. Generally speaking, the coverage of the total for the four sectors combined is fairly close to that for finished commodity output plus construction materials (see also text for series P 250–306). It differs from gross national product primarily in that it excludes the value of transportation and distributive services and of services to ultimate consumers, such as medical and educational services, and refers to the product produced within a given area rather than that accruing to the residents of the area.

The series for agriculture includes the value of food, fuel, and manufactures produced and consumed on the farm; that for mining excludes the output of precious metals mining; and that for manufacturing excludes home manufactures and the products of the independent hand trades. Forestry and fisheries are not covered in any of the series.

Estimates in constant prices were obtained for each sector as the difference between the constant price value of the output of the sector and the constant price value of the sector's purchases of materials.

The series on value of output of fixed capital covers the value of construction, manufactured producers' durables, and farm improvements. The value of repairs and maintenance is included only in the estimates for construction. Fixed capital produced by the independent hand trades—chiefly artisans' tools and agricultural implements—is not included. As noted in connection with the earlier series, the figures relate to output, not domestic use. Constant price estimates were obtained for construction by deflating the current price series by an index of the cost of labor and construction materials. For producers' durables, an index of selling prices was chiefly used, and for farm improvements, use was made of a series on acres of land improved.

In general, the principal sources were the Federal and State censuses of the period, but a wide range of additional materials was used either directly for the estimates or to test the results. Compared with the national product estimates for the late 19th century, the present series might be considered less reliable, because of the greater scarcity of materials at the earlier dates and the lower reliability of the census returns. On the other hand, restriction of scope to the commodity sectors would tend to improve reliability relative to the national product estimates, since the basic sources for the service estimates included in the latter are much less satisfactory than those for commodity output. The estimates for the different commodity producing sectors are believed about equally reliable, except that for construction which is substantially inferior to the others. Also, because of the greater relative importance of construction in the fixed capital series, it is less reliable than the value-added series for all sectors combined.

F 22–48. General note.

These series present distributions of total income or product by industrial origin. In obtaining such a distribution, the income originating in an industry is generally measured by summing employee compensation, income of unincorporated enterprises and corporate profits (both including adjustment for inventory valuation), and net interest. Because of statistical difficulties, rental income of persons is assigned wholly to the real estate industry, rather than to the industry of origin.

One of the most important uses of a distribution by industrial origin is to indicate the changing importance of various productive activities in the economy. For example, such a distribution shows whether agriculture is growing or declining, and how it is changing relative to other sectors. However, certain qualifications must be attached to such an interpretation of the sector totals. In the distribution of employee compensation by industry, establishments are classified wholly in the industry that accounts for the principal part of their activity, even though they may perform other functions that should properly be classified in another industry. Thus, the distributive functions carried on by a manufacturing establishment are generally classified under manufacturing rather than under trade. Hence, shifts in the relative weights of different industrial sectors may reflect in part a transfer of activities from one sector to another rather than a change in the relative magnitude of the functions performed. An even greater departure from an activity classification occurs when corporate profits and net interest are distributed by industry. In this case, the distribution is based, because of statistical necessity, on the principal industrial attachment of the company, though the company may include establishments engaged in several industrial lines. Thus, the industrial distributions only approximate a true distribution by type of activity.

Aside from this, changes in the relative importance of the income totals for different industrial sectors may reflect not only changes in the relative magnitude of different productive activities, but also differential movements in the prices received for products or the prices paid for material and service inputs. However, in series F 44–48, which present a constant dollar distribution by industrial origin, the influence of differential price movements has been removed, though unfortunately this adjustment is presently possible for only a few sectors. For an analysis of the difference between the current and constant dollar distributions, by industrial origin, see Simon Kuznets, "Long-Term Changes in the National Income . . . Since 1870" . . . , pp. 92–106 (for complete citation, see source for series F 34–43).

A distribution by industrial origin may also be viewed as an approximation to the incomes of groups in the population attached to particular industries. For this purpose the current dollar figures are more appropriate than the constant dollar figures, though adjustment of the current dollar figures for cost-of-living differences among the various groups would be still more satisfactory. On the other hand, there are important limitations that should be kept in mind in attempting to identify the income of a group in the population with the income originating in an industry. For example, while farmers draw most of their income from agriculture, they may also receive income from part-time employment or investments outside agriculture. Conversely, some income originating in agriculture, such as interest paid on mortgages held by nonfarm landlords, may be paid to persons not engaged in farming. Indeed, for property income in general (profits, interest, and rent), identification of the income originating in an industry with a particular social group is difficult, because those persons to whom property income is important are likely to receive income from diverse industrial sources and are not likely to depend on a single industry. Finally, the income shares of the various industries are shown before deduction for personal and, for 1929–1957, corporate income taxes. These taxes have a differential effect on the various sector totals.

F 22–33. National income, by industrial origin, in current prices, 1929–1957.

Source: 1929–1945, Office of Business Economics, *National Income: 1954 Edition, A Supplement to the Survey of Current Business*, pp. 176–177; 1946–1957, *U. S. Income and Output*, 1958.

The income total used in this distribution is that of national income (see text for series F 7). The industrial classification follows closely that of the Standard Industrial Classification Manual published by the Office of Statistical Standards of the Bureau of the Budget. For a comparison of the classification used in the national income accounts and the Standard Industrial Classification, see *National Income: 1954 Edition*, pp. 66–68.

In the discussion of series F 49–54 below, it is noted that there are differences in the reliability of the estimates for various *types* of income, and, in particular, that the estimates for proprietors' income and for rental income are of a much lower order of accuracy. This information may be used to draw some inferences concerning the relative accuracy of the industry estimates, since, generally speaking, the estimates for those sectors in which the least reliable types of income bulk large will be lowest in statistical accuracy. Accordingly, the estimates for the construction, trade, and service sectors should be considered least reliable, since in each of these, proprietors' income accounts for a disproportionately large share. The estimate for the sector labeled "finance, insurance, and real estate" should also be included in this category, because rental income is of preponderant importance. The most reliable estimates are those for mining, manufacturing, transportation, communications and public utilities, and government, while those for agriculture would probably rank somewhat below these, but noticeably above the least reliable group.

F 34–43. Percent distribution of national income or aggregate payments, by industry, in current prices, 1869–1948.

Source: Simon Kuznets, "Long-Term Changes in the National Income of the United States of America Since 1870," in International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure*, Income and Wealth Series II, Bowes and Bowes, Cambridge, 1952, p. 89.

The basic estimates used in deriving this series are those of Robert F. Martin, *National Income in the United States, 1799–1938*, National Industrial Conference Board, New York, 1939; and Simon Kuznets, *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941. The Kuznets series was extended through 1948 on the basis of appropriately adjusted Department of Commerce figures.

This measure of income originating in an industry differs somewhat from that employed in the Department of Commerce estimates, series F 22–33, corporate taxes having been excluded and interest on government debt included. Also, in the Martin series on "aggregate payments," undistributed corporate profits are not included. Hence, aside from variations in statistical technique and sources, the income totals differ somewhat for the years where the three sets of estimates overlap.

Also, there is some variation in industrial classification. The finance and miscellaneous category in the National Bureau of Economic Research estimates includes items such as income originating in fisheries and in bus, truck, and air transportation, and dividend and interest flows from the rest of the

Digitized by Google

world. In the Martin estimates this category also includes income from fisheries and the net international flow of interest and dividends, as well as income from miscellaneous professional occupations, such as the clergy, and from the hand trades. (In the other two sets of estimates these last two categories are classified in the service sector.) Also, in the Martin estimates shown in the last three lines of series F 34–43, rents are distributed among the various industries, whereas, in the estimates for all other years they are classified under the "finance" sector.

The comments made above in connection with series F 22–33 regarding variations in the statistical reliability of the estimates for the different sectors are relevant here. (See also *National Income and Its Composition, 1919–1938*, pp. 509–523.) Also, the Martin estimates, particularly for the dates prior to 1899, should be considered of a definitely lower order of reliability.

F 44–48. Gross domestic product originating in private farm and nonfarm sectors and government, in 1929 prices, 1869–1955.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, New York (forthcoming).

Gross domestic product in series F 44 differs from gross national product in series F 3 in that the former excludes net factor income from abroad. Thus the return on capital located abroad but owned by United States residents is excluded, while the income from capital owned abroad but located in this country is included. However, the quantitative difference between the two series is not great.

Kendrick derived these estimates as follows: Gross national product in constant prices, as given in series F 3, was adjusted by a constant price estimate of net factor income from abroad to obtain gross domestic product. A constant dollar estimate of gross farm product was derived as the difference between constant dollar estimates of the total value of farm output and of the value of intermediate products consumed. This procedure is preferable to the more common one of taking the physical outputs of an industry and weighting them by unit values in the base year. The latter procedure yields a measure that includes purchases from other industries, and the figures for a number of industries cannot be summed without duplication. For example, assume that the output of artificial fertilizers was to increase and to cause higher yields in agriculture; the effect on the combined output of agriculture and manufacturing (which would include the manufacture of artificial fertilizers) would be exaggerated if the individual sector estimates were derived without allowance for changes in the constant dollar value of purchases from other sectors.

"Farm" as used in series F 46 differs slightly from "agriculture" in series F 23 in that F 46 excludes agricultural services, forestry, and fisheries.

Gross government product, in accordance with present Department of Commerce concepts, consists of a deflated series on compensation of general government employees. The deflation procedure used does not allow for changes in the productivity of these employees.

Gross private product was obtained as the difference between gross domestic product and gross government product. Gross nonfarm product is the difference between gross private and gross farm product.

The reliability of gross domestic product is essentially the same as that of gross national product, from which it was derived (see text for series F 1–5). While the estimates for farm and government product, the two directly estimated components, are probably less accurate, they are nevertheless based on fairly satisfactory sources, even for the earlier dates.

F 49–66. General note.

These series present distributions of total income by type of income (employee compensation, entrepreneurial income, interest, etc.). Perhaps the chief interest attaching to a distribution of this kind lies in the indication it may provide of the changing manner in which total income in the economy is divided between returns from labor and returns from property. However, the figures as given suffer from certain limitations for this purpose, one of the most important being that entrepreneurial income (including rental income) includes a return both on invested capital and on personal services. Also the income shares are before deduction for personal (and, in the case of series F 53 and F 59, corporate) taxes. Since these taxes have a differential impact on the several shares, it would sometimes be desirable to eliminate them.

Three other recent studies, drawing largely on the same sources as those used here, which present historical data on the distribution of income by type should be noted: Daniel Creamer, *Personal Income During Business Cycles*, Princeton University Press, Princeton, 1956, appendix A; George J. Schuller, "The Secular Trend in Income Distribution by Type, 1869–1948: A Preliminary Estimate," *The Review of Economics and Statistics*, vol. xxxv, No. 4, November 1953, pp. 302–324; and Edward C. Budd, "United States Factor Shares, 1850–1910," Conference on Research in Income and Wealth, *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, New York (forthcoming).

F 49–54. National income, by type of income, in current prices, 1929–1957.

Source: 1929–1945, Office of Business Economics, *Survey of Current Business*, July 1957, pp. 8-9; 1946–1957, *U. S. Income and Output*, 1958.

The following are definitions used by the Department of Commerce:

For the definition of national income, see text for series F 7. Compensation of employees represents the income accruing to persons in an employee status as remuneration for their work. From the employer's standpoint, it is the direct cost of employing labor. It includes wages and salaries, i.e., the monetary remuneration of employees commonly regarded as wages and salaries, inclusive of executives' compensation, commissions, tips, and bonuses, and payments in kind which represent income to the recipients. It also includes supplements to wages and salaries such as employer contributions for social insurance; employer contributions to private pension, health, and welfare funds; compensation for injuries; directors' fees; pay of the military reserve; and a few other minor items of labor income.

Income of unincorporated enterprises represents the monetary earnings and income in kind of sole proprietorships, partnerships, and producers' cooperatives from their current business operations other than the supplementary income of individuals derived from renting property. Capital gains and losses are excluded and no deduction is made for depletion. An inventory valuation adjustment is included, which measures the excess of the value of the change in the volume of inventories, valued at average prices during the period, over the change in the book value of inventories. The adjustment is required because income of unincorporated enterprises is taken inclusive of inventory profit or loss, as is customary in business accounting, whereas only the value of the real change in inventories is counted as current output in the national product.

Digitized by Google

Rental income of persons represents the monetary earnings of persons from the rental of real property, except those of persons primarily engaged in the real estate business; the imputed net rental returns to owner-occupants of nonfarm dwellings; and the royalties received by persons from patents, copyrights, and rights to natural resources.

Corporate profits before taxes represent the earnings of corporations organized for profit which accrue to residents of the Nation, measured before Federal and State profit taxes, without deduction of depletion charges and exclusive of capital gains and losses. In most major respects, the definition of profits is in accordance with Federal income tax regulations. As in the case of income of unincorporated enterprises, an inventory valuation adjustment has been made in order to eliminate inventory profits.

Net interest represents total interest (monetary and imputed, private and government) accruing to United States persons and governments, minus total interest paid by United States governments. The imputed interest component of net interest is measured in general as the excess of property income received by financial intermediaries from funds entrusted to them by persons over property income actually returned in monetary form by these intermediaries to persons.

The figures are official Department of Commerce estimates. The relative accuracy of the various series as evaluated by the Department is, in terms of decreasing reliability: Employee compensation, corporate profits before taxes, net interest, income of unincorporated enterprises, and rental income. In particular, "the entrepreneurial income estimates [including rental income] are subject to significant shortcomings when compared with the other income shares."

F 55–60. Percent distribution of national income, by type of income, in current prices, 1900–1952.

Source: D. Gale Johnson, "The Functional Distribution of Income in the United States, 1850–1952," *Review of Economics and Statistics*, vol. xxxvi, No. 2, May 1954, p. 178.

The definitions for series F 55–60 are the same as those for series F 50–54, except that prior to 1929 corporate profits before taxes (series F 59) does not include an inventory valuation adjustment, and income of unincorporated enterprises (series F 57) includes one only for farm income. Also, imputed interest is not included in the series used to extrapolate the Department of Commerce estimates of net interest prior to 1929.

The underlying figures were prepared by D. Gale Johnson, who carried the Department of Commerce estimates (series F 49–54) back to 1900 on the basis of Kuznets' estimates for 1919–28; King's for 1909–1918; Martin's for 1899–1908; and certain other sources. (Simon Kuznets, *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, New York, 1941; Willford I. King, *The National Income and Its Purchasing Power*, National Bureau of Economic Research, New York, 1930; and Robert F. Martin, *National Income in the United States, 1799–1938*, National Industrial Conference Board, New York, 1939.)

The procedures followed are summarized by Johnson as follows:

> For the period 1910–28 the Bureau of Agricultural Economics' estimates of farm operators' income is used. The estimate of corporate profits is taken from a series of net profits after taxes published by the National Industrial Conference Board, to which is added the amount of corporate taxes paid. Kuznets' series for wages and salaries, nonfarm entrepreneurial income, and rent were accepted as published for 1919–28. His interest series is substantially below that of the Department of Commerce after interest paid by governments is eliminated. It was linked with the Department of Commerce series in terms of average relationship for the period 1929–38. The estimates of King for 1909–18 and Martin for 1899–1908 were adjusted in a similar fashion.

The evaluation of the relative accuracy of series F 50–54 applies also to the present series, though for the years prior to 1929, and particularly before 1919, the general level of reliability of all series is less than for the later period. For 1929–1952, there may be minor discrepancies between the percentage distribution shown in series F 55–60 and those derived from series F 49–54, since the latter series incorporate some recent revisions.

F 61–66. Percent distribution of aggregate payments, by type of income, in current prices, 1870–1948.

Source: See source for series F 34–43, p. 136.

These series provide a somewhat longer historical perspective on the trend in the distribution of income by type, chiefly by drawing on an earlier study by Willford I. King, *The Wealth and Income of the People of the United States*, Macmillan, New York, 1919. However, the reliability of these earlier figures is uncertain, as is clear from the following statement accompanying presentation of the table in the source:

> [The following table] assembles the information available on [the] distribution of aggregate payments by type for the period under consideration. W. I. King's figures are of somewhat doubtful usefulness in this connection, since the treatment of corporate and government savings is not clear from his analysis, and the statistical basis for the estimates is quite thin. Although Martin's figures are on a somewhat more secure basis, the differences in level between [the overlap values for 1909–1918] indicate lack of comparability with the more acceptable estimates for recent decades. One must, therefore, pick one's way with caution in any attempt to infer long-term changes in the distribution of income payments by type.

These series are based on a somewhat different aggregate than those in series F 49–54 and F 55–60, the most important difference being that the "aggregate payments" concept includes only corporate dividends rather than corporate profits before taxes. Hence, corporate profits tax liability, undistributed corporate profits, and the corporate inventory valuation adjustment are all excluded from the total underlying series F 61. In addition, the interest series includes government interest and excludes imputed interest (though in bringing the National Bureau of Economic Research series up to date by means of the Department of Commerce data, the first three entries in series F 65, a series including imputed interest was used). With regard to the remaining three series (employee compensation, entrepreneurial income, and rent), the underlying concepts correspond closely to their counterparts in series F 50, F 51, and F 52, though the statistical procedures followed differ somewhat.

F 67–157. General note.

These series provide a summary view of the end products of the economy. From these data one can determine, among other things, to what extent the annual flow of production took the form of consumers' goods, on the one hand, and capital goods, on the other. In addition, one can examine the composition of the flow of goods to consumers (in terms of broad categories such as services, nondurable goods, and durable goods), and of capital formation, classified according to types such as construction, producers' durable equipment, etc.

F 67–86. Gross national product, by major type of product, in current prices, 1929–1957.

Source: 1929–1945, Office of Business Economics, *Survey of Current Business*, July 1957, pp. 8–9; 1946–1957, *U. S. Income and Output*, 1958.

The following are definitions used by the Department of Commerce:

For the definition of gross national product, see text for series F 1–5. Personal consumption expenditures (series F 68) represent the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. It includes the rental value of owner-occupied houses but does not include purchases of dwellings, which are classified as capital goods. Consumer durable commodities are generally defined as those having an average

Digitized by Google

life of 3 years or longer. Gross private domestic investment (series F 72) consists of acquisitions of newly produced capital goods by private business and nonprofit institutions and of the value of the change in the volume of inventories held by business. It covers all private new dwellings, including those acquired by owner occupants. Producers' durable equipment is defined in terms of items having an average life of one or more years. Net foreign investment (series F 80) is the net change in international assets and liabilities, including the monetary gold stock, arising out of the current international flow of goods and services, factor incomes, and cash gifts and contributions. Government purchases of goods and services (series F 81) measures purchases of goods and services by government bodies, exclusive of acquisitions of land and used depreciable assets and of current outlays of government enterprises. It consists of general government expenditures for compensation of employees, purchases from business (net of sales by government of consumption goods and materials), net government purchases from abroad and international contributions, and the gross investment of government enterprises. Transfer payments, government interest, subsidies, and loans are excluded. Federal national security expenditures include, in addition to national defense outlays, expenditures for international security and foreign relations (other than military assistance) and promotion of the merchant marine.

The figures are official Department of Commerce estimates. With regard to the relative accuracy of the different product series, the Department states that government purchases of goods and services, particularly Federal Government purchases, is highest on the scale of reliability, while the change in business inventories (which includes an inventory valuation adjustment) is lowest. Lying between these extremes are, in order of decreasing accuracy: Producers' purchases of durable equipment and personal consumption expenditures for durables and nondurables; personal consumption expenditures for services; and new construction. While the estimate of net foreign investment is based on a good deal of statistical information, it is nevertheless liable to substantial percentage error because it is derived as the difference between much larger numerical values.

F 87–103. Gross national product, by major type of product, in 1954 prices, 1929–1957.

Source: Office of Business Economics, *U. S. Income and Output*, 1958.

These series present estimates in 1954 prices for most of the current price series presented in series F 67–86. The general procedure followed by the Department of Commerce was to divide the current price figures (organized in a product breakdown much finer than that shown in series F 67–86) by appropriate price indexes based on 1954 = 100. The price indexes used in deriving the 1954 price estimates do not generally allow for quality change. Therefore, the constant price figures do not reflect part of the secular quality improvement in the economy. Also, the present series overstate somewhat short-run fluctuations in output, because available price information understates effective short-run fluctuations in prices. The choice of a recent year price base rather than an earlier year base (for example, 1929) to derive the constant price estimates tends to reduce somewhat the magnitude of the long-term growth in gross national product.

F 104–130. Gross and net national product, by major type of product, in current prices, 1869–1931.

Source: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, National Bureau of Economic Research, New York (forthcoming).

The difference between the gross national product series presented in series F 104 and the Department of Commerce series in series F 1 and F 67 is primarily conceptual, and relates almost wholly to the treatment of government in the estimation of national product. In series F 104, government purchases of goods and services is omitted as a component of gross national product. However, an estimate of government services to consumers is added to personal consumption expenditures to obtain an estimate of "flow of goods to consumers" and government capital formation (consisting of both war and nonwar public construction, purchases of durable equipment including durable munitions, and the change in the stock of monetary metals) is added to private capital formation. In addition, series F 104 excludes from flow of goods to consumers and from gross national product the imputed value of unpaid services of financial intermediaries.

The effect of these adjustments is to yield a lower aggregate for gross national product, chiefly because government expenditures which are considered not to take the form of services to consumers or capital formation are omitted from the total. In effect, these omitted expenditures are treated as yielding intermediate services that facilitate the flow of goods to consumers or capital formation, but do not in themselves constitute final products; just as the production of wheat contributes to the production of bread but is not counted as a final product in addition to bread. For the earlier years, the quantitative difference between the two series (F 1 and F 104) arising from this conceptual difference is fairly small, but for the most recent decades it would be quite large, because of the great relative expansion in Government expenditures for military and defense purposes, which in the Kuznets concept are largely excluded from the total.

Net national product differs from gross national product in that an allowance for capital consumed during the year in the process of production has been deducted from the gross national product total. In the present case, capital consumption, both private and public, is valued at reproduction cost. Thus, a piece of equipment used up during the current year is valued at the current cost of replacement, irrespective of the original cost of the equipment. In addition, the capital consumption estimate includes an allowance for depletion of natural resources.

The differences between the present series and the Department of Commerce series with regard to the major components (that is, between personal consumption expenditures and flow of goods to consumers, and between gross private domestic investment and private and public capital formation) have been indicated above in the discussion of the differences in the gross national product concepts. Consumer perishables, semidurables, and durables are commodities that, without marked change and retaining their essential physical identity are ordinarily employed, respectively, less than 6 months, from 6 months to 3 years, and more than 3 years. Because of differences, usually minor, in the scope or method of derivation of the figures, the estimates presented here differ somewhat from those for apparently comparable categories (such as consumers' durables) in series F 67–86.

With regard to the statistical reliability of the estimates, the following quotation, relating to decade rather than the quinquennial averages presented here, is relevant:

> For the comprehensive totals of national product and their major components, such as flow of goods to consumers, gross value of producer durables, gross construction, the maximum error in the estimates for the decades before 1919 can be said to be 15 percent; for the later three decades [1919–28, 1924–38, 1929–38] less than 10 percent. The maximum errors may be somewhat larger for the various categories of the flow of goods to consumers; and, on a percentage basis, much larger for the net totals—net producer durables, net construction, changes in inventories, changes in claims against foreign countries, particularly the last two.

Digitized by Google

> Owing to possible shortages in the underlying data or errors inherent in some of the assumptions, the comprehensive totals for the 1869–78 decade may be understated by as much as 10 percent; for the 1874–83 decade by as much as 5 percent; for the subsequent decades through 1899–1908 by as much as 2 to 3 percent. (Simon Kuznets, *National Product Since 1869*, National Bureau of Economic Research, New York, 1946, pp. 85–86.)

This statement, though made with respect to an earlier set of estimates, is also applicable to the revised figures presented here, but since the present estimates refer to quinquennial periods, the allowance for maximum error should be increased.

F 131–157. Gross and net national product, by major type of product, in 1929 prices, 1869–1931.

Source: See source for series F 104–130.

See also text for same series.

These series are exact counterparts of series F 104–130, except that the estimates are expressed in 1929 prices instead of current prices.

The estimates were derived as follows: For commodity production, the current dollar estimates used in deriving series F 104–130, but in the narrowest categories that production statistics permitted, and at producers' prices, were deflated by price indexes for corresponding product groups. The resulting estimates of commodity output in 1929 prices were then adjusted upward by a constant ratio to allow for transportation and distributive margins, thus yielding commodity output at final cost to consumers. The current dollar estimates of services included in series F 104–130 were deflated by the implicit average price index for all consumer commodities, except in the case of rent, which was deflated by a specific rent index.

The discussion of margins of error with regard to series F 104–130 applies here also, except that the deflation procedure increases the possible error somewhat. In particular, since the price indexes used for deflation do not adequately allow for quality change or new goods, an element of downward bias is introduced that is not present in the current dollar estimates.

NATIONAL WEALTH AND SAVING (Series F 158–345)

F 158–251. General note.

The national balance sheet is derived by summing similar balance sheets for groups of transactors in the economy—nonfarm households, agriculture, unincorporated business, corporations, etc. The balance sheet of each group is in turn derived by summing the balance sheets of the constituent units, based as far as possible on a comparable valuation of assets and liabilities. In deriving the balance sheet, no creditor-debtor or owner-issuer relationships among units are eliminated; for example, the debts of households to corporations appear on one side as assets of corporations and on the other as liabilities of households. When all relationships among constituent units are canceled, whether these units be in the same or different groups, the balance sheet reduces to a national wealth statement. This statement shows only tangible assets plus the net balance of United States claims against foreign countries, in effect, consolidated net national worth. (In the series shown, the estimate for total tangible assets in the national balance sheet differs very slightly from that in the national wealth statement because of a minor disparity in the treatment of monetary metals.) Thus, the national balance sheet adds to the national wealth statement a comprehensive summary of the various types of financial obligations outstanding at a particular date, and provides perspective on the magnitude of financing activities in the Nation's economy.

The national balance sheet falls somewhat short of the goal of a comprehensive summary of the assets, liabilities, and net worth of all transactors in the economy, since, for lack of data, obligations among households are not included, and in the case of corporations with subsidiaries, the balance sheet of the parent company is used, thus eliminating relationships among the subsidiary units. In addition, intangibles such as goodwill and patent rights are excluded from the balance sheet. Finally, and this limits the comprehensiveness of the national wealth statement as well, inventories of nondurable goods in the hands of consumers, expenditures on soil improvement, subsoil assets, and military and naval equipment held by the government are omitted. Needless to say, no account is taken of the economic value of the stock of the Nation's human resources.

The value for "equity" in the national balance sheet exceeds total national wealth, that is, consolidated net national worth. This is primarily because in the balance sheet the net worth of the various constituent units are added together. For example, the net worth of a corporation is added to the net worth of the stockholders. In the national wealth statement, however, they are consolidated. That is, the outstanding stock of the corporation is canceled against the holdings of the owners, leaving only the net worth of the stockholders and the undistributed earnings of the corporations. Stated differently, the "equity" entry in the balance sheet includes the equity of intermediaries as well as of ultimate owners.

F 158–196. National balance sheet, in current prices, 1900–1955.

Source: 1900–1949, Raymond W. Goldsmith, et al., *A Study of Saving in the United States*, vol. III, Princeton University Press, Princeton, 1956, pp. 60–61; 1955, National Bureau of Economic Research, *Thirty-Seventh Annual Report*, p. 36.

The figures for 1955, which were prepared by Raymond W. Goldsmith and Morris Mendelson, represent preliminary estimates and in some cases are not fully comparable with those for earlier dates.

The national balance sheet is derived by summing similar balance sheets for various transactor groups in the economy—nonfarm households, agriculture, unincorporated business, etc. (see general note for series F 158–251). For most of these groups, however, balance sheets of the constituent units are nonexistent, so that in practice the group balance sheet is compiled from separate estimates of the various categories of assets and liabilities, net worth being derived as a residual. Only in the case of corporations and the Federal Government does a substantial proportion of the items come from their own financial statements.

The estimates presented are in current prices rather than original cost. Essentially this means that reproducible tangible assets are valued at reproduction cost, and nonreproducible tangible assets and intangibles at market value, though some intangibles, particularly short-term claims, are valued at par or face value.

In deriving the estimates, a problem sometimes arose because of a difference between two groups in the value at which the same item is carried on the balance sheet, a difference not attributable to bad debt reserves alone. Where this was the case, no attempt was made to force consistency. Both valuations were carried over into the national balance sheet on the appropriate sides. This, together with the treatment of net holdings of foreign assets and liabilities, principally accounts for differences between the asset and liability totals for certain intangible items; differences which are generally small compared with the balance sheet totals.

The following statement from the source bears on the reliability of the estimates:

> There is unfortunately no way of estimating the margin of error in the individual items of assets and liabilities and net worth, or in the balance sheet totals. This is due partly to conceptual difficulties, i.e., the difficulty of agreeing [as to] what should be regarded as the true figure for a given asset or liability of a given group at a given date, even if the basic principle of valuation at current prices is accepted. It also reflects the absence, in almost all cases, of benchmark or alternative estimates. The margin of error obviously is considerably lower for assets like cash, inventories, bonds, and farm and residential mortgages, and for the corresponding liabilities, than for items like structures and equipment, land, accounts receivable and payable, common stock, and interest in unincorporated business. The estimates of net worth, being derived as residuals, are of course particularly subject to error, and the more so, the smaller the proportion of net worth to total assets and liabilities. Similarly, the figures are as a rule more reliable—for the same class of assets or liabilities—for groups like corporations and agriculture, for which comprehensive balance sheets of some type have been available, than for nonfarm individuals, unincorporated business, personal trust departments, and governments, for which they have had to be developed practically from the ground up. Finally, the margin of error is undoubtedly smaller—again for the same group and type of asset or liability—for the last three benchmark dates [1939, 1945, and 1949] than for earlier dates. This statement, however, must be qualified by the fact that over-all national wealth statements, which provide valuable checks, exist for the first three benchmark dates, but are entirely absent for later ones.

The source provides considerable additional detail, in particular, balance sheets for separate transactor groups, such as nonfarm households, agriculture, etc., and makes it possible to trace the patterns of claims and counterclaims among the various groups.

F 197–221. National wealth, by type of asset, in current prices, 1850–1956.

Source: 1850–1900, Raymond W. Goldsmith, "The Growth of Reproducible Wealth of the United States of America From 1805 to 1950," International Association for Research in Income and Wealth, *Income and Wealth of the United States: Trends and Structure*, Income and Wealth Series II, Bowes and Bowes, Cambridge, 1952, p. 306 (estimates for 1805 presented in this publication have not been reproduced here because of questionable reliability); 1900–1945, see source for series F 158–196, pp. 14–15; 1949, 1956, preliminary estimates by Raymond W. Goldsmith, following the methods of *A Study of Saving in the United States*, vol. III; final estimates to be published by National Bureau of Economic Research.

The estimates for 1900 to the present were constructed by Goldsmith by means of the "perpetual inventory method." In this method, the stock of an asset in existence at a given point in time is estimated from annual output totals extending back over a period equal to the average life of the asset, the output total for every year being depreciated to the end of the period, and the results summed. The underlying estimates for 1850 appear in the Census Office, *Preliminary Report of the Eighth Census*, 1862, p. 195; and those for 1880, 1890, and 1900 in Simon Kuznets, *National Product Since 1869*, National Bureau of Economic Research, New York, 1946, pp. 202–215. In every case, the original estimates were adjusted by Goldsmith, that for 1880 substantially, to improve comparability with the estimates for 1900–1956. The basic sources for these earlier estimates were returns on stocks of various assets in the industrial censuses and censuses of wealth. Hence, there is a sharp break in the method of derivation between the earlier and later estimates. However, the figures for the overlap year, 1900, agree reasonably well. The figures for 1850 exclude the value of slaves.

The estimates for 1900–1956 are in "current prices," that is, each asset is valued at its replacement cost in the given year. This is preferable to valuation at original cost, whether depreciated or undepreciated. Assets appearing in the wealth statement for any given date were produced in different years, and since prices change from year to year, summation of original cost values would often result in an arithmetic aggregate without economic meaning. (However, totals in original cost are also given in *A Study of Saving in the United States*. . . .) For the estimates for 1850 to 1900, which are primarily from the Federal censuses, the basis of valuation is not always certain, and is not uniform among types of assets and among industries. It is possible that the figures may approximate either current market values or original cost, depreciated or undepreciated, or some combination of the two. Some assurance as to the comparability of the earlier and later sets of figures on this score is provided, however, by the overlapping values for 1900, though this comparison applies only to a single year.

As to the reliability of the estimates, the source (*Income and Wealth of the United States: Trends and Structure*, p. 264) states "that the margin of error in the estimates is substantial, amounting to hardly less than 10 to 20 percent at any date; that this relative margin increases as we go back in time; but that it is not at all certain that comparability is impaired by as much as the size of the margin may imply because the error probably tends in the same direction for most if not all benchmarks although it is likely that the understatement is more pronounced in the early part of the period than in the latter." With regard to the estimates for 1900–1956, derived by the perpetual inventory method, it is noted that "the most important source of error . . . resides in the estimates of expenditures on construction . . . ." (same source, p. 259). For some of the components of total wealth, the reliability is strengthened because of the possibility of checks against alternative estimates. "This is the case primarily for residential real estate, farm structures, inventories and international assets. . . . Checks are less satisfactory for nonfarm business structures and equipment . . . but the information provided in corporate balance sheets submitted to the Bureau of Internal Revenue assures us that the Perpetual Inventory estimates are not too far off the mark for the last 20 years. The only sectors of reproducible tangible wealth in which the Perpetual Inventory estimates can be subject to no checks, or to only very unsatisfactory ones, are consumers' durables and government fixed assets . . . ." (same source, pp. 260–261).

The same source also presents considerably greater detail (for example, annual estimates for 1896–1949). Estimates of national wealth by contemporaries are also available for various dates during the 19th century. See, for example, Samuel Blodget, Jr., *Economica; A Statistical Manual for the United States*, 1806 edition, and *Annual Report of the Director of the Mint, 1881*.

F 222–246. National wealth, by type of asset, in 1929 and 1947–49 prices, 1850–1956.

Source: 1850–1900, see source for series F 197–221, p. 307; 1900–1945, see source for series F 158–196, pp. 20–21; 1945–1956, see source for series F 197–221.

These estimates were derived by adjusting the current dollar figures for a given class of assets in series F 197–221 for the change in price or cost of construction of that type of asset between each year and the base year. Thus, conceptually, changes over time in the constant price value of a category of assets reflect changes in the physical stock of that asset and not in its value. For 1945–1956, a different base year was necessary because estimates in 1929 prices for the most recent years are not available. This shift in base years introduces some element of incomparability, since the relative weights of individual assets in the price index differ between the two years.

For 1900–1956, an attempt was made to adjust for price changes by fairly narrow classes of assets, using construction cost or price indexes referring specifically to the assets in each class. For 1880, 1890, and 1900, a more summary adjustment was used. Only three separate deflators were employed for construction (residential, other private, and farm), and a single deflator was used for all types of equipment. For 1850, the same price index (Snyder's index of the general price level) was applied to all types of structures and equipment, although for the adjustment of inventories the wholesale price index was used.

Goldsmith states that the conceptual significance of a constant price estimate for land is open to question. If land is carried for all dates at its absolute value in the base year, the relation to the constant price value of reproducible assets tends to become unrealistic, particularly at dates fairly far removed from the base year. In the present estimate, an alternative procedure is followed, a constant price value of land being derived, generally speaking, as a fixed proportion of the constant price value of structures. This permits derivation of a constant price series for aggregate national wealth, but it should be recognized that the deflated estimates of land values included in the totals cannot be conceived as reflecting changes in physical units alone.

The adjustment for price changes introduces errors in the estimates in addition to those discussed in connection with series F 197–221. On balance, any error is likely to lead to-

Digitized by Google

wards an overstatement of the price rise over the period and hence an understatement of growth rates because the techniques used in adjusting for price change fail to make adequate allowance for improvement in the quality of the assets, and there is no evidence that the error is larger for one part of the period than for another, although the possibilities of error are certainly greater in the 19th century than the 20th. In addition, it is likely that the failure to allow for quality improvement has a differential effect on the different components of wealth. In particular, it leads to a more serious understatement in the growth of components such as producer and consumer durables and livestock than for structures and inventories.

F 247-251. Value of stock of structures and equipment in specified sectors, in 1929 prices, 1880-1948.

Source: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, National Bureau of Economic Research, New York (forthcoming).

These estimates fall somewhat short of the value of all reproducible wealth in each sector, since the value of inventories is omitted, and considerably short of total wealth, since land is excluded. Also, data are not available for other business sectors; for example, trade and the service industries are omitted. However, it is estimated that the four sectors included here accounted for about 80 percent of the stock of structures and equipment in 1880.

The underlying sources of the estimates are three monographs prepared in connection with the National Bureau of Economic Research Study of Capital Formation and Financing: Alvin S. Tostlebe, *Capital in Agriculture: Its Formation and Financing Since 1870*, Princeton University Press, Princeton, 1957; Daniel Creamer, Israel Borenstein, and Sergei P. Dobrovolsky, *Capital Formation and Financing in Manufacturing and Mining* (forthcoming); and Melville J. Ulmer, *Capital in Transportation, Communication, and Public Utilities: Its Formation and Financing* (forthcoming). With the exception of the last monograph, the approach followed in deriving the estimates of capital stock differed rather noticeably from that chiefly employed in obtaining the figures presented in series F 197-246, since the basic data, such as census returns on capital or balance sheet items in *Statistics of Income*, related to stocks rather than output flows. Further detail on capital investment by type and/or minor industrial sector is given in these monographs.

F 252-345. General note.

Statistics of saving provide the link between the statements of national income or product, on the one hand, and the national wealth statement and balance sheet, on the other. Generally speaking, for the Nation as a whole, aggregate saving, which equals national income less national consumption, is identical with net national investment, and the latter, in turn, is equal to the change in real national wealth. For the individual economic unit, however, saving is equal not to the change in holdings of real assets, but to the difference between the change in total assets (both tangible and intangible) and total liabilities. The national balance sheet registers the effect of saving on the stock of intangibles as well as tangibles.

The link provided by the saving statistics is imperfect for both conceptual and statistical reasons. To note only some of the principal conceptual differences, there are, first, variations in the treatment of government. In the Department of Commerce estimates of income and saving, government investment and government saving are excluded, while in the Kuznets income estimates, and the Goldsmith saving and wealth estimates, Government saving and investment are included, though the Goldsmith estimates exclude military assets. Another important difference is in the treatment of consumer durables, which in both the Department of Commerce and Kuznets income estimates is not considered investment, but in the Goldsmith estimates of saving and wealth is so considered. Finally, there are important differences in the scope and valuation of capital consumption allowances. Beyond the conceptual differences, there are variations in the sources and techniques employed by the different estimators. The broad outlines of the relationships among the different social accounts can, nevertheless, be distinguished. In addition, the saving statistics throw important light on the nature of the different groups of savers in the economy and the forms that saving takes.

F 252-260. Gross private saving, in current prices, 1929-1957.

Source: 1929-1945, Office of Business Economics, *National Income: 1954 Edition, A Supplement to the Survey of Current Business*, pp. 164-165; 1946-1957, *U. S. Income and Output*, 1958.

The following are definitions used by the Department of Commerce:

Gross private saving represents the sum of series F 253-256 and F 260. Generally speaking, it is the total of household and business saving. Saving through government, including government insurance funds, is excluded. Household expenditures for consumer durables, except on residential construction, are not treated as saving. Series F 252 is "gross" in that it includes business capital consumption allowances and depreciation on residences.

Personal saving represents the excess of personal income over the sum of personal consumption expenditures and personal tax and nontax payments. It includes the current saving of individuals (including owners of unincorporated business), nonprofit institutions, and private pension, health, welfare, and trust funds. Personal saving may be in such forms as changes in cash and deposits, security holdings, indebtedness, and reserves of life insurance companies and mutual savings institutions, the net investment of unincorporated enterprises, and the acquisition of real property net of depreciation. Inventory profits and other capital gains are excluded.

Undistributed corporate profits represent the difference between corporate profits after tax and dividends. Corporate profits after tax are the earnings of corporations organized for profit which accrue to the residents of the Nation, measured after Federal and State profit taxes, without deduction of depletion charges and exclusive of capital gains and losses. Dividends measure cash dividend disbursements by corporations organized for profit to stockholders who are residents of the United States.

Corporate inventory valuation adjustment is the excess of the value of the change in the volume of nonfarm corporate business inventories, valued at average prices during the period, over the change in the book value of nonfarm corporate inventories.

Capital consumption allowances represent the sum of business depreciation charges, accidental damage to fixed business capital, and capital outlays charged to current expense.

Business depreciation charges are charges made by private business against receipts for the current consumption of durable capital goods and comparable allowances for nonprofit institutions. They include depreciation charges against owner-occupied houses. Depreciation reported by business is not adjusted for changes in the replacement value of capital goods, except for farm enterprises.

Accidental damage to fixed business capital represents the value of the physical losses by fire, natural events, and other

Digitized by Google

accidents to fixed capital of private business not covered by depreciation charges.

Capital outlays charged to current expense represent new construction and purchases of new durable capital goods included in gross private domestic investment (series F 72) that are charged as current expense by business rather than entered on capital account.

Excess of wage accruals over disbursements represents wages earned during the current period but not disbursed.

With respect to reliability of these estimates, the Department of Commerce notes that the margin of error in the estimates of gross private saving and its components tends generally to be high. Because personal saving is derived as the difference between two much larger totals, it is subject to large percentage error in both level and movement. Undistributed corporate profits is more accurate, but the corporate inventory valuation adjustment is liable to considerable error, so that the reliability of the two items combined is not high. Furthermore, while approximately half of the estimate for capital consumption allowances is based on fairly solid data, the remainder is estimated on the basis of a variety of sources and methods, and some of these are subject to a wide margin of error.

F 261–303. Individuals' saving, by components, in current prices, 1929–1957.

Source: 1929–1932, Irwin Friend and Vito Natrella, *Individuals' Saving*, John Wiley & Sons, New York, 1954, pp. 85 and 91 (except series F 293 for 1929–1932, Raymond W. Goldsmith, *A Study of Saving in the United States*); 1933–1957, Securities and Exchange Commission, records.

Conceptually, individual saving in series F 261 is identical with that in series F 253. However, the total is derived in an entirely different way. In the procedure followed in obtaining series F 261, referred to as the direct or balance sheet method of estimating saving, the total is derived by summing the changes in the various assets and liabilities of the economic units included in the personal sector. Since the reliability of the underlying components varies widely, it is not possible to state unequivocally that the total in series F 261 is subject to a smaller margin of error than that in series F 253. Rather the two series should be viewed as providing a reciprocal check, with the present series also presenting detail on the various types of saving. While the difference between the two series is substantial for a few dates, they are generally in fair agreement with regard to absolute amount.

The estimates for saving in the form of currency and deposits (including deposits in savings and loan associations) have a relatively small margin of error, while those for saving in the form of corporate and State and local securities probably have a greater margin of error. Generally speaking, the estimates for the earlier years, particularly 1929–1932, are subject to greater error than those for the later years. For a discussion of the limitations of the estimates for a number of the components, see the source (Friend and Natrella).

F 304–315. National saving, by major saver groups, in current prices, 1897–1945.

Source: Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, Princeton University Press, Princeton, 1955, p. 345 (saving, excluding consumer durables, computed by subtraction of estimates of saving in consumer durables for nonagricultural individuals, p. 359, and for agriculture, p. 756).

In contrast to series F 252–260, these series provide an estimate of saving by government (thus permitting the derivation of aggregate national saving), and estimates of personal saving subdivided among three major groups—nonagricultural individuals (including private nonprofit institutions and personal trust funds), agriculture, and unincorporated business. There are also some differences in the scope of the saving concept. While these estimates include all forms of saving covered in series F 252–260, they also cover saving in the form of consumer durables, and of brokers' and dealers' commissions and profits on change of hands of existing assets. In addition, in deriving these estimates of net saving, capital consumption allowances have been valued at replacement cost. Neither set of figures, however, includes saving in the form of soil improvement or additions to military assets. An important difference also exists between the two sets of estimates in the technique of derivation. The estimates in series F 252–260 were derived by the income approach; these figures, with the exception of those for corporate saving, were obtained by the balance sheet method. In this respect, they are similar to the estimates of personal saving presented in series F 261–303, though differences in techniques and in concept cause the actual estimates for personal saving to differ between the two tables, e.g. because of inclusion in series F 337 (but not in series F 289) of stock issues of small corporations not distributed by security dealers.

The following statement from the source (pp. 40–41) provides an indication of the reliability of the estimates:

> Evaluation of the possible errors in the individual series from which the estimates of group and national saving have been constructed indicates that the margin of error is hardly under 10 percent for any given year or for the average annual figure in any series, that it is probably in the order of magnitude of 20 to 30 percent in many of them, that it may run even higher in not a few cases, but that the relative margin of error in most cases is reduced for sequences of several years and generally the smaller the longer the period. . . .
>
> Most of the components utilized in building the estimates of saving of any of the major saver groups are statistically independent; and the estimates for the major saver groups are very largely independent of each other except for those of nonfarm households and unincorporated business enterprises. Accordingly since the number of components of saving is large for each of the groups, running to several dozen even if only those of substantial quantitative importance are taken into account, there is reason to assume that errors in one direction, i.e. overstatements or understatements of saving, made in any one year in some of the component series will be offset by errors in the opposite direction in other series. As a result, the relative error in the estimates of saving by the major groups, and still more the estimates of broad aggregates such as national or personal saving, may be expected to be considerably lower than the average of the relative errors in the component series. Indeed, it is quite possible that, if we take account of the number of independent component series and their relative size, and even take a pessimistic view of errors in constituent series, the relative error of national or personal saving in any one year does not on the average exceed something like 10 percent.
>
> The quality of most of the individual series used in the measurement of saving has undoubtedly improved. It would seem to be substantially poorer for the period before the thirties than for the last two decades, and within the earlier period, in turn, to be particularly poor for the years before approximately 1905. Nevertheless, there is no statistical evidence, such as might be provided by the difference between estimates of saving and investment, that the estimates of aggregate saving have larger relative errors in the earlier part of the period than in the later part. Indeed, from that point of view, the relative error in the estimates would have to be regarded as substantially the same through the thirties, and as considerably lower only for the last decade. There is, however, evidence . . . that the error is . . . in the direction of an overstatement of saving in the first three decades and an understatement during the thirties.

F 316–345. Personal saving, by major components, in current prices, 1897–1956.

Source: 1897–1945, see source for series F 304–315, pp. 353–355; 1946–1956, preliminary estimates by Raymond W. Goldsmith and Morris Mendelson, following the methods of *A Study of Saving in the United States;* final estimates to be published by the National Bureau of Economic Research.

See text for series F 304–315 regarding concept and reliability of personal saving estimates.

The estimates for 1946–1956 are not fully comparable with those for earlier years. The savings and loan association liability called loans in process and the surplus of mutual financial intermediaries are imputed to personal saving in the new estimates, though not in the earlier figures. Furthermore, in the estimates for the earlier years brokers and dealers were

Digitized by Google

not distinguished from other unincorporated businesses, and the estimates for the components of saving included the changes in the assets and liabilities of these brokers and dealers. In the new estimates, brokers and dealers are treated as financial organizations and personal saving through brokers and dealers is assumed to take the form of changes in equity in these organizations. Changes in loans in process, surplus of mutual financial organizations, and equity in brokers and dealers are all included in total personal saving (series F 316 and F 317), but not included in any of the components shown in series F 316–345. The data for these three forms of personal saving are given in the tabulation below.

There are also other differences between the new and old estimates which reduce comparability. The estimates of accrued tax liabilities were not carried forward and as a result the estimates of personal saving are somewhat higher in most and lower in a few years than they would otherwise be. Finally, in several instances, changes in the sources of data used influences comparability. The most important of them is the substitution of flow-of-funds for Securities and Exchange Commission data, particularly in the case of net trade debt of nonfarm, noncorporate business (included in series F 344). This change was made primarily to achieve consistency with other bodies of data utilized in the National Bureau's postwar Capital Market Study where flow-of-funds data are used extensively. The result is that the present estimates of personal saving diverge more from the SEC estimates than do those of earlier years.

Consumer Income and Expenditures

FAMILY AND INDIVIDUAL INCOME (Series G 1–190)

G 1–190. General note.

The development of reasonably reliable nationwide estimates of income distribution for families and individuals was dependent on the availability of comprehensive basic source material from Federal individual income tax returns and from representative sample field surveys of family incomes. Annual tabulations of tax-return data originated during World War I, but until the 1940's, when the minimum income requirement for filing returns was substantially lowered, these tabulations provided information for only a small fraction of the upper-income population. Sample field surveys of family incomes that were designed to cover all income and occupation groups in the Nation were not introduced until the 1930's.

Reflecting the lack of adequate source data, the early estimators of income distribution had to piece together various sets of sample income statistics that were available for selected occupation groups or local areas, and combine these figures with income data from State or Federal income tax returns or with income distribution series derived by applying yield rates to estimated size-class distributions of wealth. Among the early estimators were Charles B. Spahr who constructed a family income distribution in 1896, Willford I. King who developed income distribution estimates by size-class for families for 1910, and for individuals for 1921 and 1928, Frederick R. Macaulay who constructed income distributions for individuals for 1918, and Maurice Leven who did the same for families and individuals for 1929.

The following publications relate to these early efforts:

C. L. Merwin, "American Studies of the Distribution of Wealth and Income by Size," *Studies in Income and Wealth*, vol. 3, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1939.

Charles B. Spahr, *The Present Distribution of Wealth in the United States*, New York, 1896.

Willford I. King, *Wealth and Income of the People of the United States*, New York, 1915; also unpublished manuscript at the National Bureau of Economic Research, New York.

W. C. Mitchell, W. I. King, F. R. Macaulay, and O. W. Knauth, *Income in the United States*, National Bureau of Economic Research, New York, 1921 and 1922.

Maurice Leven, H. G. Moulton, and Clark Warburton, *America's Capacity to Consume*, The Brookings Institution, Washington, D. C., 1934.

The Consumer Purchases Study of 1935–36 was the first sample field survey in the United States in which income data were collected from all types of families without restriction as to occupation or earnings group. Based largely on the 300,000 family income schedules collected in that study and on tax returns for upper incomes, the National Resources Committee constructed estimates of family income, by income size-class, for a 12-month period during 1935 and 1936. Aside from their firmer statistical basis, the figures developed by Dr. Hildegarde Kneeland and her staff represented a marked improvement over earlier estimates by providing separate income distributions for numerous subgroups, e.g., for families classified by major occupation of the head, type and size of community, region, color, and family size. (See National Resources Committee, *Consumer Incomes in the United States: Their Distribution in 1935–36*, Washington, D. C., 1938.)

The Survey of Spending and Saving in Wartime provided the only other pre-World War II statistics on the distribution of families, by total income brackets, on a nationwide basis. This survey for 1941, though much smaller in size than the 1935–36 study, represented a further advance in that the sample of families selected for interview was designed specifically for the purpose of "inflating" the results to produce nationwide estimates of family income distribution. (See Bureau of Labor Statistics, *Family Spending and Saving in Wartime*, BLS Bulletin 822, 1945; also Bureau of Human Nutrition and Home Economics, *Rural Family Spending and Saving in Wartime*, U. S. Department of Agriculture Misc. Publication No. 520, 1943.)

Detailed distributions of families, and of persons 14 years old and over, by size-class of their money wage and salary income in 1939, were provided by the 1940 Census of Population, the first decennial census to include income questions. For items of income other than wages or salaries, the census obtained only a "yes" or "no" response as to the receipt of $50 or more, so that over-all size-class distributions on a total income basis are not available. A 5-percent sample of these returns was tabulated with extensive cross-classifications. For many types of analysis, e.g., for studying occupational differentials in wage-salary earnings distribution, these tabulations for 1939 comprise the best available data for comparisons between the prewar and postwar periods. (See Bureau of the Census, *Population—The Labor Force (Sample Statistics): Wage or Salary Income in 1939;* and *Population—Families: Family Wage or Salary Income in 1939*. For other decennial census reports that include income data, and for list of available tabulations, see Edwin D. Goldfield, "Decennial Census and Current Population Survey Data on Income," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.)

For postwar years, annual nationwide sample survey data are available from two sources: The annual Current Population Surveys of the Census Bureau which present distributions by total money income brackets for families and for persons 14 years old and over for 1944–1957; and the annual Surveys of Consumer Finances conducted by the Survey Research Center of the University of Michigan for the Board of Governors of the Federal Reserve System, which furnish distributions by total money income brackets for families and for "spending units" for 1945–1957. Income size-class distributions from both these sets of sample survey data are available for numerous subgroups of the population. (See Bureau of the Census, *Current Population Reports: Consumer Income*, Series P–60, Nos. 1–29, and Series P–S, Nos. 22 and 22–S; and Board of Governors of the Federal Reserve System, "1958 Survey of Consumer Finances: The Financial Position of Consumers," *Federal Reserve Bulletin*, September 1958, and corresponding articles for earlier years.)

In the 1950 Census of Population the income questions covered all items of money income, not just wages and salaries. The tabulations based on this census show separate money income distributions for families for local areas, and for persons 14 years old and over, classified by demographic and socioeconomic characteristics. (See Bureau of the Census, *1950 Census of Population*, vol. II; see also article by Goldfield, cited above.) Comparative distributions for 1939 and 1949 of persons classified by money wage or salary brackets and cross-classified by sex and detailed occupation and industry groups have been compiled from the census material by H. P. Miller. (See Herman P. Miller, *Income of the American People*, John Wiley and Sons, New York, 1955; and "Changes in the Industrial Distribution of Wages in the United States, 1939–1949," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.)

In addition to these nationwide surveys and censuses, other postwar surveys providing income data for selected population groups are the income-expenditure surveys conducted by the Bureau of Labor Statistics, which show urban family income distributions for 1944 and 1950, several studies of farm family incomes by the Department of Agriculture, and a number of surveys in individual localities conducted by the Bureau of the Census. (See Bureau of Labor Statistics, "Expenditures and Savings of City Families in 1944," *Monthly Labor Review*, January 1946; "City Family Composition in Relation to Income, 1941 and 1944," *Monthly Labor Review*, February 1946; and *Study of Consumer Expenditures, Incomes and Savings, Statistical Tables, Urban U.S.—1950*, vol. XI, *Details of Family Accounts for Incomes, Savings, Insurance and Gifts and Contributions*, tabulated by the Bureau of Labor Statistics for the Wharton School of Finance and Commerce, University of Pennsylvania, 1957; Department of Agriculture and Department of Commerce, *Farms and Farm People, A Special Cooperative Report*, 1953; and *Farmers' Expenditures, A Special Cooperative Survey*, 1956.)

Since 1937, income distributions are also available for workers covered under the Old-Age and Survivors Insurance Program. These figures show workers classified by size brackets of "covered" wages and salaries (and, since 1951, "covered" self-employment income). The group of workers covered by these series was substantially expanded in the postwar period, but the usefulness of the series is limited by the upper limit of $4,200 for "covered" earnings for 1955–1957 ($3,000 prior to 1951; $3,600 for 1951–54). (See Social Security Administration, *Handbook of Old-Age and Survivors Insurance Statistics: Employment, Wages, and Insurance Status of Workers in Covered Employment, 1953–54*, 1957, and earlier issues.)

Distributions of Federal individual income tax returns by income bracket are available annually since 1913. Until World War II, the minimum filing requirements were relatively high so that the tabulations covered only a small fraction of the population. Successive lowering of the filing limit coupled with the rise in incomes after the depression of the 1930's led to a very marked expansion in coverage so that all but a very few groups of the population are included in the postwar tabulations. (See Internal Revenue Service, *Statistics of Income, Individual Income Tax Returns*, annual.)

Tax-return data have been used in several studies to measure changes in relative income distribution over time. Rufus Tucker applied measures of dispersion to tax-return distributions for 1863–1935. He included in his series some less reliable tax data for the Civil War period. (See Rufus S. Tucker, "The Distribution of Income Among Income Taxpayers in the United States, 1863–1935," *Quarterly Journal of Economics*, vol. L II, 1938, pp. 547–587.) The most detailed study of the tax-return statistics is that by Simon Kuznets (see text for series G 131–146).

A number of the family income distribution estimates for the pre-World War II period were developed by integrating tax-return and survey data. Among them are the estimates of The Brookings Institution for 1929 and the National Resources Committee for 1935–36, both cited earlier, and the Survey of Spending and Saving in Wartime distribution for 1941 as subsequently adjusted in the light of tax-return data by Joseph Pechman. (See Joseph Pechman, "Distribution of Income Before and After Federal Income Tax, 1941 and 1947," *Studies in Income and Wealth*, vol. 13, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1951.) In developing these prewar distributions, data from Federal individual income tax returns could be used only to construct estimates for the top ranges of the family income scale, which were then linked directly to field survey data for the low and middle income brackets.

The much broader coverage of Federal individual income tax returns introduced in World War II, coupled with the availability of annual postwar sample survey data, made possible the construction of family income distributions for the postwar period that are more firmly based statistically than the earlier estimates. As part of its national income work, the Office of Business Economics has developed distributions of families and family income by brackets of family personal income for 1944, 1946, 1947, and for each year, 1950–1957, by combining the two sets of source data and adjusting the results so that they accord statistically and definitionally with the personal income series prepared in that office. (See Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950*, 1953; revised and brought up to date in articles on income distribution in the *Survey of Current Business*, March 1955, June 1956, April 1958 and 1959.)

In order to derive meaningful comparisons over time, the family distributions for the prewar period required adjustment to make them consistent with postwar series. Adjusted family income distributions reasonably comparable with the postwar series of the Office of Business Economics were developed for 1935–36 and 1941 by Selma Goldsmith, et al (see source cited for series G 1–28 for 1935–36 and 1941). Mrs. Goldsmith also adjusted the figures in The Brookings Institution study for 1929 to remove the major elements of incomparability. (See Selma F. Goldsmith, "The Relation of Census Income Distribution Statistics to Other Income Data," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958.)

Direct comparability among income distribution series is frequently precluded by variations in definition or coverage which are due in many instances to the different purposes for which the data were collected. Definitional differences may apply to the basic unit of classification, to the definition of the income measure, or to the time period to which the income data or the definition of the family unit refers. (See Simon Kuznets, "The Why and How of Distributions of Income by Size," *Studies in Income and Wealth*, vol. 5, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1943, and "Economic Growth and Income Inequality," *American Economic Review*, March 1955, vol. XLV, No. 1; Dorothy S. Brady, "Research on the Size Distribution of Income," *Studies in Income and Wealth*, vol. 13, Conference on Research in Income and Wealth, National Bureau of Economic Research, New York, 1951; and *Income Distribution in the United States . . .*, cited above.) For measures of the effect of alternative income definitions on changes observed over time in relative income shares of top income groups,

see Selma F. Goldsmith, "Changes in the Size Distribution of Income," *American Economic Review*, May 1957, vol. XLVII, No. 2.

Aside from definitional variations, the several sets of income distribution statistics differ with respect to the extent to which adjustments have been made to allow for incomplete reporting of family incomes. Tabulations of the postwar sample data on family incomes from the Current Population Surveys and the Surveys of Consumer Finances, for example, represent "inflated" income data obtained directly through interviews with sampled families. These tabulations understate family money income as estimated from business and governmental data sources. Income distributions from these field surveys are therefore not directly comparable with the Office of Business Economics income distribution series which account for larger money income aggregates for most major types of income. The inclusion of selected nonmoney income items in the OBE income measures, and their exclusion from the postwar sample surveys, is a further reason for differences between the series, particularly in the lower ranges of the family income scale.

For the prewar period, also, direct comparison is not warranted between certain sets of income distribution statistics. For example, for 1941, the income classification in series G 508–522 is in terms of family money income brackets, and in series G 1–28, it is in terms of family personal income brackets. For 1929 and 1935–36, the income for series G 523–543 and for series G 1–28 are not directly comparable because of adjustments incorporated in the latter as noted above.

G 1–28. Families and unattached individuals and family personal income, by income level, 1935–36 to 1957.

Source: 1935–36 and 1941, Selma F. Goldsmith, George Jaszi, Hyman Kaitz, and Maurice Liebenberg, "Size Distribution of Income Since the Mid-Thirties," *Review of Economics and Statistics*, February 1954, p. 4; 1944–1957, Office of Business Economics, *Survey of Current Business*, April 1959, p. 14.

The definitions of families and unattached individuals in these series conform with those used by the Census Bureau. Families are units of two or more persons related by blood, marriage, or adoption, and residing together; unattached individuals are persons other than institutional inmates who are not living with any relatives. The total number of families and unattached individuals is estimated as of the end of the calendar year to which the income data pertain (for 1935–36, the estimate refers to July 1, 1936). It is derived, for most years, by interpolating between Census Bureau figures after adjustment to exclude certain minor groups of individuals.

Family personal income represents the current income received by families and unattached individuals from all sources, including wage and salary receipts (net of social insurance contributions), other labor income, proprietors' and rental income, dividends, personal interest income, and transfer payments. In addition to monetary income flows, family income includes certain nonmoney items such as wages in kind, the value of food and fuel produced and consumed on farms, the net imputed rental value of owner-occupied homes, and imputed interest. Total family personal income is a somewhat smaller amount in each year than the personal income aggregate from which it is derived, because it excludes the income received by institutional residents (including military personnel not living with their families), or retained by nonprofit institutions, private trust, pension, and welfare funds.

For discussion of these definitions, see Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950*, 1953, pp. 17–25. For limitations of the prewar distributions with respect to their comparability with the postwar series, see source for prewar figures.

G 29–56. Families and family personal income, by income level, 1935–36 to 1957.

Source: 1935–36 and 1941, compiled from unpublished tabulations underlying estimates shown in source for series G 1–28; 1944–1954, Office of Business Economics, *Survey of Current Business*, April 1958, p. 15; 1955–1957, *Survey of Current Business*, April 1959, p. 14.

For definitions of terms, see text for series G 1–28.

G 57–74. Families and unattached individuals and family personal income, by income level in 1950 dollars, 1929–1957.

Source: 1929, Selma F. Goldsmith, "The Relation of Census Income Distribution Statistics to Other Income Data," *Studies in Income and Wealth*, vol. 23, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton, 1958, p. 93; 1935–36 to 1944, see source for series G 1–28 (1935–36 and 1941); 1950, *Survey of Current Business*, April 1959, p. 14; 1957, Office of Business Economics, records.

1957 data were computed by applying the OBE price index used for deflating personal consumption expenditures (of the national income accounts) to the income distribution expressed in current dollars for that year; the latter appears in the *Survey of Current Business*, April 1959, p. 11. For definitions of terms, see text for series G 1–28.

The price-deflated income size distributions such as are shown here represent only approximate measures of real income distribution because separate price indexes applicable to the various income brackets are not available. It is therefore necessary to use the same index throughout the income range even though all brackets may not have been affected by the price rise in the same way. Moreover, available price indexes which refer to consumer expenditures for goods and services must be applied to income totals that include income taxes and saving as well as outlays for consumption. For interpolation procedures used in deflating income size distributions, see Office of Business Economics, *Income Distribution in the United States by Size, 1944–1950*, p. 38.

Because of inadequacies in the basic source data, the estimates for 1929 are less reliable than for other years in the series. For limitations of the prewar data, see the sources.

G 75–98. Families and unattached individuals and family personal income after Federal individual income tax liability, by after-tax income level, 1941–1957.

Source: 1941, compiled from unpublished tabulations underlying estimates shown in source for 1941, series G 1–28; 1950–1954, Office of Business Economics, *Survey of Current Business*, April 1958, p. 18; 1955–1957, *Survey of Current Business*, April 1959, p. 16.

Federal individual income tax liability which has been deducted from family personal income in these series includes liability reported on Federal individual income tax returns, plus an estimate for amounts uncovered by subsequent audit, minus liability of military personnel not living with their families, minus liability on net capital gain. See also definitions in text for series G 1–28.

G 99–117. Family personal income received by each fifth and top 5 percent of families and unattached individuals, 1929–1957.

Source: 1929 (series G 99–105), see source for 1929, series G 57–74, p. 92; 1929 (series G 106–117), unpublished tabulations underlying estimates shown in source for 1929, series G 57–74; 1935–36 and 1941, see source for same years, series

For definitions of terms, see text for series G 1–28.

G 118–130. Number and average size of families and unattached individuals, and average family personal income before and after Federal individual income tax liability, 1929–1957.

Source: 1929-1941, unpublished tabulations underlying estimates shown in source for 1935-36, series G 1-28; 1944-1954, Office of Business Economics, *Survey of Current Business*, April 1958, pp. 11 and 16-19 (except series G 127, G 129, and G 130, for the following years: 1944-1947, *Income Distribution in the United States by Size, 1944-1950*, 1953, pp. 82-84; 1950-1951, *Survey of Current Business*, March 1955, pp. 25-26; 1952, *Survey of Current Business*, June 1956, p. 13. Series G 121 and G 123, 1944-1954, and series G 122, 1944-1946, Office of Business Economics, records); 1955-1957, *Survey of Current Business*, April 1959, pp. 10 and 15-16, and Office of Business Economics, records.

For definitions of terms, see text for series G 1–28 and G 75–98.

Farm-operator families cover all families operating farms as defined in the Census of Agriculture; the total number is estimated annually by the Agricultural Marketing Service. Nonfarm families include all multiperson units other than farm-operator families.

G 131–146. Percent shares of total income received by top 1 percent and 5 percent of total population, 1913–1948.

Source: Simon Kuznets, *Shares of Upper Income Groups in Income and Savings*, National Bureau of Economic Research, New York, 1953, pp. 582, 585, 635, 637, 646, and 649.

The top percentiles in these series represent the 1 or 5 percent of men, women, and children covered on those individual income tax returns reporting the largest per capita incomes in each year. The basic variant is the total of employee compensation, entrepreneurial income, rent, interest, and dividends; the economic variant represents the basic variant adjusted to allow for such factors as the nonreporting of State and local government salaries prior to 1938, the omission of imputed rent on owner-occupied houses, and, most important, the effects of classifying the tax data by an inappropriate base and unit; the disposable income variant is derived by deducting from the economic income variant Federal income taxes paid, and adding the net balance of realized gains and losses from sales of assets.

G 147–168. Median money wage or salary income of primary families and individuals with wage or salary income, by selected characteristics, 1939–1957.

Source: All years (except 1953–1954 for all series, and 1953-1957 for series G 147), Bureau of the Census, *Current Population Reports*, Series P–60, Nos. 5, 7, 9, 12, 24, 27, and 30; for the exceptions, Bureau of the Census, records.

The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption. If no one in the household is related to the head, then the head himself constitutes a "primary individual."

Money wages or salaries are defined as total money earnings received for work performed as an employee during the calendar year, including wages, salary, commissions, tips, piecerate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

G 169–190. Median money wage or salary income of all workers with wage or salary income, and of year-round full-time workers, by sex, color, and major occupation group, 1939–1957.

Source: Bureau of the Census, *Current Population Reports*, Series P–60, Nos. 9, 11, 14, 16, 19, 23, 27, and 30.

CONSUMER EXPENDITURE PATTERNS (Series G 191–584)

G 191–218. Personal consumption expenditures, by type of product, 1929–1957.

Source: 1929–1945, Office of Business Economics, *National Income: A Supplement to the Survey of Current Business, 1954 Edition*, pp. 206–208; 1946–1957, *U. S. Income and Output*, 1958.

Detailed estimates by the Department of Commerce of consumer expenditures for commodities and services since 1929 were first published in the *Survey of Current Business*, June 1944. The figures on personal consumption expenditures for commodities were calculated by the "commodity flow methods" developed by Simon Kuznets, *Commodity Flow and Capital Formation*, National Bureau of Economic Research, New York, 1938. Estimates of personal consumption expenditures for services are based on a variety of source materials which cannot be summarized briefly. For further detail, see *National Income: 1954 Edition*.

As defined by the Department of Commerce, personal consumption expenditures represent the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. Rental value of owner-occupied houses is included; purchases of dwellings, which are classified as capital goods, are excluded.

G 219–243. Personal consumption expenditures, by type of product, 1909–1929.

Source: J. Frederic Dewhurst and Associates, *America's Needs and Resources, A New Survey*, The Twentieth Century Fund, New York, 1955, pp. 965–980.

The first detailed estimates of aggregate consumer expenditures for goods and services in the United States over a period of time appeared in William H. Lough (with the assistance of Martin Gainsbrugh), *High-Level Consumption*, McGraw-Hill, New York, 1935. These pioneer estimates covered the years 1909, 1914, 1919, 1921, 1923, 1925, 1927, 1929, and 1931. The data for the later years were revised and extended by Harold Barger, *Outlay and Income in the United States, 1921–1938*, National Bureau of Economic Research, New York, 1942. In the 1940's, J. Frederic Dewhurst and Associates (*America's Needs and Resources*, 1947) revised these various estimates and expanded those on recreational expense to take account of estimates by Julius Weinberger, "The Economic Aspects of Recreation," *Harvard Business Review*, Summer issue, 1937.

G 244–543. General note.

Collection of data on consumer expenditures, and, especially wage earners' expenditures, began in the United States in the 1870's. It was undertaken on a small scale by a number of different State agencies using a great variety of methods. The most substantial of these studies was that made for Massachusetts by Carroll D. Wright, Bureau of Statistics of Labor of Massachusetts. He undertook a carefully planned survey of the earnings and expenditures of 397 families of skilled and unskilled workers in 1875. The usefulness of the data gathered in this study led the Congress to request further studies of this type on a broader base by the newly formed U.S. Bureau of Labor of which Wright had become Commissioner.

Some of the results of the large-scale studies made by the Bureau of Labor for 1888–91 and 1901 are given in series G 303–321. The data on food expenditures obtained in the 1901 survey were used to provide the design for an index of prices of food purchased by workingmen. This index was used generally as a deflator for workers' incomes and expenditures for all kinds of goods until World War I.

During that period, the need for a more inclusive index of retail prices became clearer because food prices rose so much faster than those of many other commodities and of rents. A nationwide study of the expenditures of wage earners and clerical workers was undertaken in 1918 to provide a list of items to be priced for such an index and also to provide data on the relative importance of each item. Because of the number of wage disputes in the shipbuilding centers, the survey was first undertaken in seacoast cities. It was later expanded into what was regarded as a representative sample of industrial centers in the United States.

The first study made in this country of the over-all consumer expenditures of a group of farm families was made in Livingston County, N.Y., in 1909. In the early 1920's, the Department of Agriculture initiated a cooperative project on the subject with the State Agricultural Experiment Stations under the direction of E. L. Kirkpatrick. In 1925, it was decided, for lack of any other data on farm family expenditures extending across State lines, to average the data that had been collected in 11 States covering one year in the period 1923–1925. The resulting averages given in series G 488–507 have been widely used, but other State studies made in the next few years indicated that the averages for the 2,886 families were too high to be representative of the expenditures of farm-operator families throughout the country at that time.

Dramatic increases in productivity in industry and agriculture during the 1920's and the economic collapse which began in 1929 led a number of economists to study the factors affecting consumer expenditures and to estimate changes in consumption patterns over time. The pioneer investigation in this field was made by Simon Kuznets, *Commodity Flow and Capital Formation*, National Bureau of Economic Research, New York, 1938. This study shows national aggregates for four types of consumer goods and services. The Brookings Institution published, in 1934, estimates of expenditure patterns at different income levels of farm and nonfarm families and single individuals in 1929 (see M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume*, The Brookings Institution, Washington, D. C., 1934). The figures were prepared by Clark Warburton on the basis of scattered sample studies made during the 1920's and early 1930's and correlated with national income estimates made by Maurice Leven (see text for series G 482–487 and G 538–543). In 1935, estimates of aggregate consumer expenditures in detail for 1909 and 1929 and selected years between were prepared by Martin Gainsbrugh and published in William H. Lough, *High-Level Consumption* (see text for series G 219–243). This book included a comparison with The Brookings Institution's aggregates for 1929, showing that the two estimates were very close for food expense, and reasonably close for attire and home maintenance; but the estimates by Lough and Gainsbrugh of expenditures for all other items were much higher than the Brookings' figures.

In the middle 1930's, two national cross-section studies of consumer expenditure patterns were undertaken. The first, conducted by the Bureau of Labor Statistics, covered employed city wage and clerical workers and was initiated to provide a new list of items and weights for the Consumer Price Index of the Bureau of Labor Statistics. The second, the Study of Consumer Purchases, conducted jointly by the BLS and the Bureau of Home Economics in the Department of Agriculture, related to families (with native-born heads) who were not on public relief rolls during the survey year, and was initiated to provide data relating the effect on expenditure patterns of income, occupation of the head, race, family composition, and type of community. The results of the second study were used by the National Resources Planning Board as the basis for a national estimate of consumer expenditures (see text for series G 409–426, G 464–481, and G 523–537). The data from this study were supplemented by information from the Bureau of Internal Revenue on income distribution and receipts from excise taxes, and from a few studies of the expenditures of families on public relief rolls and of those with foreign-born heads.

A small nationwide survey covering 1941 conducted by the Bureau of Labor Statistics and the Bureau of Home Economics (see text for series G 391–408 and G 445–463) provides the most recent detailed data on the expenditure patterns of rural and urban families in the same year. BLS also conducted a sample national study of urban family expenditures in 1944 (see text for series G 373–390). Another BLS urban study covering 1950, intended primarily to serve as a basis for revision of the Consumer Price Index, subsequently provided detailed tabulations of consumer expenditures, income, and savings (see text for series G 244–263). The Department of Agriculture, in cooperation with the Bureau of the Census, conducted a survey of farm family expenditures in 1955 (see text for series G 427–444) to obtain data to revise the Parity Index and improve the basis for estimating farm operators' production expenses, which provides detailed data on farm family expenditures.

In recent years, there have been a number of nationwide surveys of consumer expenditures by income level for specified types of goods. See, for example, individual reports in the series published by Department of Agriculture, *Household Food Consumption Survey*, 1955. The reports of this survey provide detailed data for farm and nonfarm households on quantities and values of food consumed and on dietary levels by money income after taxes in the United States as a whole and in four major regions.

The annual Surveys of Consumer Finances, conducted for the Board of Governors of the Federal Reserve System by the Survey Research Center of the University of Michigan, yield data on consumer purchases of selected durable goods by income level of all "spending units" in the United States. Reports of these surveys appear in the *Federal Reserve Bulletin*.

Other recent national sample surveys conducted for use in marketing research have covered a very large proportion, but not all types, of consumer goods and services. The most comprehensive of these is the study of consumer expenditures conducted for Life Magazine by Alfred Politz Research, Inc., which is based on a sample designed to represent all individuals, 20 years of age and over, in continental United States. The study provides an unusual amount of detailed material on expenditures for commodities along with data on buying habits of households of different types.

The lack of continuity in the tables shown here which present data by income level is, at least in part, due to the fact that the coverage and definitions used in obtaining the data differ so greatly from study to study. The chief differences in population coverage and in the classification and definition of goods and services purchased are briefly specified in the tables and in the text which follows. Differences in definition primarily affect the figures on income, expenditures for housing, and for "sundries" or "miscellaneous goods and services."

The figures on income represent annual income before deduction of direct personal taxes, i.e., income, poll, and personal property, except the following, which represent annual income after deduction of taxes: Urban families in 1917–19 (series G 283–302), 1944 (series G 373–390), and 1950 (series G 244–263 and G 353–372); and farm-operator families in 1955 (series G 427–444).

Direct personal taxes, as well as indirect taxes, were generally tabulated as an item of current expenditure in the consumer expenditure surveys made before the 1930's. Since the Consumer Purchases Study of 1935–36, such taxes have been presented separately and have not been included in consumer expenditures. For the series presented here, direct personal taxes were deducted from expenditure figures in the earlier surveys, wherever possible, to insure greater comparability with the most recent surveys.

Social Security taxes paid by the worker (first collected in 1937) were treated as savings in the 1941 and 1944 surveys, and handled with personal insurance as a separate class of disbursements in the 1950 urban and the 1955 farm surveys.

In the early studies of wage earners' incomes and expenditures, no attempt was made to evaluate the products received by a family from its garden, poultry, hogs, or cows. Most studies of the incomes and expenditures of farm-operator families include data on the value of food and fuel produced by the family for its own use, sometimes valued at prices which would have been paid for them had they been purchased through nearby trade channels, and sometimes at prices which would have been received if the products had been sold.

The treatment of imputed income resulting from expenditures for owned homes varies considerably from one series to another. Series G 191–243 include rental value of owned homes, but not capital expenditures for housing. In the early studies of wage earners' expenditures, the statistical difficulties of handling homeowners' housing expenditures were avoided by excluding homeowners from the "normal" family group and including only renters. In studies made in the middle 1930's and early 1940's information was obtained not only on homeowners' current year expenditures for housing and for investments in their homes, but also on the net rental value of their homes. These figures are not presented here, but are available in the original sources.

Conceptually, premiums paid on life insurance policies may be classified wholly as current expenditures or partly as savings and partly current expenditures, depending on the type of policy; but in sample surveys it is difficult to obtain from respondents information on the type of policies on which premiums are paid.

Series G 191–243 include as consumer expenditures the part of insurance premiums paid which covers the expense of handling life insurance, but not the part which will eventually be returned to the consumer buyer or his beneficiaries. In sample surveys of consumer expenditures made before the 1930's, the difficulty of obtaining information on the types of policies held resulted in classifying payments on such premiums in the sundries or miscellaneous group as current expenditures. In expenditure surveys made since 1930, it has been the practice to exclude insurance premiums from current expenditure data,

Digitized by Google

handling them either as savings or as a separate class of disbursements.

G 244–330. General note.

Data on the consumption expenditures of families of city wage and clerical workers of two or more persons were collected at irregular intervals and for a variety of purposes. Only the 1950 BLS Study of Consumer Expenditures was based on a sample representing families of all types in these occupational groups in cities of all sizes throughout the entire country. Insofar as the original publications make it possible, the figures from the earlier studies have been adjusted as to definition and classification of consumer expenditures so as to conform to those used in 1950.

See also general note for series G 244–543.

G 244–263. Consumption expenditures, in current prices, of families of city wage and clerical workers of 2 or more persons, by income class, 1950.

Source: Department of Labor, *How American Buying Habits Change*, 1959.

These series are based on a *Study of Consumer Expenditures, Incomes and Savings; Statistical Tables: Urban U.S.—1950*, a joint study by the Bureau of Labor Statistics and the Wharton School of Finance and Commerce, University of Pennsylvania, 1956, vols. I, II, III, IX, and X.

The survey of consumer expenditures in 1950 was conducted by BLS to provide the basis for revising its Consumer Price Index. The survey was undertaken during the first half of 1951 in 91 urban areas throughout the United States ranging in size from places of 2,500 inhabitants to the greater New York area with a population of 9 million. Complete and usable reports were obtained from 12,489 consumer units. Since the study was directed toward the determination of expenditure weights for the BLS revised CPI, the data for family expenditures for individual consumption goods and services purchased by the 7,007 wage-earner and clerical-worker families of 2 or more persons were tabulated and averaged for each of the 91 cities surveyed.

Subsequently, the same data were tabulated in considerable detail and published as part of the study of consumer expenditures, income, and savings, which was made by the Wharton School of Finance and Commerce in cooperation with BLS under a grant from the Ford Foundation.

To obtain data for wage-earner and clerical-worker families of 2 or more, the following groups were excluded: Single consumers; self-employed; salaried professionals; officials, etc.; and persons not gainfully employed. Within the 9 classes of cities averaged for the Wharton School publications (large cities, suburbs, and small cities in the North, South, and West), averages were based on the sample families as weights; in combining the resulting averages, universe (total consumer units, i.e., families and single consumers) weights were used.

G 264–282. Consumption expenditures, in current prices, of families of employed city wage and clerical workers of 2 or more persons, by income class, 1934–36.

Source: Bureau of Labor Statistics, records.

These series are based on Faith M. Williams and Alice C. Hanson, *Money Disbursements of Wage Earners and Clerical Workers*, Bureau of Labor Statistics, Bulletin No. 638, summary volume, 1941.

The data in this 1934–36 study were gathered to provide the basis for revising the BLS Consumer Price Index. The survey (conducted in a period of mass unemployment) was restricted to families of two or more in large cities, who had an income of at least $500 and who had not been on public relief rolls during the survey year. These limits precluded from the pattern on which the CPI was to be based the irregular spending of workers on "relief" and those employed so irregularly that their purchases could not have been typical of long-range consumption patterns. The survey covered 12,903 white families and 1,566 Negro families in 42 cities with population 50,000 or more.

These series derived from Bulletin No. 638 have been adjusted for comparability with definitions and classifications of the 1950 *Study of Consumer Expenditures* . . . (see text for series G 244–263), as follows: "Vocation" outlays shown in table 1 were deducted from both "average annual current expenditures" in table 1 and from "average annual amount" of total net family income in table 7. "Community welfare" and "gifts and contributions to persons outside the economic family" were deducted from "average annual current consumption expenditures" in table 7.

G 283–302. Consumption expenditures, in current prices, of families of city wage and clerical workers with at least 1 child, by income class, 1917–19.

Source: Bureau of Labor Statistics, Bulletin No. 357, *Cost of Living in the United States, 1917–19*.

These data were collected from white city worker families having husband and wife and at least 1 child, who was not a boarder or lodger. The families could have no boarders and

Digitized by Google

not over 3 lodgers; at least 75 percent of family income had to come from the principal breadwinner or others who contributed all earnings to the family fund; slum or charity families or non-English speaking families who had been in the United States less than 5 years were excluded.

This survey was first undertaken in shipbuilding centers for the purpose of providing market baskets which could be used in computing consumer price indexes for cities most affected by the inflation which occurred during and just after World War I. It was later broadened to cover 92 cities and localities throughout the entire country.

The income and expenditure figures presented in Bulletin No. 357 were adjusted for comparability with definitions and classifications used in the 1950 *Study of Consumer Expenditures* . . . (see text for series G 244–263). Thus, average money income after taxes (see series G 285) was derived by deducting dues to labor organizations, personal property and poll taxes, and expenditures for tools (Bulletin No. 357, pp. 448 and 454) from total average income per family (Bulletin No. 357, p. 4). Average expenditures for current consumption (see series G 286) were derived by deducting from total average yearly expenses per family (Bulletin No. 357, p. 5) the same items deducted from income and, in addition, life insurance premiums; contributions to church, charity, and patriotic purposes; and gifts (Bulletin No. 357, pp. 447 and 448). Each consumption group was adjusted for maximum comparability with the corresponding groups as classified in the 1950 *Study* (when they differed from the original published table).

G 303–312. Consumption expenditures, in current prices, of normal families of city wage and clerical workers of 2 or more persons, by income class, 1901.

Source: Department of Labor, *How American Buying Habits Change*, 1959.

These series are based on 18th Annual Report of the Commissioner of Labor, Document No. 23, Bureau of Labor, 1903, *Cost of Living and Retail Prices of Food*, pp. 581, 592, and 593.

Earnings and expenditure data from this report covered families with wage and salary incomes not exceeding $1,200 a year, and were collected through personal interviews by experienced special agents of the Bureau of Labor. About 15 percent of these families had incomes from boarders and lodgers and other sources. The latter income raised a few families total income above $1,200. Therefore their expenditures could be, and were, above $1,200. Altogether, data were collected from 25,440 families of all types but only those from the 11,156 families defined as "normal" were summarized by income levels. These "normal" families had a husband at work, a wife, not more than 5 children and none over 14 years of age; no dependents, boarders, lodgers, or servants; and provided data on expenditures for rent, fuel, lighting, food, clothing, and sundries.

The 1901 study had a wide city and industry coverage in 32 States and the District of Columbia, and appears to have provided a very good picture of "normal" families in wage and salaried occupations. The selection of the number of persons interviewed in each geographical area was roughly apportioned in accordance with the number of persons employed in the manufacturing industries of the States.

G 313–321. Consumption expenditures, in current prices, of normal families of city wage and clerical workers of 2 or more persons in 9 basic industries, by income class, 1888–91.

Source: Department of Labor, *How American Buying Habits Change*, 1959.

These series are based on Sixth Annual Report of the Commissioner of Labor, 1890, *Cost of Production*, part III; and Seventh Annual Report of the Commissioner of Labor, 1891, *Cost of Production*, vol. II, part III. Only data for so-called "normal" families in all industries (identified by budget numbers, Seventh Annual Report, pp. 1826-1839, 1887-1898) were used for comparative purposes. Family size, income, and expenditures were tabulated from the Sixth Annual Report (pp. 790–801, 914–925, 984–989, 1076–1085, 1128–1131, 1160–1162), and the Seventh Annual Report (pp. 1170–1206, 1374–1390, and 1552–1569). Those data provided the basis for calculation of average family size, income, and total expenditures for all "normal" families by income class. The percentage distributions of total expenditures for "normal" families, in the Seventh Annual Report (pp. 2012 and 2013), were applied to the appropriate averages to estimate the dollar expenditure by income class.

Earnings and expenditure data in the study covered 2,562 "normal" families. "Normal" families had both a husband and wife, not more than 5 children, no one of whom was over 14 years of age; no dependents or boarders; did not own its own dwelling place; and had expenditures for rent, fuel, lighting, clothing, and food. The study covered workers in the following industries: Pig iron, bar iron, steel, bituminous coal, coke, iron ore, cotton, woolen, and glass.

G 322–330. Consumption expenditures, in current prices, of Massachusetts, families of city wage and clerical workers of 2 or more persons, by income class, 1874–75.

Source: Department of Labor, *How American Buying Habits Change*, 1959.

These data are based on Massachusetts Bureau of Statistics of Labor, Sixth Annual Report, March 1875, Public Document No. 31, pp. 221-354, 372, 373, and 441. The data were collected from families of wage earners in 15 cities and 21 towns by trained agents of the Bureau of Statistics of Labor who approached 1,000 families before they were able to find 397 who had enough information about their affairs to answer the questions put to them and who were also willing to "having their private life inquired into." The families included about equal numbers of skilled and unskilled workers, and were those who, with comparatively few exceptions, had children dependent on them for support.

Series G 322–330 were computed from data in the Massachusetts report which show, by income class, the number of families from whom figures were received, their aggregate earnings and expenses in each class, and percentages of expenditure as regards income, by income class, for five major categories of expense. The resulting weighted averages for all families' earnings and expenses were found to check with all family averages shown elsewhere in the report. Average figures on money earnings, expenses for all goods and services and for fuel also checked with such averages in the report. The figures on expenses for food, rent, and sundries checked within a few dollars (differences probably caused by rounding of the percentages).

In this report, the items of expenditure not specifically for subsistence, clothing, rent, and fuel were listed as sundries. The report states that sundry items of expense are those which "although . . . not absolutely necessary for the life of the body, are, in their way, imperative necessity in a man's social life." Some specified sundries include furniture, carpets, books and papers, societies, religion, charity, sickness, care of parents, care of house, recreation, housegirl, travel to work, and life insurance.

G 331–352. Consumption expenditures, in 1950 prices, of families of city wage and clerical workers of 2 or more persons, 1888–91 to 1950.

Source: Department of Labor, *How American Buying Habits Change*, 1959.

Digitized by Google

Figures on average money receipts and outlays of wage and clerical workers' families of two or more persons in large cities have been converted into dollars of 1950 purchasing power for each of the survey years since 1888–91. The BLS Consumer Price Index was used to convert current expenditures and average income into dollars of 1950 purchasing power for the surveys of 1917–19 and 1934–36. The cost-of-living index developed by Paul Douglas (see *American Economic Review*, Supplement, March 1926, p. 22) was used to convert income and total consumption expenditures for the 1888-91 and 1901 studies; the BLS Retail Food Index was used to convert the expenditures for food and drink. Other categories of expenditures were not converted into 1950 dollars because no indexes are available for these categories prior to 1913.

Series G 331–352 for 1950, 1934–36, and 1917–19 relate to expenditures of wage and clerical workers' families in large cities, i.e., with populations of 30,500 and over in 1950; 50,000 and over in 1934–36 and 1917–19. Populations of the large industrial centers surveyed in the two earliest surveys were not specified.

G 353–426. General note.

For discussion of the surveys from which these series were taken, see general note for series G 244–543 and the text for series separately grouped by survey which follows.

G 353–372. Consumption expenditures, in current prices, of all families of 2 or more persons in cities of 2,500 and over, by income class, 1950.

Source: *Study of Consumer Expenditures, Incomes and Savings; Statistical Tables: Urban U. S.—1950*, cited above, vol. XVIII, pp. 14-23.

For a description of this survey, see text for series G 244–263. To obtain the data for all families of two or more persons, only single consumers were excluded; all occupational groups were included. Within the nine classes of cities averaged for the Wharton School publications (large cities, suburbs, and small cities in the North, South, and West), averages were based on the sample families as weights. In combining the resulting averages, universe (total consumer units) weights were used.

G 373–390. Consumption expenditures, in current prices, of all families of 2 or more persons in cities of 2,500 and over, by income class, 1944.

Source: Bureau of Labor Statistics, *Monthly Labor Review*, January 1946, p. 4; and Bulletin No. 838, *Wartime Food Purchases*, pp. 1–4, and appendix.

A study of expenditures and savings in 1944 of city families was undertaken by BLS for the primary purpose of comparing prices reported by city consumers with prices indicated by urban store reports. The survey was made in two parts. The first part, made in the fall of 1944, provided detailed information on food purchases during 1 week, purchases of clothing and household textiles during the first 8 months of the year, tenure and rental in August 1944, and sufficient information on family composition, living arrangements, and income to provide a basis for classification. The second part provided data on purchases of food during 1 week early in 1945, of clothing and other textiles during the last 4 months of 1944, and of other goods and services throughout 1944.

The sample used in this survey was very similar to that used in the 1941 survey (see text for series G 391–408) and related to the civilian noninstitutional population in cities of 2,500 or more scattered throughout the country. The sample included approximately 1,700 families and single persons in 28 metropolitan districts and 20 cities with a population under 50,000 outside of metropolitan districts. These places were selected to represent, with respect to region, State, and city size, all cities in the United States with a population of 2,500 or more.

Family income represents the sum of all types of income received by family members during 1944; included are wage and salary earnings after payroll deductions of income taxes, entrepreneurial net income or withdrawals, and nonearned income from all sources except inheritances, large gifts, and lump-sum insurance settlements.

Although the figures were originally published as preliminary and subject to slight revisions, no revisions were subsequently issued.

G 391–408. Consumption expenditures, in current prices, of all families of 2 or more persons in cities of 2,500 and over, by income class, 1941.

Source: Bureau of Labor Statistics, Bulletin No. 822, *Family Spending and Saving in Wartime*, pp. 68, 70, 71, 76, 102, and 109.

The survey of family spending and saving in wartime is the only survey which was conducted for the primary purpose of providing national estimates of expenditures and savings by income class.

The method of drawing the sample used for this survey differed in several important respects from that followed in earlier surveys of family incomes and expenditures. A description of these changes appears in part I, "Scope and Method," of the source. The coverage of population was more complete than in any previous survey and included such segments of the population as families on public relief rolls, foreign-born and broken families, single consumers, occupational groups, and city-size classes; but it excluded inmates of institutions, residents of military camps, and persons in labor camps.

The sample was smaller than in any previous survey on which national estimates have been based. The sample for urban areas covered about 1,300 families and single persons in 62 cities of 2,500 or more scattered throughout the country. The cities were so selected as to give proper representation to (1) each city-size group; (2) proximity to a metropolis (for cities under 50,000); (3) each region and State; (4) low, medium, and high rent cities; and (5) cities of differing racial composition.

Information was obtained on both money and nonmoney income, although only money income figures are shown here. Expenditures for family living were reported in detail under 14 categories of expense. All purchases of durable goods made during the year, except payments on homes and improvements on homes, were considered current expenditures. Financing charges, interest on installment and other credit purchases, and shipping and delivery charges were considered as part of the expenditure. Discounts and trade-in allowances were deducted from the gross price. Sales and excise taxes were included in the expenditure for each article except in the case of the details for food expenditure.

Sample data for the $5,000 to $10,000 and the $10,000 and over classes are included, although the averages for these classes are based on a small number of cases and are therefore quite irregular and subject to a wide margin of error. They should be considered as statements of sample results only, and not as estimates of actual expenditures by the entire group of families in those income groups.

G 409–426. Consumption expenditures, in current prices, of all families of 2 or more persons in cities of 2,500 and over, by income class, 1935–36.

Source: National Resources Planning Board, *Family Expenditures in the United States, Statistical Tables and Appendixes*, 1941, pp. 61, 120, and 157.

Digitized by Google

The study of family expenditures is part of the *Study of Consumer Purchases*, conducted by the Bureau of Labor Statistics and the Bureau of Home Economics, in cooperation with the National Resources Committee, the Central Statistical Board, and the Works Progress Administration. The Bureau of Home Economics conducted the survey in rural-farm and rural-nonfarm areas and in the majority of the small cities covered, and the Bureau of Labor Statistics conducted the surveys in the other small cities and all of the larger urban communities.

The study of consumer purchases was the most detailed analysis of family expenditures in the United States made up to that time. Data were published on over 90 categories of outlays. They are classified to permit study of differences between the farm, rural-nonfarm, and urban population, of regional variations, of differences with respect to size of family and between white and Negro families, as well as of differences between income levels.

Detailed information on expenditures and savings during a 12-month period between January 1935 and December 1936 was secured from a sample of about 60,000 families living in cities of different sizes, in villages, and on farms in 30 States, of which 54,000 were used in preparing the family expenditure data. The urban sample covered 51 cities and approximately 30,000 expenditure schedules. Both the sample expenditure data and the population weights used in preparing the estimates (shown in these series) of family expenditures by income class exclude families receiving any direct or work-relief assistance (however little) at any time during the year.

Income was defined to include total net money income received during the year by all members of the economic family, plus the value of certain items of nonmoney income such as net value of owner-occupied homes and rent received as pay. Consumption data were collected only from native white families in most sample communities and from native Negro families in the Southeast, in New York City, and Columbus, Ohio.

G 427–507. General note.

For discussion of the surveys from which these series were obtained, see general note for series G 244–543 and the text for series separately grouped by survey which follows.

G 427–444. Consumption expenditures, in current prices, of farm-operator families of 2 or more persons, by income class, 1955.

Source: Derived from Department of Agriculture, Statistical Bulletin No. 224, *Farmers' Expenditures in 1955 by Regions*, 1958, and from unpublished records of the Agricultural Research Service.

These data are based on a weighted sample of approximately 4,000 schedules, selected on the basis of the 1954 Census of Agriculture distribution of farms by economic class of farm (value of all products sold). The number of families included a small number not reporting income. Federal and State personal taxes have been deducted from money income. Expenditures for dwelling upkeep included for owned homes an assigned share of real estate taxes and special assessments, insurance premiums, mortgage interest charges, legal and settlement charges; and for both owned and rented homes expense for repairs, replacements, alterations and improvements, and cash rent for off-farm rented dwellings. Expense for lodging away from home and for vacation homes was also included. Expenditures for automobile and truck transportation include family share of purchase and upkeep. Expenditures for other goods and services include expense for funerals for family members, legal fees, bank charges for service and deposit box, rental of post office box, money lost or stolen, interest paid on borrowing for family use, occupational expense, union dues, poll taxes, and personal property taxes.

G 445–463. Consumption expenditures, in current prices, of farm-operator families of 2 or more persons, by income class, 1941.

Source: Department of Agriculture, Miscellaneous Bulletin No. 520, *Rural Family Spending and Saving in Wartime*, June 1943, pp. 156 and 159.

These data were obtained from a study conducted in 1942 by the Bureau of Home Economics in areas representing the entire rural population of the country. The survey was paralleled by a study of the income and expenditures of urban families and single consumers conducted by the Bureau of Labor Statistics (see text for series G 391–408). The study was based on a sample of 1,000 rural-nonfarm families and single consumers and 760 farm families and single consumers in 45 counties, stratified to give representation to all regions and to economic groups in the rural population.

The data collected included nonmoney as well as money income; the former was limited to that received in the form of food, housing, fuel, ice, clothing, or household furnishings. However, classification in these series is by money income only. Expenditures for family living were reported in detail under 15 categories of expense. All purchases of durable goods made during the year, except payments on homes and improvements on homes, were considered as current expenditures. Financing charges and interest on installment and other credit purchases, shipping and delivery charges were considered as part of the expenditure. Discounts and trade-in allowances were deducted from the gross price. Sales and excise taxes were included in the expenditures for each article except in the case of the details for food expenditure. Although the survey included expenditures of families and single consumers, these series cover farm families only.

G 464–481. Consumption expenditures, in current prices, of farm-operator families, by income class, 1935–36.

Source: National Resources Planning Board, *Family Expenditures in the United States, Statistical Tables and Appendixes*, June 1941, pp. 51, 120, and 157.

These data are based on information obtained as part of the Works Progress Administration study (see text for series G 409–426) and summarized for the United States by the National Resources Planning Board. The definition of income used in this study includes, in addition to money income, the nonmoney income items of net rental value of owner-occupied homes and housing received as pay and the net imputed value of food produced at home for the family's own use. For farm families, it also includes the net imputed value of certain other farm-produced goods used by the family, i.e., fuel, ice, tobacco, and wool, plus or minus the value of any increase or decrease in the amount of livestock owned or of crops stored for sale.

Estimates for approximately 15,000 native farm families (excluding those on public relief rolls) living in rural areas are presented in these series. For the main categories of disbursement, 140 villages and 66 farm countries in 30 States were surveyed. The farm sample represents the more important types of farming. Farm families operating part-time farms were excluded from the consumption sample (except in Oregon).

G 482–487. Consumption expenditures, in current prices, of farm-operator families, by income class, 1929.

Source: Computed from M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume*, The Brookings Institution, Washington, D. C., 1934, p. 260.

Digitized by Google

Aggregates presented in the original source were divided by the number of families in each income class to derive average expenditures per family.

The number of families is based on the distribution of families by income estimated by Maurice Leven. The estimates of consumer expenditures were made by Clark Warburton on the basis of 6 sample studies of the value of consumer goods and services used by farm families in one year between 1924 and 1930.

The income figures shown here represent both annual money and nonmoney income. Included in nonmoney income are imputed value of home-produced food and fuel, and of owned homes. The expenditure for "other" items includes direct taxes and contributions.

G 488–507. Consumption expenditures of farm-operator families, by income class, 1922–1924.

Source: Computed from E. L. Kirkpatrick, *The Farmer's Standard of Living: A Socio-Economic Study of 2,886 White Farm Families of Selected Localities in 11 States*, Department of Agriculture, Bulletin 1466, pp. 29 and 34.

These data were derived from a number of special studies made by the Department of Agriculture in cooperation with 12 colleges or universities. The studies were planned to show the following items among others: Tenure, acres per farm, and value of land per acre; quantities and value of food, fuel, and other materials furnished during the year; quantities and costs of food, fuel, furniture and furnishings, household supplies, and household labor purchased during the year; and expenditures for other items such as clothing, health, education, recreation, personal care, etc.

The economic level of farm business resources and of farm family living was the chief consideration in the selection of the localities represented in this study. The localities were situated in 11 States (New Hampshire, Vermont, Massachusetts, Connecticut, Kentucky, South Carolina, Alabama, Missouri, Kansas, Iowa, and Ohio). Of the 2,886 families represented in the study, 1,950 were owners, 867 were cash and share tenants including croppers, and 69 were hired men or managers. The study was limited to families who had an adult man operating the farm and an adult woman as homemaker; generally the operator and homemaker were man and wife.

Total expenditures for current consumption and expenditures for each consumption category were derived from figures in the source showing percentage distribution of the value of all goods. Expenditures for life and health insurance were deducted from the total. Consumer goods and services purchased include food, fuel, and housing furnished by the farm. Food and fuel provided by the farm were valued at prices halfway between what they would have brought and what they would have cost in the open market; housing provided was valued at 10 percent of the estimated value of the house occupied.

The class intervals shown in series G 488-507 as value of goods purchased and goods furnished in kind are ambiguously referred to in the original as "total value or income" groups. A comparison with other studies by the author indicates that the classes are not representative of income. Series G 488-507 therefore differs in this respect from the other series in this chapter.

G 508–543. General note.

For discussion of the surveys from which these series were obtained, see general note for series G 244–543 and the text for series separately grouped by survey which follows.

G 508–522. Consumption expenditures, in current prices, of families and single consumers combined, by income class, 1941.

Source: See source for series G 391–408, p. 75.

For a description of this study, see text for series G 391–408 and G 445–463.

The expenditure data in these series represent expenditures of all families and single consumers including families with negative incomes and incomes of $5,000 and over not shown separately, for the country as a whole. Nonmoney income is not included. The expenditure patterns are based on a sample of 3,100 families and single consumers in 62 cities and 45 rural counties.

G 523–537. Consumption expenditures, in current prices, of all families and single consumers combined, by income class, 1935–36.

Source: National Resources Committee, *Consumer Expenditures in the United States, Estimates for 1935–36*, pp. 77 and 84.

The study from which these series were derived was part of the Works Progress Administration study already described in the text for series G 409–426 and G 464–481, supplemented by data from other sources on expenditures of families with foreign-born heads, and of families having received public relief assistance. The expenditure data were secured from a sample of more than 60,000 families living in cities of different size, in villages, and on farms in 30 States. Similar patterns for single men and women were built up from less extensive sample data available from the Study of Consumer Purchases and from various supplementary sources. Average consumption patterns for broad groups of the population and for the Nation as a whole were obtained by weighting the patterns for the component groups of families and single individuals according to their relative importance at each income level. The population weights for this purpose and for estimating the aggregate consumption of the Nation in 1935–36 were derived from the study of consumer incomes (see National Resources Committee, *Consumer Incomes in the United States, Their Distribution in 1935–36*).

G 538–543. Consumption expenditures, in current prices, of all families and single consumers combined, by income class, 1929.

Source: Computed from M. Leven, H. G. Moulton, and C. Warburton, *America's Capacity to Consume*, The Brookings Institution, Washington, D. C., 1934, pp. 260, 261, and 265.

For the purpose of presenting these series in a form roughly comparable with those from other sources for earlier years, average consumption expenditures of all families and single consumers were derived by combining aggregate consumption expenditures (in millions of dollars), by income class, of farm and urban families and single consumers, as given in the report, and dividing these by the total number of consumers (in thousands) in each income class.

The estimates of consumer expenditures presented in *America's Capacity to Consume* were made by Clark Warburton who based his figures on sample surveys of expenditures of nonfarm families for 1918–1930, of farm families for 1924–1930 (see text for series G 482–487), and of single persons for 1918–1933 from a variety of sources. In addition, he used the results of a questionnaire concerning incomes, expenditures, and savings in 1929 circulated by The Brookings Institution to families of business and professional men.

G 544. Index of volume of food marketings and home consumption, 1910–1957.

Source: Agricultural Marketing Service, *National Food Situation*, July 1958; and the 1956 supplement to *Consumption of Food in the United States, 1909–52*, Agriculture Handbook No. 62.

Digitized by Google

This index was derived for 1940–1957 by weighting the quantities of the major farm-produced foodstuffs sold or used in farm households by average farm prices in 1947–1949. For 1910–1939, average prices for 1935–1939 were used and the series was "spliced" to the levels indicated by the newer weights on the basis of overlapped calculations for 1940. This index, as well as others including nonfood commodities, is described in *Major Statistical Series of the U. S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 2, pp. 38–49. For a comparison of this index with the production subindex (series K 104) of the index of supply-utilization of farm food commodities, see *Measuring the Supply and Utilization of Farm Commodities*, Agriculture Handbook No. 91, 1955, pp. 37–39.

G 545. Index of food consumption per capita, 1909–1957.

Source: See source for series G 544.

This index was derived by weighting per capita consumption of food, retail weight equivalents, by average retail prices in 1947–1949. Details of the construction of this index are described in *Consumption of Food in the United States, 1909–52*. Revised retail weight data were published in the Supplement for 1956 to that bulletin. The retail weight data are derived from such series as those on per capita food consumption (series G 552–584), by means of average conversion factors for nonprocessed and partially processed items which allow for wastes and losses in distribution between the particular primary distribution level at which each series is measured and the retail store level.

This index measures changes in quantity, primarily, although it also reflects certain changes in quality of foods consumed, such as the shift from lower-priced to higher-priced foods. It does not reflect price changes as such, because base-period prices are used throughout. Subindexes and a comparison with other measures of food consumption are given in *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 5, pp. 65–68.

G 546–551. Nutrients available, per capita per day, 1909–1957.

Source: See source for series G 544.

These figures are averages for the total population, 1909–1940, and for the civilian population only, 1941–1957. Data are computed on the basis of estimates of apparent civilian consumption (retail basis) including estimates of consumption from urban home gardens. No deductions have been made in the nutrient estimates for the loss or waste of food in the home or for the destruction or loss of nutrients during the preparation of food. Deductions have been made for inedible refuse.

The computations were made by multiplying the estimated per capita quantity of each food consumed by appropriate food composition figures. The composition values are those published in Department of Agriculture, *Composition of Foods . . . Raw, Processed, Prepared*, Agriculture Handbook No. 8, supplemented by a few unpublished values.

Since the early 1940's, there has been enrichment or fortification of several types of foods with minerals and vitamins. Composition figures used include these added minerals and vitamins. Foods that are commonly enriched or fortified are white flour and bread, breakfast cereals, and margarine.

The consumption of vitamins and mineral preparations, other than those used in the enrichment or in the fortification of foods mentioned, is not included here. Quantities of calcium or other minerals added to flour to make it self-rising or phosphated are not included nor is the nutritive content of baking powder, yeast, or dough conditioner.

G 552–584. Apparent civilian per capita consumption of food, 1849–1957.

Source: See source for series G 544.

Department of Agriculture estimates of the consumption of major foods are based on a great variety of information pertaining to supplies moving through trade channels for use by the civilian population. All estimates for foods other than cane and beet sugar are derived from data obtained primarily for other purposes. This accounts (1) for the lesser degree of reliability which should be placed on data in many of the series for earlier years, particularly before 1924 and (2) for the several levels in distribution at which the official estimates of consumption of individual foods are measured.

From the annual supply of each food (production plus beginning stocks, plus imports) are deducted feed, seed, industrial, and other nonfood use, exports and shipments, government purchases, and ending stocks. The residual is taken as a measure of the quantities moving into domestic civilian consumption during a given calendar year. Data used are from the following sources:

Item	*Source of data*
Stocks	Agricultural Marketing Service; Department of Commerce; trade reports.
Production	Agricultural Marketing Service; Fish and Wildlife Service.
Foreign trade	Department of Commerce; shipment data of Agricultural Marketing Service.
Nonfood use	Agricultural Marketing Service.
Military procurement	Special reports submitted to Department of Agriculture.

Data on military takings during World War I were so incomplete that they could not be used. Accordingly, data on total domestic food "disappearance" for 1909–1940 were divided by the total population. For 1941–1957, the total food supplies available for civilian consumption were divided by the number of people eating from civilian supplies. For 1941–1945, adjustments were made for members of the Armed Forces who were on leave or were, for other reasons, eating in homes or restaurants in this country.

The basic disappearance data are in varied terms, such as the carcass weight of meats at the slaughter level and the farm weight of fresh fruits and vegetables. However, such variation does not impede comparisons for a given food through time. Although disappearance data are not the same as consumption data, since they measure the quantities of food going into the distribution system instead of the quantities bought or consumed by consumers, they are the only available estimates of consumption. The possibility of error is present throughout, but the data are internally consistent. All disappearance data are on a national basis and no regional or State estimates can be made without the collection of much additional statistical information.

Some scattered data that are basic to estimates of apparent consumption have been gathered from decennial censuses prior to 1900. The food production data from the Census of Agriculture for 1910 were more complete, and are the first important benchmark for most food consumption estimates. The completeness and accuracy of the data have been greatly improved as the crop reporting system has developed. Data on consumption of major foods since about 1924 are viewed as much more reliable and comparable.

Extensive descriptions of methodology, sources, and inherent limitations for all series are given in *Consumption of Food . . .* (cited above) and are summarized in *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 5, chap. 3.

G 552–555, meat. Consumption is measured at the wholesale level in terms of weights of dressed carcass, excluding offal. Carcass weight of pork includes head meat, but excludes cuts rendered into lard. Quantities slaughtered under the Emergency Government Relief Purchase Program in 1934 and 1935 are included.

Digitized by Google

G 556, total fats and oils. Data are measurements at wholesale level and include fat content of butter, margarine, lard, shortening, and "other edible fats and oils." Other edible fats and oils are those used in cooking and salad oils and for minor uses such as fish canning, etc.

G 560, fresh fruit. Consumption is measured at the farm level. Includes apples (from commercial areas only, 1934–1957), apricots, avocados, bananas, cherries, cranberries, figs, grapes, nectarines, peaches, pears, pineapples, plums and prunes, strawberries, and citrus fruits. Excludes supplies used in processing.

G 561, citrus fruits. Includes oranges, tangerines, lemons, limes, and grapefruit.

G 562, canned fruit. Includes apples and applesauce, apricots, berries, cherries, cranberries, figs, fruit salad and cocktail, peaches (including spiced), pears, pineapple, plums and prunes, olives, and citrus segments. Data in terms of net weight reflect disappearance from the wholesale level of distribution.

G 563, canned fruit juice. Consumption is measured at wholesale level. It includes grapefruit, orange, blended citrus and lemon juices (single strength juices, 1930–1957; concentrated juices converted to single strength basis, 1941–1957), and apple, berry, fruit nectars, grape, pineapple, prune, and tangerine juices. Prior to 1928 only grape juice was covered.

G 564, dried fruit. Includes apples, apricots, dates (pits-in basis), figs, peaches, pears, prunes (excludes quantities used for juice), and raisins and currants. Disappearance or consumption since 1941 has been measured at the wholesale level.

G 565, frozen fruits and fruit juices. Includes blackberries, raspberries, strawberries, other berries, apples, apricots, cherries, grapes and pulp, peaches, citrus juices (product weight), and miscellaneous frozen fruits. Disappearance is measured at the wholesale level.

G 566, potatoes. Consumption is measured at the farm level. It excludes quantities supplied by nonfarm home gardens and quantities frozen or canned because they are counted in processed form, but includes quantities used for other purposes, such as for potato chips.

G 567, sweetpotatoes. Consumption is measured at the farm level. It excludes quantities canned and supplies from nonfarm home gardens.

G 568, fresh vegetables. Consumption is measured in terms of farm weights at the farm level, and includes tomatoes, artichokes, asparagus, lima beans, snap beans, broccoli, Brussels sprouts, cabbage, carrots, kale, lettuce and escarole, green peas, peppers, spinach, beets, cauliflower, celery, corn, cucumbers, eggplant, garlic, onions and shallots, and minor vegetables. It excludes quantities produced in home gardens and all supplies going into commercial processing.

G 569, canned vegetables. Excludes soups, baby food, and baked beans; but includes asparagus, lima beans, snap beans, carrots, peas, pumpkin and squash, spinach, tomatoes, tomato catsup and chili sauce, paste and sauce, and pulp and puree, tomato and other vegetable juices, beets, corn, pickles, sauerkraut, potatoes, sweetpotatoes, miscellaneous greens, pimientos, and mixed vegetables. Information on January 1 stocks was not available before 1943. Disappearance measured at wholesale level.

G 570, frozen vegetables. Includes asparagus, snap beans, lima beans, carrots, peas, peas and carrots, pumpkin and squash, broccoli, Brussels sprouts, spinach, cauliflower, corn (cut basis), succotash, rhubarb, potato products, and miscellaneous frozen vegetables. Disappearance measured at wholesale level.

G 571, melons. Consumption is measured at the farm level and includes watermelons, cantaloups, and honey dew and honey ball melons. Excludes quantities produced in home gardens.

G 572, dry beans. Disappearance is measured at the farm level, includes quantities used for canned baked beans and soups, and excludes supplies produced in home gardens.

G 573, total milk for human consumption. The total is measured in terms of whole milk equivalent, on fat solids basis, of all dairy products.

G 574, fluid milk and cream. Includes fluid cream on a whole milk equivalent basis (about 4 percent butterfat) and covers fresh use only; excludes fluid skim and buttermilk.

G 575, condensed and evaporated milk. Evaporated milk is unskimmed, unsweetened, case goods; the condensed milk is unsweetened (plain condensed), unskimmed bulk goods; and sweetened condensed milk, unskimmed, case and bulk goods. Data are measured at the processing level.

G 576, cheese. Includes all whole and part whole milk cheeses; excludes cottage, pot, and bakers' cheese and full-skimmed American.

G 577, ice cream. Data measured at the processing level in terms of product weight. Figures exclude frozen dairy product desserts such as sherbet, frozen custard and malted, and ice milk and mellorine (which is made from skim milk products and vegetable fats).

G 578, eggs. Consumption is measured at approximately the wholesale level of distribution and includes all eggs used in processed foods. Eggs were assumed to weigh approximately 1.5 pounds per dozen through 1946. To adjust for the increasing size of eggs, this factor was increased, beginning in 1947 by 0.01 pound each year through 1952, continued at 1.56 for 1953–1956, and raised to 1.57 for 1957.

G 579, chickens and turkeys. Consumption is measured at the wholesale level. Although most poultry was sold in dressed form until recent years, more is now sold ready-to-cook. The entire series was put on this basis to achieve comparability. Ready-to-cook includes the weight of giblets. Prior to 1947, the factor used to derive ready-to-cook weight from dressed weight for chicken was 0.75; for turkey, 0.824; beginning in 1947, data were computed using differing factors for the various items of supply and distribution.

G 580, sugar, cane and beet. Represents sugar used for all purposes, including quantities in processed fruit and vegetable items and ice cream. Data for 1875–1908 were obtained from Henry Schultz, *Theory and Measurement of Demand* (based on data in *Concerning Sugar*, a looseleaf service by United States Sugar Manufacturers Association, which had been derived from Willett and Gray, *Weekly Statistical Sugar Trade Journal*).

G 581, wheat flour. Includes white, whole wheat, and semolina flour (which is used primarily for macaroni and spaghetti); excludes use in breakfast cereals, but includes use in all other processed foods.

G 582, corn flour and meal. Estimates are based on census data. In recent years approximately 50 percent of cornmeal has been degermed.

G 583, peanuts. Excludes quantities crushed for oil; includes commercially cleaned and shelled peanuts plus quantities used on farms and farm sales for food use.

G 584, coffee. Consumption is measured in terms of green-bean equivalent of all types of coffee, reflecting disappearance from the wholesale roasting level.

[1] Includes value of food produced and consumed on farms and alcoholic beverages.
[2] Nonfarm dwellings.
[3] Telephone, telegraph, cable, and wireless.
[4] Includes cleaning and polishing preparations, and miscellaneous household supplies and paper products.
[5] Includes drug preparations and sundries, ophthalmic products, and orthopedic appliances, physicians, dentists, other professional services, privately controlled hospitals and sanitariums, and medical care and hospitalization insurance.
[6] Includes brokerage charges and interest, bank service charges, value of financial services, legal services, interest on personal debt, and other.

[1] Includes smoking supplies.
[2] Includes rent of transient accommodations.
[3] Excludes practical nurses.
[4] Includes death expenses.
[5] Accident, health, and prepayment. 1909–1927, estimated at 11 percent of life insurance expenditures.
[6] Includes expenditures for automobile parts, repair, and maintenance, gasoline and oil, luggage, and 1909–1927 for horse-drawn vehicles and equipment, and blacksmith's services.
[7] Figures differ from comparable estimates shown in series H 500. See text for series H 500–515 for explanation.

Series G 244–330. Consumption Expenditures, in Current Prices, of Families of City Wage and Clerical Workers of 2 or More Persons, by Income Class: 1874–75 to 1950

Series No.	Item	All income classes	Income class (after taxes)							
			Under $1,000	$1,000 to $2,000	$2,000 to $3,000	$3,000 to $4,000	$4,000 to $5,000	$5,000 to $6,000	$6,000 to $7,500	$7,500 to $10,000	$10,000 and over
	1950: FAMILIES IN CITIES OF 2,500 AND OVER

[1] Derived from Faith M. Williams, "Standards and Levels of Living of City-Worker Families," *Monthly Labor Review*, Sept. 1956. Figures do not correspond to those given in series G 244–263 because these relate to wage and clerical workers' families in large cities only; those in G 244–263 relate, in addition, to such families in suburbs and small cities.

[2] Derived from Bureau of Labor Statistics, *Cost of Living in the United States*, Bulletin No. 357.

[3] Derived from Departments of Commerce and Labor, Eighteenth Annual Report of the Commissioner of Labor, *Cost of Living and Retail Prices of Food*.

[4] Derived from the Sixth Annual Report of the Commissioner of Labor, 1890, *Cost of Production*, part III, "Cost of Living"; and Seventh Annual Report of the Commissioner of Labor, 1891, *Cost of Production*, vol. II, part III, "Cost of Living."

[5] Families of 3 or more persons.

[6] Refers to "normal" families; see text, series G 303–321.

[1] Computed from unrounded numbers.
[2] Includes small quantity of lard used in other fats and oils products 1899–1908; beginning 1909 excludes quantities so used.
[3] Prior to 1909, data are for year beginning July.
[4] Beginning 1934 excludes apples from noncommercial areas. Citrus fruits on crop year 1941 to date.
[5] From 1941 to date, year begins October or November prior to year indicated.
[6] Data on pack-year basis 1909–1942, beginning early June of year indicated.
[7] Citrus juice on pack-year basis beginning November prior to year indicated and year for grape juice in 1909–1933 and 1948 to date begins November prior to year indicated.
[8] Pack-year data, beginning middle of year indicated.

[9] For 1909–1942, calendar-year data were derived from pack-year data by combining proportional parts of each pack-year involved.
[10] Cleaned basis.
[11] Cream included on whole-milk equivalent basis.
[12] Chicken only 1909–1928, but turkey consumption very small during that time.
[13] On September-August year through 1939; August-July year thereafter.

Social Statistics

SOCIAL SECURITY AND WELFARE (Series H 1–222)

H 1–222. General note.

The concept of social welfare used in these series, and more particularly in series H 1–45, includes all governmental programs directed specifically toward promoting the well-being of individuals and families. Except for the veterans program, social welfare activities in the United States remained largely a local responsibility throughout most of the 19th century. State governments began to establish separate State institutions for the mentally ill and other dependent groups in the late 1850's and State boards of health were in operation in a number of States by 1900. State laws authorizing pensions for the blind, for orphans and their mothers, and for the aged were adopted in a number of States during the period 1900–1930. Workmen's compensation spread rapidly between 1911 and 1920. Special retirement systems for State and local government employees, principally teachers, policemen, and firemen, were in existence in a few localities before 1900. The civil service retirement system for Federal employees was established in 1920.

It was not until the Social Security Act of 1935, however, that the Federal Government participated in any major way in permanent welfare programs for the general population. The Social Security Act established a national system of old-age insurance (now old-age, survivors, and disability insurance) and a Federal-State system of unemployment insurance, and provided Federal grants-in-aid to the States for public assistance, child health and welfare services, general public health services, and vocational rehabilitation services.

Since 1936, a substantial volume of statistical data relating to old-age, survivors, and disability insurance, unemployment insurance, and public assistance is available from the operating records of the administering agencies. Statistics based on operating data can also be obtained for the railroad retirement program, the civil service retirement program, and the four State temporary disability insurance programs. Estimates of expenditures under State workmen's compensation programs and State and local employee retirement systems since 1934 have been made by the Social Security Administration.

The principal source of statistics of social insurance and welfare programs is the Social Security Administration, which presents annual figures in the *Annual Statistical Supplement* to the monthly *Social Security Bulletin* (for the years 1939-1948 in the *Social Security Yearbook;* for 1949-1954, in the September 1950-1955 issues of the *Bulletin;* since 1956, issued separately), and in annual articles in the October issues of the *Social Security Bulletin* (since 1955).

Figures shown for recent years are subject to revision. All figures represent the latest estimates available and may differ from those shown in the sources cited. In all such cases, the revised figures were obtained from the Social Security Administration records or estimates.

H 1–29. Social welfare expenditures under civilian public programs, 1890–1956.

Source: 1935, 1940, 1945, and 1950–1956, Social Security Administration, *Social Security Bulletin*, October issues; all other years, Social Security Administration, records.

Estimates presented for 1890, 1913, and 1929 were primarily based on the following: R. A. Musgrave and J. M. Culbertson, "The Growth of Public Expenditures in the U. S., 1890–1948," *National Tax Journal*, June 1953; and J. Frederic Dewhurst and Associates, *America's Needs and Resources*, Twentieth Century Fund, New York, 1955; and reports of official agencies.

Scattered data relating to social welfare programs in particular localities or States may be found in other sources. The definitions used in these sources, however, are highly variable and the original source of the data is frequently not indicated. Further historical study might yield some additional quantitative information, but no data comparable to those shown for later years are readily available.

The data for education, workmen's compensation, and State and local retirement programs relate to continental United States. For the other programs, some payments and expenditures outside continental United States are included, primarily payments in Territories covered by the programs and payments to beneficiaries living in other countries.

Estimates of expenditures for public assistance and for other public aid in the 1930's differ in various sources because different accounting concepts were used. There are differences in methods of allocating work program expenditures by years and in treatment of funds from the Federal Emergency Relief Administration. In some sources, FERA funds are treated as general relief payments (and therefore as State and local expenditures for public assistance); in others, they are treated as other public aid from Federal funds. The estimates for the 1930's shown here (series H 13–15) correspond to those in the National Resources Planning Board report, *Security, Work, and Relief Policies*, 1942, appendix 19, except for the substitution of more recent estimates of the value of surplus commodities and minor revisions of some figures on public assistance payments. See also text for series H 186–198 and H 199–206.

The estimates for health and medical services (series H 16) are derived from the Census of Governments and the Federal Budget. They include net public expenditures for hospital and medical care (after deduction of fee payments), hospital construction, community and related public health services, maternal and child health services, the operation of sanitation services (but not sewer construction or water supply), food and drug inspection, and medical research. They exclude expenditures for domiciliary care (other than in mental and tuberculosis institutions) which are included under institutional care (series H 19). They also exclude expenditures for health and medical services provided in connection with veterans programs, public education, public assistance, workmen's compensation, State temporary disability insurance, and vocational rehabilitation; these are included in the total expenditures shown for those programs. Also excluded are international health activities, medical activities of the Department of Defense and the Atomic Energy Commission, and medical

Digitized by Google

activities subordinate to the performance of other functions, such as those of the Civil Aeronautics Authority. (For detailed discussion, see *Social Security Bulletin*, October 1956 and 1957.)

The estimates for veterans programs (series H 23–28) were obtained from the *Annual Report of the Veterans Administration*, supplemented by unpublished data. The figures exclude expenditures for bonus payments (regarded as deferred pay, rather than as social insurance benefits), appropriations to the Government life insurance trust fund (impossible to allocate by years on an incurred cost basis), and accounts of several small revolving funds (which are in the nature of business activities). The appropriate administrative costs are included in each of the five categories of expenditure shown, thereby facilitating the addition of veterans health expenditures to other health and medical expenditures, veterans education expenditures with other education programs, etc.

See also general note for series H 1–222.

H 30–45. Social welfare expenditures under civilian public programs, by source of funds, 1890–1956.

Source: See source for series H 1–29.

Federal grants-in-aid are classified as expenditures from Federal funds (contrary to the practice in the national income accounts which includes them as expenditures from State and local funds). Benefit payments under the State unemployment insurance programs are classified as expenditures from State funds (in the national income accounts they are classified as Federal expenditures, based on the fact that the State unemployment insurance trust funds are held and invested by the Secretary of the Treasury). Federal grants to the States for the administration of unemployment insurance and the employment service are classified as expenditures from Federal funds.

H 55–67. Estimated payrolls in employment covered by selected social insurance programs, 1937–1957.

Source: 1937–1948, Social Security Administration, records; 1949–1957, *Social Security Bulletin, Annual Statistical Supplement*, various issues.

The Office of Business Economics is the original source for total earnings and wage and salary disbursements (series H 55–57). The Social Security Administration is the original source for payrolls covered by State and local government retirement systems and by workmen's compensation (series H 62 and H 67). See also text for series H 175–185. Figures for series H 58–61 and H 63–66 are based on reports of the agencies administering the programs specified.

Annual estimates of the number of workers and the amount of payrolls covered by workmen's compensation laws are based on data compiled by the Social Security Administration for certain benchmark years—1940, 1946, and 1953. For the intervening years, coverage estimates have been projected on the basis of the percentage change under the unemployment insurance laws, with adjustments, where necessary, for changes in coverage under the two programs. Coverage estimates for the benchmark years are based primarily on payroll data provided by the National Council on Compensation Insurance, the major rate-making organization in the country. The number covered is the average of the number of workers in covered employment in the pay period ending nearest the 15th of each month. All the estimates are submitted to the respective State workmen's compensation administrative agencies for review and comment at least every 2 or 3 years.

H 68–114. Monthly benefits and beneficiaries under social insurance and related programs, by risk and program, 1940–1957.

Source: Social Security Administration, *Social Security Bulletin, Annual Statistical Supplement*, various issues.

Lump-sum payments are excluded. Data for workmen's compensation and State and local retirement systems are for continental United States only; data for other programs include benefits paid and beneficiaries in Territories or in other countries.

Most of the data are derived from operating statistics of the administering agencies. For the basis of estimates of workmen's compensation payments, see text for series H 175–185.

Estimates of the operations of State and local government retirement systems (series H 73 and H 97) are based primarily on Bureau of the Census reports on city and State government finances. Fiscal-year data in these reports show, both for State-administered and city-administered systems, the contributions by the government and by employees and the total payments (with benefits and withdrawals separately identified when available). These figures must be adjusted to derive estimates of benefits for several reasons. Systems administered by counties, for example, are not included. On the other hand, comparison with reports of the systems themselves (specifically for the New York systems) indicates that contributions borrowed by members may be included as benefit payments. Moreover, benefit payments may include withdrawals made as refunds to members leaving the system and lump-sum death payments. The 1957 Census of Governments survey of employee retirement systems will make possible considerable refinement of this series.

H 115–161. General note.

The national system of old-age, survivors, and disability insurance originally covered employees in industry and commerce. Beginning in 1951 (as a result of the 1950 amendments of the Social Security Act) coverage was extended to regularly employed agricultural and domestic workers, to most urban self-employed persons, and on a group-voluntary basis to employees of nonprofit organizations and to employees of State and local governments not covered by separate retirement programs. In January 1955, coverage was further extended to self-employed farmers and additional farm workers, to most professional self-employed persons, on a group-voluntary basis to most State and local government employees covered by their own retirement system, and on an individual-voluntary basis to ministers. Effective with taxable years ending after 1955, additional self-employed professional groups and certain farm owners and operators were covered. As of January 1957, military personnel were covered on a compulsory basis. Free wage credits for military service from September 1940 through December 1956 are reflected in benefits paid in the years covered by the series (primarily in benefits to

Digitized by Google

young survivors) but do not enter into the count of covered workers or taxable earnings. The additional cost of benefits paid in any year as a result of these credits is met by a transfer to the trust funds from general revenues.

An individual in covered employment may not be covered for the full amount of his earnings. Contributions were payable only on earnings up to $3,000 a year during the period 1937–1950, up to $3,600 a year for 1951–1954, and up to $4,200 a year for 1955–1957. Taxable earnings represented about 93 percent of total earnings in covered employment in 1938, about 80 percent in 1950, about 85 percent in 1951, about 80 percent in 1954, about 84 percent in 1955, and about 82 percent in 1956.

Contributions were payable on taxable earnings at the following rates: 1937–1949, employers and employees 1 percent each; 1950–1953, employers and employees 1½ percent each, self-employed 2¼ percent; 1954–1956, employers and employees 2 percent each, self-employed 3 percent; 1957, employers and employees 2¼ percent each, self-employed 3⅜ percent or 1½ times this amount.

Lump-sum death payments became payable in 1937, monthly benefits in 1940. The original Social Security Act provided for monthly old-age benefits only. Amendments adopted in 1939 added benefits for dependents (wives 65 years old and over, and children under 18) and for survivors (widows 65 years old and over, children under 18 and their widowed mothers, and dependent parents 65 years old and over when there was no surviving widow or child). Beginning in September 1950, aged husbands or widowers who had been dependent on their wife's earnings became eligible for benefits. As a result of amendments adopted in 1956, the age at which women became eligible for benefits was lowered to 62, effective November 1956, and monthly disability benefits became payable in January 1957 to dependent disabled children 18 years old and over who were totally disabled before attaining age 18 and in July 1957 to permanently and totally disabled insured individuals 50–64 years old.

Insured workers who retire from any substantially gainful work may receive benefits beginning at age 65 (since November 1956 at age 62 for women who elect to receive an actuarially reduced benefit). The test of substantially gainful work was taxable earnings of $15 a month or more during 1940–1950; $50 a month in 1951–1952; $75 a month for wage workers in 1953–1954 and $600 and $900 a year, respectively, for self-employed workers during the same period, with no restrictions for workers aged 75 or over; $1,200 per year beginning 1955, with no restrictions for workers aged 72 or over.

H 162–174. Unemployment insurance—coverage, benefits, and financing under State programs, 1941–1957.

Source: Bureau of Employment Security, *The Labor Market and Employment Security* and the monthly *Statistical Supplement*.

Most of these series also appear in the *Social Security Bulletin, Annual Statistical Supplement*. Data relate only to State programs under Title IX of the Social Security Act. Note that data in series H 1–114 include, in addition, the railroad unemployment insurance system, unemployment allowances for veterans, reconversion unemployment benefits for seamen, and unemployment benefits for Federal employees paid by the States as agents of the Federal Government.

In all States, covered employment represents employment in industrial and commercial establishments of 8 or more for 1941–1955, and 4 or more for 1956–1957 (coverage required under the Federal statute); in some States, covered employment also represents employment in smaller establishments and employment for additional groups of workers, such as State and local employees or seamen. Taxable wages represent wages up to $3,000 a year in all States except Delaware, Nevada, Oregon, and Rhode Island, where the limit has been $3,600 since January 1956; in Alaska, wages up to $3,600 were taxable in calendar 1956 and up to $4,200 since January 1957. Contributions payable by employers to the Federal Government (0.3 percent of taxable wages), and used primarily for Federal grants to the States for the cost of administering unemployment insurance and employment services, are not included in these series. Employer contributions to States for unemployment insurance vary in rate depending on the individual employer's experience (in earlier years not all States permitted variable rates), ranging generally from 0.5 percent or less to 2.7 percent or more of taxable payrolls. In 1941, 5 States also collected contributions for this program from employees; by 1958, only Alabama, New Jersey, and Alaska did so.

In most States, a waiting period of 1 week must be served before payments begin. Benefits are payable for a maximum number of weeks, ranging from 16 to 30 weeks among the States; maximum weekly benefits without dependents' allowances range from $25 to $45 under the several State laws. In 11 States, maximum allowances for dependents ranging from $3 to $25 raise the range of maximum augmented benefits to $30 to $70.

H 175–185. Workmen's compensation—payments, by type of benefit and type of insurance, 1939–1957.

Source: 1939–1952, Social Security Administration, *Social Security Bulletin*, March 1954; 1953–1957, *Social Security Bulletin*, December issues, and Social Security Administration, records.

The figures include estimated payments under State workmen's compensation laws (46 States in 1939; 48 States, 1948–1957) and under Federal workmen's compensation laws covering employees of the Federal Government, private employees in the District of Columbia, and longshoremen and harbor workers. Most of the State workmen's compensation laws exempt employment in agriculture, domestic service, and casual labor; the majority exempt employers who have fewer than a specified number of employees. Occupational diseases, or at least specified diseases, are compensable under nearly all laws.

Digitized by Google

To make certain that benefit payments will be made when due, the covered employer is required by law to obtain insurance from a private insurance carrier, from a State insurance fund, or to give proof of his qualifications to carry his own risk, which is known as self-insurance.

Estimates of workmen's compensation payments depend on a variety of sources of published information, supplemented by correspondence with State agencies. Data on payments by private insurance companies and some of the competitive State funds are obtained from annual issues of *Spectator*: *Insurance by States of Fire, Marine, Casualty, Surety and Miscellaneous Lines*. Data on payments made by the remaining State funds are obtained from annual or biennial reports issued by State Workmen's Compensation Bureaus or Divisions, or State Insurance Departments, and from the annual publication of the Bureau of the Census, *Compendium of State Government Finances*. Data on payments by self-insurers in some States are obtained directly from State reports. For most States, however, estimates are calculated using one of several ratios (e.g., reported accidents, claims filed, taxes paid, etc.) that exist between firms which are insured with private carriers, or State funds, and firms which self-insure.

H 186–198. Public assistance—recipients and average monthly payments, by program, 1936–1957.

Source: Social Security Administration, *Social Security Bulletin, Annual Statistical Supplement, 1957*, p. 74.

Assistance programs financed in part by Federal grants-in-aid were in effect on a State-wide basis in 1936 in 42 States for old-age assistance, 27 States for aid to dependent children, and 25 States for aid to the blind. Programs have been in effect in all 48 States and the District of Columbia beginning 1938 for old-age assistance, 1955 for aid to dependent children, and 1953 for aid to the blind. Approval of the first plans for aid to the permanently and totally disabled was effective October 1950, and in 1957, 44 States and the District of Columbia were participating. General assistance, provided from State or local funds or both, is available to certain other categories of needy persons in all States. In 1956, about one-third of the States did not provide general assistance to employable persons and in 16 States, general assistance was provided entirely from local funds.

Series H 1-29. Social Welfare Expenditures Under Civilian Public Programs: 1890 to 1956

[In millions of dollars. Represents expenditures from public funds (general and special) and trust accounts, and other expenditures under public law; excludes transfers to such accounts and loans; includes capital outlay for hospitals, public elementary and secondary schools, and publicly controlled higher education; includes administrative expenditures except as noted. Years ending June 30 for Federal Government, most States, and some localities; for other States and localities covers various 12-month periods ending in specified year. (State temporary disability insurance programs operate in 4 States only.)]

[1] Government expenditures are from general revenues and social insurance trust funds; excludes workmen's compensation and temporary disability insurance payments made through private carriers. Although these are included as social welfare expenditures, series H 1 (under statutory provisions).

[2] Excludes refunds of employee contributions to those leaving service. Federal expenditures include retirement pay of military personnel.

[3] Includes unemployment compensation for Korean veterans (beginning 1953) and for Federal employees (beginning 1955).

[4] Payments by private insurance carriers, State funds, and self-insurers of benefits payable under State law and estimated State costs of administering State funds and of supervising private operations and payments and administration cost under Federal employees compensation programs. Administrative costs of private insurance carriers and self-insurers not available. Prior to 1949 excludes all administrative costs for workmen's compensation.

[5] Old-age assistance, aid to dependent children, aid to the blind, aid to the permanently and totally disabled (beginning 1951), and from State and local funds, general assistance.

[6] Work program earnings, other emergency aid programs, and value of surplus food distributed to needy persons. (From 1936 to 1940, includes unknown amount of surplus food distributed to institutions.)

[7] Not available.

[8] Some public aid expenditures included under "Other welfare services."

[9] Excludes expenditures included under other programs.

[10] Includes value of surplus foods for school lunches or nonprofit institutions. (See footnote 6.)

[11] Beginning 1946, total exceeds sum of items because of inclusion of State payments to veterans.

[12] Includes burial awards.

[13] Vocational rehabilitation, specially adapted homes and automobiles for disabled veterans, counseling, beneficiaries' travel, loan guarantees, and, beginning 1950, domiciliary care; for earlier years, domiciliary care included with health and medical services.

[14] Federal and State subsidies (and administrative costs) for low-cost housing.

[15] Net refunds.

1934	52.2	28.9	10.0	-------	-------	1.4	17.0	-------	-------

[1] Bureau of the Census total of persons 14 years old and over in the civilian labor force; includes unpaid family members and the unemployed, not shown separately.

[2] Beginning in 1954, includes persons covered under both a government retirement system and old-age, survivors, and disability insurance (about 1,000,000 in December 1956, 600,000 in December 1955, and 800,000 in December 1954); excludes persons who were eligible for coverage but not actually covered (about 8.5 million in December 1956); also excludes railroad employees jointly covered by OASDI and their own retirement program.

[3] Includes persons covered under both a government retirement system and old-age, survivors, and disability insurance; see footnote 2.

[4] State, railroad, and Federal employee programs.

[5] State and railroad programs. Excludes government employees covered by sick-leave provisions.

[1] Includes earnings of self-employed.
[2] Wage and salary disbursements paid in cash and in kind in continental United States and pay of Federal personnel in all areas.
[3] Beginning 1953, adjusted for duplication of payrolls covered by both old-age, survivors, and disability insurance and State and local retirement systems.
[4] Taxable plus estimated nontaxable wages and salaries in employment covered by programs.
[5] Includes a small amount of taxable wages for Alaska and Hawaii.
[6] Preliminary.
[7] Beginning 1955, includes payrolls of Federal civilian employees in all areas.
[8] Payrolls of employers insuring with private carriers, State funds, or self-insured, and Federal programs; excludes railroads (covered by Employers' Liability Act).
[9] Not available.

Series H 68–114. Monthly Benefits and Beneficiaries Under Social Insurance and Related Programs, by Risk and Program: 1940 to 1957

[Partly estimated. Refunds of employee contributions excluded, for State and local government, Federal civil service, and other contributory retirement plans]

[1] Includes $56,676,000 and 123.7 thousand beneficiaries under old-age, survivors, and disability insurance for 1957, not shown separately.
[2] Includes benefits paid to aged wives, to dependent husbands (first payable Sept. 1950), and to children of retired-worker beneficiaries.
[3] Includes Federal civil service and other contributory systems and Federal noncontributory systems. For contributory systems, prior to 1954, includes small but unknown amount and number of disability and survivor benefits and beneficiaries (included with old-age retirement). For noncontributory systems, for 1940, significant amount and number of disability payments included with old-age retirement. Before 1954, small but unknown amount and number of survivor payments included with old-age retirement.
[4] For fiscal year, usually ending June 30. Data for 1957 preliminary. Under survivorship, number represents families.
[5] Under Veterans Administration. Old-age retirement data are for veterans of the Spanish-American War, the Boxer Rebellion, and the Philippine Insurrection; beginning Oct. 1951, include all service pensions. Disability data include pensions and compensation, and subsistence payments to disabled veterans undergoing training.
[6] Small but unknown amount of lump-sum death payments included with monthly survivor payments. Disability benefits exclude payments for medical care.
[7] Benefits first payable in Rhode Island, Apr. 1943; in California, Dec. 1946; in New Jersey, Jan. 1949; and in New York, July 1950. Includes maternity data for Rhode Island. Excludes hospital benefits in California and hospital, surgical, and medical care benefits paid under approved plans in New York. Number represents average weekly number of beneficiaries; excludes private-plan beneficiaries in California and New Jersey.
[8] Beginning 1955, includes payments to unemployed Federal employees made by the States as agents of the Federal Government.
[9] For unemployment allowances (under the Servicemen's Readjustment Act beginning Sept. 1944 and under the Veterans' Readjustment Assistance Act beginning Oct. 1952), average weekly number. For self-employment allowances under the Servicemen's Readjustment Act beginning Nov. 1944, average monthly number. For 1953 to 1957, a small number and amount of self-employment allowances included with unemployment benefits; not shown separately.
[10] Average monthly number, except as noted.
[11] Not available.
[13] Average number of beneficiaries during a 14-day registration period.
[13] Average weekly number.
[14] Less than $500,000, or 500 beneficiaries.
[15] Revised unpublished estimate.

[1] Estimates; not adjusted to reflect effect of provisions that coordinate old-age and survivors insurance and railroad retirement programs, and wage credits for military service. Only partially adjusted to eliminate duplicate count of persons with taxable earnings reported on more than 1 account number; effect of such duplication is substantially less significant for insured workers than for uninsured.

[2] Workers with first taxable earnings under program in specified year.

[3] Partly adjusted for workers having more than 1 account.

[4] Not adjusted for earnings excluded in benefit computations, i.e., amounts above taxable base earned by workers with more than one employer or source of earnings and on which employee contributions were subsequently refunded. Annual wages in excess of $3,000 before 1951, $3,600 during 1951–1954, and $4,200 beginning 1955, paid to workers by any 1 employer, were not taxable. Beginning with 1951, self-employment earnings were taxable; amount taxable may not exceed amounts specified above from a combination of wages and self-employment earnings.

[5] Represents number of different employers filing tax reports. A report may relate to more than 1 establishment if employer operates separate establishments.

[6] Includes insurance contributions, adjusted for refunds, and transfers during calendar years 1947–1951 from general funds equivalent to additional payments arising from extension of survivors insurance protection to certain veterans of World War II (Social Security Act Amendments of 1946).

[7] Before 1940, represents operations of old-age reserve account.

[8] Not available.

[9] Preliminary estimate.

[1] Before 1945, average of workers in last pay period of each type (weekly, semimonthly, etc.) ending within the month; thereafter, ending nearest 15th of each month. Excludes Alaska and Hawaii.
[2] Includes initial transitional claims.
[3] For total unemployment; includes dependents' allowance.
[4] Based on date final payments were issued.
[5] Excludes Wisconsin for all years; in addition excludes data as follows: 1941, for 5 states; 1942–1943, 3 States; 1944, 7 States; 1945, 11 States; 1948–1949, 1 State.
[6] Excludes small amounts of reconversion unemployment benefits for seamen in 1947–1950.
[7] Includes contributions, penalties, and interest from employers; employee contributions in States which tax workers; and $40.6 million deposited by Federal Government in 1938 to trust funds of 15 States, representing payroll taxes collected by the former in 1936.
[8] Wages subject to State unemployment insurance taxes.
[9] Funds available for benefits. Excludes transfers as follows; To railroad unemployment insurance program, $8 million in 1941; to States' temporary disability funds, $200,000 in 1946, $15 million in 1947, and $64 million in 1948. Includes in 1955, $3 million advance to Alaska from Federal account in Unemployment Insurance Trust Fund, which advance was repaid in December 1956. Includes $33.4 million allocation to the States in July 1956, based on 1955 taxable wages in accord with Employment Security Administrative Financing Act of 1954.
[10] Excludes January-March 1948 data for all States.
[11] Excludes Indiana, Wisconsin, and Wyoming from 1940–1943; Wisconsin and Wyoming in 1944; and Wisconsin in January-November 1945.

[1] Includes as recipients, the children and 1 parent or other adult relative in families in which the requirements of at least 1 such adult were considered in determining the amount of assistance. Beginning October 1950, Federal funds were available for payments to these adults under the 1950 Social Security Act amendments.

[2] Program initiated October 1950 under the 1950 Social Security Act amendments.

[3] Excludes Idaho for 1957 and Nebraska for 1952 and 1953.

[1] General coverage of State reports: 1937–1947, services administered or financed in whole or in part by official State agencies under the Social Security Act; 1948–1949, services provided or purchased by official State agencies exclusive of prediagnostic services; 1950–1956, "physician's services" consisting of clinic service, hospital care, convalescent home care, and other services by physicians. Data for 1937 are for 45 States, the District of Columbia, Alaska, Hawaii (Georgia, Louisiana, Oregon not participating); for 1938, Georgia and Oregon also included and for 1939, Louisiana as well (except for first quarter). Puerto Rico excluded beginning with the last half of 1940, and Virgin Islands beginning the last half of 1947; prior to these dates they were included. Arizona, which did not participate 1950–1956, excluded for these years. Rates for each year are based on the population of States participating in those years.

[2] Includes services administered or supervised by official State health agencies. Reports were received each year except 1941 from 48 States, the District of Columbia, Alaska, Hawaii. Missouri was not participating in 1941. Puerto Rico is included beginning with 1940, and the Virgin Islands beginning with the last half of 1947.

[3] Prior to 1956 antepartum service only.

[4] Rates no longer computed because mothers may receive maternity medical clinic service in more than one calendar year and in years different from year of giving birth.

[5] Rates no longer computed as older children are included.

chapter H

EDUCATION (Series H 223–411)

H 223–411. General note.

Nationwide statistics on education have been collected and published primarily by the Office of Education and the Bureau of the Census. Data on education have also been collected and published by other Federal and State and local governmental agencies, and by independent research organizations.

The Office of Education generally obtains data from reports of State and local school systems and institutions of higher learning. These data relate to school enrollment and attendance, graduates, instructional staff, curricula, school district organization, receipts, and expenditures for elementary and secondary schools, and enrollment, faculty, degrees conferred, income, expenditures, property, and plant fund operations for institutions of higher education.

Data from the Bureau of the Census are obtained through household interviews in decennial censuses and current sample surveys, and relate essentially to school enrollment, literacy, and educational attainment of the general population.

H 223–315. General note.

The Office of Education has issued statistical reports on elementary and secondary education since 1870. For 1870–1917, statistics were included as part of the *Annual Report of the United States Commissioner of Education*. Since 1918, a report has been issued for each even-numbered school year under the title, *Biennial Survey of Education in the United States*. Chapter 1 of the *Biennial Survey*, "Statistical Summary of Education," and chapter 2, "Statistics of State School Systems," are primary sources for some derived measures relating to education. Beginning with 1941 and ending with 1951, chapter 2 was supplemented by an abridged report issued as a circular for each odd-numbered school year. Data from the odd-year biennial circulars have not been included in the present compilation. Biennial survey data are based on report forms completed by State departments of education (a copy of the report form appears in the *Biennial Survey* of 1952–1954). Beginning with the *Biennial Survey* of 1952–1954, these forms have been completed by education officials in accordance with detailed instructions contained in the Office of Education, *Handbook I, the Common Core of State Educational Information*. Prior to that date, the forms were completed in accordance with various circulars of information distributed by the Office of Education.

One of the major factors in presenting accurate statistical data on a national basis is the uniformity with which all recording units use standard terms, definitions, and procedures. Prior to 1909, this was controlled only by definitions on the questionnaires requesting information. Since 1909, the Office of Education in cooperation with other national and State organizations has improved uniform recording and reporting through the means of national committees, publications, and national and regional conferences.

A major problem in the collection and processing of comprehensive nationwide school statistics is that of getting all the schools to respond within reasonable time limits. The school authorities are not compelled to report to the Office of Education. There is some evidence that the proportion of schools reporting has increased through the years. This increase is most evident in the data for secondary schools. Prior to 1930, a complete list of public secondary day schools had not been compiled, and consequently there is no way to measure the degree of response in the earlier years. In 1930, there were 23,930 public secondary day schools on file, and reports were received from 22,237. In 1938, the number of schools on file increased to 25,308, and the number reporting was 25,091. In 1952, there were 23,757 schools, and replies were received from all but 12 schools. The data for the missing schools were estimated, and the published totals for 1952 cover all public secondary day schools.

Since 1870, there have been both major and minor changes in the collection patterns with changes in the administration of the program. Some patterns lasted for many years. With voluntary response and no field service (until 1924), response rates varied in their completeness for both reporting in general and for specific items. The completeness of the coverage is not always made evident in the publication. Field service supplemented returns by mail for the 1923–1924 biennial chapters. Visits were made to State departments of education and colleges and universities to complete the coverage from basic or secondary records that were available in the State departments of education or at individual schools and institutions. The introduction of sampling in recent years has also insured adequate coverage.

The data in these historical tables will not always agree with similar data in the publications cited as sources for a specific year because tabulations were "kept open" for many years and as data came in they were added and reflected in future historical tables.

H 223–233. Elementary and secondary schools, enrollment and attendance, and high school graduates, 1870–1956.

Source: 1870–1916, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues (except for 1890 for series H 228, see source for 1918–1956); 1918–1956, *Biennial Survey of Education in the United States*, chapter 2, various issues (except for series H 228 for 1918 and 1928–1934, and for series H 232–233, see Chapter 1, "Statistical Summary of Education").

Enrollment data are also collected and issued by the Bureau of the Census; see series H 374–382 and H 383–394.

A public school is defined as one operated by publicly elected or appointed school officials in which the program and activities are under the control of these officials and which is supported by public funds. School enrollment and other figures are for public elementary and secondary day schools in continental United States. Excluded are public schools in the Territories and outlying parts of the United States, public schools operated directly by the Federal Government on military reservations and schools for Indians and Alaskan natives, public residential schools for exceptional children, and subcollegiate departments of institutions of higher education. Only regular day school pupils are included; pupils enrolled in night schools and summer schools are excluded.

A nonpublic school is defined as one established by an agency other than the State or its subdivisions, primarily supported by other than public funds, and the operation of whose program rests with other than publicly elected or appointed officials. Nonpublic schools include both denominational and

Digitized by Google

nonsectarian schools, but not private schools for exceptional children or private vocational or trade schools. Enrollment figures include only regular day school pupils; they exclude summer school pupils.

Nonpublic school figures (series H 228) for 1920–1956, which appear in the separate issues of "Statistics of State School Systems" for those years, are not strictly comparable. For example, for 1928–1934, enrollment in kindergarten was not included, and in some of the earlier years, the figures include enrollment of secondary pupils in subcollegiate departments of institutions of higher education, normal schools, etc. For data substituted from other sources, see the exceptions cited in the source note above.

Figures for average daily attendance in public schools were computed by dividing the total number of days attended by all pupils enrolled by the number of days school was actually in session. Only days on which the pupils were under the guidance and direction of teachers are considered as days in session.

Figures for high school graduates include graduates from public and nonpublic schools and exclude persons granted equivalency certificates.

Population estimates used in computing series H 225 and H 233 were provided by the Bureau of the Census.

See also general note for series H 223–315.

H 234–245. Public elementary and secondary day schools' instructional staff, school districts, and schools, 1870–1956.

Source: 1870–1916, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues; 1918–1956, *Biennial Survey of Education in the United States*, various issues, and Pamphlet No. 92, *Are the One-Teacher Schools Passing?*

A principal is defined as the administrative head of a school to whom has been delegated the major responsibility for the coordination and supervision of the activities of the school. Supervisors of instruction or consultants are school personnel who have the responsibility of assisting teachers in improving the learning situation and instructional methods.

School districts (series H 241) are administrative units at the local level which exist primarily to operate schools or to contract for school services. Normally, taxes can be levied against citizens or property or both within the units for school purposes. These units may or may not be coterminous with county, city, or town boundaries.

A school (series H 242–244) is defined as a division of the school system consisting of a group of pupils composed of one or more grade groups, organized as one unit with one or more teachers to give instruction of a defined type, and housed in a school plant of one or more buildings. More than one school may be housed in one school plant, as is the case when the elementary and secondary programs are housed in the same school plant.

One-teacher public schools (series H 245) are schools in which one teacher is employed to teach all grades authorized in the school, regardless of the number of rooms in the building.

See also general note for series H 223–315 and text for series H 223–233.

H 246–251. Public elementary and secondary schools' receipts, by source, 1890–1956.

Source: 1890–1916, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues; 1918–1956, *Biennial Survey of Education in the United States*, various issues.

Revenue receipts represent additions to assets (cash) from taxes, appropriations, and other funds which do not incur an obligation that must be met at some future date and do not represent exchanges of property for money. Receipts from county and other intermediate sources are included with local receipts. Other sources of revenue (series H 251) include gifts and tuition, and transportation fees from patrons.

Nonrevenue receipts represent amounts which either incur an obligation that must be met at some future date or change the form of an asset from property to cash and therefore decrease the amount and the value of school property. Money received from loans, sale of bonds, sale of property purchased from capital funds, and proceeds from insurance adjustments constitute most of the nonrevenue receipts.

See also general note for series H 223–315 and text for series H 223–233.

H 252–261. Public elementary and secondary schools' expenditures, by purpose, 1870–1956.

Source: 1870–1916, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues; 1918–1956, *Biennial Survey of Education in the United States*, various issues.

Expenditures for administration (series H 255) include those for the central office staff for administrative functions and all general control which is systemwide and not confined to one school, subject, or narrow phase of school services. Instruction expenditures (series H 256) include salaries of instructional staff and clerical assistants, and expenditures for free textbooks, school library books, and supplies and other expenditures for instruction. Plant operation and maintenance expenditures (series H 257) include salaries of custodians, engineers, carpenters, painters, etc.; fuel, light, water, and power; and supplies, expenses, and contractual service. Other current expenditures (series H 258) include expenditures for fixed charges and for attendance, health, transportation, food, and miscellaneous school services.

Capital outlay (series H 259) includes expenditures for the acquisition of fixed assets or additions to fixed assets (such as land or existing buildings, improvement of grounds, construction of buildings, additions to buildings, remodeling of buildings, and initial or additional equipment). Interest (series H 260) includes interest payments on short-term and current loans from current funds, and on bonds from current and sinking funds. Other expenditures (series H 261) include expenditures, when separately reported, for summer schools, community colleges, and adult education.

See also general note for series H 223–315 and text for series H 223–233.

H 262–315. Public secondary day school pupils enrolled in specified subjects, 1890–1949.

Source: Office of Education, *Biennial Survey of Education in the United States, 1948–1950.*

For 1910–1934, the percentages are based on the number of pupils enrolled in the last 4 years of all schools that returned usable questionnaires. For 1890, 1900, and 1949, the figures are based on the total number of pupils enrolled in the last 4 years of all schools. The source states that "when necessary, the subjects reported in previous surveys were analyzed, and appropriate components were either recombined, separately listed, or eliminated (with corresponding changes in the number and percentage enrolled) in a manner to yield as close comparability as possible with the data in the current (1948–49) survey."

H 316–373. General note.

The Office of Education has issued statistical reports on higher education on a periodic basis since 1870. Until 1916,

Digitized by Google

these statistics appeared in the *Annual Report of the United States Commissioner of Education*. There was no report for 1917. Since 1918, statistical reports have been issued biennially, as chapters of the *Biennial Survey of Education in the United States*. In addition, an annual report on conferral of earned degrees has been issued since 1948 and one on early fall enrollments since 1946. An annual report on current income and expenditures and other finance items was also issued from 1933 to 1940, first under the title, *The Economic Outlook in Higher Education* and later under the title, *College Income and Expenditures*.

Among the major problems involved in the collecting and processing of nationwide statistics of higher education have been those of uniformity and promptness of reporting, and completeness of coverage of the field. The problem of uniformity of reporting was attacked in 1930 with the formation of the National Committee on Standard Reports for Institutions of Higher Education; this committee was disbanded in 1935. Its successor, the Financial Advisory Service of the American Council on Education, carried on the work until 1940, when it, too, was discontinued. These two organizations, voluntary in character and operating with no official status, did much to conventionalize finance accounting and reporting procedures in universities and colleges.

The problems of promptness of reporting and completeness of coverage stem from the fact that only the land-grant institutions (fewer than 4 percent of all the institutions in the Nation) are under legal obligation to submit financial or statistical reports to the Office of Education. The percent of institutions supplying usable reports within a reasonable time, however, has increased materially in the last two or three decades, in spite of the fact that inquiries emanating from the Office of Education have increased in number and scope.

Another problem in the compilation of historical statistics of higher education is the double counting of data for some institutions. Until 1916, the tabulations of the Office of Education were built largely around the various professional curricula, with the result that in many instances the data of a professional school within a university were included both in the over-all tabulations of universities and colleges and in those of the profession involved. With the inception of the *Biennial Survey of Education* in 1918, the emphasis in tabulation was shifted to the administrative organization and the data relating to certain professional schools were so tabulated that any possible duplication was identifiable without too much difficulty. Since 1932, the Office of Education has maintained a master list of all institutions in the Nation; thus, the problem of duplicate tabulation is no longer an important one.

H 316–324. Institutions of higher education—number, faculty, and enrollment, 1870–1956.

Source: 1870–1916, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues; 1918–1956, *Biennial Survey of Education in the United States*, various issues.

Institutions reporting include universities, colleges, professional schools, junior colleges, teachers colleges, and normal schools, both privately and publicly controlled, regular session. The figures for institutions represent administrative organizations rather than individual campuses, i.e., a university operating one or more branches away from the main campus is counted as one institution. There is probably some (undeterminable) underreporting in some of the earlier years. Since 1946, this underreporting has been corrected by the use of estimated reports prepared from secondary sources for nonrespondent institutions.

Faculty figures include full-time and part-time faculty members. Except in 1932, no attempt is made to evaluate these services on a full-time equivalent basis. Faculty figures also include the entire administrative, instructional, research, and other professional personnel. Resident instructional staff, however, excludes administrative and other professional personnel not engaged in instructional activities.

Enrollment data are cumulative and cover the entire academic year concerned, except for 1954 and 1956, where data are for November 1953 and 1955, respectively.

A special student is a resident student taking courses on a college level but not working for a degree.

See also general note for series H 316–373.

H 325–326. Junior colleges, 1918–1954.

Source: See source for series H 316–324.

A junior college is defined as one that offers at least one but less than four years of work and does not grant the bachelor's degree.

H 327–338. Institutions of higher education—degrees conferred, by sex, 1870–1957.

Source: Office of Education, records.

The basic sources of data for earned degrees for 1870–1916 are the various issues of the *Annual Report of the United States Commissioner of Education;* for 1918–1946, various issues of the *Biennial Survey of Education;* and for 1948–1957, *Earned Degrees Conferred by Higher Educational Institutions*.

The figures presented here were estimated from summaries and compilations from the original source material previously published by the Office of Education in *Education for Victory*, August 21, 1944; and *Higher Education*, vol. XII, No. 7, March 1956; and in Walter C. Eells, *American Universities and Colleges*, Seventh Edition, 1956, or directly from the basic sources for recent years.

The first-level degree (designated as "bachelor's or first professional") is defined as the first degree granted upon completion of a course of study in a given field. The degree must be based on at least 4 years of college work or the equivalent thereof. The same classification (namely, "first level") is given to a degree, e.g., LL. B., regardless of whether the degree is based on 7 years' preparation, 6 years' preparation, or less; and regardless of whether the student had previously earned a degree in another field. The first-level degree is ordinarily a bachelor's degree, but important exceptions occur in certain of the professional fields. The second-level degree is a degree beyond the first level but below the doctorate; ordinarily, a master's degree. The doctorate (the highest level of earned degrees) includes such advanced degrees as Ph.D., Ed.D., D.Eng., and Dr. P.H.; it includes only earned degrees, not honorary.

H 339–350. Institutions of higher education—current income, 1890–1954.

Source: 1890–1910, Office of Education, *Annual Report of the United States Commissioner of Education*, various issues; 1920–1954, *Biennial Survey of Education in the United States*, various issues.

Total current income represents funds accruing to, or received by, higher educational institutions, usable for their recurring day-to-day activities. It does not include additions to plant funds nor those to endowment and other nonexpendable funds (included in series H 362–369). Educational and general income is perhaps best understood as income available for educational and general expenditures. Income from auxiliary enterprises and activities includes income of dormitories, dining halls, cafeterias, union buildings, college bookstores,

Digitized by Google

university presses, student hospitals, faculty housing, intercollegiate athletic programs, concerts, industrial plants operated on a student self-help basis, and other enterprises conducted primarily for students and staff and intended to be self-supporting without competing with the industries of the community in which the institution is located. Other current income includes moneys becoming available for student aid (scholarships, fellowships, prizes). Until the last few years, it also included earnings of funds subject to annuity or living trust agreements, as well as some few funds so minor in amount or so infrequent in recurrence as to make special classification inadvisable.

See also general note for series H 316-373.

H 351-361. Institutions of higher education—current expenditures, 1930-1954.

Source: Office of Education, *Biennial Survey of Education in the United States*, various issues.

Expenditure data were not tabulated for all institutions of higher education until 1930. Prior to that time they were collected from land-grant institutions and teacher-education institutions only. Other professional schools and non-land-grant institutions were omitted from the surveys.

H 362-369. Institutions of higher education—plant fund operations, 1930-1954.

Source: Office of Education, *Biennial Survey of Education in the United States*, various issues.

Data represent moneys received and spent by higher educational institutions for expanding their physical holdings (land, buildings, equipment of various sorts) held or utilized primarily for instructional, recreational, or student residence purposes. Real estate held and operated for investment purposes is not included.

H 370-373. Property of institutions of higher education, 1890-1954.

Source: See source for series H 339-350.

Data represent value of all permanent or quasi-permanent assets which include lands, buildings, and equipment; funds held for investment purposes only (the income from such funds being available for current use); funds subject to annuity or living trust agreements; and funds the principal of which may be lent to students to help defray their living expenses or tuition bills. The term "fund" is used in its accounting sense of cash or other valuable assets (real estate, bonds, stock certificates, and other evidences of ownership or equity).

H 374-382. School enrollment rates, by color and sex, 1850-1957.

Source: 1850-1930, Bureau of the Census, Fifteenth Census Reports, *Population*, vol. II, pp. 1094 and 1095; 1940-1950, *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-206; 1954-1957, *Current Population Reports*, Series P-20, Nos. 54, 66, 74, and 80.

The statistics for decennial years refer to the total population within the specified age group; figures for 1954-1957 refer to the civilian noninstitutional population. Persons not covered for the later years (Armed Forces and institutional population) are known to have low enrollment rates.

In the Census of Population for 1940 and 1950, and in the Current Population Survey (1954-1957), enrollment was defined as enrollment in "regular" schools only—that is, those schools where enrollment may lead to an elementary or high school diploma, or to a college, university, or professional school degree. Such schools are public, private, or parochial schools; colleges, universities, or professional schools, either day or night. Enrollment was either full time or part time.

If a person was receiving regular instruction at home from a tutor and if the instruction was considered comparable to that of a regular school or college, the person was counted as enrolled. Enrollment in a correspondence course was counted only if the course was given by a regular school, such as a university, and the person received credit thereby in the regular school system.

Children enrolled in kindergarten were not included in the "regular" school enrollment figures in the 1950 Census of Population; however, they have been included here to make the data comparable with earlier years and with current practice. In censuses prior to 1950, no attempt was made to exclude children in kindergarten so that the statistics for those years include varying proportions attending kindergarten. Also, in censuses prior to 1940, the data were not restricted as to type of school or college the person was attending.

In addition to differences in definitions of school enrollment and in population coverage, the enrollment data for different years may differ because of variations in the dates when the questions were asked and time periods to which enrollment referred. Data from the current surveys were obtained in October and refer to enrollment in the current school term. In 1940 and 1950, the censuses were taken as of April 1, but enrollment related to any time after March 1 in 1940 and any time after February 1 in 1950. The corresponding question in the censuses from 1850 to 1930 applied to a somewhat longer period: In 1910, 1920, and 1930, to the period between the preceding September 1 and the census date (April 15 in 1910, January 1 in 1920, and April 1 in 1930); and in 1850 to 1900, to the 12 months preceding the census date.

Information on school enrollment is also collected and published by the Office of Education (see series H 223-228 and H 321-324). These data are obtained from reports of school systems and institutions of higher learning, and from other surveys and censuses. They are, however, only roughly comparable with data collected by the Bureau of the Census by household interviews, because of differences in definitions, time references, population coverage, and enumeration methods.

See also general note for series H 223-411.

H 383-394. School enrollment, by age, 1910-1957.

Source: 1910-1950 (decennial data), Bureau of the Census, *U. S. Census of Population: 1950*, vol. II, part 1, p. 1-95; 1945-1957 (annual data), *Current Population Reports*, Series P-20, Nos. 30, 52, 54, 66, 74, and 80.

See text for series H 374-382 for definitions and qualifications of data.

The decennial data and the annual data differ as to the enrollment rates for each age group in part because of differences in the time of year at which the questions were asked and the period to which they referred, and because of differences in the age of persons at the time of the inquiry. For example, some persons 18 or 19 years old may not yet have completed their schooling by April 1, but may have finished before October of that year. Also, some of the differences may have been caused by variations in the accuracy of reporting. Although the same definitions of enrollment were used in the 1950 Census and in the Current Population Survey, there is evidence that some persons, particularly at post-compulsory school ages, were counted as enrolled in the census who should not have been included under the definition. For the current survey, as compared to the census, more detailed questions are asked and the enumerators are generally more experienced and have better training and supervision.

H 395–406. Median years of school completed, by age, sex, and color, 1940 and 1950.

Source: Bureau of the Census, *U. S. Census of Population: 1950*, vol. II, part 1, pp. 1-236 to 1-239.

In general, the data refer to education ever received in "regular" schools. For the definition of "regular" schools and enrollment in these schools, see text for series H 374–382.

The median year of school completed is defined as the value which divides the population group into two equal parts—one-half having completed more schooling and one-half having completed less schooling than the median. The medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, the fourth year of high school is indicated by 12 and the first year of college by 13. The procedure used both in 1940 and 1950 for calculating the median year of school completed made allowance for the fact that many persons reported as having completed a given full school year had also completed a part of the next higher grade. Thus, it is assumed that persons who reported 12 full years of school completed had actually completed 12.5 years, on the average.

Differences in the quality of education data for the two censuses may have resulted in part from changes in the way the information was requested. In 1940, a single question was asked on highest grade of school completed. In 1950, data on years of school completed were obtained from a combination of responses to two questions, one asking for the highest grade of school attended and another whether that grade was finished. Analysis of data from the 1940 Census returns and from surveys conducted by the Bureau of the Census, using the same question wording used in 1940, indicated that respondents frequently reported the year or grade they had last attended, instead of the one completed. There is evidence that, as a result of the change in the questions in 1950, there was relatively less exaggeration in reporting educational attainment than in 1940. Hence, the indicated increases in attainment between 1940 and 1950 tend slightly to understate the true increase.

Although the statistics on median years of school completed have been available only since 1940, the data by age give further indication of time trends.

See also general note for series H 223–411.

H 407–411. Percent illiterate in the population, by color and nativity, 1870–1952.

Source: 1870–1930, Bureau of the Census, Fifteenth Census Reports, *Population*, vol. II, p. 1223; 1940 and 1947, *Current Population Reports*, Series P-20, No. 20, pp. 4, 7; 1950 and 1952, *Current Population Reports*, Series P-20, No. 45, pp. 7, 22.

Persons were regarded as illiterate who could not read and write, either in English or some other language. Information on illiteracy of the population was obtained from direct questions in the censuses of 1870–1930. The data for 1947 and 1952 were obtained from sample surveys, and the statistics for the census years 1940 and 1950 were derived by estimating procedures. In 1947, the literacy question was asked only of persons who completed less than 5 years of school; in 1952, the same general procedure was used but the question was asked of those who completed less than 6 years of school.

Some variation has existed over the years in the way the question on illiteracy was asked. Since 1930, reference has been made as to whether or not the person was able to read and write. In censuses of 1870–1930, two questions were asked, one on whether the person was able to read and one on whether he could write. Illiteracy was defined as inability to write "regardless of ability to read." Since the data showed that nearly all persons who were able to write could also read, the earlier statistics should be generally comparable with data obtained through the consolidated question used in later years.

Ability to read and write cannot be defined so precisely in a census as to cover all cases with certainty. No specific test of ability to read and write was used, but enumerators were instructed not to classify a person as literate simply because he was able to write his name. Analysts of earlier census data assumed that the illiterate population comprised only those persons who had no education whatever. Information on the educational attainment of illiterates obtained in recent sample surveys indicates, however, that some persons cannot read and write even though they have had some formal schooling. For example, data from the Current Population Survey of October 1952 show that among persons 14 years old and over the proportion reported as illiterate ranged from 77.8 percent of those who had not completed a year of school to 1.3 percent of those who had completed 5 years.

Data on illiteracy were also collected in the censuses of 1840, 1850, and 1860, but are not included here because they are not comparable with statistics for subsequent years, and because of limitations in the quality of data for those early years. In 1840, the head of the family was asked for the total number of illiterates in each family, a method which undoubtedly led to some understatement. Beginning with 1850, the individual entry system was used, the question being asked regarding each member of the family. By 1870, another change in census methods was introduced, separate questions being asked on ability to read and ability to write. In addition to changes in the form of the inquiry, the statistics on illiteracy for 1840, 1850, and 1860 related to the population 20 years old and over, whereas in the 1870 and later censuses they referred to the population 10 years old and over.

The percentages of illiterates in the total population 20 years old and over, as recorded in those earlier censuses, were as follows: 1840, 22.0 percent; 1850, 22.6 percent; and 1860, 19.7 percent. The comparable percentages for the white population 20 years old and over in those years were: 9.0, 10.7, and 8.9 percent, respectively. The apparent increases in illiteracy of white persons in 1850 and 1870 may be due, in part, to the large influx of immigrants during those periods, many of whom could not read and write in any language. It is more likely, however, that the apparent increases resulted from improvements in the way the information was obtained at those census dates.

[1] Computed for teaching positions only, prior to 1920; beginning 1920, also includes supervisors and principals.
[2] Prior to 1938, number of different persons employed rather than number of positions. Includes librarians and guidance and psychological personnel.
[3] Classroom teachers only. Excludes other nonsupervisory instructional staff.
[4] Excludes 1,840 districts in Texas "in legal existence" which do not operate schools
[5] Includes 231 part-time teachers not classified by sex.
[6] Partially estimated.

[1] Prior to 1918, includes expenditures for interest.
[2] In dollars. For 1948–1956, excludes expenditures not allocated to pupil costs.
[3] Prior to 1910, includes only expenditures for salaries of teachers and superintendents.
[4] Prior to 1918, includes plant operation and maintenance; prior to 1910, includes all current expenditures except salaries of teachers and superintendents.
[5] Beginning 1954, includes expenditures for community services, previously included in "current expenditures for day schools."
[6] Includes $7,816,000 in undistributed expenses.

[1] Special students tabulated by level (undergraduate and graduate) in November 1953; all special students tabulated with undergraduates in 1952 and earlier years. In some instances, a student may be enrolled simultaneously as both a graduate and an undergraduate, with the result that the total in series H 321 (different individuals) is less than the sum of series H 323 and H 324.

[2] Percentages for 1910, 1920, 1930, and 1940–1954 are based on population, 18 to 21 years old, as of July 1 prior to the opening of school; for all other years based on July 1 population after the closing of school in June. Beginning in 1946, percentages are based on all enrolled students rather than merely nonveteran students. The percentages, biennially, of nonveteran students to the population for 1946–1954 are, respectively: 15.10, 15.01, 19.44, 21.84, and 25.93.

[3] 1956 data as of November 1955; 1954 as of November 1953. Cumulative figures for academic year 1954 are total, 2,535,000; undergraduate, 2,257,000; and graduate, 278,000.

[4] Excludes 23 public junior colleges (normal schools) having a combined enrollment of 1,108.

[5] Excludes 26 public junior colleges (normal schools) having a combined enrollment of 1,184.

[6] Includes military students.

[7] Distributions estimated.

[8] Full-time equivalent; total number of different persons not tabulated.

[9] Estimated.

[10] Data for 1924 and previous years taken from *Education for Victory*, vol. 3, No. 6, 1944.

[11] Estimates for 1920 not shown because available figures exclude "instructors in normal courses" in teachers colleges and normal schools.

chapter H

CRIME AND CORRECTION (Series H 412–454)

H 412–454. General note.

In the United States there are many difficulties to be faced in drawing together national statistics on crime and correction. There is no one body of criminal law or procedure that relates to the United States as a whole. Under the United States constitution, the police powers are reserved to the States. Thus, there are 48 sovereign jurisdictions of crime control in the 48 States in this country and a 49th in the District of Columbia which has a penal code and a criminal enforcement system provided by Act of Congress.

Federal criminal jurisdiction is something quite apart from State jurisdiction. Federal crimes are defined by Acts of Congress in connection with enforcing laws relating primarily to customs, taxation, and interstate matters. Therefore, except for offenses committed within the limited geographical area of a Federal reservation, crimes such as murder, robbery, burglary, larceny, rape, arson, etc., are juridically State crimes rather than Federal.

Within each State, the enforcement of the criminal law is predominantly the responsibility of local agencies. Police departments, prosecutors, and courts are in most instances either municipal or county agencies. To a large extent, even the correctional processes such as probation and misdemeanant imprisonment are functions administered by local authorities. Direct State responsibility is largely confined to providing penal institutions for those offenders convicted and committed to long-term imprisonment.

The inherent difficulties of collecting only the basic information about crime from hundreds of independent police departments, prosecutors, courts, and correctional agencies within a single State, not to mention the difficulties encountered in attempting to synthesize such information for the 48 States and the District of Columbia, have limited the development of adequate national compilations of criminal statistics.

There have been three different collections of nationwide criminal statistics undertaken in recent years: One summarized data on offenders committed to prison; the second, data on crimes known to the police and arrests; and the third, statistics on criminal defendants prosecuted in the trial courts. The first two of these are still being carried on.

Statistics on prisoners were collected by the Bureau of the Census in connection with each decennial Census of Population from 1850 to 1890. Independent enumerations of prisoners were made in 1904, 1910, 1923, and 1933. The first nationwide collection of criminal data on an annual basis was made in 1926 by the Bureau of the Census (a compilation of prisoners received and released from State and Federal prisons and reformatories). This agency published an annual summary and an analysis of these data from 1926 to 1946, and a very brief summary in 1947. Subsequently, the Federal Bureau of Prisons assumed this responsibility.

These annual reports have, from the beginning, covered most of the States, never less than 44 of the 49 jurisdictions plus reports from the Federal prison system, and have been consistent and complete enough to offer historical data that have some acceptable comparability (see series H 412–431).

The second annual nationwide collection began in 1930. Summary reports on serious offenses known to the police and arrests made by them were collected from a large number of police departments by the Federal Bureau of Investigation. Annual and semiannual statistics have been regularly issued ever since in *Uniform Crime Reports*. Because the sources of data for this series are cooperating individual police departments in all of the States, there have never been data available which represented complete reporting from all police departments in any one State. Further, the variability in procedure and practice in the reporting of crimes known to the police and the lack of uniformity in the definition of offenses are serious obstacles in compiling valid historical series on crimes and arrests in the United States as a whole.

A third collection of data on a national basis was made under the auspices of the Bureau of the Census in 1932 when reports were obtained from a number of States accounting for defendants prosecuted and convicted and sentenced in courts of general trial jurisdiction. The usual pattern throughout the country is that there is one such court in each county and there are over 3,000 counties in the 48 States. This series was continued for 15 years, and reports summarizing these data were issued annually by the Bureau of the Census under the title, *Judicial Criminal Statistics*. However, at no time were there more than 32 States involved in this reporting system. Partly because of its limited existence and incomplete coverage, its inclusion here is not justified. In addition, the variations from State to State and even within States from county to county that occurred in the reporting of the data created many unresolved questions of comparability and completeness.

H 412–420. Prisoners present in Federal and State institutions, prisoners received from courts, and conditional-release violators returned, 1926–1957.

Source: 1926–1939, Bureau of the Census, *Prisoners in State and Federal Prisons and Reformatories;* series H 412–417, 1940–1957, Federal Bureau of Prisons, *National Prisoner Statistics*, Bulletin No. 19, July 1958; series H 418–420, 1940–1957, Federal Bureau of Prisons, *National Prisoner Statistics*, annual issues.

These data, as well as those shown in series H 421–431, are based on information reported for State prisons and reformatories and for Federal prisons with the following exceptions: No data were reported for Delaware or the District of Columbia prior to 1931. The New Castle County Workhouse was the only reporting institution for Delaware for 1931-1956 except for 1933 when no data were reported; in 1957, all State prisoners in Delaware were included. No data were reported in 1926 for Alabama, Florida, Idaho; in 1927 for Alabama; in 1928 for Mississippi, Idaho; in 1929 for Alabama, Georgia, Mississippi; in 1930 for Alabama, Georgia, Idaho. For 1931–1937, inclusive, no data were reported for Alabama, Georgia, or Mississippi. South Carolina was omitted in 1932. The Milwaukee House of Correction in Wisconsin is excluded in series H 414 and H 417 for 1937-1939; it is also excluded in series H 420 for 1937-1946. In 1938 and 1939, all States except Alabama and Georgia were included. Rhode Island data include both misdemeanant and felony prisoners for all years except 1957 when only felony prisoners were included. Although there have been years since 1940 when 2 or 3 States did not report, the published data have been adjusted to include estimates for these missing States. Therefore, the data presented for 1940–1957

Digitized by Google

represent prisons and reformatories in all States and the District of Columbia. However, a significant change was introduced in the series in 1940 by the addition of reports for 9 Federal correctional institutions and 2 detention headquarters to the Federal totals. Also for 1940-1957, series H 414 and H 417 include felony prisoners present at the end of the year and received from court for North Carolina Road Camps; series H 420 excludes such prisoners except for 1957.

Institutions for adult offenders may include a sizable number of juveniles for certain States.

H 421–431. Prisoners released from Federal and State institutions, by type of release, 1926–1957.

Source: 1926–1946, Bureau of the Census, *Prisoners in State and Federal Prisons and Reformatories;* 1947 and 1948, Bureau of Prisons, records; 1949-1957, Bureau of Prisons, *National Prisoner Statistics*, and records.

Data are for live releases. Between 1926 and 1957 only 2,177 prisoners died in Federal institutions; 32 of these were executions carried out between 1927 and 1957. In State institutions, there were 30,528 deaths between 1926 and 1957. Of these, 4,003 were executions. Most of these executions were carried out by State authorities, however, some were carried out by local authorities. The data on executions by State and local authorities are incomplete for 1926-1929.

All the limitations on completeness of coverage of series H 412-420 are also applicable for these series.

Series H 421-431 exclude escapees, temporary releases, etc.

H 432–444. Prisoners executed under civil authority, by race and offense, 1930–1957.

Source: Federal Bureau of Prisons, *National Prisoner Statistics*, Bulletin No. 20, February 1959.

Figures represent all executions occurring within the States whether they were carried out in a State institution or by local agencies. Executions by military authorities are excluded. The Army (including Air Force) carried out 157 executions (148 between 1942 and 1950, and 3 each in 1954, 1955 and 1957); 104 of the 157 were executed for murder (including 21 involving rape), 52 for rape, and 1 for desertion. The Navy carried out no executions during the period.

H 445–451. Urban crime, by type of major offense, 1937–1957.

Source: Federal Bureau of Investigation, *Uniform Crime Reports*, Annual Bulletin, 1957, vol. XXVIII, No. 2, p. 85. (The source also shows estimates for rape and larceny.)

Figures are from the same 353 cities for each year. Their total population was 36.5 million in 1940 and 42.7 million in 1950. If a police department is known to have made major changes in its records procedures during the period covered, its reports have been excluded.

The fact that the basic source of these data is 353 individual reporting areas scattered over the 48 States, that there are differences among the States in the definition of some of these offenses, and that there has been improvement in reporting procedures on the part of some police agencies over this period of years makes the matter of interpreting these figures as reflecting a relatively exact measure of crime somewhat doubtful. It is likely that the reliability of reports on murder and robbery is higher than those for other offenses as these 2 offenses are more clearly and consistently defined throughout the various States than are the other types of offenses shown.

H 452–454. Persons lynched, by race, 1882–1956.

Source: 1882–1951, *1952 Negro Year Book*, William H. Wise and Co., p. 278; 1952–1956, Tuskegee Institute, Department of Records and Research, unpublished estimates.

Additional information and more detailed figures can be found in Arthur F. Raper, *The Tragedy of Lynching*, University of North Carolina Press, Chapel Hill, 1933, pp. 480–484, and James E. Cutler, *Lynch Law: An Investigation Into the History of Lynching in the United States*, Longmans-Green, New York, 1905, pp. 160–161. Raper presents statistics of lynchings for whites and Negroes for 1889–1932, based on the *Negro Year Book*, 1931–1932, and on material obtained from the Department of Records and Research, Tuskegee Institute. For 1916–1932, Raper's estimates agree with those shown here; but for all earlier years there are differences which are due to subsequent revisions made in the series by Tuskegee Institute. Cutler's estimates are based on the annual record kept by the Chicago Tribune (daily newspaper). Estimates shown here are for whites and Negroes only. During the period 1882–1903, Cutler found that 45 Indians, 12 Chinese, 1 Japanese, and 20 persons of Mexican ancestry had been lynched.

The *1952 Negro Year Book* presents a detailed discussion concerning the difficulty of defining the term "lynching." According to this source, ". . . agencies concerned about the lynching problem have not been able to come to a conclusive agreement even when using the same criteria in classifying cases of lynching." The same source refers to a conference held on December 11, 1940, at Tuskegee Institute which established the following criteria to cover persons considered as victims of lynching:

1. There must be legal evidence that a person was killed;
2. The person must have met death illegally;
3. A group must have participated in the killing;
4. The group must have acted under pretext of service to justice, race, or tradition.

[1] Includes all willful felonious homicides; excludes suicides and justifiable homicides.
[2] Includes deaths primarily attributable to gross negligence on the part of some individual other than the victim.
[3] Includes the stealing or taking of anything of value by force or violence or by threat of force or violence; includes attempted robbery.
[4] Includes assault with intent to kill. Excludes simple assault, assault and battery, fighting, etc.
[5] Includes any unlawful entry to commit a felony or a theft. Includes attempted burglary and burglary followed by larceny.
[6] Includes all cases where motor vehicles are driven away and abandoned. Excludes those taken for temporary use when actually returned by the taker.

RECREATION (Series H 455–525)

H 455–525. General note.

Statistics on recreation have not been generally compiled and published in a systematic way. One major difficulty is that recreation, as a field of human activity and of social science research, has not been clearly defined in a manner accepted by all students. This general problem, and some of the consequent statistical problems, have been explored in the study by Marion Clawson, "Statistical Data Available for Economic Research on Certain Types of Recreation," *Journal of the American Statistical Association*, March 1959.

In general, many more data are available in the files of public agencies or private groups than have been published; and much of the publication is in forms not physically permanent nor likely to be preserved in libraries and other reference sources. Much of the data are inaccessible and therefore essentially unavailable. The series presented here represent only the more readily available data.

All series except H 500–522 were obtained from the report by Marion Clawson, *Statistics on Outdoor Recreation*, Resources for the Future, Inc., Washington, D. C., 1958. The original sources of these data are discussed below in the text for the various series. *Statistics on Outdoor Recreation* includes much more detail than it has been possible to include here; in particular, it includes much data for individual States and other geographic regions.

H 455–470. National parks, monuments, and allied areas—number, area, and visits, 1850–1956.

Source: Marion Clawson, *Statistics on Outdoor Recreation*, Resources for the Future, Inc., Washington, D. C., 1958.

Data on number and area of units were compiled by the National Park Service. Data on visits appear in the annual reports of the National Park Service or of the Secretary of the Interior. Figures on recreation in these areas are contained in the annual reports of the Director of the National Park Service, in annual reports on *Areas Administered by the National Park Service*, and in periodic reports on attendance at the various units. The records of the National Park Service also contain data on area and visits to each of the units of the national park system, at least for recent years and, in some cases, for years before 1910.

The estimates cover all areas now administered by the National Park Service, although some have in the past been administered by the Department of Agriculture or by the War Department. These areas were established by law or by Executive Order. Areas are tabulated according to their legal designation at the time of tabulation. When designations were changed, numbers of areas and acreages in each series were shifted accordingly. Data do not include areas which are named national historic sites administered by States.

Series H 469–470, national recreation areas, include national seashore recreational areas, but exclude recreation demonstration areas which existed from about 1933 until 1952. In 1932, there were 46 such areas with a total acreage of 395,844. By 1952, all had been disposed of to States or absorbed into the national park system.

Gross acres are reported for 1850–1934; federally owned acreage for 1935–1956. (Series F 17 and F 18 in *Historical Statistics of the United States, 1789–1945*, dealt with area within the national park system and total visits to it, respectively. Those data related only to continental United States, whereas series H 456–457 presented here include the Territories as well.) Data on acreage are compiled from both official and unofficial reports, internal records, and memoranda, among which are many unresolved inconsistencies, particularly for the early years. Acreage data, therefore, should not be considered either final or official.

In many areas, visitors are required to pay an entrance fee, and an actual count of visitors or of cars is obtained. In other areas, visits must be estimated. Each person is counted each time he enters any area of the system. Hence, the number of visits is substantially in excess of the number of different individuals. No data are available on the latter. Data do not include visits to parts of the system when they were not under National Park Service administration. After 1936, all areas which were a part of the system were also administered by the National Park Service. In general, the use of these areas prior to 1936 was not large.

H 471–474. Recreational use of national forest lands, 1924–1956.

Source: See source for series H 455–470.

The basic data are published in annual reports of the Forest Service and in *Agricultural Statistics;* however, a great deal of detailed information is made available in annual processed releases or is in the files of the Forest Service. This is particularly true of data for individual areas. More data, by Forest Service regions, by purpose of visit, and by month are to be found in *Statistics on Outdoor Recreation.*

The national forests are open to several kinds of recreation. In some areas, actual counts of visits are obtained; in most, however, estimates are necessary. A recreational use includes a stop of at least 15 minutes; data do not include a count of persons who drove over highways through national forests but made no other use of the areas. Use of a national forest area for recreation for a period of ¼ to 3 hours is counted as ¼ day; of 3–5 hours, as ½ day; of 5–7 hours as ¾ day; and of 7–24 hours as a full-day use. As with the national park data, a visitor is counted each time he visits an area. Therefore, the number of different persons involved is substantially fewer than numbers of visits.

H 475–487. State parks—acreage, expenditures, funds, revenue, employees, and attendance, 1939–1956.

Source: See source for series H 455–470.

Many different kinds of areas and names are used to describe State-owned areas open for public recreation. Data on such areas are collected by the National Park Service and published in two series. *State Park Statistics* is published annually in mimeographed form and contains data for one year on expenditures, sources of funds, attendance, areas and acreages, personnel, and anticipated expenditures for the next year. *State Parks—Areas, Acreages, and Accommodations* is published quinquennially. Each series is based upon voluntary reports by State agencies to the National Park Service. The

Digitized by Google

latter report for 1955 lists some 55 different kinds of State park areas, or, at least, 55 different names are applied to such areas.

In making its 1956 annual survey, the National Park Service sent questionnaires to some 94 different State agencies. Returns were received from 89 agencies in 47 States. The areas included in these studies vary in size from less than 50 acres each (35 percent of the number of areas) to over 50,000 acres each (0.4 percent). The larger areas, however, contain 64 percent of the total area of the entire system.

The areas as defined in these studies exclude State forests and wildlife areas, some of which have important recreational facilities, and also exclude wayside areas if administered by State highway departments. The extent of the reporting has been variable; however, the more important States and agencies have usually reported. Considerably more data, particularly by individual States, is found in *Statistics on Outdoor Recreation.*

Acreage data are based upon reports from most but not all States, the extent of the coverage increasing in recent years. Land acquired includes purchases, gifts, transfers from other State or Federal agencies, and other means. Of the total, only 38 percent has been by purchase.

Funds available for expenditure include not only current appropriations, but also carryovers from previous appropriations, revenues from operations of concessions and other sources when these are available for expenditure, and "other." Revenue from operations include revenues from publicly operated facilities, from leased concessions, from entrance and parking fees, and from "other."

Attendance data at recreational areas are often estimated, sometimes on various bases. Comparability of figures in these series (H 485–487) is somewhat marred by the transfer in California of numerous very popular beaches from State to county control. This accounts for the apparent drop in total attendance for 1947–1948, when, in fact, attendance was rising rather rapidly.

H 488–499. Municipal recreation—parks, leadership, and facilities, for cities of 100,000 inhabitants or more in 1950, 1880–1955.

Source: See source for series H 455–470.

Statistics on municipal parks and recreation have been collected for many years by the National Recreation Association of New York, a private organization. Questionnaires are sent to all cities of 2,500 and over, to many smaller communities, and to all counties which are believed to have county park systems; and within each, to all agencies known or believed to have administration over parks or recreational programs. Provision of information is voluntary, and in spite of the best efforts of the Association, there is apparently a large degree of underreporting. Between 50 and 60 percent of all cities reported; however, the reporting was complete for the largest cities, fair for middle-size ones, and low for small ones. Many of the latter had no parks, but it is not possible to differentiate between those with no parks and those making no report. Perhaps as many as 90 percent or more of all parks are reported. Data from these surveys have been published in Bureau of Labor Statistics, *Park Recreation Areas in the United States,* Misc. Series Bulletin No. 462, 1928, and No. 565, 1932; George D. Butler, *Municipal and County Parks in the United States, 1935,* National Park Service and National Recreation Association; and the following National Recreation Association publications: *Municipal and County Parks in the United States, 1940; Recreation and Park Yearbook—Midcentury Edition—A Review of Local and County Recreation and Park Developments, 1900–1950; 1956 Recreation and Park Yearbook;* and other *Yearbooks* published annually for 1910–1940 and biennially for 1942-1950. In the published reports, no effort was made to correct for underreporting, but the number of cities reporting is shown.

However, the estimates shown here have been adjusted for nonresponse. These estimates are based on special tabulations prepared by the National Recreation Association. The extent and basis of estimating is described in *Statistics on Outdoor Recreation.* In general, the amount of estimating was small and it is believed the totals here reported are approximately correct. In *Statistics on Outdoor Recreation* these data are shown for individual cities; there are also shown selected totals for all cities reporting at each period.

H 500–515. Personal consumption expenditures for recreation, 1909–1957.

Source: 1909–1927, Twentieth Century Fund, unpublished estimates (prepared for *Survey of Time, Work, and Leisure*); 1929–1945, Office of Business Economics, *National Income: A Supplement to the Survey of Current Business,* 1954 edition, p. 206; 1946–1957, *U. S. Income and Output,* 1958.

The data for 1909–1927 are based on J. Frederic Dewhurst and Associates, *America's Needs and Resources: A New Survey,* Twentieth Century Fund, New York, 1955. Dewhurst in turn drew his data on recreation from William H. Lough, *High-Level Consumption,* McGraw-Hill, New York, 1935; and Julius Weinberger, "Economic Aspects of Recreation," *Harvard Business Review,* Summer 1937.

For more detailed definitions of the specific series, see the Department of Commerce publications defining these series. Payments are those made by consumers at point of use; expenditures for clothing, transportation, food and drink, shelter, and other items, even though primarily for the purpose of recreation, are excluded here. However, expenditures for most of these items are included in Chapter G, Consumer Expenditure Patterns. For expenditures in constant dollars, see Dewhurst, *America's Needs and Resources.*

H 516–525. General note.

The items included here were selected because they are of some importance, and data are available for them. Other items of perhaps equal importance have been omitted for lack of data or have been included in other chapters. For data on radio and television, for example, see series R 90–98.

H 516–517. Bowling, 1896–1957.

Source: 1896–1946, American Bowling Congress, *Bowling Magazine,* September 1956, Milwaukee, Wis., p. 117; 1947–1957, series H 516, American Bowling Congress records, and series H 517, *Bowling Magazine,* September 1958, p. 118.

While some bowling is not covered by these data, it is believed that they give a fair picture of the growth of this activity. Additional data are available in the publications of the Congress.

H 518. Horse racing attendance, 1940–1957.

Source: 1940–1952, *New Encyclopedia of Sports, 1947,* and *Encyclopedia of Sports, 1953,* A. S. Barnes and Co., New York; 1953–1957, The National Association of State Racing Commissioners, *Statistical Reports on Horse Racing in the United States,* Lexington, Ky., various issues.

Statistics exclude attendance at quarter-horse and harness racing and races at fairs. Sources also contain data on number of racing days, number of races run, number of horses

Digitized by Google

run, and money distributed as purses; in some cases as far back as 1908.

H 519–520. Major league baseball attendance, 1916–1956.

Source: New York World-Telegram, *World Almanac*, annual issues, and *New Encyclopedia of Sports, 1947*.

H 521. Boxing, gross receipts, 1944–1956.

Source: *The Ring*, Nat S. Fleischer (publisher), New York.

The basic data are compiled from reports of State boxing commissions.

H 522. Movies, average weekly attendance, 1922–1955.

Source: *1956 Yearbook of Motion Pictures*, Film Daily, New York.

H 523–524. Paid hunting and fishing license holders, 1923–1956.

Source: See source for series H 455–470.

Additional data on number of nonresident licenses, and amounts paid for licenses, all by States, are shown in the source. The original data are from reports made by the various State game commissions or departments of the Fish and Wildlife Service, and released annually in mimeographed statements.

H 525. Outboard motors sold, 1919–1956.

Source: Outboard Boating Club of America, Chicago.

These and other data on outboard motors, boats, and trailers, including some data by States for recent years, are summarized in *Statistics on Outdoor Recreation*.

Series H 455–470. National Parks, Monuments, and Allied Areas—Number, Area, and Visits: 1850 to 1956

[For years ending September 30 prior to 1941; thereafter, years ending December 31. Embraces all areas now administered by the National Park Service. Includes areas in Alaska, Hawaii, Virgin Islands, and Puerto Rico. However, excludes National Capital Parks (Washington, D. C. area) which are similar to other municipal parks and hence not comparable with national parks and monuments]

[1] Not the same as the "national park system." Definition of the latter has changed from time to time; for instance, National Recreation Areas were included prior to 1943, and after that excluded. Series H 455–457 are merely totals of the other items listed.

[2] Total for some years includes visits not shown separately.

[3] Includes national historical parks, national military parks, national battlefield parks, national battlefield sites, national cemeteries, national historic sites, and one national memorial park. Does not include historical areas established under the Antiquities Act of 1906 and designated national monuments.

[4] Yellowstone National Park, the first national park, established 1872.

[5] Hot Springs Reservation set aside by the Federal Government in 1832 and established as a national park in 1921. Initial Federal acreage was much greater than indicated, but over a period of years was subdivided into tracts and sold, some 900-odd acres being permanently reserved to the Federal Government. These series begin with 1850, the first year following the establishment of the Department of the Interior.

[1] Totals include only 42 percent of the national estimated expenditures for books and maps and magazines, newspapers, and sheet music. The remaining 58 percent were classified as educational rather than recreational outlay. Expenditures for these items classified as "recreation" expenditures (42 percent of the total) are (in millions of dollars): 1927—349; 1925—313; 1923—270; 1921—239; 1919—204; 1914—131; 1909—104.

chapter H

RELIGIOUS AFFILIATION (Series H 526–543)

H 526–543. General note.

National statistics for all religious bodies, on an interdenominational basis, have been compiled at intervals since 1850 and until 1936 by the Bureau of the Census, and during the past few decades by the *Christian Herald*, a periodical published in New York, and by the National Council of Churches in the *Yearbook of American Churches*, which contains statistical data furnished by all faiths.

Practically all national religious bodies compile reports or estimates from time to time based on records kept by local churches (congregations or parishes), or from estimates furnished by the local churches. Probably about half the national bodies receive reports from their local churches annually and then issue the figures to their constituencies or to the public. The bodies which report annually the figures systematically received from their local churches are mainly the larger denominations. The other national bodies report their statistics at irregular intervals.

For those denominations which have standard forms, the records are kept locally as determined by the national body. For other denominations, the records are kept in accordance with the wishes of the local churches. The statistics are gathered by the denominations for their own, often different, purposes, thus leading to variety in the forms used and in the nature of the information gathered. In addition, local church records are usually kept by persons untrained in the keeping of statistical records, or persons with only the most elementary instruction or experience.

All denominations make their own definitions of membership or affiliation, and accordingly there are also variations in the basis of compilation. However, the bodies reporting have made no major changes in their definitions since the Census of Religious Bodies, 1926. The definitions used since that date for the larger bodies are as follows:

The Eastern Churches report estimates of the total number of persons within the cultural or nationality group served.

The Jewish Congregations report on the number of Jews in communities having congregations.

The Roman Catholic Church, the Lutheran bodies, and the Protestant Episcopal Church report as members the total number of baptized persons, including infants.

Most Protestant bodies report as members those persons who have attained full membership, usually at about age 13.

Variations in definitions for years prior to 1926 are noted below in the text for specific series.

One relatively large body, the Church of Christ, Scientist, with headquarters in Boston, Mass., now forbids the enumeration of its members and the publication of statistics of affiliation. The local churches of this body reported a total membership of 268,915 in the Census of Religious Bodies for 1936, but have made no public report since then. A few relatively small bodies also do not report membership figures to compilers of national data. However, it is believed that the figures presented here cover all but a fraction of one percent of total religious affiliation.

H 526–530. Church denominations, members, and edifices, 1850–1936.

Source: 1850–1890 and 1916, Bureau of the Census, *Religious Bodies, 1916*, part I; 1906–1936, *Religious Bodies*, 1906, 1926, and 1936 volumes.

Data presented are not directly comparable from census period to census period. Special note must be taken in the case of the data for 1936 in relation to other years. The compilation for that year was less complete than those of other years for reasons noted below.

Limited information on religious bodies (number of congregations and buildings, and value of edifices) was first published in the census report for 1850 and similar information was included in the reports for 1860 and 1870. In 1880, the figures gathered by the Census Office were not published. In 1890, the Census Office collected figures from religious organizations concerning membership, number and value of edifices, number of ministers, etc.

The 1906 Census of Religious Bodies (2 parts) was the first to be compiled by means of a questionnaire mailed to the pastors or clerks of the local churches. The Jewish Congregations reported heads of families only (101,457, principally male, persons). It is indicated that, in most denominations, 99 percent of the local churches to which forms were mailed made returns.

The 1916 Census reported 41,926,854 members, a figure adjusted in the 1926 report to read 43,311,648 persons, for reasons there given. The Jewish Congregations reported only heads of families (357,135 persons). The methods used in the 1916 and 1926 Censuses were essentially the same as those used in the 1936 Census (see below).

Students of church statistics regard the compilation of 1926 as probably the most adequate one ever made. In this census, every local organization was classed as a church whether it was commonly known as a church, a congregation, a meeting, a society, a mission, a station, a chapel, or by some other term. "A local church may have had officers and an enrolled membership, or it may have been little more than an association or fellowship, but to be included in this enumeration it must have had a religious purpose and a distinctive membership."

For all denominations except the Jewish Congregations, the 1926 Census reported 50,495,104 members, compared with a corrected total figure, partly estimated, of 42,954,512 persons in 1916. The Jewish Congregations reported "all Jews in communities where there is a congregation," whereas in 1916 they reported only "heads of families, seat holders, and other contributors." The figures for Jews were admittedly incomplete. With this census also, the Lutheran bodies, the Protestant Episcopal Church, and the Christian Reformed Church began to report on a more inclusive basis than in previous censuses.

The data for the 1936 Census were obtained by means of a schedule for local church organizations mailed to the clergyman or the lay clerk of the local parish or congregation. The data collected were for the year 1936, "or to the church record year most nearly conforming to the end of that year." The

Digitized by Google

Census Bureau established contact with persons in authority in the various religious bodies in order to secure lists of pastors or clerks of the local religious organizations. Special agents were employed for the purpose of securing data from "some loosely organized denominations, or those averse to publishing the statistics of their organizations." The census received only halfhearted support from a few denominations and undoubtedly the total membership figures would have been much larger if all churches had furnished statistics. The incompleteness of returns is also reflected by the fact that total value of church edifices (series H 530) is lower in 1936 than in 1926. A private compilation for 1936, published in the *Christian Herald*, New York, July 1937, based on official reports of the religious bodies, listed 244,147 local churches. It seems probable that about 20 percent of the officers of active local churches in 1936 did not report to the Bureau of the Census. The *Christian Herald* stated, for example, that the *Southern Baptist Handbook* for 1937 reported 4,482,315 members for 1936, while the Bureau of the Census reported only 2,700,155 members.

Differences among the religious bodies in defining the term "member" were noted. The Jewish Congregations, continuing a basis begun in 1926, reported "all persons of the Jewish faith living in communities in which local congregations are situated. . . . Among the Roman Catholic and Eastern churches, all persons, even infants, are considered members, provided they have been baptized according to the rites of the church . . . The Protestant Episcopal Church, and the Lutheran bodies, because they also count as members all baptized persons in the congregation, tend toward the more inclusive definition of the term." In the large majority of Protestant bodies, the term "member" is applied only to "communicants," or to persons who have attained to full membership, usually at age 13.

H 531-537. Membership of religious bodies, 1890-1957, and by major groups, 1951-1957.

Source: 1890-1926 and 1936, Bureau of the Census, *Religious Bodies*, various issues; 1931-1935, 1937, and 1945-1949, The Christian Herald Association, *Christian Herald*, New York, various issues; 1938-1944 and 1950-1957, National Council of the Churches of Christ, *Yearbook of American Churches*, various issues.

The Bureau of the Census usually secured information for the year indicated, but it also accepted a figure for the church year nearest to that for which data were sought. In the compilations of private agencies the "latest information" is published for each denomination; in a number of instances, the actual figures of a denomination are for a previous period. For 1956, e.g., most bodies reported figures for that year, but many others had available only the data compiled for previous years. The lag is usually only of several years duration, but in a few instances (for small bodies) the actual figures are from the 1936 Census of Religious Bodies. Data for certain years, which do not appear in these series, appear in the *Christian Herald;* these data are not comparable as they include only the "communicant" or adult membership.

For definition of membership used by the larger groups (Eastern Orthodox, Jewish Congregations, Roman Catholic, and Protestant bodies), see general note for series H 526-543. See also text for series H 526-530.

H 538. Roman Catholic members, 1891-1957.

Source: Records of P. J. Kenedy & Sons (publishers of the *Official Catholic Directory*), New York.

Certain of the typographical errors appearing in the annual published reports issued by this firm have been corrected in this series. Figures are compiled from reports by dioceses and parishes. For definition of membership, see general note for series H 526-543.

H 539. Presbyterian members, 1826-1956.

Source: 1826-1926, Presbyterian Church in the U. S. A., *Presbyterian Statistics Through One Hundred Years, 1826 to 1926*, Philadelphia; 1927-1957, Presbyterian Church in the U. S. A., records.

Figures include persons who have attained full membership, usually at age 13; exclude foreign members.

H 540. Protestant Episcopal members, 1927-1957.

Source: *The Episcopal Church Annual*, Morehouse-Goreham Co., New York, 1957.

Data include an unpublished number of members living outside the United States. The source gives the number of "communicants" residing abroad, but not the total number of members. The foreign residents among the communicants have numbered less than one-half of one percent of the total communicants during the period for which the figures are given. For definition of membership, see general note for series H 526-543.

H 541. Methodist members, 1790-1956.

Source: 1790-1948, Statistical Office of the Methodist Church, *Methodist History as Revealed in Statistical Form* (loose insert in *The Methodist Fact Book*), Chicago, 1949; 1949-1956, *The Methodist Fact Book*, 1957.

The Methodist Church was formed in 1939 by a merger of the Methodist Episcopal Church; the Methodist Episcopal Church, South; and the Methodist Protestant Church. Figures include all three bodies prior to 1939. Members are persons who have attained full membership, usually at age 13.

H 542. Seventh-day Adventist members, 1907-1957.

Source: Records of the Statistical Secretary of the Seventh-day Adventist Church, Tacoma Park, Washington, D. C.

The members of this body are mainly 13 years old and over. The latest year for which age grouping was reported was 1936, when the local churches of the body reported that only about 3 percent of their members were less than 13 years of age.

H 543. Southern Baptist members, 1845-1957.

Source: Southern Baptist Convention, *Southern Baptist Handbook, 1958*, Convention Press, Nashville.

Membership in the Southern Baptist churches consists only of individuals who present themselves to the church, request membership, and are baptized. Infant baptism is not practiced.

Land, Water, and Climate

LAND AND WATER UTILIZATION (Series J 1–108)

J 1–2. Territorial expansion of the United States, 1790–1947.

Source: Bureau of the Census, reports and records.

Boundaries of territories listed under continental United States were indefinite, at least in part, at time of acquisition. Area figures shown here represent precise determinations of specific territories which have been marked upon maps, based upon interpretations of the several treaties of cession, which are necessarily debatable. These determinations were made by a committee consisting of representatives of various governmental agencies in 1912. Subsequently these figures were adjusted to bring them into agreement with remeasurements made in 1940.

"All other" (38 square miles) includes the following islands with gross areas as indicated: Midway (2), Wake (3), Canton and Enderbury (combined area, 27), Swan (1), Navassa (2), Baker, Howland, and Jarvis (combined area, 3), Johnston and Sand (combined area, less than 0.5), Kingman Reef, Quita Sueno Bank, Roncador Cay, and Serrana Bank (each less than 0.5). Other possessions include the following islands for which area figures are not available: Caroline, Christmas, Danger (Pukapuka), Flint, Funafuti, Malden, Manahiki, Nukufetau, Nukulailai, Nurakita, Penrhyn, Rakahanga, Starbuck, Vostok, Phoenix Group (except Canton and Enderbury), and Union (Tokelau) Group, not enumerated in decennial censuses.

J 3–5. Acquisition of the territory of the United States, 1783–1853.

Source: Department of the Interior, *Areas of Acquisitions to the Territory of the United States*, 1922.

All areas are given as computed in 1912 by a Federal Government committee representing the General Land Office, the Geological Survey, Bureau of Statistics, and the Bureau of the Census. Figures for 1957 have been adjusted for the new area measurements for the United States which were made for the 1940 Decennial Census. For the revised figures in square miles, see series J 1–2.

Recognition of its sovereignty over its present continental land area of 2,977,128 square miles, or about 1,905 million acres (as recomputed for the 1940 Decennial Census), was acquired by the Federal Government through a series of international agreements and treaties. The United States, however, did not gain title to all of these lands by such agreements. At the time of acquisition of sovereignty over the areas involved, title to about 463 million acres rested in individual States and their political subdivisions or in private owners, which title was not relinquished to the United States. Title to the remaining 1,442 million acres passed to the Federal Government during the period from 1781 to 1853.

J 6–8. Acquisition of the original public domain, 1781–1853.

Source: See source for series J 3–5.

For area by States, see Bureau of Land Management, *Annual Report of the Director*, Statistical Appendix, 1957.

By acts of cession, during the period 1781–1802, 7 of the original 13 States relinquished to the Federal Government for the common good their claims to the "western lands," roughly the area north of the Ohio River and east of the Mississippi River and the area embraced by the present States of Alabama and Mississippi. The State of Maryland ceded the present area of the District of Columbia in 1788. In 1850, the State of Texas sold its land outside its present boundaries to the United States. Title to the remaining area west of the Mississippi River (except the State of Texas) and to Florida passed to the Federal Government as sovereign at the time of their addition to the Nation during the period 1803–1853. For detailed information, see E. M. Douglas, *Boundaries, Areas, Geographic Centers and Altitudes of the United States and the Several States . . .*, Geological Survey Bulletin No. 817, 1939 edition, and B. H. Hibbard, *History of the Public Land Policies*, Macmillan Co., New York, 1924.

With the exception of land in the District of Columbia, the total of 1,442 million acres of land area (see series J 7), title to which became vested in the Government, is known as the *original public domain*. Any of such lands which the Government has not disposed of under the public-land laws are generally referred to as *public-domain lands*.

In addition to the public domain, the Federal Government has from time to time acquired by purchase, condemnation, and gift, tracts of land needed for various public purposes, such as sites for public buildings, defense installations, and natural-resource conservation activities. Such lands are often referred to as *acquired lands*, to distinguish them from public-domain lands. Complete statistics are not available as to the extent of such acquisitions.

J 9. Estimated area of the public domain, 1802–1957.

Source: 1802–1956, Bureau of Land Management; 1957, General Services Administration, *Inventory Report*, 1957.

For definition of public domain, see text for series J 6–8.

J 10–18. General note.

For definition of public-domain lands and acquired lands, see text for series J 6–8. The laws which govern the management, use, and sale or other disposal of public-domain lands are known as the *public-land laws*. The policy of the Federal Government in the early years was to pass the public lands into private ownership as rapidly as possible. Congress passed thousands of laws providing for the disposal of the original public domain to States and their subdivisions and to private owners. Initially this was done to raise revenue and later to hasten the settlement and development of the country. Under these laws, approximately 285 million acres have been patented to homesteaders, 225 million acres have been granted to States for various public purposes, 90 million acres have been granted to railroad corporations to aid in financing the construction of railroads, and about 430 million acres have been sold or otherwise disposed of. Disposals have reduced the original public domain to its present area of about 410 million acres (see series J 9). Special laws provide for the disposal of surplus *acquired lands*, as, for example, the Surplus Property Act of 1944.

J 10. Vacant public lands, 1904–1957.

Source: Bureau of Land Management (formerly the General Land Office), *Annual Report of the Director*, various issues, and records.

Data are estimates as of June 30 of each year; they do not include public lands in Alaska.

The vacant public lands of the United States are public-domain lands (see text for series J 6–8) which are not reserved for any purpose other than for reclassification and which are not covered by any non-Federal right or claim other than permits, leases, right-of-way, or unreported mining claims. They are subject to acquisition by applicants under appropriate laws, such as the laws governing homesteads or grants to States. It is upon these laws for the most part that entries and selections (see text for series J 13–15) are made. The Bureau of Land Management administers the public-land laws relating to such entries and selections, a function transferred to it from the General Land Office as a part of Reorganization Plan No. 3 of 1946 (U. S. Congress).

J 11. Cash receipts of the Bureau of Land Management, 1881–1957.

Source: Bureau of Land Management, *Annual Report of the Commissioner of the General Land Office*, 1946, Statistical Appendix, pp. 120–121, and thereafter, annual reports of the Bureau of Land Management.

Figures are for fiscal years and include receipts from such sources as: Sales of public and ceded Indian lands; fees and commissions; mineral rentals, royalties, and bonuses; sales of timber; grazing fees and rentals; and land rentals. These data represent the total receipts of the General Land Office and Bureau of Land Management covered into the Treasury for 1881–1957 and include the relatively small receipts from land and resources in Alaska. They do not include the receipts which other Government agencies realized from their operations on Federal lands, although they do include some receipts from lands under the administration of such agencies. For example, mineral leases for public-domain lands within areas administered by the National Forest Service were issued by the General Land Office, which also collected the mineral rentals, royalties, and bonuses from such lands. Also for 1935 through part of 1940, the General Land Office collected grazing fees for lands within grazing districts; and, for 1908 through the first half of 1913, it collected water-right charges in connection with the Bureau of Reclamation irrigation projects. Other examples of multiple jurisdiction exist.

For receipts from sales of public lands as reported by the Treasury Department, see series Y 263. The data representing receipts from sales of public lands which are included here, however, are not identical to those shown for series Y 263, since the General Land Office reports of receipts from sales did not cover the same period as the Treasury reports.

J 12. Land granted by the United States to the several States, 1802–1938.

Source: Bureau of Land Management, *Annual Report of the Commissioner of the General Land Office*, 1946, Statistical Appendix, pp. 108–119.

See also *General Land Office Information Bulletin No. 1, 1939 series.*

The data on land grants to the States for various public purposes are presented according to the calendar year in which the granting legislation was passed by the Congress. Some variation in the series is possible since the language of some of the statutes, including that of amendatory legislation, offers alternatives in the selection of the year to which individual grants could be assigned. As with the land grants for the construction of canals and other transportation improvements (series J 44–48), many of these grants were satisfied through delivery of evidence of legal title throughout the years.

J 13–15. Original entries and selections, final entries, and patents and certifications, 1869–1957.

Source: 1869–1919, Department of Commerce, *Statistical Abstract of the United States*, various issues, 1879–1919 (data for 1903–1908 are revised as shown in the *Statistical Abstract*, 1909); 1920–1957, Bureau of Land Management, *Annual Report of the Director*, various issues.

The data on entries, selections, patents, and certifications refer to transactions which involve the disposal, under the public-land laws (including the homestead laws), of Federal public-domain lands to non-Federal owners. In general terms, *original entries* and *selections* are applications to secure title to public-domain lands which have been accepted as properly filed. Some types of applications, however, are not reported until the final certificate is issued and are, therefore, not included in series J 13.

Applications become *final entries* upon issuance of a *final certificate* which is given to the applicant after he has complied fully with the requirements of the laws relating to his application. These requirements may include, in particular cases, settlement upon and improvement of the lands entered, or payment of statutory fees or purchase money. A *final certificate* passes equitable title to the land to the applicant. With respect to certain State selections, no final certificate is issued. Such selections are, therefore, not included in series J 14 (final entries). *Patents* are instruments which pass legal title to the lands to the applicant. *Certifications* are issued in lieu of patents in connection with certain State selections.

The data do not include the area of certain lands which have been granted to the States to aid in the support of common schools. Title to such lands usually passes to the States upon survey of the lands by the Federal Government. Owing to legal complexities, detailed statistical records were not kept of these lands. Figures published here have been subjected to minor adjustments to improve comparability. They have not been checked, however, for internal accuracy or for strict comparability which would require analysis of supporting records. Data include disposals of lands in Alaska.

J 16–18. Homestead entries, except on ceded Indian lands, 1863–1957.

Source: Series J 16, 1863–1883, Thomas Donaldson, *The Public Domain*, Government Printing Office, 1884, pp. 351–355; 1884–1957, Bureau of Land Management, *Annual Report of the Director*, various issues. Series J 17, Department of Commerce, *Statistical Abstract of the United States*, 1889–1957, various issues. Series J 18, 1868–1928, *Statistical Abstract*, 1929, p. 130; 1929–1957, *Statistical Abstract*, various issues.

For definitions of the terms *original entries* and *final entries*, see text for series J 13–15.

Figures for original homestead entries exclude applications which were accepted for lands ceded by the Indians to the United States with the provision that proceeds from their disposal would be covered into the Treasury to the credit of the Indians. Detailed statistics on such homestead entries were not published in the reports of the Commissioner of the General Land Office prior to 1924. Such reports contain general information as to the disposal of ceded Indian lands. The records upon which the reports were based are for the most part on file in the National Archives.

Digitized by Google

Acreage figures of final entries (series J 18) do not include commuted homesteads. A *commuted homestead entry* is a homestead entry not exceeding 160 acres in connection with which the entryman pays the minimum statutory price for the land in consideration for reduction in residence and other requirements. Only certain classes of homestead entries can be commuted.

J 19–24. Revenues from public-domain, revested, and acquired land, 1785–1956.

Source: Marion Clawson and Burnell Held, *The Federal Lands: Their Use and Management*, The Johns Hopkins Press, Baltimore, 1957, text table 8 and appendix tables 25 and 27.

The original data for 1785–1880 are from J. R. Mahoney, *Natural Resources Activity of the Federal Government*, Public Affairs Bulletin No. 76, Library of Congress, 1950. Data for 1881–1956 are from annual reports of the Bureau of Land Management.

These are gross cash revenues, from which certain payments were made to States.

O & C lands are those areas granted to the Oregon and California Railroad Company in 1866. Later the Federal Government repossessed this land because the terms of the grant were not carried out.

J 25–31. Receipts from timber sales and grazing fees and use from public-domain lands, 1935–1956.

Source: See source for series J 19–24, appendix tables 12 and 14.

Data were compiled from annual reports of the Bureau of Land Management (formerly General Land Office and Grazing Service). Value of timber sold (series J 25) is the sum of amounts involved in timber sale contracts concluded during the fiscal year; actual cash receipts and volume of timber cut on each contract are spread over several months, often for 2 years or more, after the contract is signed. Data are for fiscal years; grazing receipts are credited to the year received even though part of the period covered extends into the following year.

An animal-unit-month represents the forage required to maintain 5 sheep or goats or ½ horse or 1 cow for a month. Data on grazing exclude grazing on reclamation land, land utilization projects where not part of a grazing district, O & C lands (see text for series J 19–24 for definition of O & C lands), and Alaskan grazing; include lands rented and sublet under the Pierce Act (43 USC 315M). Amount of grazing in districts (series J 29–31) includes free-use, crossing, and trailing permits in addition to regular paid use.

J 32–40. Oil and gas leases of public-domain lands—acreage, receipts, and output, 1920–1957.

Source: 1920–1955, see source for series J 19–24, appendix table 15; 1956 and 1957, records of Bureau of Land Management and the Geological Survey.

Original data for 1920–1955 are from annual reports of the Bureau of Land Management (formerly General Land Office) and the Geological Survey.

J 41–42. Livestock permitted to graze in National forests, 1905–1956.

Source: See source for series J 19–24.

Original data were obtained from Forest Service, annual reports and records.

Data are for the number of animals under paid permit, not necessarily the actual number grazed.

J 43. Public land sales, 1800–1860.

Source: Walter B. Smith and Arthur H. Cole, *Fluctuations in American Business, 1790–1860*, Harvard University Press, Cambridge, 1935.

Data were derived from Hibbard, *A History of the Public Land Policies*, 1924, pp. 100, 103, 106, and from *Annual Report of the Commissioner of the General Land Office*, various issues. The data differ from those presented by Hibbard (p. 106) for the years after 1850. After 1850, Hibbard's data shifts from calendar years to fiscal years ending June 30.

J 44–48. Public land grants by United States to aid in construction of railroads, wagon roads, canals, etc., 1823–1871.

Source: Bureau of Land Management, *Annual Report of the Commissioner of the General Land Office*, 1946, Statistical Appendix, pp. 100–107.

Figures include only the area of lands for which title passed to the grantee States and corporations. The exact extent of practically all of these grants was, owing to their terms, indeterminate at the time the granting acts were passed by the Congress. The procedures for the satisfaction of the grants generally required the grantees to submit lists of lands to which they requested evidence of legal title on the basis of the provisions of the authorizing legislation. This process of issuance of instruments of title has not been fully completed by the Department of the Interior; a relatively small area remains to be adjudicated.

For the series presented, the areas shown in the instruments of title which were issued for each grant over the years were totaled and shown as of the fiscal year in which the grant was *originally enacted*, even though in certain instances grants were revived at a later date after the expiration of statutory time limits while others were enlarged by subsequent legislation. Because the tabulation is based on instruments of title, the data do not reflect the area of those portions of grants which could not be satisfied under the law for various reasons or of those grants or portions of grants which were forfeited.

J 49–79. General note.

Area measurements in the United States began with measurements for the country as a whole; and, as mapping progressed, included measurements for the States and later for counties and minor civil divisions. For total figures (gross, land, and water) in square miles, 1790–1950, see series A 17–19. In 1940, a remeasurement of the United States was made for the Sixteenth Census of the United States. The last previous measurement was that for the Census of 1880. Differences between the two measurements are due primarily to the more accurate determination of the outer limits of the United States, the improvement in mapping, and omission of certain bodies of water included in the previous measurements. See Bureau of the Census, *Areas of the United States, 1940*, Sixteenth Census of the United States, 1942, pp. 1–5.

Collection of land utilization statistics began with the Census of 1850, when farmland was enumerated as "improved land" or "unimproved land." In 1890 and later census years, these inquiries were expanded and revised. After the turn of the century, collection of various land utilization statistics was begun by branches of the Department of Agriculture, while other contributions to the literature on this subject were made by numerous agencies, State universities, and individuals.

The Census of Agriculture is the primary source of data concerning land in farms in census years. Statistics concerning land not in farms are less complete, except for forest land, and have been collected by various interested agencies for individual items (e.g., acreage of forest land by the Forest Service, public-domain lands by the Department of the Interior) and for local areas by Federal, State, and private agencies and individuals. During the 1930's, studies by the National Resources Planning Board and assisting agencies contributed greatly to the available statistics on total land utilization. Since 1920, the former Bureau of Agricultural Economics and the Agricultural Research Service have prepared periodic inventories of land use.

Digitized by Google

Data on the utilization of farmland for 1850–1925 are chiefly estimates made by the former Bureau of Agricultural Economics based on the Census of Agriculture conducted by the Bureau of the Census. The estimates for 1930–1954 are from the Census of Agriculture, except for an adjustment made by the Agricultural Research Service in cropland harvested and other land in farms for 1950 and 1954. This adjustment was made to compensate for some of the underenumeration of cropland indicated by the postenumeration surveys conducted by the Bureau of the Census and to obtain greater conformity with the total acreage of crops harvested as reported by the Agricultural Marketing Service.

Acreages of nonfarm uses of land were estimated by the former Bureau of Agricultural Economics and the Agricultural Research Service from records and reports of State and Federal agencies concerned with management of public land, conservation of land, public services, and assessment of land for taxation.

Changes in total farmland for 1850–1954 represent in part increased agricultural activity and in part more complete census enumeration and changes in census definition of *land in farms*. Uses not reported by the Bureau of the Census and additions to census data for 1925–1954 are based largely on agricultural statistics assembled by the Department of Agriculture. Forest-land inventories and grazing-land studies during this period are believed to have improved the reliability of the estimates of these items for this period as contrasted with earlier years. Estimates for 1925 and prior census years for land not in farms are based on more limited evidence, such as available charts, maps, records, and reports on land areas and uses.

J 49. Total land area, 1850–1954.

Source: Department of Agriculture, *Major Uses of Land in the United States: Summary for 1954*, Agriculture Information Bulletin No. 168, 1957, pp. 36 and 37.

See also *1940 Census of Agriculture*, vol. III, p. 33, for additional detail for 1850–1940. For total land area for 1950 and 1954, see *U.S. Census of Agriculture: 1950*, vol. II, p. 64, and *U.S. Census of Agriculture: 1954*, vol. II, p. 60.

Total land area, as defined by the Census for the 1940 remeasurement includes "dry land and land temporarily or partially covered by water, such as marshland, swamps and river flood plains . . . (except tidal flats) . . . streams, sloughs, estuaries, and canals less than 1/8 of a statute mile in width; and lakes, reservoirs, and ponds having less than 40 acres of area." The total land area reported by the Bureau of the Census for 1950 and 1954 is less than that reported for 1940 mainly because of the completion of additional reservoirs.

J 50–64. Land utilization, by type, 1850–1954.

Source: Department of Agriculture, *Major Uses of Land in the United States: Summary for 1954*, Agriculture Information Bulletin No. 168, 1957, pp. 36 and 37. (Data for series J 56–57 and J 61–62 for 1900 from records of Agricultural Research Service.)

These data are based on estimates from the following sources: Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, pp. 8 and 9; Department of Agriculture publications, as follows: *Pasture Land on Farms in the United States*, Bulletin No. 626, 1918; *Agriculture Yearbook, 1923*, 1924, pp. 415–506; *Inventory of Major Land Uses, United States, 1945*, Miscellaneous Publication 663, 1948; *Major Uses of Land in the United States*, Technical Bulletin No. 1082, and Supplement, *Basic Land Use Statistics, 1950;* and National Resources Board, *A Report on National Planning and Public Works. . .*, 1934, pp. 108–113.

Cropland used for crops includes cropland harvested, crop failure, and cultivated summer fallow. *Cropland idle or in cover crops* includes idle land left unplanted for a year or two only, as well as some poorer cropland abandoned for crop purposes and soil-improvement crops not harvested and not pastured. *Grassland pasture* includes cropland used only for pasture and all other nonforested pasture in farms. *Farm woodland* includes grazed or ungrazed farm wood lots or timber tracts, natural or planted, and cutover land with young growth, which has or will have value as wood or timber. Chaparral and woody shrubs are omitted. *Other land in farms* includes farmsteads, roads, lanes, wasteland, and so on.

Nonfarm grazing land comprises the open grassland and shrub grazing lands and the woodland and forest area grazed. *Nonfarm forest land not used for grazing* excludes forested areas in parks, wildlife refuges, military areas, recreation sites, and arid woodland, brushland, and forest land used for grazing. *Other nonfarm land* includes urban, industrial, and residential areas outside farms; parks and wildlife refuges; military lands; roads; railroads; ungrazed desert, rock, swamp, and other unused wasteland.

J 65–79. Private and public land ownership, by major uses, 1920–1954.

Source: 1920, Bureau of Agricultural Economics and Agricultural Research Service, records; 1930–1954, see source for series J 50–64, pp. 90–92.

See also Department of Agriculture, *Federal and State Rural Lands, 1950, with Special Reference to Grazing*, Circular No. 909, 1952. For definitions and for longer series on total land area, see text for series J 49 and J 50–64.

The figures were compiled from a number of Federal and State reports and records and varying degrees of reliability attach to them. The figures used are applicable for different dates. All of them were assembled for some other purpose than that for which they are used here. The areas of all unsurveyed lands are estimated, and the areas of many lands based on surveys are subject to correction. Some of the data are not complete and are used merely for comparison. Therefore, although they are the best available, the figures given here are not strictly accurate, often not complete, and are not comparable among themselves. Nevertheless, they give some idea of the major features of land use and control for the country as a whole.

Private land is land held or owned by private individuals, groups, and corporations, and is generally used for private purposes. Indian lands held in trust and administered by the Federal Government for the benefit and use of groups or tribes of the Indian people are included in private land, as three-fourths of this land is used directly for farming and grazing by Indian farmers and stockmen. Much of the rest is leased for farming and grazing to other farmers and ranchers and the proceeds are received by the Indian owners. These lands are subject to eventual private individual ownership by the Indians.

Public land as used here is land owned or administered by Federal, State, county, municipal, or other governments for common or public purposes (e.g., highways, airports, national defense, flood control, water supply, forests, and parks). Public land frequently is used for farming and grazing by private parties under a system of permits or leases. However, most of it is dry, rough, rocky, swampy, or otherwise unsuited for farming. When used by individuals, public land is sometimes included in reporting statistics on acreages in farms. More often, when public land is used in common by several persons, it is not reported as in farms.

J 80–90. Land drainage and irrigation, 1890–1954.

Source: Series J 80, Bureau of the Census, *Drainage of Agricultural Lands*, 1950, p. 2; series J 81–83, *Drainage of Agricultural Lands*, 1940, p. 1; series J 84–86, 1890–1950, *Irrigation of Agricultural Lands*, 1950, vol. III, pp. 34–37, 1954, Bureau of the Census, records; series J 87–90, *Irrigation of Agricultural Lands*, 1940 and 1950, and *U.S. Census of Agriculture: 1954*, vol. II, p. 9.

The date of each drainage census was January 1 of the census year. The data on condition and use of the land refer to the year preceding the date of the census. The number of States covered has varied from census to census. The New England States and West Virginia have never been included. The 1920 Census also excluded the Middle Atlantic States, Alabama, Delaware, Maryland, and Virginia. This was also true for 1930 except that Virginia was included. In addition, New Jersey, New York, and Pennsylvania were omitted in 1940 and Pennsylvania in 1950.

The Bureau of the Census has collected irrigation statistics by means of two censuses: (1) The Censuses of Agriculture, which have provided irrigation statistics since 1890 and represent a direct enumeration of farmers; and (2) the Special Censuses of Irrigation Enterprises, taken decennially since 1910, which collect information from irrigation enterprises and cover only the States where irrigation is very extensive. In addition, a special census of irrigation was taken in 1902 and the statistics were published in 1904 in *Bulletin 16* of the Census Bureau.

For reasons of comparability with the acreage series on cropland and pasture shown here, the irrigation data presented here are from the Censuses of Agriculture.

The States included for series J 86–88 are: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming.

For series J 89–90, the States included are: Alabama, Arkansas, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin.

Although both types of reclamation are important, drainage development overshadows irrigation in acreage of land already converted to farming and in land that still may be developed. Drainage developments are concentrated mainly in the humid areas of the Eastern and Central States, whereas irrigation developments are located predominantly in the arid and semiarid areas of the West. However, in irrigated areas, drainage also must be provided to carry away any water not required by crops.

J 91–102. Water use, 1900–1955.

Source: Business and Defense Services Administration, *Water Use in the United States, 1900–1975*, July 1959. (The source also contains a detailed bibliography on water utilization.)

The figures are based on nationwide estimates of water uses as developed by various agencies whose primary interest lies within this field. The estimates shown here are considered conservative and are subject to revision as new information permits readjustment in the several categories of water use.

Public water supplies (series J 95 and J 96) include those basic systems furnishing water for domestic, commercial, and industrial purposes within their area of distribution. Self-supplied use applies to all water uses which are individually provided, and without assistance from a publicly owned supply. Domestic use (series J 97 and J 98) includes all water used primarily for household purposes, the watering of livestock, the irrigation of gardens, lawns, shrubbery, etc., surrounding a house or domicile. Industrial and miscellaneous use (series J 99 and J 100) includes manufacturing industries, mineral industries, air conditioning, resorts, motels, rural, commercial, military, and other miscellaneous uses not elsewhere included, all self-supplied. Steam electric power use (series J 101 and J 102) applies to all water used in the production of steam for the generation of electric energy. The increase in industrial production, accompanied by increasing mechanization and automation, has rapidly increased consumption of electric power, the major portion of which is produced by steam generation.

J 103–108. Water wells in use, 1900–1955.

Source: Business and Defense Services Administration, records. (Estimates are shown in chart form in Walter L. Picton, "The Water Picture Today," *Water Well Journal*, April 1956.)

In the formulation of these estimates, due consideration has been given to growth in population, the population served by public water supplies, the rural-farm and nonfarm self-served population, and the relative essential water facility requirements to serve them. In addition to population growth, the increase in per capita domestic water use, irrigation requirements, and industrial demands have been considered.

Although the trend appears to be upward in all segments of the water well industry, the extent of increase cannot be firmly measured on a region-to-region basis. In the absence of measurable data, the level of activity in the field has been gauged by the process of deduction, utilizing the populations of rural and other areas not serviced by public water supplies.

Gadsden Purchase	1853	29,640	All other		38

[1] Includes that part of drainage basin of Red River of the North, south of 49th parallel, sometimes considered part of Louisiana Purchase.
[2] Not included in total. Ceded by Spain in 1898, the Philippines constituted a territorial possession of the United States until 1946. Granted independence July 4, 1946.
[3] Under jurisdiction of United States in accordance with treaty of Nov. 18, 1903, with Republic of Panama.
[4] Leased (1914) from Republic of Nicaragua for 99 years.
[5] Under trusteeship with the United States as administering authority. See *Trusteeship Agreement for the Former Japanese Mandated Islands (Documentary Supplement No. 1)* of the Security Council of the United Nations which became effective on July 18, 1947.

Series J 3–9. Acquisition and Extent of Territory and Public Domain, Continental United States: 1781 to 1957

[Areas are as computed in 1912, hence do not agree with total figures (in square miles) shown in series J 2, or with figures (in acres) shown for 1940 and 1945 in series J 49 and J 65]

1802, estimate of public domain							*200,000,000*
1783, Treaty with Great Britain	541,364,480	526,570,240	14,794,240				
1781–1802 (State Cessions)				236,825,600	233,415,680	3,409,920	

[1] Estimated from imperfect data available for indicated years.
[2] Includes Indian Trust properties.
[3] Data for Louisiana Purchase exclude area eliminated by the Treaty of 1819 with Spain. Such areas are included in figures for annexation of Texas and the Mexican Cession.
[4] Includes 33,920 acres subsequently recognized as part of the State of Texas which is not a public-domain State.
[5] Represents drainage basin of the Red River of the North, south of the 49th parallel. Authorities differ as to the method and exact date of its acquisition. Some hold it as a part of the Louisiana Purchase, others maintain it was acquired from Great Britain.

[1] Includes grants for such public purposes as the following: Educational, penal, and other public institutions and buildings; bridges, reservoirs, and other internal improvements; reclamation of swamp and arid lands; experiment stations; recreational areas; wildlife and forestry areas; military camps; and payment of bonds issued by local governments. Does not include grants tabulated in series J 44–48. Does not include acreage of swamplands lost to the States, for which the States received indemnity in cash.

[2] Includes homesteads.

[3] Previous to 1911 the data included, in addition to original entries and selections, some classes of final entries and patents.

[4] Exclusive of commuted homesteads.

[5] Not reported.

[6] Less than 1,000 acres.

[7] The increase in area over 1925 was reported as the result of a "special check" of field office records which was "used as a basis for a complete revision of the vacant land statistics."

[8] Grants of unsurveyed lands to Wisconsin for forestry purposes; area not determined.

Series J 19–24. Revenues From Public-Domain, Revested, and Acquired Land: 1785 to 1956

[In millions of dollars]

Period	Total	Sales of public domain	Grazing fees and rentals [1]	Timber sales [1] (O & C, and public domain)	Mineral Leasing Act receipts—public-domain and acquired land [1]	Miscellaneous [2]
	19	20	21	22	23	24
Total	[3] 1,573.1	414.2	27.2	123.0	615.4	139.7
1951–1956	[3] 709.2	8.8	12.5	94.4	335.0	4.9
1941–1950	199.4	2.4	11.5	24.9	158.0	2.6
1931–1940	58.0	1.4	3.2	8.7	46.0	3.7
1921–1930	104.5	6.7	----	----	76.4	21.4
1911–1920	67.0	27.9	----	----	----	39.1
1901–1910	94.1	64.8	----	----	----	29.3
1891–1900	33.5	21.3	----	----	----	12.2
1881–1890	99.3	76.9	----	----	----	22.4
1785–1880	208.1	204.0	----	----	----	4.1

[1] Revenues of earlier years included under "Miscellaneous." (See text for definition of O & C lands.)

[2] Includes fees and commissions, sales of Indian lands, various rentals and permits, and a varied assortment of minor items. For the period roughly 1910–1920 contains relatively minor amounts from mineral leases of various kinds. For the period roughly 1910–1945, contains minor amounts from sale of dead, down, or damaged timber, including trespass damages for timber cutting; and for the period roughly 1910–1934, includes minor amounts for grazing, including grazing trespass damages. From 1916 through 1932, also includes receipts from sale of O & C timber.

[3] Includes $253.6 million of mineral leasing submerged areas of outer Continental Shelf not shown separately.

[1] Includes bonuses. Rentals are estimates derived by deducting royalties from total receipts.

[2] Includes gasoline and butane on an equal basis with petroleum (42 gallons per barrel), and 6,000 cubic feet of natural gas equal to 1 barrel of petroleum.

[3] Estimated from Geological Survey, calendar year data.

[1] Acreage irrigated as reported by the agricultural census for the year preceding the date of the census.
[2] Excludes data for 17 States prior to 1920 as some States had not yet been admitted to the Union.
[3] Includes 4,110,000 acres reported drained by irrigation enterprises.
[4] Estimate based on increase in acreage of improved land, 1930 to 1940, and increase in acreage of land in drainage enterprises, 1940 to 1950.
[5] Arkansas and Louisiana. Data for the other 29 Eastern States not available.
[6] Data for 1910 and 1920 for the 17 Western States are interpolated from censuses of irrigation for these years.

chapter J

CLIMATE (Series J 109–265)

J 109–265. General note.

Climate may be defined as the statistical summary of the state of the atmosphere at a given place for a given period of time. However, each element of this definition deserves comment.

The "state" of the atmosphere properly includes many weather elements in addition to the most influential ones like temperature, precipitation, and wind; not all of these are given much attention, nor have they been adequately measured throughout the United States. Virtually every human pursuit finds itself sensitive to one or more factors of its climatic environment, particularly when and where they range beyond critical limits as, for example, the freezing temperature of water.

In view of the significance of ranges of climatic elements, mere arithmetic averages are usually unsatisfactory in specifying the state of the atmosphere, although the description of climate in much of the Nation has had to be so limited. Fully as significant, if less convenient to summarize, are the probability distribution and extreme values of individual weather elements, the joint frequency distributions of two or more elements, and certain specialized indices involving many elements.

Climate often differs significantly in a surprisingly short distance through the air or along the ground and a rather careful definition of the "place" to which an observed climate refers is required. The collection of climatological statistics is, therefore, essentially a sampling process, and in many respects existing statistics should be taken as indicative rather than definitive.

Climate is known to be changing irregularly. The numerical description of climate thus depends somewhat on the period of history over which weather statistics are compiled. A standard climatological period has been defined by the World Meteorological Organization to consist of the 30 years ending with the most recent decade year. At present, the standard period includes 1921 to 1950. Averages over this period are defined as *normals;* averages over other periods should properly be called by other names.

The longest climatological series in the United States are not homogeneous, and no exact statistical methods exist for making them so. (A homogeneous series is one which refers to the same "place" or to equivalent places throughout the period of record, and whose sampling bias is randomly distributed in time around its average bias which, in turn, need not equal zero.) These long series, widely published in the past without qualifying notes, must therefore be used with discrimination.

The representativeness and hence utility of all climatological series is more or less constrained by a variety of sampling and data-processing uncertainties. (See Charles F. Brooks, *The Climatic Record: Its Content, Limitations, and Geographic Value,* Annals of the Association of American Geographers, vol. XXXVIII, No. 3, 1948, pp. 153-168.) Observed climate at a point is valuable merely as a sample of the climate of other points in the surrounding region. Typically, this region is nonuniform in geographical character, and the sample is complexly biased. Even today, with the best coverage by climatological stations in the history of the United States, the average temperature station must represent over 500 square miles of land surface. (Precipitation stations now average one in about 300 square miles; "first-order" Weather Bureau stations with observations of most other elements average one in about 10,000 square miles.) This sampling density is insufficient to interpolate the climate of every hamlet and bean patch; it is, however, more than sufficient to indicate relative *variations* of temperature, precipitation, and certain other elements from one year (or decade) to another because simultaneous departures of these from their normals are closely parallel over large areas. For this reason, homogeneous series for one station may reflect satisfactorily the historical variations of climate over 10,000 or even 100,000 square miles, while surely not the climate itself.

Many factors operate to compromise the homogeneity of typical climatic series. These chiefly derive from observational practice which, being flexibly geared to ever-changing requirements, has never been well adapted to the special application of historical comparison of climate. The longest series to which so much attention has traditionally been given have exclusively come from stations within slowly expanding cities. This fact has introduced warming trends in temperature and complex changes in precipitation which are not representative of their rural surroundings. Also, the occasional need to move stations to new locations with their slightly different climates has blemished their combined record with discontinuities.

Changes in daily observation time and in exposure of instruments have caused further discontinuities; this problem is especially acute in records prior to the establishment of standardized Weather Bureau practices in these respects in the 1880's. Other sources of inhomogeneity derive from neglect of occasionally missing daily records in forming monthly averages, and from familiar human errors in instrument reading, observation copying, editing, computing, and printing. These have been reduced since 1948 by better universal quality control methods but cannot be eliminated entirely.

Virtually all "first-order" Weather Bureau stations had been located (and relocated) in cities until recent years when (at various times since the 1930's) many were transferred to nearby airports. Resulting discontinuities in their records can rarely be corrected for; in some published versions of the records wherein corrections were attempted, insufficient details of the methods are given by which to judge their merits.

Only 2 or 3 percent of the city stations have remained in one location for their full history. (See station histories in Weather Bureau, *Local Climatological Data,* published annually for each station.) Many cooperative stations staffed by uncompensated cooperative Weather Bureau observers, on the other hand, are beyond range of major city influences on climate; some can be found which have not been significantly moved since their inception. Moreover, the *per se* climatological basis of their program has ensured against its repeated disruption for the convenience of other programs.

"Climatological benchmark network." Since less than one percent of the total reporting network, suitably distributed, would be sufficient for sampling historical variations of climate in the Nation, it is potentially possible to select a network

Digitized by Google

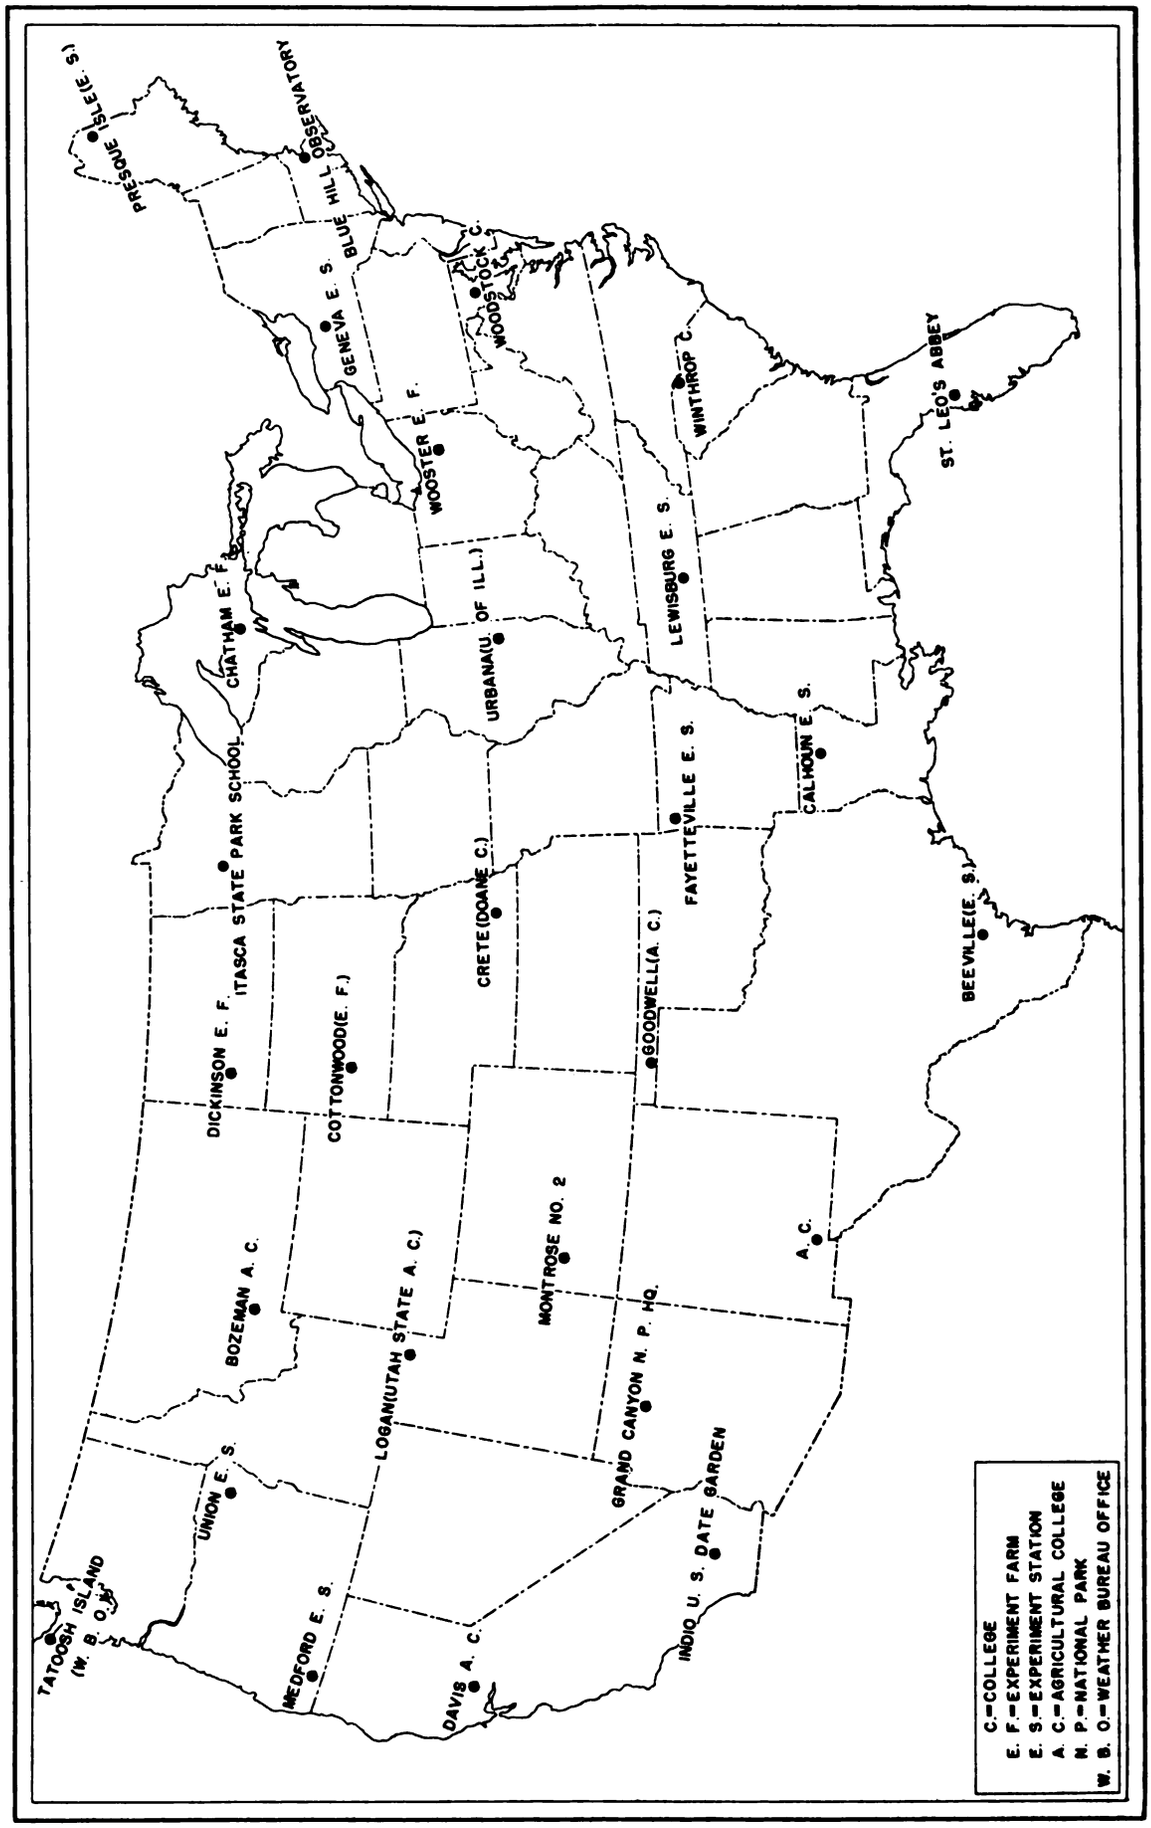

Fig. 1. Climatological Benchmark Station Network

Digitized by Google

in which each station not only (1) possesses fairly long and unbroken records, but also (2) has suffered few if any relocations of instruments, (3) has a good ground exposure little influenced by environmental changes such as city growth or sheltering trees, and (4) is preferably operated by a public or private agency which, by reason of its own interest in the data, will ensure future perpetuation of the station.

A network which comes as nearly as possible to meeting these requirements is the "Climatological benchmark network." Twenty-eight continental stations in the network presented here have thus far been chosen on a tentative basis; others will be added in the future. The best qualified are among those maintained by Federal or State agencies (parks, forests, experiment stations, reclamation projects, etc.), colleges and universities, religious organizations, and public utility companies. Most of them are at agricultural colleges and agricultural experiment stations.

The program now in progress of checking benchmark station records should, in the future, minimize the drawback of relatively low quality control. While the drawback of limited variety of measured elements at cooperative stations generally remains, it is pertinent to add that the records of the larger variety of elements at first-order stations are irretrievably blemished by the effects of many station moves, changes in observational routine, and local city growth. Historical series based on such records must always be suspect.

The latitude, longitude, and altitude of the benchmark stations are given in table 1. The choice of stations to use in a particular data application may be facilitated by figure I.

Table I. Climatological Benchmark Stations

[Abbreviations: A. C.—Agricultural College; E. F.—Experiment Farm: E. S.—Experiment Station; N. P.—National Park; WBO—Weather Bureau Office; and Obs.—Observatory]

Station	Latitude	Longitude	Altitude

Union E. S., Oreg	45° 13′	117° 53′	2,765

It is anticipated that application of these data will be attempted in both correlation studies and trend analyses. The first kind of application, in which temporary deviations of climate are related to those of other statistical series, is a sound one to be encouraged where appropriate. The second application, to the extent that trends of general climate are derived with high quantitative precision and related to trends in other statistics, is not recommended, however.

Long-period trends in homogeneous climatic series are usually small and irregular. Because there are many opportunities for observational inhomogeneities to introduce trends and discontinuities into climatic series, which are not characteristic of the climate at large, real trends in the latter are easily distorted or obscured. Not even the "climatological benchmark" data are above all reproach in this respect.

Concerning climatic trends, it is important to realize that in many instances they could readily be duplicated fortuitously in random number series of equal variance. While this obviously means that statistically observed climatic trends cannot be extrapolated into past or future time reliably, they are nonetheless capable of inducing important trends in concurrent climate-dependent series.

Monthly and annual values of average temperature and total precipitation can most conveniently be found in the following official Weather Bureau publications:

Local Climatological Data, annual summary. This is issued annually for each of approximately 280 stations. With few exceptions, these are first-order Weather Bureau city and/or airport stations. The contents partially include normal values of temperature and precipitation, and comparative data for each month and year back to 1900 or the beginning of record, whichever is later. They also include a station history giving the various station locations and elevations of instruments.

Climatological Data, annual summary. This bulletin is issued annually by climatological sections. In most instances, a section is a State. Nearly all cooperative climatological stations as well as first-order Weather Bureau stations are included. This publication was founded in the 1880's, but was included as part of the Weather Bureau *Monthly Weather Review* from 1911 to 1913, inclusive.

Climatic Summary of the United States (Bulletin "W"). Monthly and annual series of total precipitation at all stations and mean temperature at selected (first-order) stations are also contained in this publication. Values from the beginning of record up through 1930 are given by geographical sections in the earlier Bulletin, published in the early 1930's. Values for later years are given in *Climatic Summary of the United States—Supplement for 1931 Through 1952*, by States, published variously since 1954.

Length-of-record series of monthly and annual temperature, pressure, and precipitation up to 1940 may also be found in H. H. Clayton (ed.), *World Weather Records*, Smithsonian Miscellaneous Collections, vol. 79 (1944), vol. 90 (1944), and vol. 105 (1947). A new volume by the Weather Bureau will bring the series up through 1950. Some station history information is included, and records are listed for nearly 50 Weather Bureau stations in the United States. Temperature data are corrected for differences in daily observation time, and, being reduced to 24-hour means, differ somewhat in value from the same data appearing in Weather Bureau publications.

For daily data on extreme values, or on elements other than temperature and precipitation, see monthly editions of *Climatological Data* and, since 1948, *Local Climatological Data*.

J 109–135. Climatological benchmark stations—normal monthly, seasonal, and annual temperature.

Source: Series J 109–131, J 133–135, Weather Bureau, unpublished records (figures computed from monthly temperature data in *Climatological Data*). Series J 132, *Local Climatological Data*, annual editions. (Data for series J 110 appear in *Local Climatological Data*, but the temperatures there have been adjusted to values based on 24 daily observations and so are incompatible with other temperature data for that station given here.)

Nearly all weather stations have been moved several times in their history (see general note, above). Consequently, the Weather Bureau has adopted the practice of using "normal"

Digitized by Google

values of temperature and precipitation for comparative purposes rather than long-term means which are derived from records taken at the several different locations the stations may have had over the years.

Normal values of temperature and precipitation are based on records for the 30-year period 1921 to 1950, inclusive. Where a station had a record for the entire 30 years from the same instrument site, monthly precipitation normals are the mean of the monthly values for the 30 years. For such stations, the temperature normals were obtained in a similar manner, using normal maximum and normal minimum values to obtain monthly normals. The annual normal temperature is obtained by dividing the sum of the annual normal maximum value and the annual normal minimum value for temperature by 2.

For stations that did not have continuous records from the same instrument site for the entire 30 years, 1921 to 1950, the means have been adjusted to the record at the present site. In these adjustments, a "difference factor" was used for temperature and a "ratio factor" for precipitation. These factors were determined by parallel comparison, either between records at the actual station sites or through a second station that had a continuous record to compare against both sites for obtaining the resultant adjusting factors. Normals were thereafter obtained as outlined above.

This system of normals has three characteristics: (1) The 30-year period (1921 to 1950) adopted for the computations is consistent with the term of years accepted by the World Meteorological Organization for climatic normals; (2) where the station and exposure for records in a given locality have been changed, the whole record has been carefully studied and adjusted to the latest source of records and reports; (3) the normals for maximum and minimum temperatures are separately tabulated and made available for the first time.

See also general note for series J 109–265.

J 136–162. Climatological benchmark stations—normal monthly, seasonal, and annual precipitation.

Source: See source for series J 109–135.

See also text for series J 109–135.

J 163–245. Climatological benchmark stations—temperature, precipitation, and description of year, 1884–1957.

Source: Weather Bureau, *Climatological Data*, annual summary.

The description of the year is given by three digits; the first digit applies to the year as a whole, the second applies to the summer season (June, July, and August), and the third applies to the winter season (December *of the previous year*, January, and February). The following code defines the meaning of each digit:

Code	*Temperature*	*Precipitation*
1	In warmest quartile	In wettest quartile
2	Near normal	In wettest quartile
3	In coldest quartile	In wettest quartile
4	In warmest quartile	Near normal
5	Near normal	Near normal
6	In coldest quartile	Near normal
7	In warmest quartile	In driest quartile
8	Near normal	In driest quartile
9	In coldest quartile	In driest quartile

For example, a code 5–1–9 indicates that, for a particular year and station, the annual mean temperature and annual total precipitation were both near normal (i.e., not within either extreme quartile of their distributions in the normal 1921–1950 period); but that the summer season was unusually warm and wet, while the winter season was unusually cold and dry.

Smoothed ogives of the distribution of average values in the 30-year normal period were used to obtain the upper and lower quartile limits of temperature and precipitation for each season and for the year as a whole. Any given quartile therefore separates approximately one-quarter of the number of years in the normal period, but probably more or less than one-quarter of the total years in any full length-of-record series owing to the presence of climatic trends or variations.

J 246–265. Long-record city stations—annual mean temperature and annual total precipitation, 1780–1957.

Source: Series J 246, J 247, J 250–255, J 257–265, 1780–1940, H. H. Clayton (ed.), *World Weather Records*, Smithsonian Miscellaneous Collections, vol. 79 (1944), vol. 90 (1944), vol. 105 (1947); 1941-1950, Weather Bureau, *World Weather Records*, 1941–1950 (forthcoming); 1951–1957, Weather Bureau, *Local Climatological Data* (corrected to 24-hour means), annual editions. Series J 248, J 249, and J 256, *Local Climatological Data* and *Climatic Summary of the United States*, annual editions.

The series for city stations selected for presentation here are among the longest existing climatological series for the United States. They were selected with the realization that they are not homogeneous, but have comparative value in the earlier years and have been less frequently affected by changes of station location. The series, however, are not adjusted for known station changes, and coming as they do from growing cities, they contain climatic trends which in part are typical only of major metropolitan centers.

Each long-record station has suffered several changes of location and exposure of instruments. The following station history notes are extracted from the annual editions of *Local Climatological Data*, and indicate all known changes likely to have affected the temperature and/or precipitation records. The history of each station prior to the date of establishment by the Federal weather service is essentially unknown; occasional exposure changes in earlier years undoubtedly occurred whose effects, although significant, may never be discovered.

Records for 2 of the 10 stations shown refer in recent years to airport locations; the observation program in New Haven city terminated in 1943, and that in St. Paul-Minneapolis terminated in 1937. With one exception, all other records are continuously available from city locations although the major part of Weather Bureau activities in each case has been transferred to airport stations. The exception is Santa Fe, where interpolations have been required to complete the city record in recent years.

In the following notes, "temperature means" indicate the combination of hourly temperature readings each day which were averaged together to form means. For example, 1/3 (7, 15, 21) indicates an average of readings at 7 a.m., 3 p.m., and 9 p.m. local standard time. The formula 1/3 (7:35, 16:35, 23) was in general use for 1870–1879 (Nov.), and the formula 1/3 (7, 15, 23) for 1879–1888, the times referring to the 75th meridian (Washington). Since about 1888, however, daily maximum and minimum temperatures, observed with special registering thermometers, have been averaged to obtain means.

Numbers in parentheses refer to elevations of the thermometers and rain gauge, respectively; the example (51/70) indicates the thermometers were 51 feet above ground, and the rain gauge funnel was 70 feet above ground (roof exposures). Asterisks indicate that heights are estimated from circumstantial information; a question mark indicates unknown.

Albany, N.Y. Temperature means: 1795–1796, unknown; 1813–1814, 1/3 (7, 15, 21); 1820–1870, 1/3 (7, 14, 21). Station established by Army Signal Service in Dudley Heights December 1873 (11/?); instruments moved July 1874 (17/1). Station moved 1.3 miles W March 1880 (51/70), 400 feet E

Digitized by Google

October 1884 (80/100). Exposure changed July 1888 (84/99), October 1901 (102/100), October 1928 (107/100). Station moved 100 feet N April 1935 (97/88).

Baltimore, Md. Temperature means: 1817–1870, unknown. Station established December 1870 (34/69); thermometers relocated October 1885 (76/69). Station moved 0.1 mile January 1889 (86/78), 0.8 mile June 1891 (87/80), 0.7 mile September 1895 (120/116), 0.6 mile August 1896 (69/73), 0.8 mile January 1908 (100/91). Recording instruments only after July 1949 (100/90).

Charleston, S. C. 1738–1861, discontinuous records by various doctors. Temperature means: 1823–1872, unknown. Station established January 1871 (40/57); thermometers moved January 1886 (60/55). Station moved 0.2 mile N February 1897 (11/76); rain gauge moved July 1932 (11/3); thermometers moved August 1949 (6/3).

New Haven, Conn. Temperature means: 1780–1865, unknown but corrected to 24 hours; 1866–1872, unknown, monthly temperatures available to whole degrees only. Station established December 1872 (85/109); instruments moved February 1881 (118/110). Station moved 600 feet E March 1919 (74/68). City station closed and observations taken over by airport station 4 miles SE July 1943 (4/3).

New York, N. Y. (Central Park). 1822–1864, records from Jamaica, N.Y.; 1865–1868, records from 86th St. Reservoir, N. Y. Temperature means: 1822–1842, 1/3 (7, 14, 21); 1843–1870, 1/4 (Sunrise, 9, 15, 21). Station established December 1868 (61/64); moved 1 mile N January 1920 (6/22).

Philadelphia, Pa. Temperature means: 1825–1870, unknown. Station established December 1870 (?/?); moved 0.3 mile E September 1871 (100*/91), 0.7 mile W February 1882 (54*/106*), 0.1 mile E April 1884 (169/167). Instruments moved February 1904 (117/114); thermometers moved January 1914 (124/114). Station moved 0.6 mile E December 1934 (175/166).

San Francisco, Calif. Temperature means: 1851–1853, 1/4 (Sunrise, 9,15,21); 1854, 1/3 (9,12,21); 1857–1859, 1/3 (7,14, 21); 1861–1868, 1/4 (7,14,21 weighted twice). Station established February 1871 (48/75); moved 0.5 mile SW September 1890 (109/101), 0.3 mile NE November 1892 (161/154), 3.1 miles W May 1906 (29/40), 3.0 miles E October 1906 (200/191). Instruments moved October 1914 (209/200). Station moved 1.0 mile SW May 1936 (112/104). Temperature probably affected at times by nearby ventilators April 1919–May 1936.

Santa Fe, N. Mex. Temperature means: 1849–1854, 1/4 (Sunrise, 9,15,21); 1855–1872, 1/3 (7,14,21). Station established November 1871 (30*/27*); moved March 1878 (5*/2*), March 1882 (50*/50*), November 1884 (35*/32*), January 1892 (53*/50*), March 1893 (42*/39*), July 1907 (5*/2*), April 1912 (52*/49*), March 1922 (34*/31*). Continued as cooperative station 0.5 mile NE September 1941 (39*/36*). Instruments moved May 1942 (5*/2*), October 1942 (23*/20*). Station moved about 1 mile SE May 1944, few hundred feet NW July 1947, 1 mile SE October 1950, about 0.3 mile NW October 1951, few hundred feet March 1954, and 1.5 miles SE May 1955. Ground exposures, approximately (5/2), at last six locations.

St. Louis, Mo. Temperature means: 1836–1870, unknown but corrected to 24 hours. Station established October 1870 (70/93). Several suspected changes of thermometer exposure; station then moved 0.2 mile WNW March 1873 (105/100), 250 feet E August 1903 (208/199), 300 feet E September 1913 (264/258), 0.4 mile SW November 1935 (179/172).

St. Paul, Minn. Records from Fort Snelling 1820–1855, from Minneapolis 1856–1858. Temperature means: 1820–1858, unknown; 1859–1870, 1/4 (7,14,21 weighted twice). Station established November 1870 (30/36); moved 0.2 mile WSW December 1871 (34/44), 0.2 mile ENE April 1878 (33/58), 0.2 mile NE April 1883 (45/61), 0.2 mile NNW July 1885 (103/92), 0.1 mile SE July 1904 (171/162). Instruments moved January 1911 (201/195), July 1918 (237/227). Station moved 0.3 mile W April 1931 (114/106). Record July 1933–April 1937 8.8 miles WNW at Minneapolis City (102/91); April 1937–December 1955 7.5 miles SSE at Minneapolis–St. Paul International Airport (43/40).

[1] For definition of codes, see text.

[2] Figures corrected for station move about Jan. 1914.

Digitized by Google

Series J 163–245. Climatological Benchmark Stations—Temperature, Precipitation, and Description of Year: 1884 to 1957—Con.

[Italicized figures are based on interpolated monthly values. Standard error of interpolated figures: For temperature, less than 1° F.; for precipitation, less than 0.5 inch. Record for Medford Experiment Station, Oreg., too short to obtain normals; therefore description of year omitted]

Agriculture

K 1–328. General note.

Basic statistics on agriculture are, for the most part, prepared by the Bureau of the Census which conducts the Census of Agriculture, and by the Agricultural Marketing Service and the Agricultural Research Service which prepare current estimates.

Annual agricultural statistics have been issued by the Department of Agriculture since May 1, 1863. Statistics compiled by the Agricultural Marketing Service on crops, livestock and livestock products, agricultural prices, farm employment, and related subjects are based mainly on data obtained by mail from nearly three-quarters of a million reporters, mostly farmers. They are located in every agricultural county in the United States and report on one or more items during a year.

Beginning with 1840, a Census of Agriculture has been taken every 10 years and, beginning in 1925, a middecade Census of Agriculture has also been taken. Census information is obtained by a personal canvass of individual farms. The first census was limited in scope. It included such items as an inventory of the principal classes of domestic animals, the production of wool, the value of poultry, the value of dairy products, and the production of principal crops. The number of farms and the acreage and value of farmland were first included in 1850 and in 1880 information on farm tenure was first secured. A detailed classification of farmland according to use was first obtained in 1925; in earlier censuses, farmland was classified only as improved land, woodland, and other unimproved land (see chapter J). For brief discussions of the comparability of various agricultural data, census to census, see Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II.

For each decade from 1840 through 1900, the Census of Agriculture was taken as of June 1. The five decennial censuses since then have been taken as of April 15, 1910; January 1, 1920; April 1, 1930, 1940, and 1950. The 1925, 1935, and 1945 quinquennial Censuses of Agriculture were taken as of January 1; the 1954 Census was taken in October and November.

The definition of a farm has varied as follows from census to census:

For the 1954 Census of Agriculture, places of 3 or more acres were counted as farms if the annual value of agricultural products for sale or home use (exclusive of home-garden products) amounted to $150 or more. Places of less than 3 acres were counted as farms only if the annual value of sales of agricultural products amounted to $150 or more. Places for which the value of agricultural products for 1954 was less than these minima because of crop failure or other unusual conditions and places operated for the first time in 1954 were counted as farms if normally they could be expected to produce these minimum quantities of agricultural products.

If a place had croppers or other tenants, the land assigned each one was considered a separate farm, even though the landlord handled the entire holding as one operating unit in respect to supervision, equipment, rotation practice, purchase of supplies, or sale of products. Land retained by the landlord and worked by him with the help of his family and/or hired labor was likewise considered a farm.

For the 1950 Census of Agriculture, the definition of a farm was the same as for 1954. For the 1945 and earlier censuses, the definition of a farm was somewhat more inclusive. For 1925–1945, farms included (1) places of 3 or more acres on which there were agricultural operations and (2) places of less than 3 acres if the agricultural products for home use or for sale were valued at $250 or more. The only reports excluded from the 1925–1940 tabulations were those taken in error and those with very limited agricultural production, such as only a small home garden, a few fruit trees, a very small flock of chickens, etc. In 1945, reports for places of 3 acres or more with limited agricultural operations were retained only if (1) there were 3 or more acres of cropland and pasture or (2) the value of products in 1944 amounted to $150 or more.

The definition of a farm in the 1910 and 1920 Censuses was similar to that used from 1925 to 1940 but was even more inclusive. In those years, farms of less than 3 acres with products valued at less than $250 were to be included provided they required the continuous services of at least one person. In 1900, there were no acreage or production limits. Market, truck, and fruit gardens, orchards, nurseries, cranberry marshes, greenhouses, and city dairies were to be included provided the entire time of at least one person was devoted to their care. For 1870, 1880, and 1890, no tract of less than 3 acres was to be reported as a farm unless $500 worth of produce was sold from it during the year. For 1860, no definition was given the enumerators. For 1850, no acreage qualification was given, but there was a lower limit of $100 for value of products.

K 1. Number of farms, 1850–1957.

Source: 1850–1900, Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, p. 4; 1910-1956, Agricultural Marketing Service, *Number of Farms, by States, 1910-1956* (revised estimates), November 1957; 1957, "Number of Farms, by States, 1957" (mimeographed release), February 1958.

For 1910–1957, figures are adjusted estimates that are not exactly comparable with earlier data. Estimates for census years were adjusted for underenumeration and for changes in definition of a farm; estimates for intercensal years are based on trend and on indications of change in acreage and livestock surveys, in annual assessors' censuses in a number of States, in Agricultural Stabilization and Conservation records, and in other miscellaneous verifying data.

K 2. Land in farms, 1850–1954.

Source: Census years, Bureau of the Census, *Censuses of Agriculture*, various reports; intercensal years, Department of Agriculture, records (data obtained by straight-line interpolations).

Information on farmland values in scattered local areas is referred to by P. W. Bidwell and J. I. Falconer, *History of Agriculture in the Northern United States, 1620–1860*, pp. 70–71, 242, and 328. Similar information for Southern States is found in L. C. Gray, *History of Agriculture in the Southern*

United States to 1860, vol. I, pp. 403–406, and vol. II, pp. 640–645.

K 3. Total value of selected items of farm property, 1850–1957.

Source: Agricultural Research Service, *Balance Sheet of Agriculture*, annual issues.

Current market values of farm real estate, machinery and equipment, and livestock are combined in this series. Estimates of the value of farm real estate are based upon census reports and the annual index of farm real estate values, as described in series K 7. Inventory values for machinery and equipment and for livestock are based in part on census reports and supplemental estimates made by the Agricultural Marketing Service. A description of the estimates relating to machinery and equipment appears in *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 3.

K 4–5. Value of farmland and buildings, 1850–1957.

Source: Agricultural Research Service, *Current Developments in the Farm Real Estate Market*, various issues.

Data for years 1850-1910, 1920, 1925, 1930, 1940, 1950, and 1954 are from Census of Agriculture reports; figures for all other years are estimates derived by applying the change in the index of average value of land and buildings per acre to these census benchmarks, recognizing changes in acres of land in farms. All farm operators were asked to estimate the market value of their farms in each census from 1850 through 1945. In the 1950 and 1954 Censuses, data were obtained from all large farms and from a 20-percent sample of other farms.

Average value of land and buildings per acre is obtained by dividing the total value shown by the acres of land in farms, using unrounded data.

K 6. Total value of farm buildings, 1900–1957.

Source: See source for series K 4–5.

Data for 1900, 1910, 1920, 1925, 1930, and 1940 are from Censuses of Agriculture. Annual estimates since 1940 are extrapolations from this date based upon estimates of the market value of land with and without improvements obtained from the regular crop reporters of the Department of Agriculture. The average value per acre of unimproved land (without buildings) is expressed as a percentage of the value of improved land (with buildings) and converted to an index with 1940 as 100. This index is then applied to a comparable ratio obtained from the 1940 Census. Aggregate dollar values of buildings are obtained by applying the projected ratios for each State (buildings as a percentage of land and buildings) to the annual estimates of the total value of farm real estate mentioned in text for series K 3. The resulting dollar estimates reflect the amount added to the market value of farmland by buildings. They bear no direct relationship to the value of buildings that would be derived by applying the cost-less-depreciation principle to building valuation.

K 7. Index of average value of farm real estate per acre, 1912–1957.

Source: See source for series K 4–5.

See also *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 6, for a more complete description of methods used and limitations.

This index, which is available also by States, is designed to measure changes in the market value of farm real estate, including land, buildings, and such other permanent improvements as are customarily included when farms are sold. The index is constructed from estimates of average value of farm real estate per acre obtained from the regular crop reporters of the Department of Agriculture. It is not based upon the value of farm real estate obtained in the census. Between 15,000 and 20,000 reporters supply estimates of the market value of farms per acre in their localities as of March 1, July 1, and November 1. Although they undoubtedly base their estimates in part upon actual sales, no sales data are used directly in computing the index. Averages for crop-reporting districts are weighted by acres of land in farms as taken from the 1945 and 1950 Censuses to obtain weighted State averages which are, in turn, weighted by acres of land in farms to obtain regional and national averages. The weighted dollar values per acre are then expressed as index numbers.

K 8–52. Farms, by color and tenure of operator, and acreage and value, by tenure of operator, 1880–1954.

Source: Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, pp. 954-959.

Data on farm-operator status was not obtained until the Census of 1880. Studies of land tenure before 1860 are based, necessarily, upon fragments of information. See Bidwell and Falconer's *History of Agriculture . . .*, and Gray's *History of Agriculture . . .* (see text for series K 2).

The 1900 Census of Agriculture covered the ownership of rented farms, with particular reference to absentee ownership and the concentration of ownership. On a sample basis, the Department of Agriculture made a study of ownership of rented farms in 1920; the results were published as *Bulletins 1432* and *1433*. The Bureau of the Census and Department of Agriculture cooperated on sample surveys in 1945, 1950, and 1954 which were designed to show the portion of all farmland owned by each major class of owner. The results of these studies are published in Department of Agriculture, *Agricultural Economics Research*, vol. V, No. 4, 1953, and in Agricultural Research Service and Bureau of the Census, *Graphic Summary of Tenure, 1954*. A complete study of farmland ownership in the United States was made in 1945 and published as Department of Agriculture, *Miscellaneous Publication No. 699*.

In 1916, the Bureau of the Census published *Plantation Farming in the United States* from a 1910 Census study of plantations in 325 selected counties in 11 Southern States. In the selected plantation area, 39,073 plantations were reported as having 5 or more tenants. Another study of plantations was made in connection with the 1940 Census, but the results have not been published. In 1947, the Bureau of the Census published *Multiple Unit Operations* from a study made in connection with the 1945 Census of Agriculture. The Bureau has also published volumes on multiple unit operations from the 1950 and 1954 Censuses of Agriculture. In 1924, the Bureau of Agricultural Economics issued *Department Bulletin 1269*, the results of a study by C. O. Brannen, *Relation of Land Tenure to Plantation Organization*.

For the Censuses of 1880 and 1890 only the number of farms was classified by tenure. Classifications by the color of the farm operator and crossclassifications by color and tenure were first made in the Census of 1900.

A farm operator, according to the Census definition, is a person who operates a farm, either performing the labor himself or directly supervising it. The Census definition of a farm is based on operating units, rather than ownership tracts. A farm may consist of a number of separate tracts held under different tenures, some owned and some rented. Similarly, when a landowner has several tenants, renters, or croppers, the land operated by each is considered a separate farm. Therefore, the number of farm operators, for all practical

Digitized by Google

purposes, is identical with the number of farms (series K 8) and these items are used interchangeably.

In the color classification of farm operators, Mexicans are reported as white. The nonwhite group includes Negroes, Indians, Chinese, Japanese, and other nonwhite races.

Each farm was classified according to the tenure under which the operator controlled the land. Land was considered owned if the operator or his wife held it under title, homestead law, purchase contract, or as one of the heirs or as trustee of an undivided estate. If both an owned and a rented tract were farmed by the same operator, these were to be considered as one farm even though the tracts were not contiguous and each was locally called a farm. Farm operators were classified as (*a*) full owners who own all the land they operate; (*b*) part owners who own a part and rent from others the rest of the land they operate; (*c*) managers who operate farms for others and receive wages or salaries for their services (persons acting merely as caretakers or hired laborers were not classed as managers, and farms operated for institutions or corporations were considered to be managed even where no person was specifically indicated as being employed as the farm manager); (*d*) tenants who operate hired or rented land only. Croppers are share tenants to whom landlords furnish all of the work animals or tractor power in lieu of work animals. Croppers were first classified separately in the 1920 Census.

In the 1920, 1925, and 1930 Censuses, croppers were defined as share tenants whose landlords furnished the work animals. The 1935 Census schedule carried no inquiry on the method of paying rent and, therefore, croppers for that year included all tenants whose landlords furnished the work animals. The furnishing of tractor power was not taken into account in classifying croppers until the 1940 Census.

The greatest difficulties in making a classification by tenure result from the sharecropper system. Briefly, the question involved is whether the sharecropper should be considered merely a type of laborer or a farm operator. In reality, croppers have some of the characteristics of both laborers and tenants.

K 53–60. Number, acreage, value, and amount of indebtedness of mortgaged farms, by tenure of operator, 1930-1956.

Source: Bureau of the Census and Agricultural Research Service, *U.S. Census of Agriculture: 1954*, vol. III, pt. 5.

Information on the number of mortgaged farms has been collected by both the Bureau of the Census and the Agricultural Research Service. Generally speaking, such data have been published with the data on amount of debt in census years, except in 1900 when no information on amount of debt was obtained. For a historical summary and an analysis of the data on number of mortgaged owner-operated farms for 1890–1935, see "Number and Percentage of Farms Under Mortgage," *Agricultural Finance Review*, vol. 1, No. 2, November 1938. The source cited above also includes State data on the number of mortgaged farms in each tenure class for 1940, 1945, 1950, and 1956.

Farm-mortgage debt includes the unpaid principal of mortgages, deeds of trust, sales contracts, vendors' liens, and all other debt for which farm real estate is pledged as security. Any farm which has a real estate mortgage is classified as a mortgaged farm even though only a portion of it is mortgaged.

These estimates are based on information obtained in the Census of Agriculture for owner-operated farms, mail surveys of samples of farm owners (including both operators and landlords), and reports from farm-mortgage lenders.

For each of the years shown, mortgage information was obtained from full-owner farm operators in the Census of Agriculture. Similar information was obtained by the Bureau of the Census for part owners for 1940, 1945, 1950, and 1956. This information was supplemented by data obtained in mail surveys for land operated by part owners, tenants, and managers. The 1930 mail survey was conducted by the Bureau of Agricultural Economics. Later surveys were cooperative undertakings of the Bureau of the Census and the Bureau of Agricultural Economics or the Agricultural Research Service.

For information by States and geographic divisions and descriptions of procedures, see the source cited, and *U.S. Census of Agriculture: 1950*, vol. V, pt. 8.

See also text for series K 8–52 for definition of tenure.

K 61-72. Farms and land in farms, by size of farm, 1880-1954.

Source: Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, pp. 352–354.

See general note for series K 1–364 for changes in definition of farm.

Since 1920, farms of 10 to 99 acres have shown a marked decrease, farms of 100 to 259 acres a slight decrease, and farms from 260 to 1,000 acres and over some increase. The greater number of very large farms does not mean that family farms are decreasing in relative importance. Rapid advances in technology have enabled a given family labor force to farm larger acreages.

With the development of better roads and more off-farm job opportunities, farms of less than 10 acres increased in number between 1940 and 1945, then decreased in 1950. This decrease may have been due to the change in the definition of a farm, which eliminated many small places previously counted as farms.

K 73–75. Farm employment, 1910–1957.

Source: Agricultural Marketing Service, Statistical Bulletin No. 236, September 1958.

For detailed descriptions of farm employment concepts, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 7, pp. 8–12. See source publication for geographic regional and State data.

These data are based on (1) data from the Census of Population used as benchmarks for 1910, 1920, and 1930, and data from the Census of Agriculture used for 1940, 1950, and 1954; (2) estimates of farm employment from nationwide enumerative sample surveys made at intervals during 1945–1948, together with historical data on the seasonal distributions of man-hour labor requirements in farm production, used to develop measures of seasonal variation; (3) returns from the monthly mailed questionnaire on employment on farms of crop reporters, available since 1925; and (4) annual estimates of the number of farms by States and regions used to expand "adjusted" average employment per farm to obtain regional and national estimates of total farm employment and of the family and hired worker components of the total.

The source also presents monthly estimates of total farm employment for 1950–1957 for the United States, for each of the 9 major geographic divisions, and State data for 35 selected States.

Family workers include working farm operators, plus members of their families who did unpaid farmwork or chores for 15 hours or more during the survey week. All persons working one hour or more during the survey week for pay at farmwork or chores are classified as hired farmworkers. Members of the operator's family receiving wages for work on their farms are counted as hired workers. Sharecroppers

Digitized by Google

are considered family workers when working on their own crops but are classified as hired workers when doing farmwork for pay off their tracts. A person employed as both a family worker and a hired worker during the survey week on the same farm is counted as a hired worker. The survey week is the last complete calendar week in the month, but when that week includes the last day of the month the survey week is the next to the last full calendar week.

The average number of hired and family workers per farm is computed for the reporting farms for all States. The averages are then adjusted by factors based on comparisons with the last census level, labor requirements data, and the estimated seasonal pattern of employment based on the latest census and special studies in selected States. The adjusted averages are then multiplied by the estimated number of farms in each State to estimate the number of family and hired workers employed. Data from the census, State assessors' reports, Agricultural Stabilization and Conservation records, and indications of change from the larger acreage and livestock surveys are used in estimating the number of farms. Annual averages of employment are simple averages of last-of-month employment estimates. In addition to farm employment estimates, monthly indexes of farm employment are available.

Farm employment data were first collected through crop reporters in October 1923. In 1938, the National Research Project of the Works Progress Administration developed monthly farm employment estimates for 1925–1936 from the crop reporter data. See E. C. Shaw and J. A. Hopkins, *Trends in Employment in Agriculture, 1909–1936*, Works Progress Administration, Philadelphia, November 1938. Monthly estimates have been made by the Agricultural Marketing Service and the former Bureau of Agricultural Economics from crop reporter data for 1936–1957, using the methods developed in the Works Progress Administration project, plus certain recent refinements. Periodic revisions have been made as new benchmark data became available from national enumerative surveys or from Censuses of Agriculture. Following the 1950 Census of Agriculture, the entire historical series was reexamined and revised. Data for 1950–1957 reflect revisions following the 1954 Census of Agriculture.

K 76–80. Farm wage rates, 1866–1957.

Source: 1866–1909, Bureau of Agricultural Economics, *Farm Wage Rates, Farm Employment, and Related Data*, January 1943 (processed); 1910–1957, Agricultural Marketing Service, *Farm Labor*, January 1958.

Information on farm wages prior to 1866 is scattered; it consists of individual records or covers only certain States rather than the entire country. See Department of Agriculture, Bureau of Statistics, *Wages of Farm Labor in the United States*, Miscellaneous Series, Report No. 4, 1892; same agency's *Wages of Farm Labor*, by George K. Holmes, Bulletin 99, 1912; and T. M. Adams, *Prices Paid by Vermont Farmers for Goods and Services and Received by Them for Farm Products, 1790–1940;* see also Vermont Agricultural Experiment Station Bulletin 507, *Wages of Vermont Farm Labor, 1780–1940*, Burlington, February 1944.

The first investigation made by the Department of Agriculture of wage rates for hired farm workers was in 1866. In the next 44 years, 18 similar studies were made at irregular intervals. Then, for 1909–1923, inquiries were made annually and, since 1923, quarterly. In all these surveys, questionnaires were sent to the voluntary crop reporters.

For 1866–1909, crop reporters were requested to estimate the average wages in the locality for the year. Sometimes the inquiry was made in the spring and sometimes in the fall or winter. When it was made in the spring, the year to which the annual average refers is uncertain. For this reason, a dual date is designated for certain of these years as, for example, "1874 or 1875." In each of these 19 investigations, wage rates per day were obtained separately for harvest work and other work. The data published here for these years are the day rates for "other than harvest work."

The monthly wage rates (series K 77–78) shown for 1866–1909 are not strictly comparable throughout this period. For 1866–1890, monthly wage rates shown are for workers hired by the year. In addition, in the first three of the aforementioned inquiries, crop reporters were asked for monthly rates paid to workers hired for the season, which are published by Holmes (see above). For 1891–1909, the monthly rate requested was on a combined annual and seasonal basis. In 1909, the distinction was again made, but the two types of monthly rates were averaged. The weighted average (revised) is published here. For the original averages of the monthly rates for workers hired by the year and for those hired by the season, see Holmes, *Wages of Farm Labor*, referred to above. For 1866–1909, wage rates requested were those paid to men doing outdoor work. In 1902, 1906, and 1909, rates paid women for domestic work on farms were also requested.

Data from the 19 wage inquiries were published in 4 bulletins by the Bureau of Statistics of the Department of Agriculture—No. 4 (1892), 22 (1901), and 26 (1903) of the "Miscellaneous" series, and Bulletin 99 (1912) of the Bureau of Statistics series. In the first 3 bulletins, the rates were published without reducing currency to gold values, since the monetary system was not on a gold basis; but in Bulletin 99 and in subsequent reports the wage rates for the period of inflated currency values during and following the Civil War were reduced to gold values. In Bulletin 99 the weighting system, which was not uniform for all previous surveys, was revised and wage-rate data for all 19 surveys were recomputed. The number of male agricultural laborers in each State, as reported by the census of occupations, was used as the weight to obtain United States and major region averages from State average wage rates.

For 1909–1923, annual inquiries on farm wage rates in their localities were made of crop reporters. They were asked about monthly rates with and without board; and about daily rates with and without board "at harvest" and for "other than harvest labor." In 1923, to give an overlap for linking purposes, a quarterly inquiry was initiated. The new quarterly series eliminated the distinction between day rates for harvest work and for nonharvest work; it changed the time reference of day rates to "average wage rates being paid to hired labor at the present time in your locality," with an additional instruction to include in the estimates of day rates "average daily earnings of piece workers." The new rates obtained after 1923 are probably more nearly comparable with the old daily wage rates for "other than harvest work" than they are with either the old daily rates for harvest work or with a combination of the two types of daily rates.

For 1923–1948, the questions asked crop reporters on wage rates continued in almost exactly the same form. In 1948, the wage rate series was changed to include more different kinds of rates and to specify more clearly the perquisites received in addition to cash wages. Value of perquisites is not included in wage rates obtained—they are cash rates only. The types of rates currently obtained are as follows: Per month with board and room, per month with house (no meals), per week with board and room, per week without board or room, per day with board and room, per day with house (no

Digitized by Google

meals), per day without board or room, per hour with house (no meals), and per hour without board or room.

Rates for 1949–1957 are not exactly comparable with rates for previous years. They only approximate the rates denoted in the series headings and represent averages for the following rates: Per month with board and room, per month with house, per day with board and room, and per day without board or room.

Average rates based on data reported by crop reporters are published quarterly and annually in Agricultural Marketing Service, *Farm Labor*, but annually only in the Department of Agriculture, *Agricultural Statistics*. Both quarterly and annual average rates are published for States, nine major geographic divisions, and the United States. The annual average rates are averages of the quarterly averages weighted by the number of hired farm workers employed each quarter.

Since employment data are for approximately the last week of the month and wage rates are usually reported a few days before the end of the month, they must be weighted to center on July 1 (the midpoint in the calendar year) in computing an annual average. The annual average is a 5-quarter average based on data for January of the current year and January of the following year. The use of only the January current year data would not properly weight the changes after October 1, especially when rates are rising or falling significantly.

K 81. Farmers' expenditures for hired labor, 1910–1957.

Source: Agricultural Marketing Service, *The Farm Income Situation*, July 1958 (No. 174).

Data for census years are from Bureau of the Census; intercensal year figures are Agricultural Marketing Service estimates. For a detailed description of concepts and methods, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 3.

Estimates of farmers' total expenditures for hired labor are available for 1929 and since 1949 for individual States. The total farm labor bill is divided between cash wages and the value of perquisites furnished. It is also divided between the wages paid to workers living on farms and those not living on farms.

K 82. Index man-hours of labor used for farmwork, 1910–1957.

Source: Department of Agriculture, *Changes in Farm Production and Efficiency*, Statistical Bulletin No. 233, August 1958.

Man-hours of labor used in farming are estimated by applying regional average man-hours per acre of crops and per head or unit of production of livestock to the official estimates of acreages and numbers made by the Agricultural Marketing Service.

Time for farm maintenance or general overhead work is calculated separately and added to the direct hours for crops and livestock to obtain the total number of man-hours. Annual man-hours per acre or per head are estimated by interpolating between or extrapolating from benchmarks.

Benchmarks are estimates of labor used per acre and per head in each State converted to a geographic-division basis. State estimates for 1939, 1944, and 1950 appear in two reports of the former Bureau of Agricultural Economics (*Labor Requirements for Crops and Livestock*, 1943, and *Labor Requirements in the United States*, 1939 and 1944) and in reports of the Agricultural Research Service (*Labor Used for Field Crops*, Statistical Bulletin No. 144, June 1954; and *Labor Used for Livestock*, Statistical Bulletin No. 161, 1955). Similar benchmarks for 1910, 1919, and 1929 developed from data in the Works Progress Administration National Research Project reports were summarized in that agency's *Changing Technology and Employment in Agriculture*, 1941. These reports were based on extensive field surveys, while the first-mentioned studies were based on secondary data.

The interpolation of numbers of man-hours per acre or per animal between benchmarks and extrapolation beyond benchmarks are modified by several factors. For crops, these include such items as yields per acre, utilization of the crop, methods of harvest, and source of power as indicated by numbers of tractors and work stock on farms. For livestock, the modifiers include such factors as size of enterprise, production per animal, and extent of different methods and practices followed.

For more detailed explanation, for the aggregate man-hours upon which the indexes are based, and for other more detailed data, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 2.

K 83–97. Man-hours used to produce specified amounts of wheat, corn, and cotton, 1800–1950.

Source: 1800–1940, Department of Agriculture, *Progress of Farm Mechanization*, Miscellaneous Publication No. 630, October 1947; 1950, *Labor Used for Field Crops*, Statistical Bulletin No. 144, June 1954.

In Publication No. 630, the yield of cotton was reported in gross weight, including an allowance for the weight of bagging and ties on a standard bale. In series K 96, the yield was converted to pounds of cotton lint which corresponds to the current method of reporting yields of cotton.

The 1950 figures for yield per acre (series K 86, K 91, and K 96) are averages for 1948–1952. This agrees with the procedure for computing yields for the other years. Because of the higher 5-year average yield and because the time required to pick cotton is closely related to the yield, it was necessary to raise the number of man-hours used in harvesting cotton (series K 95) above those shown in Bulletin No. 144. The numbers of hours used in harvesting wheat and corn were not adjusted because the 5-year average yield did not differ significantly from the 1950 yield.

The numbers of man-hours per acre (series K 83–85, K 88–90, and K 93–95) are estimated from data on labor requirements published by State and Federal agencies. A list of such publications appears in Bureau of Agricultural Economics, *A Partial List of Publications on Farm Labor Requirements by Commodities*, 1943. For recent years, the estimates of man-hours per acre, like those in Bulletin No. 144, have been developed on a State basis. Related data used in preparing the estimates include sources of farm power as indicated by numbers of tractors, work stock and associated machines on farms, yield per acre, and methods of harvesting. These related materials are too numerous to list, but, as an example, see Department of Agriculture, *Harvesting Corn for Grain*, Statistical Bulletin No. 129, 1953.

The figures for yields (series K 86, K 91, and K 96) were developed from Agricultural Marketing Service acreage and production data (series K 265–266, K 269–270, and K 301–302).

K 98–103. Acreages of harvested crops, by use, and indexes of cropland used for crops and crop production per acre, 1910–1957.

Source: See source for series K 82.

488910 O - 60 - 18

Digitized by Google

These data measure changes in the total acreage of crops harvested and in acreages used for different broad purposes. Acreages for harvested crops do not include pasture. The total number of crop acres harvested consists of acreages of the 59 crops harvested (excluding duplication) plus acreages in tree fruits, small fruits, tree nuts, and farm gardens. Acreages of several minor crops, which are not included, have accounted for about 0.5 million acres in recent years. Basic data for the estimates are published in the releases of the Agricultural Marketing Service and in the Census of Agriculture reports from the Bureau of the Census.

Acreages used for production of each crop exported are determined by dividing the quantity exported by the average yield per acre. Two steps are necessary in computing the acreages of crops used to produce each of the livestock products exported. The first consists of estimating the quantities of each feed crop used to produce 100 pounds of pork, 100 pounds of milk, 100 dozen eggs, and so on. The second consists of determining the quantity of each feed crop used to produce the products exported, and then determining the acreages needed to produce each feed crop, at average yields per acre. Periodic 5-year average yields rather than yields for each year are used.

Yield data for the export estimates are from reports of the Crop Reporting Board. Data for volume of exports prior to 1940 are from *Agricultural Statistics*. For 1940–1957, export data are from reports and records of the Agricultural Marketing Service.

Estimates of feed consumed by horses and mules are based on the following average rations of corn, oats, and all hay: For 1910–1919, the calculations allow 800 pounds of oats, 1,600 pounds of shelled corn, and 1.8 tons of hay per head for farm horses and mules 3 years old and over and animal-unit equivalents for younger animals. For 1920–1940, it was assumed that as farm horses were worked less, they consumed less grain and more hay. Consequently, the rate of feeding corn was decreased 10 pounds per head per year and the rate of feeding hay was increased 20 pounds. Beginning with 1941, it was assumed that horses and mules would work less each year, and that on the average they would be fed less corn, oats, and hay and would consume more pasture.

For nonfarm horses and mules, it was assumed that, for 1910–1931, the quantities of grain and hay consumed per head per year were a third more than those consumed by farm work animals. Since 1932, the computations have rounded out to one million acres used in producing feed for nonfarm horses and mules.

Basic data on horses and mules are from publications of the Agricultural Marketing Service. The rations for horses and mules are based on data from many sources, especially from Bureau of Agricultural Economics, *Work Performed and Feed Utilized by Horses and Mules*, Farm Management 44, 1944, and on judgment of workers familiar with the subject.

The series on cropland used for crops (series K 102) is made up of three components—acres of harvested cropland (land from which one or more crops were harvested), crop failure, and summer fallow. The index is intended to measure changes in the land area in crops or being prepared for crops the following year; it excludes idle cropland and land in soil-improvement crops during the entire year and not harvested. These figures are based on estimates of principal crops harvested and crop losses of the former Bureau of Agricultural Economics and the Agricultural Marketing Service and on data from the 1925 to 1954 Censuses of Agriculture. Data from the 1950 and 1954 Censuses of Agriculture were adjusted to cover some of the underenumeration indicated by post-enumeration surveys.

Acreages of crop failure were derived from the 1925 to 1945 Censuses of Agriculture, and interpolations for intervening years were based on BAE estimates of crop losses or differences between planted and harvested acreages of principal crops. Acreages of crop failure for recent years are based chiefly on crop losses as reported by AMS. Reported acreages of crop losses are adjusted for the replanting of part of the acreage on which winter wheat is abandoned. Hay land that produced nothing but pasture in some dry seasons is not included in crop failure in recent years.

Estimates of acreage of cultivated summer fallow were made only for the geographic divisions west of the Mississippi River. For 1945–1948, they were based chiefly on acreages seeded to wheat on summer fallow land, as estimated by BAE and according to data issued by the Great Plains Council. For 1949–1957, estimates of fallow were based partly on the 1950 and 1954 Censuses of Agriculture, estimates of wheat seeded on summer fallow made by AMS, and information obtained from the Great Plains Council. Estimates for years prior to 1945 were built up from fragmentary data available in BAE.

Indexes of total crop production were divided by indexes of cropland used for crops to derive indexes of crop production per acre (series K 103). Indexes of crop production were developed as one step in the calculation of farm output.

For a more detailed explanation of these series, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 2.

K 104–115. Index of supply and utilization of farm food commodities, 1924–1957.

Source: Agricultural Marketing Service, *National Food Situation*, quarterly issues.

This index involves the use of the basic disappearance data described in series G 552–584, converted to farm level, and of average 1947–49 farm prices to derive value aggregates in terms of constant dollars. Prices used are midmonth prices received by farmers in 1947–49 weighted by volume of monthly sales.

Each part of the index includes processed and unprocessed commodities. Where processing of farm commodities yields byproducts or joint products, the relative economic importance of the various products is retained by apportioning the farm value of the unprocessed commodity according to the ratio of the wholesale value of the several resulting end products. For processed commodities where no byproduct or joint product is involved direct conversion to the farm weight is made. See also Agriculture Handbook No. 91, *Measuring the Supply and Utilization of Farm Commodities*, 1955.

K 104, production. Includes harvested crops (including those used for feed and seed) and marketings of livestock products for consumption plus use on farms where produced.

K 105, imports and inshipments. Imports and inshipments from U.S. Territories include farm commodities similar to those produced in this country plus those not produced domestically but which are substitutes for United States products. Coffee, tea, cocoa, and bananas are included but rubber and silk are excluded. Dockside prices were used for commodities not produced in the United States. Imports include both processed and unprocessed commodities.

Reports on shipments to and from Alaska and Hawaii were discontinued in April 1948. For foods for which such trade is significant, estimates of inshipments have been made.

Digitized by Google

K 106, net change in available stocks. Changes in reported stocks other than those held for the USDA foreign supply programs are treated as a source of domestic supply. Such stocks include those accumulated under price support programs.

K 109, civilian food. Figures are derived as a residual by deducting feed, seed, and other nonfood uses, exports and shipments, Government purchases for the military and for export, and ending stocks from total supply of each food available for the year.

K 110, military food. No reliable information on military food procurement is available before 1941, but such takings were relatively small between 1919 and 1940. Data from reports of the Armed Services are supplemented by estimates to cover local procurement of some fresh commodities and items supplied daily. Civilian feeding in areas occupied by the Armed Forces is included.

K 111, domestic nonfood use. For data on nonfood use divided into feed, seed, and "other" (alcoholic beverages, soap, and industrial uses), see Supplement for 1956 to Agriculture Handbook No. 91, *Measuring the Supply and Utilization of Farm Commodities.*

K 112, commercial exports and shipments to U.S. Territories. Includes trade not handled by the Federal Government although Government financial aid may have been involved in the transaction in one way or another. Trade with Alaska and Hawaii has not been reported since April 1948 but shipments of some items are estimated.

K 113–115, USDA export program. Measures the annual takings of farm food commodities from commercial channels by the Department of Agriculture expressly for subsequent shipment abroad under foreign supply and special export programs. Quantities thus removed are designated as "net purchases" and are derived by adjusting the USDA deliveries of farm food commodities by the change in Department stocks.

K 116–118. Taxes levied on farm property, 1890–1957.

Source: Agricultural Research Service, *Agricultural Finance Review*, annual issues.

These data cover all ad valorem taxes levied upon farm property by State and local governments. They do not cover special assessments such as those levied by drainage, irrigation, or other special districts. Farm real estate comprises all land defined by the Bureau of the Census as land in farms, and structures thereon (see general note for series K 1–364). Farm personal property covers all livestock, machinery, automobiles, trucks, produce, and household and personal effects. Much personal property on farms is not taxed, either because of statutory exemptions or through faulty assessment.

Taxes include those levied on farm property whether owned by the operator or not. They do not necessarily represent taxes paid by farmers. "Levies" rather than "payments" are shown because the timing of actual payments is uncertain.

Real estate tax figures are developed from data for sample farms obtained from local tax officials and from data in the Censuses of Agriculture for 1930, 1940, and 1950. The acreages used in computing taxes per acre are census data for farmland in private ownership, with interpolations for intercensal years. The values used in computing taxes per $100 of value are based on census data of operator estimates of value, with interpolations for intercensal years based on the ARS index of farmland values. For a more detailed discussion, see Agricultural Research Service, *Taxes Levied on Farm Property in the United States and Methods of Estimating Them*, Statistical Bulletin No. 189, August 1956.

Personal property tax figures are developed from statistical data on assessed values and taxes published by State tax commissions, boards of equalization, or similar bodies; see "Taxation of Personal Property Owned by Farmers in the United States, 1940–49," *Agricultural Finance Review*, vol. 15, November 1952.

K 119. Automotive taxes paid by farmers, 1924–1957.

Source: See source for series K 116–118.

These data include payments of all registration and "tag" fees for automobiles and trucks on farms and for drivers' permits by farmers. Amounts paid for licenses and permits are based on estimates of vehicles on farms, and average charges per vehicle. The latter is the average charge for all vehicles registered, adjusted to the level of charges for vehicles on farms as determined from special surveys. State and Federal motor-fuel taxes are those arising out of the use of automobiles, trucks, tractors, and other machines by farmers. Motor-fuel figures represent net amount paid, after refunds, and are derived from estimates of fuel consumption of farm vehicles and the average tax rate on such fuel as developed from special surveys. For further discussion, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 6.

K 120–121. Farmers' mutual fire insurance, 1914–1957.

Source: Agricultural Research Service, *Agricultural Finance Review*, annual issues and records (compiled from published State reports and from data supplied by State insurance officials, company officials, and others).

Data include insurance against fire and lightning, and exclude, in most cases, insurance against windstorm, hail on growing crops, or other hazards. For 1914–1933, farmers' mutual fire insurance companies were defined as those which had more than 65 percent of their insurance on farm property. Since 1933, this has been reduced to 50 percent. During both periods, however, all business of such companies was considered farm business, although only about 85-88 percent of the total insurance was on farm property. The business of general-writing mutual and stock fire insurance companies, which also write insurance on farm property, is not included.

Figures for insurance in force (series K 120) include only companies for which reports were obtained and may not be entirely complete. For 1956 and 1957, the figures include an estimate for incompleteness. Figures for cost per $100 of insurance (series K 121) do not include any amounts collected from members which have been added directly to surplus or reserve funds. Such funds are, of course, available for payment of future losses and operating expenses. The average increase in these surplus funds during the 10-year period, 1947–1956, suggests that, on the average, annual assessments collected from members amounted to about 27.7 cents per $100 of insurance, compared with amounts actually paid out for losses and operating expenses of about 23.1 cents.

K 122–128. Cash receipts from farming and farm income, 1910–1957.

Source: Agricultural Marketing Service, *The Farm Income Situation*, July 1958 (No. 174).

These estimates refer to calendar-year income arising from commodities and services produced on all farms in the United States, as defined in the Census of Agriculture, to the expenses associated with such production, and to other income received by persons living on farms.

Estimates of farm income were started in 1924 on a crop-year basis. In 1936, a legislative formula for income parity

Digitized by Google

for agriculture, based on a 1910–1914 comparison of farm and nonfarm per capita incomes, resulted in an extensive project of research designed to extend the estimates back to 1910, to put them on a full calendar-year basis comparable with estimates of nonagricultural income, and to improve and expand the data in other respects.

No adequate statistics are available on farm income and expenses before 1910. Willford I. King's early estimates of the total value produced in agriculture go back to 1850, but for census years only (published in *The Wealth and Income of the People of the United States*, Macmillan Co., 1915). They were based on inadequate information and are not comparable with any of the current series. Without data for intercensal years, King's decennial figures may be misleading even as an indication of the long-term trend. The decennial projections back to 1800 prepared by the National Industrial Conference Board, *National Income in the United States, 1799–1938*, 1939, are in much the same category, and must be regarded only as very rough approximations. Annual estimates of gross farm income extending back to 1869, and covering a substantial part of total farm production, are given in Department of Agriculture, *Gross Farm Income and Indices of Farm Production and Prices in the United States, 1869–1937*, Technical Bulletin No. 703, December 1940. Although not comparable with any of the current series, these estimates are probably fairly reliable as an indication of trends in the gross value of farm production.

In the absence of any direct reporting of farm income on an adequate scale, estimates have been developed by indirect methods using available data on production, disposition, prices, and costs. The procedure followed has been to treat agriculture as one tremendous enterprise, and to derive its net income by first computing "gross income," as defined below, and then deducting aggregate expenses of production.

Figures for series K 122–125 are estimates of realized gross farm income and its principal components. These estimates are "gross" in the sense that they represent the total value of commodities and services produced by farms without any deduction for costs incurred in their production, and without any consideration of who reaps the ultimate benefit from their sale or use, whether it be a farm operator, a landlord, a farm laborer, or a bank. Cash receipts from farm marketings, in the case of crops, include all sales of crops by farmers; purchases by other farmers for use as feed or seed are later deducted as production expenses. Similarly, in the case of livestock and products, the estimates include all sales by farmers, with purchases of livestock by other farmers included as a production expense in series K 126. Farm sales of firewood and other forest products are included in the crop totals.

For 1933–1957, total cash receipts from all farm marketings include Government payments to farmers. The latter include rental and benefit, conservation, price adjustment, parity, production, and Soil Bank payments—in short, all money paid directly to farmers by the Government in its farm programs. Indirect financial aid to farmers through commodity prices or loan values is covered in cash receipts from marketings. Government payments to landlords, as well as farm operators, are included but the former are also covered under farm production expense (series K 126) as rental payments to nonfarm landlords.

Realized gross farm income (series K 125) represents total cash farm income, the value of farm-produced food and fuel consumed in farm households, and an imputed rental value for all farm dwellings. Farm-household consumption of farm products is valued at prices received for the sale of similar products. It includes food and fuel furnished to hired farm laborers, later deducted as a part of total labor costs to farm operators. The rental value of dwellings is on a gross basis; later deductions of rent, interest, taxes, insurance, maintenance, and depreciation are for farms as a whole with their buildings and equipment, and include shares allocable to farm dwellings.

The figures for gross farm income have been derived, commodity by commodity, from the periodic Crop Reporting Board estimates of production, disposition, price, and value. These estimates in turn are generally based on periodic census enumerations supplemented by regular reports from field statisticians, long lists of farmers, and special crop, livestock, and price correspondents, and by records and reports of public and private agencies concerned with the inspection, storage, marketing, transportation, or processing of farm products.

The figures for total farm-production expenses (series K 126) comprise the aggregate cost to farm operators, or all of that part of gross farm income not retained by farm operators. It includes (1) wages paid for hired labor, both in cash and in kind; (2) purchases of feed, livestock, fertilizer, and lime; (3) outlays for the operation of tractors, trucks, and automobiles (excluding the portion assigned to family use); (4) a large number of other current farm operating expenses; (5) charges for maintenance and depreciation of farm buildings, motor vehicles, machinery, and equipment; (6) taxes levied on farm property; (7) interest paid on farm-mortgage loans; and (8) net rents paid to landlords not living on farms, including that part of Government payments that goes to such landlords and not to farm operators. Other farm rents paid to landlords who are also farm operators are not included, as they constitute offsetting items of income and cost for farm operators as a group.

The estimates of production expenses are generally based on the Censuses of Agriculture, supplemented by special surveys. For years other than census or survey years, estimates for a specific item have for the most part been derived from relative changes in similar or related series. A combination of two series is frequently used, one indicating changes in quantity and the other, changes in price. For a few types of costs, however, the records of public or private agencies provide the basis for direct annual estimates.

The figures for realized net income of farm operators (series K 127) are obtained by subtracting total production expenses from realized gross farm income. The term "realized" is used because the estimates include the value only of farm products sold. In other words, they do not include changes in farm inventories of crops and livestock. These figures should not be confused with net income from agriculture or agriculture's contribution to the total national income. The latter includes farm wages, rent, and interest in addition to inventory changes and the realized net income of farm operators.

The figures for net income to persons on farms from farming (series K 128) include the realized net income of farm operators; the value, at annual average prices, of the net change during the year in crop and livestock inventories on farms; and wages, in cash or in kind, paid to farm laborers who live on farms. Inventory changes are included to achieve comparability with the net income of nonfarm businesses. Only about two-thirds of all hired farm workers live on farms; and only their wages are included. This series is the one previously used, together with corresponding estimates of the income of persons not on farms, in the now superseded legislative formula for computing income parity for agriculture.

Digitized by Google

The figures for series K 128 are generally comparable throughout the period shown and are believed to be fairly complete and reliable despite the indirect methods of estimation. For a more detailed discussion and for other series, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 3, December 1957.

K 129–131. Indexes of prices received by farmers, 1910–1957.

Source: 1910–1951, Agricultural Marketing Service, *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 1; 1952–1957, *Agricultural Prices*, January, February, and May 1959.

Data on prices received by farmers in their local markets are identified as "local market prices" in the source publication to distinguish them from "wholesale prices" of farm products at central markets.

The first comprehensive index-number series of prices of farm products was published in 1921 as Department of Agriculture Bulletin No. 999, *Prices of Farm Products in the United States*. Research in 1923 and 1924 resulted in the development of the aggregative type of index-number series first published in *Crops and Markets* in August 1924. Later revisions of the prices received index numbers were published in 1934, 1944, 1950, and 1959.

From the first indexes in 1921 to the 1950 revisions, the base period for index numbers of prices received by farmers was the 60-month period, August 1909–July 1914. This base was selected, because in these prewar years prices of farm products were relatively stable, and they were assumed to have a more nearly normal relationship with prices of other things than in any other period for which data were then available. In 1950, the base period was changed to January 1910–December 1914 pursuant to the provisions of the Agricultural Adjustment Act of 1938 as amended by the Agricultural Acts of 1948 and 1949.

The figures for prices received by farmers used to construct these indexes are based on reports from a group of voluntary respondents, most of whom are buyers of, or dealers in, farm products at country shipping points, and a few of whom are well-informed farmers. The number of these reporters has increased, and, as of 1958, reports were based upon returns from about 10,000 respondents. For most commodities, prices relate to a midmonth average, but for some, prices represent an average for the month.

These index numbers are based upon local market prices for 55 important agricultural commodities classified into 2 major groups, crops and livestock. There are 8 crop subdivisions (food grains, feed grains and hay, cotton, tobacco, oil-bearing crops, fruits, commercial vegetables, and potatoes, sweetpotatoes, and dry edible beans); and 4 livestock subdivisions (meat animals, dairy products, poultry and eggs, and wool). No single set of weights is representative of the long period covered by the index; but as a reasonably satisfactory compromise, weights for 1910–1935 are based on cash receipts in 1924–1929, and weights from 1935 to August 1952 are based on 1937–1941 receipts, and from September 1952 on, 1953–1957 receipts. For further details, see the first-listed source cited above.

K 132–137. Indexes of prices paid by farmers, interest and taxes payable per acre, and farm wage rates, 1910–1957.

Source: 1910–1951, see source for 1910–1951 for series K 129–131; 1952–1957, see source for same series for 1952–1957.

These indexes are based on monthly indexes which relate to prices as of the 15th of the month. For a detailed explanation, see the first-listed source above.

The indexes are a combination of the index of prices paid by farmers for commodities used for family living (6 groups—203 different commodity price series as of September 1958), the index of prices paid by farmers for commodities used in production (9 groups—232 different commodity price series as of September 1958), and of indexes of taxes on farm real estate, interest on loans secured by farm real estate mortgages, and farm wage rates. The index of prices paid for family living items (series K 132) represents prices of the following groups of commodities: Food and tobacco, 52 items; clothing, 39; household operation, 17; household furnishings, 40; building material for houses, 43; autos and auto supplies, 12. The index of prices paid for production items (series K 133) is based on the following groups of commodities: Feed, 26 items; livestock, 6; motor supplies, 15; motor vehicles, 12; farm machinery, 50; farm supplies, 37; fertilizer, 34; building and fencing material, 27; and seed, 25. Prices for individual commodities are collected monthly or periodically by mail, supplemented to some extent by interview, from independent stores and chain stores, hatcheries, etc., from a total of about 35,000 voluntary reporters. Prices by States for each commodity are weighted by estimated quantities purchased in each State to obtain the national average price.

National average prices for individual commodities are combined into group indexes by the weighted aggregative method. The commodity group indexes are weighted by estimated expenditures of farmers for commodities in the respective groups to obtain the family living and the production indexes.

There have been substantial changes in relative quantities of commodities bought by farmers during the period back to 1910. From 1910 to March 1935, the weights used in the index represent farmers' purchases during 1924–1929; from March 1935 to August 1952, the weights represent average purchases during 1937–1941, and from September 1952 on, the weights represent average purchases during 1955.

The index of interest payable per acre on farm mortgage indebtedness (series K 134) is constructed from estimates of interest charges on farm mortgages per acre. These interest charges are computed from the average of interest rates, as obtained from the various sources of farm credit, applied to the total mortgage indebtedness per acre of land in farms.

The index of taxes levied per acre on farm real estate (series K 135) is based on the Census of Agriculture and, for intercensal years, on data from local tax officials. Taxes levied during the year are, in most areas, payable in the following year. Figures for this series are available back to 1890.

The index of farm wage rates (series K 136) covers average wage rates paid hired farm workers. It is based on reports from crop reporters throughout the country and is seasonally adjusted before being combined with the other components of the parity index. The index is available on an annual basis back to 1866 for most years and quarterly since 1923.

The index of prices paid, including interest, taxes, and farm wage rates (series K 137), often referred to as the parity index, is used in computing parity prices of farm products under the formula prescribed by the Agricultural Adjustment Act of 1938 as amended by the Agricultural Acts of 1948 and 1949. It is the most comprehensive measure available of prices paid by farmers for the goods and services bought for both living and production purposes including interest, taxes, and hired farm labor. It is computed by weighting together the index of prices paid for living and production goods, the index of interest payable per acre of farm real estate, the

Digitized by Google

index of taxes payable per acre of farm real estate, and the index of wage rates paid for hired farm labor.

K 138. Parity ratio, 1910–1957.

Source: See source for series K 129–131.

The parity ratio is the quotient (multiplied by 100) obtained by dividing the index of prices received by farmers (series K 129, by the index of prices paid by farmers, including taxes, interest, and wage rates (series K 137). If the ratio is 100 or over (i.e., if the prices received index is as high as, or higher than, the index of prices paid by farmers including interest, taxes, and wage rates), farmers' average purchasing power per unit of farm commodities is as high as, or higher than, it was in 1910–1914. If the ratio is lower than 100, this purchasing power is lower than it was in 1910–1914.

K 139–149. Value of farm gross output and product, in current and constant dollars, 1800–1900.

Source: M. W. Towne and W. E. Rasmussen, "Farm Gross Product and Gross Investment During the 19th Century," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research (forthcoming).

These estimates are designed to measure the output of agriculture from 1800 to 1900 on a gross product, or "value-added" basis. The series for 1870–1900 are more reliable than for earlier years, and those for 1840–1860 are more reliable than for 1800–1830.

K 140–142, sales and home consumption of farm products, are totals of commodity values estimated separately from price and quantity estimates for individual commodities and groups of commodities. The data for 1870–1900 are based primarily on Department of Agriculture, *Gross Farm Income and Indices of Farm Production in the United States, 1869–1937*, Technical Bulletin No. 703, December 1940. Production estimates for 1840–1860 are based mostly on the Census of Agriculture. For 1800–1830, output is generally derived as the product of population and per capita production rates suggested by data for 1840–1860, although independent estimates were employed for the major cash crops, which amounted to about one-eighth of the total. Prices for current dollar valuation were obtained by extrapolating the 1870 farm price estimates of Technical Bulletin No. 703 to earlier years by changes in related wholesale prices and average prices received by farmers.

K 143, livestock inventory changes, is based on Department of Agriculture inventory and value-per-head data for 1870–1900. Inventory data from the Census of Agriculture were used for 1840–1860. For 1800–1830, the inventory estimates were projected backward from 1840 by population changes. Average values per head were projected to earlier years from 1870 by related wholesale price series.

K 144, gross rent from farm dwellings, represents imputed income from home ownership. Figures were obtained by multiplying the 1910–1914 average gross rent per farm (from the current farm income series) by the estimated number of farms in the decade years 1800–1900, and by inflating to current dollars by an index of construction costs. Estimates for number of farms were obtained from the Censuses of Agriculture for 1850–1900, and were extrapolated from 1850 to 1820 by the estimated number of persons engaged in agriculture, and from 1820 to 1800 by population figures.

K 146, intermediate products consumed, represents the cost of goods and services purchased for production purposes by farms from the nonfarm sector. It is deducted from gross output to derive the net contribution of the agricultural sector, or farm gross product (series K 145). The intermediate products and services originating off farms include fertilizer, cotton ginning, horseshoeing, repairs, and rent paid to nonfarm landlords. For most items, estimates for 1800–1900 were constructed by extrapolating the 1910–14 average costs in the current series backward by changes in series closely related with respect to quantity or price. The estimates of intermediate products have as a whole less foundation in census or other contemporary benchmark sources and are less reliable than the gross output estimates.

K 148 and K 149, farm-produced improvements and home manufactures, although not included in current official measurements of gross farm output, are presented here because of their greater relative importance in the earlier years. The land improvement estimates were derived as the product of average annual number of acres improved and estimated per acre labor cost of improvement. The value of home manufactures series is based on survey and census estimates for 1810 and 1840–1870, with other decades estimated on the basis of trends in real output indicated by these benchmarks; a textiles price index was used for deflation.

Estimates of data in 1910–14 dollars, were derived in nearly all cases by multiplying estimated quantities of individual products by average prices for 1910–14.

K 150–157. Motor vehicles and specified machines on farms, 1910–1957.

Source: See source for series K 82.

Census counts were first made of tractors, automobiles, and motortrucks in the 1920 Census of Agriculture, of grain combines and farms with milking machines in the 1945 Census, of cornpickers and pickup balers in the 1950 Census, and of field forage harvesters in the 1954 Census. Estimates for intercensal years and before census data were available are as of January 1.

Before 1950, figures of machines shipped by manufacturers for farm use, with an allowance for disappearance, were used mainly as the basis for these estimates. Figures for automobiles and motortrucks were based on annual registrations for a limited number of agricultural States, and a few special sample surveys that were nationwide. Since 1950, estimates of motor vehicles and machines are based largely on information supplied by the voluntary crop reporters of the Agricultural Marketing Service adjusted to data from the 1954 Census of Agriculture.

K 158. Value of farm implements and machinery, 1850–1957.

Source: 1850–1900, Bureau of the Census, Thirteenth Census, 1910, *Agriculture*, vol. V, p. 51; 1910–1939, Agricultural Marketing Service, records; 1940–1957, Agricultural Research Service, *The Balance Sheet of Agriculture*, October 1957, p. 15.

Figures for 1910–1957 represent inventory value at the beginning of the year. They are closely tied to the values presented in the Censuses of Agriculture, the figures for intercensal years being estimated from information on manufacture and sales with due allowance for wear and tear and then adjusted for changes in price levels.

The data for 1850–1900 are not entirely comparable. They covered periods of vastly different price levels and attendant investment values, including the period of expansion into the West. According to the source, however, "the data are sufficiently comparable to indicate in a broad way the agricultural progress of the country . . . ."

K 159. Farmers' expenditures for fertilizer and lime, 1909–1957.

Source: See source for series K 122–128.

Digitized by Google

For a detailed discussion of concepts, coverage, and methods, see *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 3.

K 160. Commercial fertilizer consumed in U.S., 1850–1957.

Source: 1850–1956, Agricultural Research Service, *Statistics on Fertilizers and Liming Materials in the United States*, Statistical Bulletin No. 191, April 1957; 1957, *Preliminary Report on Consumption of Commercial Fertilizer and Primary Plant Nutrient in the United States*, December 1958.

Commercial fertilizer includes any substance containing nitrogen (N), phosphoric acid (P_2O_5), potash (K_2O), or any other recognized plant-food element or compound, such as lime (CaO), magnesia (MgO), boron (B), etc., which is consumed primarily for the purpose of supplying plant food to crops, excluding barnyard manures but including dried animal manures sold commercially. Ground phosphate rock, gypsum, sulfur, borax, copper sulfate, manganese sulfate, zinc sulfate, cottonseed meal, dried blood, animal tankage, etc., are included when sold to farmers for plant food, but are excluded when sold as fungicides, animal feeds, or for any other purpose than for plant food. Limestone, dolomite, magnesia, etc., are included when used as components of mixed fertilizers but excluded when sold as soil amendments (materials used to change the physical properties or the acidity of the soil rather than to supply plant food).

The data refer to all commercial plant food, including that distributed by the Production and Marketing Administration in its soil-building program and that used by the Tennessee Valley Authority in test demonstrations.

Beginning with 1920, the data related to consumption only in continental United States, but data for 1850–1919 include consumption in Alaska, Hawaii, and Puerto Rico. The total consumption in these outlying areas increased from about 3,000 tons in 1890 to 52,000 in 1900, 93,000 in 1910, 120,000 in 1920, 254,000 in 1930, 321,000 in 1940, and 444,000 in 1950. Most of this consumption occurred in Puerto Rico and Hawaii.

The earliest data on fertilizers were collected by State fertilizer control officials. The first volume of *American Fertilizer*, 1894, presents figures for Georgia for 1875–1892. In 1945, 36 States had a Fertilizer Control Office or similar agency which published tonnages of fertilizers consumed in the State. A bibliography of such reports is given in U.S. Department of Agriculture, Circular No. 756, 1946, which also gives considerable detail on fertilizer consumption.

Annual estimates of consumption made by the National Fertilizer Association (now a part of the National Plant Food Institute) were discontinued in 1955. *The Fertilizer Review*, vol. XXI, No. 2, pp. 11–14, presents figures for continental United States by decades from 1880 to 1910, and annually to 1945.

K 161. Lime consumed on farms, 1909–1957.

Source: See source for series K 82.

This series links two series not quite alike in coverage. For 1929–1945, the tonnage is in terms of ground limestone, materials in other forms being converted to that basis, except for some coarser materials used in Illinois. These figures were based on surveys made by State agricultural college agronomists and include county surveys of producers, and data from county extension agents and AAA offices, assembled by C. E. Carter of the Production and Marketing Administration. The data for 1910, 1920, and 1925–1928, however, were assembled by A. L. Mehring of the Bureau of Plant Industry, Soils, and Agricultural Engineering. The intervening years were interpolated. Mehring's figures, with the interpolations, have been carried through 1939 in the Bureau of Agricultural Economics series, *Income Parity for Agriculture*, pt. II, sec. 2; hence, the figures given there for 1929–1939 differ from those presented here. Lime used by fertilizer manufacturers in their mixed goods is not included. Data for recent years are from National Agricultural Limestone Institute, Inc.

K 162–169. Farm-mortgage debt outstanding and loans closed, 1910–1957.

Source: Agricultural Research Service, Bureau of the Census, Farm Credit Administration, and Federal Deposit Insurance Corporation. For specific sources, see below. See also *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 6.

Farm-mortgage credit has been referred to as farm-real-estate credit, long-term credit, or capital credit. The data presented here, however, merely represent the amount of credit secured by farm real estate, whether it is extended for a short term or a long term, whether it is used for purchasing the farm, operating the farm, or financing nonagricultural activities, and whether the loan instrument is a mortgage, deed of trust, vendors' lien, or sales contract.

Estimates of the total amount of farm-mortgage debt outstanding at the beginning of each year (series K 162) are based upon census data and special surveys. Data on the amount of mortgage debt on farms operated by full owners appear in each census back to 1890, except that for 1900. In 1890, 1940, 1945, 1950, and 1956, similar information was collected on the owned part of part-owner farms.

Mortgage data may be found in the following reports of the Bureau of the Census: Eleventh Census, 1890, *Report on Real Estate Mortgages;* Thirteenth Census, 1910, *Agriculture*, vol. V, chap. 3; Fourteenth Census, 1920, *Agriculture*, vol. V, chap. 7; Census of Agriculture, 1925, *Summary Statistics by States;* Fifteenth Census, 1930, *Agriculture*, vol. IV, chap. 6; Sixteenth Census, 1940, *Agriculture*, vol. III, chap. 4. Data for 1935, 1945, 1950, and 1956 are in two cooperative publications—Bureau of the Census and Bureau of Agricultural Economics, *U.S. Census of Agriculture: 1950*, vol. V, pt. 8, and Bureau of the Census and Agricultural Research Service, *U.S. Census of Agriculture: 1954*, vol. III, pt. 5.

In 1920, 1928, and 1930 the Bureau of Agricultural Economics conducted surveys on which estimates of debt on farms operated by part owners, tenants, and managers were based. The Bureau of the Census and the Bureau of Agricultural Economics cooperated in the 1935, 1940, 1945, 1950, and 1956 surveys. The results of the 1928 survey, which included 1925 data, were published in Department of Agriculture, *Farm-Mortgage Credit*, Technical Bulletin No. 288, February 1932. Results of the later surveys appear in the two cooperative publications referred to above. Some earlier census-year estimates were revised on the basis of relationships established by the more recent surveys to make estimates for all census years more comparable.

Estimates for intercensal years are based on data on the amount of mortgages held by certain lending agencies, on estimates of the amount of farm mortgages recorded annually by major lender groups, and on the distribution by lenders of farm-mortgage debt in the last preceding census. Whenever a new census-year benchmark was established, the intercensal-year estimates were revised to reflect the new trend. For the years prior to 1935, the data on mortgages recorded were compiled from the records of selected counties through a nationwide Works Progress Administration project sponsored by

Digitized by Google

the Bureau of Agricultural Economics. For 1935–1957, this information was collected by the Farm Credit Administration. Revisions of annual debt estimates for 1950–1957 appear in Agricultural Research Service, *Farm-Mortgage Debt Rises in 1957*, ARS 43–59, September 1957. A number of publications of the Bureau of Agricultural Economics contain annual estimates of farm-mortgage debt revised to the last census-year benchmark preceding the date of publication: *Agricultural Finance Review*, vol. 15, supplement I, May 1953, which has annual data by States for 1945–1953; *Farm-Mortgage Loans and Their Distribution by Lender Groups, 1940–1948*, USDA Circular No. 812, August 1949; *Revised Annual Estimates of Farm-Mortgage Debt by States*, 1930–1943, April 1944; *Distribution by Lender Groups of Farm-Mortgage and Real Estate Holdings, January 1, 1930–1945*, August 1945.

The Federal land banks were organized pursuant to the Federal Farm Loan Act of 1916 and became important lenders in the farm-mortgage field, particularly after 1933. The data on loans outstanding and loans closed (series K 163 and K 168) are from publications of the Farm Credit Administration or its predecessor, the Federal Farm Loan Board. Land Bank Commissioner loans, first made under the authority of the Emergency Farm-Mortgage Act of 1933, were taken over by the Federal Farm Mortgage Corporation upon its creation in 1934 and were continued until July 1, 1947, when authority to make new loans, except those incidental to liquidation, expired. In 1955, the remaining outstanding loans of the Corporation were sold to the Federal land banks. For a discussion of these agencies, see Department of Agriculture, *Farm-Mortgage Credit Facilities in the United States*, Miscellaneous Publication No. 478, 1942, and annual reports of the Farm Credit Administration.

Figures on farm-mortgage debt held by life insurance companies (series K 164) are estimates of the Bureau of Agricultural Economics and the Agricultural Research Service and refer to unpaid principal owed to the companies. The estimates are based on data from the annual statements of companies that hold a large part of all farm-mortgage debt held by life insurance companies, supplemented with other information obtained by mail from various companies. The data for 1910–1929 include the unpaid principal of regular mortgages only; for 1930–1957, they also include the unpaid principal of purchase-money mortgages and farm real estate sales contracts. Estimates of the Institute of Life Insurance have been used since 1945 for United States totals—and since 1950 for State totals—of the book value of this group's holdings of farm mortgages. See also the following Department of Agriculture publications: *Farm-Mortgage Loans Held by Life Insurance Companies*, ARS 43–58, October 1957; *Farm Investments of Life Insurance Companies, 1956*, ARS 43–57, October 1956; and *Farm-Mortgage Investments of Life Insurance Companies*, December 1943.

Figures on farm-mortgage debt held by commercial and savings banks (series K 165) for 1910–1947 do not cover all banks, but they do represent a very large proportion of all bank loans on farm real estate. For 1910–1934, the data include only open State and national banks, and are estimates prepared by the Bureau of Agricultural Economics from special surveys and reports of bank supervisory authorities. (See *Agricultural Loans of Commercial Banks*, USDA Technical Bulletin No. 521, July 1936, for a discussion of these special surveys.) For 1935–1947, the data include only farm-mortgage loans of insured commercial banks as summarized in reports of the Federal Deposit Insurance Corporation. For 1948–1957, the data include farm-mortgage debt held by all operating banks—commercial, savings, and private—as compiled by the Federal Deposit Insurance Corporation and published in annual reports of the Comptroller of the Currency. Sales contracts on farm real estate may or may not be included in the figures, because banks often classify such contracts with the real estate owned. The figures do not include loans of closed banks, of mutual savings banks before 1948, nor of noninsured commercial banks for 1935–1947.

The joint-stock land banks (series K 166 and K 169) also authorized under the Federal Farm Loan Act of 1916, were under Federal supervision and regulation, but differed from the Federal land banks in that they were privately owned. Their organization and growth are discussed in C. H. Schwartz, Jr., *Financial Study of the Joint-Stock Land Banks*, Washington College Press, Takoma Park, Md., 1938, as well as in the publications cited above for Federal land banks. Liquidation of the joint-stock banks was called for in the Emergency Farm Mortgage Act of 1933 and was completed in 1951. For several Federal and federally sponsored agencies, "loans closed" include only their regular loans as distinct from purchase-money mortgages and sales contracts, and they are not necessarily comparable with "loans recorded" by other lender groups.

Within the lender group identified as "individuals and others" (series K 167), individuals are by far the most important holders of farm mortgages. Because of its residual nature, this general lender group also includes many miscellaneous sources of farm-mortgage credit, including mortgage, real estate, finance, and investment companies; State and local governmental agencies; religious, educational, civic, and fraternal organizations; mercantile firms dealing largely in farm supplies; lending agencies operating chiefly in the urban mortgage field but sometimes lending on farmland; corporations and associations chiefly engaged in making production loans but sometimes requiring real estate as security; and the Farmers Home Administration (formerly Farm Security Administration). In addition to these are the loans of mutual savings banks, for 1910–1947, closed commercial banks, noninsured commercial banks for 1935–1947, insurance companies other than life insurance companies, and certain types of loans not specifically included in the figures for the major lending groups.

K 170–172. Interest payable on farm mortgages, 1910–1957.

Source: Agricultural Research Service and Farm Credit Administration, records.

These data represent average contract rates. They are averages of the rates charged by the various types of lenders weighted by the amount of mortgages recorded or held by each. Furthermore, they are averages of rates on all farm mortgages regardless of their priority. It should be pointed out that year-to-year changes in the average rates do not necessarily reflect changes in the level of interest rates charged by the different lenders but may represent changes in the distribution among the lender groups of loans recorded or held. The averages are based on the rates specified in the mortgage contract and payable by borrowers during the calendar year; they do not necessarily represent averages of the rates actually paid, except that for rates on outstanding mortgages, they do reflect the temporarily reduced rates of the Federal land banks for 1934–1944 and of the Federal Farm Mortgage Corporation for 1938–1945.

Some information either on interest rates or interest charges on outstanding mortgages was obtained in the Censuses of Agriculture for 1890, 1920, 1930, and 1940. Interest rates on mortgages recorded (series K 170) come from two sources. The averages for odd-numbered years from 1941 to 1953 are estimates of the Farm Credit Administration based on mortgages recorded during the month of March in approximately

Digitized by Google

one-third of the counties in the United States. For 1955 and 1957, the average interest rates are based on mortgages recorded in the first quarter of the year. Rates for 1910–1935 were developed from data obtained in a nationwide Works Progress Administration project sponsored by the Bureau of Agricultural Economics (see that agency's *Average Rates of Interest Charged on Farm-Mortgage Recordings of Selected Lender Groups*, November 1940).

Average interest rates on outstanding mortgages (series K 171) for 1937–1957 are based on data obtained by the Bureau of Agricultural Economics, the Agricultural Research Service, and the Bureau of the Census in special surveys made in census years and from Farm Credit Administration surveys of farm-mortgage recordings made in selected months of intercensal years. For 1910–1936, the rates are based on the WPA data mentioned above. Rates on mortgages recorded as reported in the WPA project were converted to rates on outstanding mortgages by assuming that all mortgages recorded remained in effect for a period equal to the average of the terms of years specified in the mortgage contracts. This procedure was used for all lender groups except the Federal land banks and Federal Farm Mortgage Corporation for which averages were computed from information on the amount of loans outstanding at various interest rates. (See Bureau of Agricultural Economics, *Interest Charges Payable on Farm Indebtedness in the United States, 1910–40*, August 1942.) Some of the data for years after 1930 were later revised; see Bureau of Agricultural Economics, *Revised Annual Estimates of Interest Charges and Interest Rates on Farm-Mortgage Debt, 1930–43*, October 1944, and USDA Circular No. 821, *Farm-Mortgage Interest Charges and Interest Rates, 1940–48*, October 1949.

Figures for interest charges payable (series K 172) were developed from the estimates of farm-mortgage debt outstanding at the beginning of each year and the average interest rates charged thereon, except in the case of the Federal land banks and the Federal Farm Mortgage Corporation. Calendar-year estimates were computed by averaging the charges payable on debts outstanding at the beginning of each year and the beginning of the succeeding year. For the Federal land banks and the Federal Farm Mortgage Corporation, the actual amounts of interest charges payable on their outstanding loans during the calendar year were obtained from the Farm Credit Administration. These amounts, of course, excluded those charges no longer payable because of the interest reductions granted to borrowers. For more detailed discussion, see publications previously cited.

K 173–177. Non-real-estate agricultural loans to farmers, 1910–1957.

Source: Federal Farm Loan Board and Farm Credit Administration, records.

See also specific sources mentioned below.

Non-real-estate credit, variously called short-term credit, personal and collateral credit, or production credit, is obtained by farmers from many sources including banks, Federal and federally sponsored credit agencies, merchants, dealers, commission men, finance companies, landlords, and other individuals. Commercial banks have provided the bulk of this type of credit extended by credit institutions although, since the early 1930's, Federal and federally sponsored agencies and finance companies have become important in this lending field. The volume of non-real-estate credit extended by sources other than banks and Federal agencies is believed to have been about $3½ billion in recent years; however, data for precise estimates are lacking.

Since 1939, non-real-estate agricultural loan data of all operating banks have been available from the Comptroller of the Currency and the Federal Deposit Insurance Corporation. Since 1936, similar loans of insured commercial banks, whose loans comprise about 97 percent of the loans of all banks, have been regularly reported by the Federal Deposit Insurance Corporation. For earlier years, the only data of this type available are from Department of Agriculture surveys made in 1914, 1918, 1921, 1924, 1931, 1934, and 1936, all of which (except for 1936) are discussed in that Department's *Agricultural Loans of Commercial Banks*, Technical Bulletin No. 521, July 1936. Upon the basis of these survey data and of data on all loans of "country" national banks for intervening years, estimates have been made back to 1910. See the *Agricultural Finance Review*, "Short-Term Agricultural Loans of Commercial Banks, 1910–1945," vol. 8, November 1945; and *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 6.

The Federal Government first entered the non-real-estate agricultural credit field in 1918 when it made available $5 million for direct loans to farmers in the Northwest and Southwest where there had been two successive crop failures. During the 1920's, seed and feed loans were made available from time to time in certain "distressed" areas by special Acts of Congress. In the early 1930's, the basis for lending was broadened and the Emergency Crop and Feed Loan Office came to be a more-or-less permanent source of credit for farmers in distress. The Farmers Home Administration Act of 1946 transferred the activities of the Emergency Crop and Feed Loan Office from the Farm Credit Administration to the newly created Farmers Home Administration (successor to the Farm Security Administration) and provided for the liquidation of these loans. Thereafter, any loans of this character were made by the Farmers Home Administration under the provisions of the new law and are not included in this series. For a further discussion of the crop and feed loan program, see Department of Agriculture, *Federal Seed-Loan Financing and Its Relation to Agricultural Rehabilitation and Land Use*, Technical Bulletin No. 539, October 1936; and reports of the Farm Credit Administration.

The Agricultural Credits Act of 1923 created the Federal intermediate credit banks, the first permanent federally sponsored credit agencies making non-real-estate loans available to farmers. These banks make no loans directly to farmers, but they do make loans to and discount loans for private financing institutions (agricultural credit corporations and livestock loan companies). Loans discounted by the Federal intermediate credit banks for the production credit associations since their organization in 1933 are not included here. See Frieda Baird and Claude L. Benner, *Ten Years of Federal Intermediate Credits*, The Brookings Institution, Washington, D.C., 1933; and reports of the Farm Credit Administration.

The same 1923 Act also authorized the Federal intermediate credit banks to provide loans to and discounts for agricultural cooperatives; that is, direct loans to marketing cooperatives on the security of commodities. In 1933, special legislation authorized the creation of the "banks for cooperatives," which, by 1936, had largely taken over the function of the intermediate credit banks in making loans to cooperatives. A part of the loan funds of the "banks for cooperatives," however, is supplied by the Federal intermediate credit banks.

K 178–180. Indexes of deposits of country banks, 1923–1957.

Source: Department of Agriculture, records.

The indexes for demand, time, and total deposits are based upon deposits of member banks of the Federal Reserve System, located in places of less than 15,000 inhabitants in the 20 leading agricultural States. (See Department of Agriculture,

Demand Deposits of Country Banks, Technical Bulletin No. 575, August 1937; *Agricultural Finance Review Supplement*, vol. 15, May 1953; and *Major Statistical Series of the U.S. Department of Agriculture*, Agriculture Handbook No. 118, vol. 6.)

K 181–189. Number, memberships, and business of farmers, marketing and purchasing cooperatives, 1913–1956.

Source: 1913–1955, Farmer Cooperative Service, *Statistics of Farmer Cooperatives, 1954–1955;* 1956, *Statistics of Farmer Cooperatives, 1955–1956.*

These data were first compiled in 1913–1915 from questionnaires collected by mail from all cooperatives known to exist in the period 1912–1915. In 1919, data on the extent of cooperative marketing and farm supply purchasing were collected as a part of the Census of Agriculture. Other nationwide surveys were conducted in 1922 and for the fiscal years 1925–1926 and 1927–1928. Beginning with 1929–1930, annual nationwide surveys have been taken of farmer marketing, farm supply, and related services cooperatives. Data were collected by mail in each of these surveys except for 1936–1937 when information was collected in the field by Farm Credit Administration in cooperation with the banks for cooperatives and 33 State agricultural colleges.

A bona fide farmer cooperative is defined as one in which (1) farmers or agricultural producers hold the controlling interest; (2) no member is allowed more than one vote because of the amount of stock or membership capital he owns therein, or the cooperative does not pay dividends on stock or membership capital in excess of 8 percent a year; and (3) products of nonmembers are not handled in an amount greater in value than products of members. The annual survey includes all active bona fide farmer cooperatives responding to the initial questionnaire and showing their cooperative status, marketing of farm products, handling of farm supplies, or performing of services related to marketing or farm supply purchasing.

As cooperatives tended increasingly to diversify their operations, the annual survey figures became less satisfactory. Therefore, beginning with the survey covering fiscal 1951, revised questionnaires were used to develop information on a functional and commodity basis.

A very high percentage of response has been obtained in the annual survey. In the survey for fiscal 1955, 92 percent of the 9,887 associations in the survey furnished information. Estimates for nonreporting associations are based on every available source of information including periodicals and newspapers published by cooperatives.

K 190–194. Indexes of farm output and gross production of livestock, by groups, 1870–1957.

Source: 1870–1900, Department of Agriculture, *Gross Farm Income and Indices of Farm Production and Prices in the United States, 1869–1937*, Technical Bulletin No. 703, December 1940; 1910–1957, see source for series K 82. Census years, Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, p. 435.

The index of farm output (series K 190) includes all crops produced during the crop year except hayseeds, pasture seeds, cover crop seeds, and hay and concentrates fed to horses and mules on farms. The index also includes "net" livestock production (gross livestock production minus hay and concentrates fed) other than horses and mules on a calendar-year basis. This calculation is made to eliminate counting of feed crops in both livestock and crop production. The farm output index is also available for each of the nine census geographic divisions from 1919 to 1957. Although the indexes prior to 1910 are not strictly comparable with those for 1910–1957, they provide the best available measures for the early years.

The indexes on livestock production (as well as crop production) are measures of gross production, as they include items of production excluded in the index of farm output. They are subdivided into three livestock groups and nine crop groups.

Weighted average prices per unit of each commodity are used in constructing these indexes. Separate sets of weights are calculated for each of the nine census geographic divisions. Official reports of the Agricultural Marketing Service are the chief sources of data on both production and prices. The omission of production from farm forests and other minor items probably accounts for less than 5 percent of the total output in recent years. Commodities of little importance are omitted in some regions for earlier years.

Two weight periods are used: 1935–39 prices for 1939 and prior years, and 1947–49 prices for the period beginning in 1940. The index series for the two subperiods are "spliced" together in 1940 through the use of overlapped calculations for that year. Annual quantity-price aggregates for the United States are obtained by summing the regional data for 1919–1957.

For more detail, see *Major Statistical Series of the United States Department of Agriculture*, Agriculture Handbook No. 118, vol. 2.

K 195–204. Livestock on farms and value per head, 1867–1957.

Source: 1867–1919, Bureau of Agricultural Economics, *Livestock on Farms, January 1, 1867–1935*, January 1938; 1920–1939, *Livestock on Farms and Ranches on January 1*, Statistical Bulletin No. 88, 1950; 1940–1954, Agricultural Marketing Service, *Livestock and Poultry Inventory, January 1*, Statistical Bulletin No. 177, June 1956; 1955–1957, *Livestock and Poultry Inventory, January 1*, annual releases. Census years, see source for series K 190–194.

These estimates have been made by the Department of Agriculture since 1867. The early estimates were based on reports of the percentage change in numbers from the previous year by field agents and crop reporters. At 10-year intervals, the Census of Agriculture furnished the basic figures to which these percentage changes were applied. Since 1920, annual estimates are based primarily on survey returns from livestock producers who report on the number of livestock, by classes, on their own farms about December 1 each year. Records of livestock assessed for taxation in the various States have furnished indications of the annual percentage change in numbers, and records of marketings and slaughter have been used both by States and for the United States as check information.

Data from the Census of Agriculture have been used as periodic benchmarks for the January 1 estimates but there are few census years when the Department of Agriculture estimates and the census data are in close agreement. One of the main reasons for these differences is that there are only a few times when the census was taken as of January 1. In years when the census relates to a different date, adjustments are made to determine a January 1 equivalent number. The Department of Agriculture undertook in the midthirties a general revision of all estimates prior to 1920 to correct for irregularities in the early series and to utilize more fully the records of numbers assessed for taxation and other information not considered in preparing the original estimates; see first-cited source above.

Prior to 1920, crop reporters provided a single estimate of the value per head for a given species. Since 1920, the estimates are weighted averages based on values per head reported separately for the different age and sex classes of a

Digitized by Google

given species—using as weights the estimated number in the respective class.

K 205, 208, 210. Live weight production of livestock, 1909–1957.

Source: 1909–1944, Bureau of Agricultural Economics, *Meat Animals, Farm Production, and Income, 1924–1944*, September 1947; 1945–1949, *Meat Animals, Farm Production, Disposition, and Income*, Statistical Bulletin No. 113, July 1952; 1950–1954, Agricultural Marketing Service, *Meat Animals, Farm Production, Disposition, and Income*, Statistical Bulletin No. 184; 1955–1957, annual releases of publication with same title.

Production in live weight relates to the total poundage produced on farms and ranches during a calendar year. The estimate of production is derived by determining for each State a balance sheet which shows as debit items the inventory at the beginning of the year, the births, and inshipments, and as credit items, the marketings, farm slaughter, death losses, and numbers on hand at end of year. Estimates of average live weight are based on reports from slaughterers, collected by the Department of Agriculture and in the Census of Manufacturers, and on records obtained from stockyards. In recent years, reports have been obtained from farmers on the average weight of livestock slaughtered on farms. The total live weight for beginning and end of year is obtained by multiplying estimates of the different age and sex classes for a species by an estimate of their respective average live weight. Live weight of marketings, farm slaughter, and inshipments is determined by multiplying the estimate for these items by the respective average live weight. To obtain production, the total weight of inshipments is subtracted from the combined weight of marketings and farm slaughter. Then the difference in the inventory weight between the beginning and end of year is added or subtracted as the case might be.

K 206, 207, 209, 211, 212. Annual average price received per hundred pounds of livestock by farmers, 1909–1957.

Source: 1909–1955, Agricultural Marketing Service, *Prices Received by Farmers, 1908–1955*, Statistical Bulletin No. 180, June 1956; 1956–1957, *Agricultural Prices, April 1958 and 1959*.

Price information is obtained from voluntary price reporters who furnish average local market prices each month. The estimates of monthly prices are weighted by monthly estimates of marketings to obtain the annual average. The monthly marketings are based on reports from stockyards and packers on monthly receipts of livestock by State of origin.

K 213. Workstock, 2 years old and over, on farms, 1920–1957.

Source: See source for series K 195–204.

K 214–225. Meat slaughtering, production, and price, 1899–1957.

Source: 1899–1945, Production and Marketing Administration, *Livestock Market News, Statistics and Related Data, 1946*, September 1947; 1946–1957, Agricultural Marketing Service, annual issues of publication with same title.

Figures for slaughter include federally inspected slaughter and estimates of all other slaughter (other commercial slaughter and farm slaughter). Before 1944, this information was obtained largely on an annual basis from various sources; but, beginning in 1944, information was collected by months, first under the slaughter control program of the War Food Administration, and later under the slaughter and meat control programs of Office of Price Administration. Current data on federally inspected slaughter, which includes animals condemned as unfit for human food, are compiled by the Agricultural Research Service in connection with its regulatory functions on meat inspection. The number of animals slaughtered in other commercial channels is estimated by the Agricultural Marketing Service from monthly reports made by slaughterers who are not under Federal inspection. Estimates of farm slaughter are based on annual voluntary reports from livestock producers with periodic data from the Census of Agriculture as benchmarks. Production of the different kinds of meat are computed from estimated average live weights and dressing yields and, except for pork, is shown on a carcass weight basis. Pork production represents carcass weight excluding the raw fat rendered into lard.

The data on production under Federal inspection are based on records of production and yields reported monthly by slaughterers operating under Federal inspection. Monthly estimates of production under Federal inspection are not available prior to 1921. Reports of the biennial Census of Manufactures on slaughter were used as a basis for annual production estimates for years for which they are available. In other years, the estimates were based on information obtained from market records and other sources. Currently, information on weights and yields for other commercial slaughter is based on monthly reports from commercial slaughterers who are not under Federal inspection.

Prices of the different species of livestock at Chicago for the early years are from records published in the *Drovers Journal Yearbook*. Beginning in 1922, the price of beef steers at Chicago is based on records of all steers sold out of first hands for slaughter. The number of head, live weight, and total value of steers, by grades, are compiled by weeks. The annual prices represent the weighted average of all grades of steers sold during the year for slaughter. Since 1919, the average price for veal calves is based on the average of daily quotations. The average price of hogs at Chicago has been obtained from different sources; since 1920, it is the weighted average of packer and shipper purchases at the Chicago market. Since 1921, the price of lambs at Chicago represents an average computed from the bulk of sales price data.

K 226–233. General note.

Early development of the dairy industry in the United States is indicated by export statistics of 1790 which showed the New England States, New York, and Pennsylvania producing considerable amounts of butter and cheese in excess of their consumption requirements. The growth and spread of the industry between that time and 1849, when statistics on dairying were first available through the national census, are described in the *Agriculture Yearbook*, 1922, pp. 297–306. At the middle of the 19th century, milk cows were rather generally distributed over the eastern half of the United States as far west as southern Wisconsin, eastern Iowa, western Missouri and Arkansas, and the eastern third of Texas. By 1860, there were appreciable numbers of milk cows in the Pacific Coast States. In later years, they gradually spread over the intervening territory.

Dairy products sold by farmers in the early period were limited mainly to whole milk, farm-made butter, and farm-made cheese. Prior to 1850, these products were produced mainly on farms. The 1850 Census showed the bulk of cheese production for 1849 coming from farms in the area extending from northeastern Ohio eastward through New York and New England. Factory cheese production was in an experimental stage shortly before 1850, and made considerable progress during the next two decades. Although some butter was made in early cheese plants, the first commercial creamery was not established until 1861. Since that time, factories have largely supplanted farms in the production of both cheese and butter.

Digitized by Google

The first condensery was established in 1856, but little interest was given the product until the Civil War. Unsweetened condensed milk was first produced in 1885; the canned unsweetened product (evaporated milk) now makes up about nine-tenths of all evaporated and condensed whole milk. Ice cream was produced and sold by some retail stores in the first half of the 19th century, and wholesale plant distribution to dealers began about the middle of the century.

K 226–227. Cows and heifers kept for milk, 1850–1957.

Source: 1867–1929, Department of Agriculture, *Agricultural Statistics*, 1941; 1930–1939, *Agricultural Statistics*, 1946; 1940–1954, Agricultural Marketing Service, *Livestock and Poultry on Farms, January 1, Number, Value Per Head, and Total Value, Revised Estimates, 1940–1954*, June 1956; 1955–1957, *Livestock on Farms, January 1*, annual issues. (See also *Livestock on Farms, January 1, 1867–1935*, January 1938.) Census years, 1850–1920, Bureau of the Census, Sixteenth Census Reports, *Agriculture*, vol. III, pp. 606–607; 1925–1945, *Census of Agriculture, 1945*, vol. II, p. 381; 1950–1954, *U.S. Census of Agriculture: 1954*, vol. II, p. 440.

The estimates are based on interpretation of data from the Census of Agriculture, tax assessors, and other State agencies, together with the analysis of changes taking place in herds kept by a large sample of livestock reporters. With respect to the data on milk cow numbers obtained in the Censuses of Agriculture, the wording of the census questions has not necessarily been comparable with the definitions represented by the annual estimates and has varied somewhat from one census enumeration to another.

K 228. Milk production on farms, 1889–1957.

Source: 1889–1919, Bureau of the Census, various Censuses of Agriculture reports; 1924–1954, Agricultural Marketing Service, *Milk-Farm Production, Disposition, and Income*, Statistical Bulletin No. 175, April 1956; 1955–1957, same title, April 1959.

Beginning in 1924, the figures represent calendar-year estimates. The estimates are based on interpretations of census data, analysis of annual and monthly survey data on milk cows and milk production, and checks against information on milk utilization obtained from dairy plants and other sources. For 1919 and earlier years, the data are based on Censuses of Agriculture and converted from gallons to pounds by use of a conversion factor of 8.6 pounds per gallon. For 1889, the census totals are the reported figures. For 1899 they include estimates for incomplete reports, and for 1909 and 1919 they include estimates of production on farms that reported milk cows but failed to report milk produced. The 1889 and 1899 data were enumerated as of the following June, the 1909 data as of April 15, 1910, and the 1919 data as of January 1, 1920.

K 229–232. Production of dairy products, 1849–1957.

Source: 1849–1916, E. E. Vial, *Production and Consumption of Manufactured Dairy Products*, Department of Agriculture, Technical Bulletin No. 722, April 1940; 1917–1939, Agricultural Marketing Service, *Revisions in the Production of Creamery Butter, Cheese, and Ice Cream by States, 1916–1939*, and *Production and Utilization of Milk, United States, 1924–1952*; 1940–1957, same agency, *Production of Manufactured Dairy Products* (except for series K 232, 1940–1949, *Revisions of Ice Cream and Ice Milk Data, by States, 1940–1949*).

For 1940–1957, data are from the annual survey of output of dairy plants. For 1916–1939, data were based on the annual survey of dairy plants supplemented by estimates for incompleteness in some States based on data from the Census of Manufactures or from State sources. For the years prior to 1916 or 1917, the level of the figures was based mainly on the Census Bureau's survey of the output of dairy plants with interpolations for intervening years for some products (see E. E. Vial, cited above).

Butter production data represent farm and factory production combined. Factory butter figures for 1917–1957 are for production of creamery butter and include some estimates for incompleteness. Figures for factory production for 1849, 1859, 1869, 1879, 1899, 1904, 1909, and 1914 are from the Census of Manufactures. The 1889 census data were revised upward to allow for incompleteness. Annual figures on factory butter production for the intercensal years were interpolated on the basis of receipts of butter at major central markets for 1879–1919 and on factory production for 1917–1957.

Cheese production figures include both farm and factory cheese production prior to 1927. Since 1926, farm cheese was negligible and is excluded. For 1909–1917, cheese figures exclude full-skim American. For 1918–1957, data are from plant reports of all types of cheese manufactured except cottage, pot, and bakers' cheese and full-skin American. For 1849, 1859, 1869, 1879, 1889, and 1909 the figures for total cheese production are from the decennial censuses. The census data for 1889 were revised upward to allow for incompleteness. Estimates for the intercensal years 1869–1899 were interpolated on the basis of market receipts. Data on factory production of cheese for 1904 and 1914 are from the Census of Manufactures; data for the intercensal years 1869–1919 were interpolated on the basis of market receipts. Production of farm cheese for the intercensal years 1899–1926 was roughly projected on the basis of average change between census years and added to the factory product to obtain total cheese figures.

Evaporated and condensed milk production includes evaporated whole milk, bulk unsweetened condensed whole milk, and case and bulk sweetened condensed whole milk. Production figures for 1879, 1899, 1904, 1909, and 1914 are census totals for all condensed and evaporated milk. For 1889, the census data were revised upward to allow for incompleteness. Data for 1869 are estimated; those for the noncensus years before 1919 represent an estimated trend of production based on intervening census data.

Ice cream production figures for 1916–1957 are based on the annual survey of dairy manufacturing plants supplemented by estimates for incompleteness in some States based on data from the Census of Manufactures or State sources. For 1914, data were estimated from the Census of Manufactures. For 1909 and earlier years, the data represent merely an estimated trend of production.

K 233. Milk equivalent of manufactured dairy products, 1849–1957.

Source: See source for series K 229–232.

For 1849–1923, the figures are based on national production of manufactured dairy products converted to milk equivalent on the basis of somewhat less refined conversion factors than those used for later years. As such they include no allowance for shifts in production between States or areas of high- or low-testing milk, and they assume standard butterfat content of the products for all years.

For 1930–1956, data were based on information of products made in each State and State conversion factors for each product. Duplication of milk usage involving the production of butter from whey fat recovered from cheese making and the use of butter and condensed milk in the production of ice cream were eliminated.

K 234–235. Wholesale prices of cheese and butter, 1830–1957.

Source: Agricultural Marketing Service, records.

The wholesale prices of cheese represent averages of weekly quotations on American twins on the Wisconsin cheese exchange at Plymouth. The wholesale price of butter is that for the New York City market. Since 1830, the data for butter differ somewhat in definition and source (see tabular footnote).

K 236–239. Prices received by farmers for dairy products, 1909–1957.

Source: 1909–1954, Agricultural Marketing Service, *Prices Received by Farmers*, Statistical Bulletin No. 180, June 1956; 1955, *Crops and Markets*, November 1957, p. 73; 1956, *Agricultural Prices*, April 1958; 1957, same title, April 1959.

Prices received by farmers for butter, butterfat, wholesale milk, and retail milk are estimates based on averages of survey data reported by dealers and farmers for their local market areas. Prices of butterfat (series K 237) represent the butterfat in farm-skimmed cream sold by farmers; before 1920, survey information was not collected, and estimates were extrapolated on the basis of trends in butter prices.

Wholesale milk prices (series K 238) are for milk sold by farmers to plants and dealers including such establishments as cheese factories, condenseries, creameries, or market milk plants. Prior to 1923, these prices were asked on a per-gallon basis and since that time on a per-100-pounds basis. Additional historic information on wholesale milk-price series was collected by direct plant contacts during the middle 1930's when the State estimates were revised. See also Bureau of Agricultural Economics, *Wholesale Prices Received by Farmers for Whole Milk, 1909–36*, February 1937 (mimeographed).

Retail milk prices (series K 239) represent the milk retailed by farmers directly to consumers. Before 1923, survey information was collected on a price per-gallon rather than per-quart basis. Some of the increase in price between 1909 and 1945 probably represents additional services rendered in process of distributing the milk. See also Bureau of Agricultural Economics, *United States Average Farm Prices of Dairy Products, 1910–34*, June 1934 (mimeographed).

K 240–241. Shorn wool production and price, 1869–1957.

Source: Series K 240, 1869–1908, *Agriculture Yearbook*, 1923; series K 241, 1869–1908, Department of Agriculture, *Gross Farm Income and Indices of Farm Production and Prices in the United States, 1869–1937*, Technical Bulletin No. 703, December 1940; series K 240–241, 1909–1956, *Livestock and Meat Statistics*, Statistical Bulletin No. 230, July 1958; 1957, Supplement to Statistical Bulletin No. 230.

The original source of data for 1869–1908 was the National Association of Wool Manufacturers. Estimates have been made by the Department of Agriculture since 1909. Wool production is estimated by ascertaining the number of sheep and lambs shorn and the average weight per fleece, and using data from the Censuses of Agriculture as periodic benchmarks. Extensive revisions of production estimates back through 1909 were made in 1936. The figures for 1869–1908 are not comparable to these revised estimates. To illustrate the lack of comparability, the unrevised production estimate of 287 million pounds for 1909, published in the *Agriculture Yearbook* for 1923, may be compared with the revised estimate of 310 million pounds.

K 242–253. Poultry and eggs—number, production, and price, 1909–1957.

Source: Series K 242–248, 1909–1944, Bureau of Agricultural Economics, *Farm Production, Disposition, and Income From Chickens and Eggs*, Statistical Bulletin No. 133, July 1953; 1945–1949, same title, June 1952; 1950–1953, Agricultural Marketing Service, same title, Statistical Bulletin No. 183; 1954, same title, April 1956 (mimeographed); 1955, same title, April 1957; 1956, same title, April 1958; 1957, same title, April 1959.

Series K 249–253, 1929–1944, Bureau of Agricultural Economics, *Farm Production, Disposition, and Income From Turkeys*, June 1953; 1945–1949, same title, May 1952; 1950–1954, Agricultural Marketing Service, same title, Statistical Bulletin No. 182; 1955, same title, March 1957 (mimeographed); 1956–1957, same title, March 1958.

Census data for chickens, 1910–1945, Bureau of the Census, *Census of Agriculture, 1945*, vol. II, pp. 406–407; 1950 and 1954, *U.S. Census of Agriculture: 1954*, vol. II, p. 531. Census data for turkeys, 1910–1940, Sixteenth Census Reports, *Agriculture, Special Poultry Report*, p. 46; 1950 and 1954, *U.S. Census of Agriculture: 1954*, vol. II, p. 556.

The estimates are believed to indicate, within reasonable limits of accuracy, the actual number of farm chickens and turkeys; the production of chickens, turkeys, and eggs; and, with greater accuracy, the direction and extent of the changes from year to year.

Complete surveys of the hatchery industry are made every year in some States and every few years in all States. Monthly estimates of the production of baby chicks, based on returns from about 60 percent of total hatchery capacity, are also made. These figures of hatchery output together with a determination annually of the proportion of all farm chicks that came from hatcheries, give a dependable check on the actual level of chicken production.

Estimates of inventory numbers of chickens on farms January 1 (series K 242) are based primarily upon census enumerations. These enumerations for 1910–1955 were adjusted for changes between January 1 and the average date of enumeration in each State, and cover only farm flocks as defined by the Census Bureau. Estimates of change in numbers from year to year are based on rural carrier surveys made in December of each year, covering about 150,000 livestock farms, and on changes in flocks belonging to about 30,000 crop reporters, plus assessor and State farm census data where available.

Although census enumerations of chickens on farms were made in 1880, 1890, and 1900, the Department of Agriculture did not make annual estimates until 1909 because data showing annual changes were not available.

Estimates of inventory numbers of turkeys on farms January 1 (series K 249) are based primarily upon the census enumerations of turkeys on farms January 1, 1935, and April 1, 1940, adjusted for changes in numbers between January 1 and the date of enumeration. Turkeys on farms were not reported in the 1945 Census. The number on January 1, 1945, was estimated from the relationship between turkeys raised in 1944 and the number on hand January 1, 1945, as reported by crop and livestock reporters, using as a base the revised estimates of turkeys raised in 1944 based on the census enumeration. Annual changes in the estimates for intervening years are based mainly on the numbers on hand as reported on January 1 by crop and livestock reporters. Estimates of turkeys raised from 1954–1957 are based on poultry placement data secured from hatcheries. About an 88-percent sample is obtained. Although census enumerations of turkeys on farms were made in 1890, 1900, 1910, and 1920, the Department of Agriculture did not make annual estimates for years prior to 1929 because data showing annual changes were not available.

Chickens (series K 244) and turkeys (series K 251) produced on farms are computed from the number raised during

Digitized by Google

the year, minus the death loss of chickens and of turkeys that were on hand at the beginning of the year. Young chickens and young turkeys of the current year's hatchings that die are also excluded.

Egg production (series K 247) is estimated from returns from about 30,000 crop respondents and 5,000 commercial egg producers reporting on the first of each month for their own flocks the number of layers on hand and the eggs produced yesterday. Beginning with the estimated total number of layers on farms at the beginning of the year, the change in numbers from month to month is estimated from the changes shown by these survey farms. The monthly average number of layers and total egg production is revised at the end of the year if the change in number of layers shown by an annual survey with about 150,000 returns differs from the change estimated from monthly returns. Adjustment is also made for change in poultry farms on a monthly and annual basis.

K 254–328. General note.

For many crops, estimates of acreage, production, and prices begin in 1866, the year in which the Department of Agriculture began making regular reports. *Agricultural Statistics*, particularly the issues of 1941 and 1952, presents most of the available statistics, chiefly on a national basis, covering every phase, from acreage and production of individual commodities to utilization and consumption. *Crop Production* (Crop Reporting Board) presents monthly forecasts for the current season, beginning in March and carrying through the growing season.

The December issue provides a summary for the current season, revisions for the previous season, and comparisons with previous years. Forecasts and summary are on a State basis and for the United States. These data also appear in *Crops and Markets*. Other releases by the Crop Reporting Board present midmonth and season average prices received by farmers, value of sales and production, farm disposition, stocks in all positions, and other data. Periodic revisions connect current data with the longer historical series.

The censuses provide detailed data for counties. Census data are often not entirely comparable with the estimates shown, but furnish the benchmarks to establish the level of the estimates. For years before 1866, information from trade sources is available for some crops, such as cotton, tobacco, and rice.

Crop estimates are based chiefly upon reports from volunteer farmer-reporters who represent every part of every State. Check information is gathered from processors, from transportation and storage facilities, from buyers of farm products, from annual State farm enumerations, from various farm programs, and from other governmental agencies such as the Bureau of the Census, the Bureau of Internal Revenue, and the Bureau of Customs.

Season average prices are averages of the midmonth prices weighted by the quantity sold each month in the crop-marketing season, which is the 12-month period following the harvesting of the crop. This season may vary for different crops, and for any crop it may vary by States. The season average price of any crop is the average of all the State prices, weighted by the production of each State. Thus, it may be applied to production in any given year to obtain a measure of the value of that production. State season average prices may be weighted by quantities sold in each State to obtain an average for the United States which may be applied to total quantities sold in the United States to measure value of sales in the crop season. In neither case, however, should the computed value be confused with calendar-year income from the crop. Monthly estimates of quantity sold are based upon reports of receipts by the chief purchasers of the commodity—in the case of grains, the interior mills and elevators.

Midmonth prices received by farmers are estimated by the Crop Reporting Board and are based upon reports from thousands of firms dealing directly with farmers (such as elevators, truckers, processors, produce dealers, etc.) and from farmers themselves. The estimates are issued monthly for the principal farm commodities in *Agricultural Prices*.

Season average prices for each State and the United States are summed up in the December issue of *Crop Values* and in *Field and Seed Crops Farm Production, Farm Disposition, and Value* issued each May. Data for season average prices begins for most commodities in 1908, but is supplemented for preceding years by the December 1 price series based on farmers' estimates on December 1 of average prices for the season's sales.

See also general note for series K 254–328.

Corn figures include not only the production of corn on the acreage harvested for grain, but also an allowance for that harvested for silage and for forage, including some harvested by grazing farm animals (commonly called hogging off). Estimates of acreage harvested for grain, for silage, and for forage, including that hogged off, and production of corn for grain and silage are published by the Crop Reporting Board. Census figures for 1919 and previous years for both acreage and production represent corn harvested for grain only. For 1924–1939, census data for acreage represent corn harvested for all purposes, but those for production represent corn harvested for grain only.

The Crop Reporting Board has estimated farm stocks (series K 268), by States, quarterly since 1926 from reports of a large number of farmers. Farm stocks represent the farm carryover for crops of previous years, which become a part of the

Digitized by Google

feed supply for the new season. In addition to farm stocks of corn, stocks in all off-farm positions have been estimated since 1943. Comparison with the farm-stocks data indicates that the bulk of carryover stocks of corn on October 1 of any year is still on farms.

K 269–273. Wheat acreage, production, price, and stocks, 1839–1957.

Source: Series K 269–270, 1866–1943, Agricultural Marketing Service, *Wheat Acreage, Yield, and Production, 1866–1943*, Statistical Bulletin No. 158, February 1955 (processed); for census data, 1944, *Census of Agriculture: 1950*, pp. 556–557, and other 1944–1957 data, see source cited for series K 265–266, above.

Series K 271, see source cited for series K 267, above.

Series K 272, 1926–1939, *Stocks of Wheat on Farms, Revised Estimates, 1926–41*, February 1943 (processed); 1940–1955, see source cited for series K 268, above; 1956–1957, *Stocks of Grain in All Positions*, July 1957 and 1958.

Series K 273, 1926–1929, Department of Agriculture, *Agricultural Statistics, 1941;* 1930–1933, *Agricultural Statistics, 1946;* 1934–1955, Agricultural Marketing Service, Statistical Bulletin No. 203, January 1957 (processed); 1956–1957, *Stocks of Grain in All Positions*, July 1957 and 1958.

Wheat figures are the combined estimates for winter, durum, and other spring wheat, harvested for grain. Separate series for each of these kinds, by market classes, are published by the Crop Reporting Board. The census data on acreage and production are regarded as comparable with the estimates in most cases. Wheat acreage harvested for hay is not included in these series.

Farm stocks of all wheat, by States, have been estimated quarterly since 1926 from reports of a large number of farmers. Farm stocks (series K 272) represent the farm carryover from previous crops at the beginning of a new crop year. The carryover added to the new crop is the supply for the new season. Stocks in interior mills, elevators, and warehouses (series K 273) have been estimated by the Crop Reporting Board since 1919, and data on stocks in other commercial storages have been gathered by other agencies for varying periods.

See also general note for series K 254–328.

K 274–276. Oats for grain acreage, production, and price, 1839–1957.

Source: Series K 274–275, 1866–1943, Agricultural Marketing Service, *Acreage, Yield, and Production, 1866–1943*, June 1954 (processed); 1944–1957 and for census years, see source for series K 265–266. Series K 276, see source for series K 267.

For 1866–1948, oats for grain figures include the acreage cut ripe and fed unthreshed; for 1949–1957, they include only the acreage and production combined or threshed. Estimates of harvested acreage exclude oats cut green for hay for all years and oats cut ripe and fed unthreshed, 1949–1957. Census data are comparable only with the estimates beginning in 1949. Data on farm stocks and stocks in off-farm positions are also available in publications of the Crop Reporting Board.

See also general note for series K 254–328.

K 277–279. Barley for grain acreage, production, and price, 1839–1957.

Source: Series K 277–278, 1866–1908, Department of Agriculture, *Agricultural Statistics, 1941;* 1909–1938, *Agricultural Statistics, 1952;* 1939–1943, Agricultural Marketing Service, *Field and Seed Crops, Acreage, Yield, and Production*, April 1947 (processed); 1944–1957 and for census years, see source for series K 265–266. Series K 279, 1866–1908, *Agricultural Statistics, 1941;* 1909–1938, *Agricultural Statistics, 1952;* 1939–1957, see source cited for series K 267.

The annual estimates of barley acreage and production and the census data are on a comparable basis. Barley cut for hay is excluded. Figures on farm stocks are available from 1933–1957, and stocks in off-farm positions have been estimated since 1943. These data are available in various publications of Agricultural Marketing Service.

See also general note for series K 254–328.

K 280–282. Flaxseed acreage, production, and price, 1849–1957.

Source: Series K 281, 1866–1888, Agricultural Marketing Service, *Revised Estimates of Flaxseed Production, 1866–1929*, July 1936 (processed). Series K 280–282, 1889–1957, see source for series K 277–279. Census years, Bureau of the Census, *U.S. Census of Agriculture, 1954*, vol. II, p. 570.

See also general note for series K 254–328.

Annual estimates and census data are on a comparable basis. Flax grown for fiber is not included in the acreage estimates; flaxseed deseeded from fiber flax is not included in the production estimates. Estimates of fiber flax are available in publications of the Crop Reporting Board. Farm-stocks data and stocks in off-farm positions, 1947–1957, are also available from the same source.

K 283–285. Soybeans for beans acreage, production, and price, 1924–1957.

Source: Series K 283–284, 1924–1953, Agricultural Marketing Service, Statistical Bulletin No. 211, June 1957 (processed); 1954, *Field Crops, Acreage, Yield, and Production*, Statistical Bulletin No. 185, June 1956 (processed); 1955–1957, *Crop Production*, December annual summary, 1956, 1957, and 1958. Series K 285, 1924–1953, Statistical Bulletin No. 211 (cited above); 1954–1957, *Crop Values*, December 1955, 1956, 1957, and 1958. Census years, Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, p. 571.

Price figures are season average prices prepared by weighting the midmonth prices received by farmers. Figures for acreage grown for all purposes, alone and interplanted, and acreage and production of soybeans for hay are also estimated by the Crop Reporting Board. Data on farm stocks and stocks in off-farm positions, 1942–1957, are also available in publications of the same agency.

See also general note for series K 254–328.

K 286–288. Rice acreage, production, and price, 1895–1957.

Source: Series K 286–287, 1895–1943, Agricultural Marketing Service, *Fluctuations in Crops and Weather*, Statistical Bulletin No. 101, June 1951 (processed); 1944–1957 and for census years, see source for series K 265–266. Series K 306, see source for series K 303.

See also general note for series K 254–328.

Cotton production figures for census years are shown in running bales, and are not comparable with annual production estimates shown in 500-pound gross-weight bales. The net weight per running bale was 383 pounds in 1839, the first census period; 496.1 pounds in 1944; and 482.0 in 1954, the most recent census year.

Cotton production estimates are defined by statute as cotton actually ginned. For 1913–1924, annual ginnings as published by the Bureau of the Census included some cotton produced in lower California and Mexico and ginned in California; however, it is not included in U.S. production for those years. For those years, also, cotton ginned in the United States exceeds production by the quantity of the cross-border movement of seed cotton into this country. For all other years, beginning in 1899, production of cotton is the quantity of census ginnings by States adjusted for cross-State movement of seed cotton and rounded to thousands of bales. U.S. production is obtained by adding rounded State estimates and therefore differs slightly from the Census Bureau report on ginnings.

Before 1899, production figures were compiled from various current sources including exports and imports, rail and water shipments, mill receipts, etc., together with the decennial enumerations of the Bureau of the Census. These production estimates are the same as those in Department of Agriculture, Bureau of Statistics, Circular 32, cited above, except for minor adjustments caused by rounding State estimates.

Figures for stocks (series K 304) are in running bales, except that any small quantity of foreign cotton which is included is in equivalent 500-pound gross-weight bales. Before 1914, stocks are as of September 1. Data for 1906–1922 are from the New York Cotton Exchange Service; those for 1923–1957 were compiled by the Bureau of the Census.

Cottonseed production (series K 305) for 1866–1927 was computed from net lint production using a uniform ratio of 65 pounds of cottonseed for each 35 pounds of net lint. Beginning in 1928, ratios were estimated from data collected from cotton ginners.

The season average prices from 1908 to date for both cotton and cottonseed (series K 303 and K 306) are the weighted averages of midmonth prices. Before 1909, cottonseed prices are not available; before 1908, cotton prices were based on farmers' estimates on December 1 of average prices for the season.

The crop-marketing season for both cotton and cottonseed is August 1 to July 31 for all States except Texas where it begins about mid-July.

K 307–309. Tobacco acreage, production, and price, 1866–1957.

Source: **Series K 307–308**, 1866–1943, Agricultural Marketing Service, *Tobacco Acreage, Yield, Production, Price, and Value*, July 1948 (processed); 1944–1954, see source for series K 265–266, above; 1955–1957, *Crop Production*, July 1956–1958. **Series K 309**, 1866–1943, see source for series K 307–308; 1944–1954, Department of Agriculture, *Agricultural Statistics, 1956;* 1955–1957, Agricultural Marketing Service, *Crop Values*, December 1956, 1957, and 1958.

Estimates of potatoes and sweetpotatoes relate to the total crop harvested and include quantities used on farms where grown and losses from shrinkage, cullage, and dumping after harvest. The potato crop is divided into six seasonal groups: Winter, early spring, late spring, early summer, late summer, and fall. The seasonal estimates are based on the usual time of harvest. The schedule of estimates and the classification of States are shown in Agriculture Handbook No. 127, June 1957. Stocks on hand in the 26 fall States are published in separate reports, as of December 1, January 1, February 1, and March 1.

K 316–328. Fruit production and price, 1889–1957.

Source: Census years, Bureau of the Census, *U.S. Census of Agriculture: 1954*, vol. II, pp. 825–829 (for oranges and grapefruit for 1949 and 1954, see vol. I, parts 18, 24, 26, 30, and 33).

See also general note for series K 254–328.

Estimates of fruit production include the harvested crop plus allowances for economic abandonment in years when appreciable quantities are not harvested because of low prices or other economic factors; they exclude losses from natural causes, such as windstorms, freezes, etc. For all crops except apples, production relates to the total crop within the State, including both commercial and home production. For apple production, estimates for 1935–1957 relate to the total crop within specified counties designated as "commercial" counties.

Since annual estimates of Agricultural Marketing Service were begun they have been checked and adjusted at the end of each marketing season on the basis of shipment and processing records from transportation agencies, processors, cooperative marketing associations, and other industry organizations. The estimates are again checked at 5-year intervals with the Census of Agriculture and revised. The Agricultural Marketing Service estimates for census years do not always agree with census data because of allowance for economic abandonment and of adjustments based on available shipment and processing records.

Citrus fruits are valued at equivalent per unit returns, excluding packing, grading, and container costs, rather than at average prices for all sales.

[1] Except for data from Census of Agriculture, estimates have been adjusted for under-enumeration and changes in definition in the Census. Not strictly comparable with land in farms, value of farm property, or value of farm real estate.
[2] Intercensal estimates derived from straight-line interpolation. Excludes District of Columbia.
[3] Includes farmland and buildings, machinery and equipment, and all livestock.
[4] Census years as of date of enumeration. All other years as of March 1. District of Columbia excluded.
[5] Not available.

[1] These annual averages are simple averages of last-of-month employment estimates.
[2] Includes farm operators and members of their families doing farmwork without wages.
[3] Annual averages are weighted averages of wage rates as reported quarterly by crop reporters. Different wage rate categories used after 1948. See text.
[4] Cash wages and value of perquisites.
[5] 1877 or 1878, 1878 or 1879 (combined).
[6] Years 1866 to 1878 in gold.

Series K 83–97. Man-Hours Used to Produce Specified Amounts of Wheat, Corn, and Cotton: 1800 to 1950

96	Yield of lint per acre [1] lb.	283	245	160	191	179	147	147
97	Man-hours per bale [2]	126	191	269	280	318	439	601

[1] Yields for 1800 and 1840 are estimates by the authors. Yields for the other years are 5-year averages of published data, centered on year shown.
[2] For statistical purposes, the bale of cotton is 500 pounds gross weight or 480 pounds net weight of lint. Prior to Aug. 1, 1946, the net weight was estimated at 478 pounds. Running bales reported prior to 1899 have been converted to bales of 478 pounds net weight. Actual bale weights vary considerably.

Series K 98–103. Acreages of Harvested Crops, by Use, and Indexes of Cropland Used for Crops and Crop Production Per Acre: 1910 to 1957

[1] Includes farm and commercial stocks and holdings under price support and domestic supply programs. Minus sign means an addition to stocks.
[2] Includes civilian feeding in areas occupied by our Armed Forces.
[3] Includes seed, feed, industrial alcohol, alcoholic beverages, etc.
[4] Excludes deliveries by the Department of Agriculture.
[5] Stocks held for export. Minus sign means a withdrawal from stocks.
[6] Shipments out of this country.
[7] Represents net quantities withdrawn from domestic commercial channels.
[8] Less than 0.05 percent.
[9] Federal Farm Board exports.

[1] Includes Government payments from 1933 to 1957.
[2] Includes cash receipts from farm marketings, Government payments 1933 to date, value of home consumption, and rental value of farm dwellings.
[3] Realized gross farm income minus total farm-production expenses.
[4] Realized net income of farm operators plus value of inventory change plus wages paid to farm laborers living on farms.
[5] Base, 1910–1949: August 1909–July 1914=100; thereafter, January 1910–December 1914.
[6] Ratio of prices received by farmers (series K 129) to prices paid, including interest, taxes, and wage rates (series K 137).

[1] Beginning 1930, includes purchase-money mortgages and sales contracts in addition to regular mortgages.

[2] Beginning July 1, 1955, includes soil and water conservation loans insured by the Farmers, Home Administration.

[3] Average contract rates, except for temporarily reduced rates on outstanding loans of Federal land banks, 1934–44, and Federal Farm Mortgage Corporation, 1938–45.

[4] Payable during calendar year on outstanding loans. Excludes amounts paid by Secretary of the Treasury to Federal land banks, 1933–44, and Federal Farm Mortgage Corporation, 1937–45, as reimbursement for interest reductions granted borrowers.

[5] Average of rates on mortgages recorded during month of March-except beginning 1955 when average rates on recordings during first quarter are used.

[6] Not available.

[7] Less than $500.

[1] Includes inspected, noninspected, retail, and farm slaughter.

[2] Excludes processing tax of $0.50 per 100 pounds from Nov. 5 to 30, 1933; $1.00 from Dec. 1, 1933, to Jan. 31, 1934; $1.50 from Feb. 1 to 28, 1934; and $2.25 from Mar. 1, 1934, to Jan. 6, 1936.

[3] Excludes cattle and calves purchased for slaughter for Federal Surplus Relief Corporation from June 1934 to Feb. 1935 and for Aug. 1936; excludes also cattle thus purchased for Sept. 1936.

[4] Includes slaughter under the Emergency Government Relief Purchase Program in 1934–1935.

[5] Excludes purchases on Government account for the Emergency Hog Production Control Program from Aug. 22 to Oct. 7, 1933.

[1] Farm and factory production combined.
[2] Includes all types of cheese except cottage, pot, and bakers' cheese; full-skim American cheese excluded since 1908. Farm output not estimated since 1926.
[3] For 1919–1957, includes all evaporated and condensed whole milk as compiled by the former Bureau of Agricultural Economics and Agricultural Marketing Service. Prior to 1919, includes total production of all condensed and evaporated milk as interpolated from Census enumerations.
[4] For 1849–1923, computed from data on estimated production of manufactured dairy products, using average milk equivalent factors; 1924–1956, as published by Agricultural Marketing Service. Data include farm butter.

Series K 234–235. Wholesale Prices of Cheese and Butter: 1830 to 1957

[1] Includes shearing at commercial feeding yards.
[2] Beginning with 1943, average price for marketing season April through March following year. Prior to 1943, price relates to calendar year.
[3] Computed from State average prices for wool sold April 1957 through January 1958.
[4] Includes allowance for unredeemed wool.

[1] Estimates of the commercial crop refer to the production in the commercial apple areas of each State and include fruit produced for sale to commercial processors as well as for sale for fresh consumption.

[2] Includes tangerines.

[3] Relates to crop from the bloom of the year shown. In California the picking season usually extends from Oct. 1 to Dec. 31 for oranges, and Oct. 1 to Sept. 30 of the following year for grapefruit. In other States the season begins about Oct. 1 and ends in early summer.

[4] Prices are the equivalent per unit returns at the intake packing house door for all methods of sale.

Forestry and Fisheries

FORESTS AND FOREST PRODUCTS (Series L 1–109)

L 1–109. General note.

Statistics on the forest resource as a whole, such as the total area and ownership of forest land, total volume of timber, and growth and cut, are not presented here. Since 1900, several reports containing these basic forest statistics have been published and the five most noteworthy for inclusion of new data are listed below.

Forest Service, *Timber Depletion, Lumber Prices, Lumber Exports, and Concentration of Timber Ownership*, Report on Res. 311, 66th Congress, 2d session (The Capper Report), 1920.

Forest Service, *A National Plan for American Forestry*, Senate Document 12, 73d Congress, 1st session, 2 vols. (The Copeland Report), 1933.

U.S. Congress Joint Committee on Forestry, *Forest Lands in the United States*, Senate Document 32, 77th Congress, 1st session (The J. C. C. Report), 1938.

Forest Service, *Forests and National Prosperity*, Agriculture Miscellaneous Publication No. 668 (The Reappraisal Report), 1948.

Forest Service, *Timber Resources for America's Future*, 1959.

L 1–2. Gross area of national forest and other lands, 1905–1957.

Source: Forest Service, *National Forest Areas*, annual publications.

Data are prepared from individual land transactions of the Forest Service, such as transfers from other agencies, land exchanges, purchases, and other adjustments.

Gross area within unit boundaries (series L 1) prior to 1936 included the total land area within the authorized boundaries of the units formally designated or proclaimed as national forests. Since 1936, other lands administered by the Forest Service, including national forest purchase units, experimental areas, land utilization projects, and other land units have also been included.

The Federal Government seldom has complete ownership of all the land within the national forests and other units under administration of the Forest Service. Parts of such units are under private, State, county, and municipal ownership, or under the jurisdiction of a Federal agency other than the Forest Service. Gross area under Forest Service administration (series L 2) is thus the net area in these aforementioned units owned by the United States and administered by the Forest Service. National forests comprise the largest part of this net area, accounting for 90 percent of the total in 1956. Land utilization project lands, administered under title 3 of the Bankhead-Jones Farm Tenant Act, account for most of the remainder.

The source also includes statistics for States on the gross and net area of each national forest, purchase unit, experimental area, and land utilization area under the jurisdiction of the Forest Service.

L 3–5. Gross area approved for national forest purchase, 1912–1957.

Source: See source for series L 1–2.

The figures for gross area approved for purchase include the total area as of June 30 within purchase units that the Secretary of Agriculture has been authorized to purchase for national forest purposes by the National Forest Reservation Commission.

Statistics which show, by States and by national forests or purchase units, the area authorized by the Commission for purchase, the area purchased for national forests during each fiscal year, and the cost are presented in the annual reports of the National Forest Reservation Commission.

L 6–14. Volume and value of timber cut from national forest areas, 1905–1957.

Source: Forest Service, records.

Commercial sales (series L 8–10) include all sales from the national forests for which a charge is made. Nearly all commercial sales are made on a competitive bid basis with the sale going to the highest bidder. Most sales are timber sales (series L 8–9) but some material not measurable in board feet is also sold from the national forests (series L 10). Some timber from the national forest is exchanged for land (series L 11–12) and some is disposed of under free- and administrative-use permits to settlers, miners, residents, and other similar users (series L 13–14).

Information on individual transactions involving national-forest timber is available from the Forest Service. Unpublished records of national-forest stumpage sales are also available for all sales in the form of quarterly compilations classified according to Forest Service regions, major species and product, e.g., pulpwood, saw logs, etc.

L 15–18. Receipts from national forests, 1905–1957.

Source: Forest Service, records.

Receipts from the national forests are derived from timber and other forest product sales, settlement, and trespass; grazing and grazing trespass; and land uses such as power lines, resort and summer homesites, and ski lifts.

L 19–22. Payments to States and Territories, 1906–1957.

Source: Forest Service, records.

The "25-percent fund" (series L 20) consists of payments from gross receipts of the previous fiscal year from each national forest to the State or Territory in which the forest is situated for the benefit of public roads and schools under an Act of May 23, 1908 (35 Stat. 260) as amended. Payments are also made from timber receipts from the Tongass National Forest to Alaska for public schools and public roads, under an Act approved July 24, 1956 (70 Stat. 605).

The "Arizona and New Mexico school fund" (series L 21) consists of payments made to the States of Arizona and New Mexico under an Act of June 20, 1910. From the gross receipts of the national forests in the two States, payments are made in the proportion that the area of land granted the States for school purposes within these national forests bears to the total area of all national forests within the two respective States.

"Payments to State of Minnesota" (series L 22) consist of payments made under an Act of June 22, 1948 (62 Stat. 568).

Digitized by Google

Payments represent three-fourths of one percent of the fair appraised value of certain national forest lands in Cook, Lake, and St. Louis Counties in Minnesota.

Detailed statistics of receipts and payments by State and region and related data on Forest Service expenditures and investments are also available in records of the Forest Service.

L 23–25. Lumber production, 1799–1956.

Source: 1799–1945, Forest Service, Miscellaneous Publication No. 669, *Lumber Production in the United States, 1799–1946;* 1946–1956, Bureau of the Census, *Facts for Industry*, annual releases, "Lumber Production"; *Census of Manufactures*, 1947 and 1954; and records.

Data on lumber were first collected by the Bureau of the Census in the Census of 1810 (for the year 1809). Subsequently this agency collected and published statistics on lumber production for 1819 and decennially for 1839–1899, and annually from 1904 through 1954 excepting in 1905, 1906, 1913, 1915–1918, 1920, and 1948. The Bureau of Crop Estimates collected and published data for 1913, and the Forest Service for all other years. Federal, State, and private agencies such as the Tennessee Valley Authority, New York State, and various lumber manufacturers associations have cooperated with the Bureau of the Census and Forest Service in the collection of data on lumber production.

For 1809–1859, only the value of lumber produced was included in the decennial reports of the Bureau of the Census, although some reference to number of mills or number of saws was often made. For 1869, 1879, and 1889, the total quantity of lumber produced was reported by States. Since 1899, lumber production has been reported in quantity terms by States and species, although in recent years such reporting, based on sampling of the industry, has been restricted to major species and principal producing States.

Prior to 1912, except for decennial censuses (when there was some field followup of nonreporting mills by field agents), lumber production figures were based upon a mail canvass of producers for the entire Nation. Since 1912, except for 1948, the census in the Western United States has been conducted by mail supplemented by a field canvass to obtain reports from nonrespondents. In the Eastern States, statistics were obtained by mail canvass for 1912–1941. Since 1941, except for 1948, statistics for the East have been based either upon a complete field canvass (1942 and 1947) or upon a mail canvass supplemented by area sampling. For 1948, lumber production figures for the West were obtained by the Forest Service in cooperation with the West Coast Lumbermen's Association and the Western Pine Association through a mail canvass, with field followup of nonrespondents. For the East, 1948 figures are Forest Service estimates based upon data published by the National Lumber Manufacturers Association and other associations.

Eastern field canvasses in the early 1940's disclosed thousands of small sawmills and many larger mills not previously included in the annual surveys. These mills collectively produced a substantial volume of lumber. Accordingly, the Forest Service prepared revised estimates of lumber production for 1904–1908, 1910–1918, and 1920–1941 designed to include the production of nonreporting mills as well as of reporting mills. The revised estimates and a description of the methodology employed in revising reported lumber production estimates also appear in the source cited above for 1799–1945. In addition, this source presents lumber production figures prior to 1946, by species and States, and data on average value per thousand board feet for years prior to 1944. Data on lumber production by species and States are also available for 1946, 1947, and 1949–1956 in the Bureau of the Census publications cited above.

Production figures for 1869–1919 as reported in the decennial censuses of 1870–1920 were accepted as substantially correct. The figures for 1809, 1819, and 1839–1859 are estimates by the Forest Service based on value data from the decennial reports of the Bureau of the Census (see above). The figures for 1799 and 1829 are also Forest Service estimates.

L 26–33. Lumber imports and exports, 1899–1956.

Source: 1899–1946, Bureau of the Census, *Foreign Commerce and Navigation of the United States*, annual issues; 1947–1956, series L 26–29, *United States Imports of Merchandise for Consumption*, annual issues, and series L 30–33, *United States Exports of Domestic and Foreign Merchandise*, annual issues.

Figures are the summation of import entries and warehouse withdrawals prepared by importers or their brokers, and of export declarations prepared by shippers or their authorized agents or brokers. Series L 26–29 include lumber imports from all U.S. Territories and possessions; series L 30–33 include exports to all U.S. possessions, except Alaska and Hawaii.

Lumber imports and exports include sawn timbers, boards, planks, scantlings. joists, box shooks, and sawn railroad ties where quantities are given in board feet. The geographic area covered is the United States customs area and includes Alaska, Hawaii, and Puerto Rico, in addition to continental United States.

Supplementary statistics on the value of lumber imports and exports as well as value and volume of imports and exports of forest products, such as logs and bolts, poles, piling, Christmas trees, woodpulp, paper and paperboard, and other forest products by country of origin and destination also appear in the sources cited above.

L 34. Lumber, new supply, 1899–1956.

Source: See sources for series L 23–25, L 26–33.

Figures represent production plus imports minus exports for years prior to 1935. For 1935–1956, changes in lumber stocks are also included. The data on lumber stocks are partly Bureau of the Census and partly Forest Service estimates.

L 35. Lumber, per capita use, 1899–1956.

Source: Forest Service, records.

These figures were derived by dividing the "new supply" figures (series L 34) by total population (including Armed Forces overseas) as of July 1 of each year.

L 36–44. Lumber production, by region, 1869–1954.

Source: See source for series L 23–25.

The States included in each region are as follows:

New England:
- Connecticut
- Maine
- Massachusetts
- New Hampshire
- Rhode Island
- Vermont

Middle Atlantic:
- Delaware
- Maryland
- New Jersey
- New York
- Pennsylvania

Lake:
- Michigan
- Minnesota
- Wisconsin

Central:
- Illinois
- Indiana
- Kentucky
- Missouri
- Ohio
- Tennessee
- West Virginia
- Nebraska
- Iowa
- Kansas

South Atlantic:
- North Carolina
- South Carolina
- Virginia

South:
- Alabama
- Arkansas
- Florida
- Georgia
- Louisiana
- Mississippi
- Oklahoma
- Texas

Rocky Mountain:
- Idaho
- Montana
- Arizona
- Colorado
- New Mexico
- South Dakota
- Utah
- Wyoming

West Coast:
- California
- Oregon
- Washington
- Nevada

Digitized by Google

North Dakota is not included in any region since its production is negligible.

Production data for 1904–1908 and 1910–1914 are not adjusted for underreporting and therefore do not agree with the totals shown for series L 23.

L 45–60. Lumber production, by principal species, 1869–1956.

Source: See source for series L 23–25.

Production by species for the years 1904–1908, 1910–1918, and 1920–1941 are not adjusted for underreporting and do not agree with the totals shown for series L 23–25.

L 61, L 64, and L 67. Domestic production of pulpwood, woodpulp, and paper and paperboard, 1809–1956.

Source: 1809–1904, 1914, 1929, 1931, 1933, 1935, 1937–1956, Bureau of the Census, *Census of Manufactures*, various reports; and various *Facts for Industry* and other reports issued annually; 1905, 1916–1918, and 1920, Forest Service, records; all other years, joint reports of the Bureau of the Census and the Forest Service. The separate and joint annual releases of the Bureau of the Census and the Forest Service were issued under the general title, "Pulp, Paper, and Board."

For nearly all years, statistics have been based upon a mail canvass of woodpulp and paper producers.

Pulpwood production figures (series L 61) were reported by the Bureau of the Census for 1869–1899 in the decennial census reports for 1870–1900. In most years since 1904, data have been published showing domestic receipts (production), imports, species, and average cost delivered at manufacturing plants. In recent years, the Bureau of the Census in its monthly *Facts for Industry* release, "Pulp, Paper, and Board," has reported data on domestic pulpwood receipts, imports, consumption, and inventories by hardwoods and softwoods and by region. The annual summary of the monthly report shows this information by States. Domestic pulpwood receipts and domestic production are considered to be synonymous.

For 1946–1956, the Forest Service has published annual statistics in "Pulpwood Production in the South," which shows pulpwood production by county and by softwoods and hardwoods in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, and Virginia. It has also published similar data showing pulpwood production by species in Michigan, Minnesota, and Wisconsin for the same period.

Woodpulp production figures (series L 64) were reported decennially for 1869–1889. In 1899, 1904, 1909, 1914, and annually since 1916, woodpulp production has been reported by major grades, i.e., mechanical, sulfite, soda, sulfate, and more recently semichemical, defibrated and exploded, and special alpha and dissolving grades. In recent years, the Bureau of the Census in its monthly *Facts for Industry* release, "Pulp, Paper, and Board," has reported data on woodpulp production, inventories, and consumption, by grade.

In most years since 1899 for which data are available, woodpulp production has been reported by States. In recent years, Bureau of the Census reports show woodpulp production by grade, region, and States.

Paper and paperboard production figures (series L 67) for 1809, 1819, 1839, 1849, and 1869 are based on value data of paper production collected in the decennial censuses. Since 1870, for all years during which data were published, paper production was reported in quantity terms classified by newsprint, book paper, coarse paper, fine paper, container board, and other major grades. In the last several years, the Bureau of the Census in its monthly *Facts for Industry* release, "Pulp, Paper, and Board," has reported production for nearly 40 grades of paper and paperboard. The annual summary of this report has shown production of the major grades of paper by States and total production for nearly 200 different separate grades of paper and paperboard.

L 62, L 65, and L 68. Net imports of pulpwood, woodpulp, and paper and paperboard, 1899–1956.

Source: See source for series L 26–33.

Net imports represent gross imports minus gross exports.

L 63, L 66, and L 69. New supply of pulpwood, woodpulp, and paper and paperboard, 1899–1956.

Source: See sources for series L 61, L 64, and L 67, and also series L 26–33.

L 70–71. Domestic production of turpentine and rosin, 1900–1956.

Source: Agricultural Marketing Service, *Naval Stores Statistics, 1900–1954*, and Commodity Stabilization Service, *World Trends in Supply, Distribution and Prices of Naval Stores.* (1900–1931 figures derived from trade estimates published in *Gamble's International Naval Stores Yearbook;* for 1932–1946, figures were collected and published by Bureau of Agricultural and Industrial Chemistry; for 1947–1956, issued by Agricultural Marketing Service.)

Supplementary data showing naval stores consumption and stocks, production by type of extraction process, consumption of turpentine and rosin by type of industrial user (1922–1954), and average price and value of gum naval stores are also presented in *Naval Stores Statistics, 1900–1954*, cited above.

Beginning with the 1948 crop year, the current AMS report, *Naval Stores*, presents monthly production, stock, and export data for all naval stores except rosin oil. Information on consumption, prices, and stocks at consumption points which is not covered in the monthly report is included in the annual issue of this report.

L 72–84. General note.

Industrial timber products include all products, except fuelwood, commonly cut from round sections of trees. Items such as Christmas trees, Christmas greens, naval stores, and other nontimber forest products are not included.

The production, imports, and exports of timber products as reported by the Bureau of the Census, the Forest Service, trade associations, and other sources are customarily shown in a wide variety of units, such as board feet, cubic feet, cords, pieces, linear feet, and variations of these units. Appropriate factors have been used to convert the different measures of the various products to standard units of measure (cubic-feet roundwood) so that one product can be properly compared with another or that all can be combined and treated as a group. Cubic-feet roundwood is a measure of the roundwood volume of a log or bolt (excluding bark) from which the various products such as lumber and veneer are cut.

L 72–74. Domestic production, net imports, and new supply of industrial timber products, from roundwood, 1900–1956.

Source: Data are the sums of the series for different product groups; for production (L 75, L 78, L 81), net imports (L 76, L 79, L 82), and new supply (L 77, L 80, L 83, L 84).

L 75–77. Domestic production, net imports, and new supply of saw logs, 1900–1956.

Source: See source and text for series L 23–25, and L 26–33.

Estimates have been converted to cubic-feet roundwood on the basis of 156 cubic feet per 1,000 board-feet softwoods and 153 cubic feet per 1,000 board-feet hardwoods lumber tally.

Digitized by Google

L 78–80. Domestic production, net imports, and new supply of veneer logs, 1900–1956.

Source: Bureau of the Census, *Census of Manufactures*, various reports, and special reports under various titles; and Forest Service, records.

Data on the volume of logs consumed in the manufacture of veneers were first reported by the Bureau of the Census in 1905. Subsequently, it published data showing either log consumption or with sufficient information on veneer or plywood production to permit the derivation of estimates of log consumption for 1905–1911, biennially for 1919–1939, 1942–1945, 1947, and annually 1951–1956. Data for all other years represent estimates derived by the Forest Service.

In recent years, the Bureau of the Census *Facts for Industry* report, "Softwood Plywood and Veneer," presents figures for log consumption by species and State; log consumption in softwood plywood and veneer plants; softwood plywood production by species, type, and States; softwood veneer production in other than plywood plants, by States; and other related data. Another *Facts for Industry* report, "Hardwood Plywood, Market Shipments, and Inventories," presents current figures for market shipments and inventories of hardwood plywood by region, type of plywood, type of face ply, species of face ply, and other related data.

Logs consumed in the manufacture of veneer have been assumed to equal domestic production although small quantities of logs, mostly hardwoods, are imported each year by the veneer industry. Veneer logs commonly reported in board feet, log scale, have been converted to cubic-feet roundwood on the basis of 170 cubic feet per 1,000 board feet.

Net imports of veneer logs and bolts (series L 79) represent the equivalent net imports of veneer and plywood converted to board feet, log scale, and then to cubic-feet roundwood. The small volume of veneer logs and bolts imported are included under production (series L 78).

L 81–83. Domestic production, net imports, and new supply of pulpwood, 1900–1956.

Source: See source and text for series L 61, L 64, and L 67.

Domestic pulpwood production, net pulpwood imports, and the pulpwood equivalent of the net woodpulp and paper and paperboard imports have been converted to cubic-feet roundwood on the basis of 77 cubic feet per cord.

L 84. New supply of other products, 1900–1956.

Source: See source for series L 78–80.

"Other products" includes cooperage logs, poles and piling, fence posts, hewn ties, round mine timbers, box bolts, excelsior bolts, turnery bolts, shingle bolts, and a miscellaneous assortment of similar items. Fairly complete data are available for some of these items. For example, the Forest Service and the Bureau of the Census, either separately or jointly, published data which could be used to estimate the annual production of cooperage logs for 1905–1911, 1918–1919; biennially for 1919–1939; 1947 and 1952. Similar information covering about the same years was published by these two agencies for hewn ties and poles. For some products, particularly poles, data reported by the Forest Service in cooperation with the American Wood Preservers Association in *Food Preservation Statistics* were used as an indicator of production. Production estimates for mine timbers and other miscellaneous items have been based on periodic surveys made by the Forest Service or the Bureau of the Census. Imports of these products are small.

L 85–88. Stumpage prices for selected species, 1910–1956.

Source: Forest Service, records.

See also text for series L 6–14. All national-forest prices referred to are bid prices for timber sold on a Scribner Decimal-C log scale basis.

Stumpage prices of private timber sales and log prices were compiled by major species and principal producing regions during the period 1900–1934 and published by the Department of Agriculture in Technical Bulletin No. 626, *Stumpage Prices of Privately Owned Timber in the United States*. Comparable data for 1935–1943 and 1945 were published by the same agency in Statistical Bulletin Nos. 57, 62, 66, 71, 75, 76, 78, 79, 80, and 82. Prices shown in these publications were obtained through a mail canvass of timber sellers and buyers, such as independent loggers, sawmill operators, and other wood-using industries. The unit prices reported are of variable accuracy since exact information was lacking on timber volume, quality, accessibility, and other factors that determine stumpage and log prices. These data, however, constitute a comprehensive price series on private stumpage and log prices during earlier years and are considered useful in charting general trends and timber values.

Data on lumber values per thousand board feet, f.o.b. mill, are available for specified years in the Department of Agriculture Miscellaneous Publication No. 669, *Lumber Production in the United States, 1799–1946* (see text for series L 23–25). Data on lumber prices and price indexes have also been published by the Bureau of Labor Statistics since 1890. The publications of the Bureau of Labor Statistics vary in detail from year to year but in general give the average price, f.o.b. mill, or at some stated delivery point, for various species of lumber, by grade for major species. (For further detail on Bureau of Labor Statistics data, see text for series L 92–96.)

Douglas-fir figures (series L 85) for 1910–1931 represent national-forest timber sales of all species in Washington and Oregon; for 1932–1941, all species in western Washington and western Oregon; and for 1944–1956, national forest and Bureau of Land Management sales, Douglas-fir only, in western Washington and western Oregon.

Southern pine figures (series L 86) for 1910–1934 are stumpage prices of privately owned second growth southern pine timber as reported in Department of Agriculture Technical Bulletin No. 626, *Stumpage Prices of Privately Owned Timber in the United States;* for 1935–1949, national-forest timber sales for all southern species (most of which, however, were southern pine); and for 1950–1956, national-forest timber sales for southern pine only.

Sugar and ponderosa pine figures (series L 87 and L 88) represent national-forest timber sales for these species in California.

L 89–90. Douglas-fir log prices, 1910–1956.

Source: Forest Service, records.

For 1910–1932, data were derived from trade estimates as published in the magazine, *The Timberman;* for 1933–1956, data were derived from a compilation of average annual regional log values based on transactions shown in the Pacific Northwest Loggers Association report, *Composite Sale Analyses.*

L 91. Douglas-fir lumber prices (wholesale), 1910–1956.

Source: Forest Service, records.

Data for 1910–1929 were derived from Bureau of the Census or Forest Service reports (or both) on lumber; see text for series L 23–25. Data for 1930–1956, were derived from

publications of the West Coast Lumbermen's Association, which show average realization on lumber shipments, f.o.b. mill.

L 92. Wholesale price index for lumber, 1900–1957.

Source: 1900–1925, Forest Service, records; 1926–1957, Bureau of Labor Statistics, records.

Figures for 1900–1912, converted to a 1947–49 base by the Forest Service from an index (1935–39=100) of wholesale lumber prices published in Bureau of the Census, *Raw Materials in United States Economy, 1900–1952*. Figures for 1913–1925 were similarly converted from an index (1926=100) published in the Bureau of Labor Statistics, *Wholesale Price Indexes*.

The Bureau of Labor Statistics began publishing price data on lumber in 1890 with a series that showed wholesale prices per thousand board feet (with price indexes) for several important lumber species at designated points. In 1913, coverage was expanded and an index for all lumber was added.

L 93. Wholesale price index for plywood, 1936–1957.

Source: Forest Service, *Price Trends and Relationships for Forest Products*, 1957, p. 55.

The figures shown in the source for 1936–1946, are Forest Service estimates based on unpublished Bureau of Labor Statistics data; for 1947–1957, the figures were originally published by Bureau of Labor Statistics in *Wholesale Price Indexes*.

L 94. Wholesale price index for woodpulp, 1926–1957.

Source: 1926–1946, Forest Service, records (estimates based on unpublished Bureau of Labor Statistics data); 1947–1957, Bureau of Labor Statistics, *Wholesale Price Indexes*, various issues.

Woodpulp (sulfite domestic unbleached) figures were first published by the Bureau of Labor Statistics in 1913. In 1926, a more comprehensive series covering selected grades of woodpulp and an average wholesale price index was instituted. Between 1926 and 1957 a number of changes were made in coverage. In 1957, the Bureau of Labor Statistics coverage included wholesale prices and price indexes for five grades of woodpulp.

L 95. Wholesale price index for paper, 1926–1957.

Source: See source for series L 94.

Wholesale prices and price indexes for newsprint and manila wrapping paper were first collected and published by the Bureau of Labor Statistics in 1890. In 1926, a more comprehensive series along with an average wholesale price index covering selected grades of paper was instituted. Between 1926 and 1957 a number of minor changes were made in coverage. In 1957, the Bureau of Labor Statistics coverage included an all paper-price index, a price index for 10 grades of paper, and the average price for most of these grades.

L 96. Wholesale price index for paperboard, 1926–1957.

Source: See source for series L 94.

L 97. Lumber wholesale price index, 1798–1932.

Source: Cornell University Agricultural Experiment Station, *Wholesale Prices for 213 Years, 1720 to 1932, Memoir 142*, 1932, pt. I, pp. 107–119.

Prior to 1915, various lumber species at different delivery points were used in constructing this index. See source for further detail. For 1915–1932, the index numbers are based on the lumber index published by the Bureau of Labor Statistics.

L 98–105. Forest fires and area burned over, 1926–1956.

Source: Forest Service, *Forest Fire Statistics*, various annual issues.

Data are based upon reports submitted by the offices of the State Foresters, by the Regional Foresters of the Forest Service, the Department of Interior, and the Tennessee Valley Authority.

Protected area (series L 100–103) includes all forest lands that receive some organized fire protection. Unprotected area (series L 104–105) includes all forest lands not covered by organized fire protection.

The source publication also presents information by regions and States on areas needing protection, areas protected and unprotected, and areas burned on both protected and unprotected forest land by type of ownership, and size of fires on protected areas. No field organizations are available to report fires on unprotected areas and the statistics for these areas are generally less reliable than those for protected areas. No estimates are available for State and private lands in Arizona, Kansas, Nebraska, and Wyoming.

L 106–109. Expenditures for control of forest fires on Federal, State, and private lands, 1912–1956.

Source: See source for series L 98–105.

State and private expenditures (series L 108 and L 109) consist of expenditures for control under the Clarke-McNary section 2 program.

[1] Includes materials not measurable in board feet, such as Christmas trees, tanbark, turpentine, seedlings, Spanish moss, etc.
[2] Includes all timber sales for which a charge is made.
[3] Calendar-year data, 1922 to 1932. Figures for 1921 are for July 1, 1920, to Dec. 31, 1921. Figures for both 1932 and 1933 include data for July 1 to Dec. 1, 1932.
[4] For specified years which follow for 1934–1957, includes value of quantities not reducible to board feet; value in dollars as follows: 1934, $146; 1935, $870; 1937, $1,969; 1938, $3,648; 1940, $3,774; 1944, $7,204; 1945, $8,291; 1946, $8,894; 1947, $14,895; 1948, $20,968; 1949, $21,270; 1950, $20,468; 1951, $20,081; 1952, $15,477; 1953, $18,228; 1954, $23,281; 1955, $16,202; 1956, $15,501; 1957, not available.
[5] Includes land-exchange figures from beginning of exchange cuttings.
[6] Estimated.

[1] Includes Idaho white pine, ponderosa pine, sugar pine, and lodgepole pine.
[2] Lodgepole pine included in other softwoods.
[3] Separate data not available, included in other softwoods.
[4] Forest Service estimates.
[5] Not available.
[6] Includes some lumber not distributed by species.
[7] Data for eastern species represent Forest Service estimates; all other reported by Bureau of the Census.

chapter L

FISHERIES (Series L 110–206)

L 110–206. General note.

Fisheries data were largely compiled or derived from publications of the Fish and Wildlife Service. Additional detail can be found in these publications and in those of predecessor agencies (i.e., the Bureau of Fisheries, Department of Commerce, prior to July 1940, and the Commission of Fish and Fisheries prior to 1904). Statistical canvasses relating to the fishing industry carried out in 1880 and 1908 were made in conjunction with the Bureau of the Census (and predecessor agencies) and were published as Senate Document No. 124, 47th Congress, 1887, and as a Bureau of the Census Special Report, 1911, respectively. Since 1941, preliminary figures on many present and historical aspects of the fisheries have been published by the Fish and Wildlife Service in the form of leaflets entitled *Current Fishery Statistics*. Final and more detailed figures are published by the Fish and Wildlife Service as comprehensive annual Statistical Digests and in *Annual Reports of Alaska Fishery and Fur-Seal Industries*.

Complete statistical surveys of the fisheries and fishery industries of the United States, with the exception of those of the Mississippi River region, were made for the years 1880, 1908, 1929–1931, 1937–1940, 1950, 1954, and 1955. The fisheries of the Mississippi River and its tributaries (annual production of about 100 million pounds, or under 2 percent of the United States catch) were canvassed adequately in only 1894, 1899, 1908, 1922, 1931, 1950, 1954, and 1955. The years 1954 and 1955 are the only two consecutive years in which all sections of the United States, including the Mississippi River region, were canvassed to provide complete data on the wholesale and manufacturing industries as well as on the catch and operating units. General surveys of varying degrees of completeness for a number of States or limited areas of the United States were made for various years since 1880. Complete surveys of Alaska were made in 1892 (for that year and for the prior years 1889 to 1891), 1905–1908, 1910, 1925, and 1929–1957 (except for 1936).

While extended series for successive years are lacking for most regions of the United States, there are long continuous records available for landings at certain important ports or for certain species. The latter have been collected in connection with annual canned fish and byproducts surveys. Data on the production of canned fishery products and byproducts have been collected annually for all regions since 1921, while information was obtained on the production of packaged fish for 1926 and annually since 1928.

The coastal statistical surveys include canvasses of the commercial fisheries of the contiguous and noncontiguous ocean waters and bays of the United States and Alaska and as far up the coastal rivers as commercial fishing is conducted. The Mississippi River region includes tributaries thereof. The Great Lakes region encompasses the bays thereof, the international lakes of northern Minnesota, and the rivers emptying into these waters.

Several methods for the collection of fishery statistics have been employed. Where data were not available from some central private or public source, canvassing both by interview and by correspondence has been used to secure the required information from fishing vessel owners and operators, wholesale dealers, and manufacturers of fishery products.

Since 1946, a growing number of State fishery agencies have developed independently, or in cooperation with the Fish and Wildlife Service, relatively complete systems chiefly with respect to fish catch statistics which greatly facilitate the surveys in those States. In such instances, the Fish and Wildlife Service conducts only supplementary surveys to make the catch statistics comparable with those of other States and to secure additional wholesale and manufacturing data. Except in Alaska, securing fishery statistical data by the Federal fishery agencies has been on a nonmandatory basis.

Until 1951, all statistics of the Alaska fisheries were collected by canvass of the industry chiefly through correspondence. Subsequently, catch statistics have been compiled from copies of dealer invoices for fish and shellfish purchased from individual fishermen that are required by law to be furnished to the Fish and Wildlife Service. This procedure, first instituted by California in 1917, is becoming more generally used in a number of coastal States, and is improving the source materials available for the compilation of national statistics by the Federal Government.

Statistics on commercial landed catches of fish are usually shown in the published reports as round salable weight, being converted to such a common basis by established conversion factors. In the Great Lakes States, catches are usually shown in weights as landed, which may be in the round or eviscerated condition. Oyster, clam, and clam-like shellfish data are usually expressed in amounts of recoverable meats. Crabs, shrimps, squid, and octopus landings are shown in round weights. Whaling production from land-based plants in the United States and Alaska is included in the total of fish production in series L 112 and L 114. These land-based plants have not produced more than 17 million pounds of whale products in any year of record in this report. These series do not include the high-seas production of whale products either in this or in the previous century. The yield is expressed in terms of the weight of products produced, not the live weight of the whales.

The values of the landed catches are gross dollar returns to catching vessels and fishermen. The value of processed or manufactured items is that by the manufacturer. Data are usually collected and published on a calendar-year basis, although compilations for some States are on a fiscal-year basis.

Statistics of landed catches do not include either the marine or freshwater catches made for personal use including those by Indian populations, or for sport, or landings by foreign fishing vessels in United States ports, or imports. They include catches by United States fishing vessels landed in foreign ports for transshipment in bond to the United States.

Since 1942, the commercial catches have been credited to the port at which they were landed. Prior to that time the entire annual catch of a vessel was credited to the port out of which the majority of its yearly operations were conducted, regardless of the actual point of landing. Due to the generally broad regional grouping of the data shown here, the effect of the change in method of crediting yields upon the trends of landings has, for the most part, been insignificant. While neither method provides completely satisfactory information as to the approximate location of the fishing grounds producing the

Digitized by Google

landed catches, the present practice permits closer estimates than the former.

All general references to fish include fish, shellfish, and other marine or freshwater products including those of the land-based segment of the United States whaling industry.

Fisheries outside the continental limits of United States and Alaska, some products of which enter the domestic market duty-free, are those of Hawaii, American Samoa, and the Commonwealth of Puerto Rico. Fisheries of these areas are not subject to Federal control and are not included in the series shown here unless otherwise indicated. Total commercial production in these fisheries is of relatively small magnitude. Canned tuna for continental United States market is the chief commercial item produced in Hawaii and American Samoa. Hawaiian fisheries statistics are presented annually since 1948 in *Fishery Statistics of the United States*, Statistical Digests.

L 110–115. Yield and value of United States and Alaska fisheries, 1880–1956.

Source: Series L 110–111, sum of figures for series L 112–115. Series L 112–113, 1880, Commission of Fish and Fisheries, *The Fisheries and Fishery Industries of the United States*, 1887; 1887–1928, H. F. Taylor, *Economics of the Fisheries of North Carolina*, part III, "Survey of Marine Fisheries of North Carolina," The University of North Carolina Press, Chapel Hill; 1929–1938, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues; 1939–1956, Fish and Wildlife Service, *Fishery Statistics of the United States*, annual Statistical Digests. Series L 114–115, 1880 and 1889–1910, see source for series L 112 and L 113; 1917, J. N. Cobb, *Products of the Commercial Fisheries of the United States*, American Fisheries Society Transactions, XLVIII (1), 1918; 1922–1928, Fish and Wildlife Service, records; 1929–1956, see source for series L 112–113.

Source figures have been adjusted where necessary with revised data for the Alaska herring fishery (from O. E. Sette, *Historical Catch Statistics on Pacific Herring, Clupea Pallasii*, 1955, Fish and Wildlife Service Ocean Research Note 4 and amendments and 1957 addendum) and the conversions for cured fish discussed below.

Since 1928, complete or partial surveys have been made of the various regions of the United States, except for the Mississippi River, with sufficient frequency to produce satisfactory annual estimates of the yield and value of the United States and Alaska fisheries. Due to the relative stability and low magnitude of the Mississippi River production, the inclusion of interpolated estimates for that region do not significantly affect the national totals.

Prior to 1929, except for 1909–1914, Taylor provides a well validated and statistically satisfactory series of annual figures by summation of critically adjusted and interpolated data based upon various individual State and regional data published by the Bureau of Fisheries or its predecessor, the Commission of Fish and Fisheries. No statistically satisfactory national totals can be provided for 1909 to 1914 (Taylor). A satisfactory Alaska total is provided by Cobb, which, added to Taylor's 1917 United States total, provides a combined total for that year.

Prior to 1908, records of salt fish were not converted to equivalent fresh round weights except for 1880. It was estimated (Taylor) that such salt fish in 1887 represented at least 20 percent of the national total catch of food-fish species. By 1920, this proportion had declined to about 1 percent. Estimated corrections back to 1908 (derived from Taylor, figure 7, p. 379) have been added to the estimates of national totals (Taylor, p. 480). Also, revisions of Alaska annual herring totals for 1927–1953 (see Sette, cited above) have been carried into the national and Alaska catch totals shown for series L 110 and L 114, respectively.

See also general note for series L 110–206.

L 116–123. Landed catches in the United States, by regions, 1880–1956.

Source: 1880–1903, Commission of Fish and Fisheries (in cooperation with the Bureau of the Census and its predecessor agencies), *Commissioner's Report and Appendices*, reports for 1880 and 1908; 1904–1939, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues; 1940–1956, see publications by Fish and Wildlife Service and H. F. Taylor, cited for series L 112–113.

The regions presented comprise the following States or sections thereof:

New England States:
- Maine
- New Hampshire
- Massachusetts
- Connecticut
- Rhode Island

Middle Atlantic States:
- New York
- New Jersey
- Delaware

Chesapeake Bay States:
- Maryland
- Virginia

South Atlantic States:
- North Carolina
- South Carolina
- Georgia
- East coast Florida

Gulf States:
- West coast Florida
- Alabama
- Mississippi
- Louisiana
- Texas

Pacific Coast States:
- California
- Oregon
- Washington

Lakes Region:
- Great Lakes
- International lakes of northern Minnesota

Mississippi River:
- Including tributaries

Regional totals prior to 1909 include cured fish in terms of product weights and not round weights used for figures in series L 110 and L 112.

In spite of deficiencies arising from interpolating values over periods during which no canvasses were made in some regions, it is probable that these figures provide statistically satisfactory estimates of the trends of landed catches of all species combined in the several regions.

The annual and secular changes for the various regions have resulted from changes in composition of the catches from time to time. These changes may be deduced from the figures for series L 124–152.

Since only seven surveys were made of the Mississippi River fisheries during the period from 1899 to 1955, no extended production records are available for the principal species of the Mississippi River region. Buffalo fish, bullheads and catfish combined, and mussel shells for the button industry have provided over this period an average of 15 percent, 12 percent, and 42 percent, respectively, of the total recorded average annual production in this region. After reaching a high point of 82 million pounds in 1908, freshwater mussel-shell production has shown a sharply declining trend to the 1955–1956 level of about 30 million pounds.

L 124–131. Landed catches of principal species in New England States, 1876–1956.

Source: 1876–1886 (except for 1880), Bureau of Fisheries, *Statistics of the Mackerel Fishery of the East Coast of North*

Digitized by Google

America, 1804 to 1930, Investigational Report No. 19, vol. 1, 1934; 1880, Commission of Fish and Fisheries, *The Fisheries and Fishery Industries of the United States*, 1887; 1887–1950, Fish and Wildlife Service, *Fishery Statistics of the United States, 1950*, Statistical Digest No. 27; 1951–1956, *Fishery Statistics of the United States*, annual Statistical Digests.

The species shown here have accounted for between 65 percent and 87 percent of the total New England fish production (series L 116). The accuracy of these data has been enhanced by the fact that a long, unbroken, annual detailed record of landings by individual vessels at the major New England ports has been available. The figures for 1908 and earlier years, not including 1880, have not been corrected for portions of the catches of some species that were recorded in those early years as product weights of cured fish.

L 132–133. Landed catches of menhaden and oysters in Middle Atlantic States, 1880–1956.

Source: See source for series L 124–131.

See also general note for series L 110–206.

L 134–136. Landed catches of menhaden, oysters, and crabs in Chesapeake Bay States, 1880–1956.

Source: See source for series L 124–131.

See also general note for series L 110–206.

L 137–142. Landed catches of shrimp, menhaden, and mullet in South Atlantic States and Gulf States, 1880–1956.

Source: See source for series L 124–131.

Historically, these two regions were canvassed for statistics at infrequent intervals, and until recent years most State agencies in these regions maintained no statistical systems. The data on menhaden, however, are more complete because its use for reduction has resulted in the landings being recorded during the more frequent canvasses for manufactured fishery products by the Fish and Wildlife Service and its predecessor agencies.

See also general note for series L 110–206.

L 143–144. Landed catches of lake trout and whitefish in Lakes Region, 1885–1956.

Source: Except for 1885, see source for series L 124–131; 1885, *Fishery Statistics of the United States, 1950*, Statistical Digest No. 27.

See also general note for series L 110–206.

L 145–149. Landed catches of principal species in Pacific Coast States, 1892–1956.

Source: See source for series L 124–131 except for series L 148 for which—1911–1950, International Fisheries Commission Report 17, 1952; 1951–1956, International Pacific Halibut Commission, records.

State and Federal agencies in this region, due in part to the consistent support by the fishing industry, have maintained the most continuous and probably the most accurate series of fisheries statistics of any region in the United States.

The landed catches include both those from waters contiguous to the coasts of California, Oregon, and Washington, and waters off foreign shores; tuna from those off South and Central America; salmon and halibut from those off Canada. Also, a large proportion of the landed catch of the halibut comes from waters off Alaska.

See also general note for series L 110–206.

L 150–154. Landed catches of salmon, halibut, and herring in Alaska, 1882–1956.

Source: Series L 150, 1927–1956, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues, and Fish and Wildlife Service, *Fishery Statistics of the United States*, annual Statistical Digests. Series L 151, 1911–1950, International Fisheries Commission Report 17, 1952; 1951–1956, International Pacific Halibut Commission, records. Series L 152, 1882–1956, O. E. Sette, *Historical Catch Statistics on Pacific Herring, Clupea Pallasii*, 1955, Fish and Wildlife Service Ocean Research Note 4 (also amendments and O. E. Sette, 1957 addendum). Series L 153–154, 1884–1931, *Pacific Fisherman*, "Annual Statistical Number 30," Miller Freeman Publications, Seattle, January 1932; 1932–1956, *Pacific Fisherman*, "1957 Yearbook Number," January 1957.

The halibut figures (series L 151) include catches landed by United States vessels in the railhead port of Prince Rupert, Canada, for shipment in bond to the United States, as has also been the practice in the published compilations by Federal fishery agencies.

The major portion of the Alaska herring catch has been used for reduction to meal and oil except during the period 1912 to 1922 when salting and canning predominated. Such direct use as a food fish has since declined and practically disappeared after 1948. The variety and changing emphasis in the products reported produced each year and the problem of converting such diverse products to a common raw fish value reduced the usefulness of the originally published total catch statistics. These have been revised from time to time (see Sette who appraised the revisions of such workers as Rounsefell up to 1928 and Skud more recently).

See also general note for series L 110–206.

L 155–163. Disposition of landed catches, by major product groups, and edible imports, 1921–1956.

Source: Series L 155, see source for series L 110–111. Series L 156, derived as sum of series L 157, L 158, and L 159. Series L 157, derived as residual of series L 155 and the sum of series L 158, L 159, and L 161. Series L 158–159, 1921–1938, Fish and Wildlife Service, *Fishery Industries of the United States*, annual issues; 1939–1956, *Fishery Statistics of the United States*, annual Statistical Digests. Series 160, 1921–1955, Fish and Wildlife Service, *Frozen Fish—1955*, Current Fishery Statistics No. 1276; 1956, *Fishery Statistics of the United States*. Series L 161, Fish and Wildlife Service, *Fishery Leaflet 393, revised, April 1958*. Series L 162–163, Fish and Wildlife Service, *Imports and Exports of Fishery Products, 1952–1956*, Current Fishery Statistics No. 1595.

The fresh and frozen catch figures (series L 157) should be considered only as rough estimates since they were derived as residuals of the total catch figures (series L 155, same as series L 110) and the canned, cured, and industrial catch figures (series L 158, L 159, and L 161). The total catch figures were also derived by summing the total United States and Alaska catch (series L 112 and L 114) and then independently adjusting for 1940–1951 and 1953 (without adjustment of series L 112 and L 114).

Canned catch figures (series L 158) represent a computed amount of fish or other aquatic organisms that were heat processed in cans. Cured products figures (series L 159) represent an estimated amount of fish and other living aquatic animals that were dried or dehydrated, salted, smoked, or pickled. Industrial products figures (series L 161) represent the weights of fish and other aquatic products determined to have been manufactured into fish meal, oil, fish solubles, homogenized condensed fish, shell products, or used as bait or for animal food, and other miscellaneous items.

Digitized by Google

United States and Alaska production may also be classified according to type of products whether crustacea such as crabs, shrimps, lobsters; mollusks such as oysters, clams, squid; fresh-water organisms; bottom or demersal marine fish; surface or pelagic marine fish; and such miscellaneous products as turtles, seaweeds, and other items, not including whale products. The percentage of total production contributed by the foregoing groups at various times has been as follows:

	1908	1930	1937	1945	1950	1955
Crustacea	5	6	6	7	8	9
Mollusks	13	7	4	4	4	4
Fresh-water	11	5	4	4	4	5
Marine demersal	21	22	17	23	19	19
Marine pelagic	50	60	69	62	65	63
Miscellaneous	(1)	(1)	(1)	(1)	(1)	(1)

[1] Less than 1 percent.

L 164–171. Production and imports of selected fishery items, 1924–1956.

Source: Series L 164, Fish and Wildlife Service, *Packaged Fish—1956*, Current Fishery Statistics No. 1518. Series L 166, L 168, and L 170, 1924–1939, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues; 1940–1956, Fish and Wildlife Service, *Fishery Statistics of the United States*, annual Statistical Digests. Series L 165, L 167, L 169, L 171, Customs Service, records.

The import figures are based on Customs documents.

See also general note for series L 110–206.

L 172–175. Production of canned tuna and tuna-like fish, 1926–1956.

Source: Fish and Wildlife Service, derived from *Survey of the Domestic Tuna Industry*, Special Scientific Report: Fisheries No. 104, 1952, and *U. S. Tuna Fishery, 1911–58*, Fishery Leaflet 484, 1959.

The data have been revised and therefore differ from those published by the Bureau of Fisheries in *Fishery Industries of the United States*, annual issues, and by the Fish and Wildlife Service, *Fishery Statistics of the United States*, annual Statistical Digests.

It appears that import data for frozen tuna recorded in the latter two sources are defective and that the recently revised data by the Fish and Wildlife Service, series L 174, is much more reliable. Since 1952, the series includes production in Hawaii which represents a small proportion of the total, and from Puerto Rico and American Samoa whose contributions were still smaller.

See also general note for series L 110–206.

L 176–195. Production and value of canned fishery products, 1921–1956.

Source: 1921–1935, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues; 1936–1956, Fish and Wildlife Service, *Canned Fish and By-Products, 1956*, Current Fishery Statistics No. 1517.

See also general note for series L 110–206.

L 176–177, total, all products. In addition to the nine products for which figures are separately presented (series L 178–195) and which have represented over the period of record from 85 percent to 97 percent of production of all canned fishery products, these totals include very substantial packs of clams and clam products, large and valuable packs of crabs, and small but valuable packs of fish roes and of shrimp and oyster specialty products, and many other less important items. These data are the latest revised figures and all are equated to units of the latest defined standard case for each product. A history of conversion factors that have been used and their present definitions appear in Current Fishery Statistics No. 1517, cited above.

L 178–179, Pacific Coast salmon. (Standard case, 48 cans of 16 ounces net weight each.) Includes Alaska salmon (also shown separately, series L 150) which account for the largest proportion of the total. Five species of the genus Oncorhynchus are included—red, king, silver, pink, and chum salmon—and also an extremely small proportion of steelhead trout.

L 180–181, Pacific pilchard. (Standard case, 48 cans of 15 ounces net weight each.) The pilchard is more commonly known as the California sardine. Prior to 1937, the magnitude of the pack was determined in part by the proportion of the total catch that was permitted by California State law to be used for reduction to meal and oil.

L 182–183, Atlantic sea herring. (Standard case, 100 cans 3¼ ounces net weight each.) The Atlantic sea herring is also known as the Maine sardine.

L 184–185, tuna. (Standard case, 48 cans of 6, 6½, or 7 ounces net weight per can for grated, chunks, and solid packs, respectively.) Includes the canned pack of the true tuna species, albacore, yellowfin, bluefin, skipjack, tonno, and the tuna-like varieties, bonito and yellowtail.

L 186–187, oysters. (Standard case, 48 cans of 4-2/3 ounces drained weight each.)

L 188–189, shrimp. (Standard case, 48 cans of 5 ounces net weight each.)

L 190–191, anchovies. (Standard case, 100 cans of 5 ounces net weight each.)

L 192–193, mackerel. (Standard case, 100 cans of 5 ounces net weight each.) The production consists of Jack and Pacific mackerel of California.

L 194–195, animal food. (Standard case, 48 cans of 16 ounces net weight each.) Consists largely of pet and animal food derived from groundfish species and parts of other fish unsalable for human use or of species of low market value as human food.

L 196–202. Production and value of dried fish meal and scrap, acidulated scrap, fish and other marine oils, and imports of fish meal, 1921–1956.

Source: 1921–1938, Bureau of Fisheries, *Fishery Industries of the United States*, annual issues; 1939–1956, Fish and Wildlife Service, *Fishery Statistics of the United States*, annual Statistical Digests.

In contrast to series L 112, L 114, and others which included only the products of United States land-based whaling, series L 196 and L 200 include the meal and oil yields from the United States Antarctica and West Australia factory-ship whaling in 1935–1939.

Since 1941, the acidulated product of the menhaden fishery has been a negligible proportion of the total production of scrap and meal and it is not separated in the recorded statistics of the industry after 1946.

Acidulation of the wet menhaden press cake after removal of the oil was an alternative preservative process to drying. Since it was sometimes carried out as a temporary measure prior to drying at a later and more propitious time, it is probable that some of the tonnage of acidulated scrap may have been subsequently also reported as dried scrap leading to some duplication of reported tonnage in the earlier years.

L 205. Sealskins obtained from the Pribilof Islands, 1910–1957.

Source: 1910–1938, Bureau of Fisheries, *Alaska Fishery and Fur-Seal Industries*, Administrative Reports; 1939–1957, Fish and Wildlife Service, *Alaska Fishery and Fur-Seal Industries*, Statistical Digest.

Under the terms of the 1911 and succeeding treaties or agreements with Canada, Japan, and Russia, the take of fur seal on the Pribilof Islands in the Bering Sea has been under the exclusive and direct custodianship of the U. S. Government.

Sealskin figures represent the total take before the partitioning of the yield between the several countries involved. The figures for 1910 and 1911 were pretreaty and represent skins taken directly by the U. S. Government, as the United States' lease to the private company that had engaged in the operation since 1867 had expired early in 1910. The 1918 take was the first treaty take out of which Japan and Canada each received a 15 percent share for relinquishing all rights to pelagic sealing in the eastern North Pacific. Russia had not been previously engaged in pelagic sealing. With the abrogation of the treaty by Japan in 1940, Canada's share was increased to 20 percent under the Provisional Fur-Seal Agreement of 1942 as amended. Increases in take in 1955 and 1956 resulted from a new concept of herd management being instituted, designed to increase annual yields by the prevention of overcrowding of the environment.

Though only estimates of varying validity are available on the total size of the Pribilof Islands fur-seal herds, the high value of the skins and the fact that specified shares of the take were conveyed under treaty to Japan and Canada has ensured the accuracy of the record of annual takes. The U.S.S.R. does not share in the take even though it was a party to the treaty.

See also Fish and Wildlife Service, *A Population Study of the Alaska Fur-Seal Herd*, Special Scientific Report, Wildlife No. 12, 1954, for a history of the sealskin resource, 1786–1950.

L 206. Land-based production of whales, 1912–1957.

Source: *Pacific Fisherman*, "Annual Statistical Numbers," 1910–1957, Miller Freeman Publications, Seattle. See also Norway Committee for Whaling Statistics, *International Whaling Statistics*, Nos. 1-15, Oslo, 1930–1941.

Present century participation by the United States in the whaling industry has been relatively inconsequential compared to that of other countries and to the American high-seas whaling of the past century. It has been largely restricted to land-based operations chiefly in Alaska and to a lesser extent in Washington, terminating in each in 1939 and 1925, respectively, and to operations in California from time to time for 1918–1956.

Minerals

M 1–12. Summary of mineral operations, 1840–1954.

Source: 1840–1889, reports of Sixth, Seventh, Eighth, Ninth, Tenth, and Eleventh Censuses; 1902–1929, *Census of Mines and Quarries* for 1902, 1909, 1919, and 1929; 1935, *Census of Business: 1935;* 1939 and 1954, *Census of Mineral Industries, 1939* and *1954*. (Data shown are as reproduced in the 1954 Census of Mineral Industries summary reports, except for a few corrections.)

Figures are based on establishment reports for each operation covered in the census. These reports include all of the information shown (as well as other related data). The different series are comparable, therefore, for a given year and a given industry. The comparability of figures for various census years, however, is affected somewhat by changes in the specifications for establishments covered. For 1954, the Census tabulations excluded small establishments for which each of the following three items was less than $500 for the entire year: (1) Value of products shipped and services performed for others; (2) expenses for wages, salaries, supplies, minerals received for preparation, fuel, purchased electric energy, contract work, and purchased machinery; and (3) capital expenditures for development and exploration of mineral properties, new construction and major alterations, and new and used machinery and equipment. For 1939 and 1929, in general, small establishments were excluded if each of three similar items amounted to less than $2,500, and, in general, for 1919, if value of products was less than $500 and expenditures for development work less than $5,000. For earlier years, no general size level was specified for the censuses.

M 1, number of mines, quarries, and oil and gas wells. These figures are much less comparable from one year to another than the figures for series M 2–12 since they are greatly influenced by the inclusion or exclusion of very small operations, such as the activity of prospectors, small irregular operations, and oil and gas stripper operations. Many of these were below the Census level for inclusion for certain years but were included in other years (see preceding paragraph).

M 4, value added in mining. For 1954, represents gross value of shipments plus capital expenditures less cost of supplies, minerals received for preparation, fuel, purchased electric energy, contract work, and purchased machinery. For earlier years, to substitute for data not available from Census reports, a rough measure is included which represents value of shipments less cost of supplies, minerals received for preparation, fuel, purchased electric energy, and contract work.

M 5, production and development workers. For 1909–1954, the figures represent the average of reported employment for the midmonth pay period for the 12 months of the census year; or, in the case of the crude petroleum and natural-gas extraction industries for 1954, an average of such figures for a specified month in each quarter of the year.

M 11, capital expenditures for development and exploration of mineral property. For 1954 and 1939, the Census also obtained figures for capital expenditures for new and used machinery and equipment. Such items for 1954 were included in the capital expenditures figures used to compute value added (see series M 4).

M 12, aggregate horsepower rating of power equipment. Represents the aggregate horsepower rating of all prime movers and electric motors driven by purchased energy in use or available for use at the end of the census year.

M 13–274. General note.

The principal sources for these series are two annual publications: *Mineral Resources of the United States*, published annually for 1882-1931; and *Minerals Yearbook*, published annually since 1932–33. These volumes were prepared and issued by the Geological Survey from 1882 to 1923 and by the Bureau of Mines since 1924.

M 13–37. Value of mineral products, in current dollars, 1880–1956.

Source: See general note for series M 13–274.

The figures for series M 13, M 14, M 20, and M 30 (the grand total and commodity subtotals) cover the period presented with two overlapping series. One on the so-called "old basis" runs from 1880 through 1948, while the other on the "new basis" is the series as currently compiled, beginning with *Minerals Yearbook, 1949*. The "new basis" series has also been extended by the Bureau of Mines back through 1925 for the grand totals and subtotals; it was carried back to 1947 and 1948 in *Minerals Yearbook, 1949*, and back through 1925 in *Minerals Yearbook, 1950*. Thus, the figures shown here for series M 13, M 14, M 20, and M 30 represent the "new basis" for 1925-1956, and the "old basis" for earlier years. However, as indicated below (see text for series M 30–37), certain important aspects of the "new basis" for the value of metals production have been applied by Resources for the Future, Inc., Washington, D.C., to all of the earlier metals production figures and, therefore, the total value, series M 13, and total metals, series M 30, are affected.

A description of the revision included in *Minerals Yearbook, 1949*, pp. 29–30, indicates the deficiencies in the earlier statistics which the "new basis" of measurement was designed to correct. These deficiencies and their corrections apply in the main to, and are, therefore, described below in the text for fuels (series M 14–19), nonmetals (series M 20–29), and metals (series M 30–37). Another improvement applicable to all statistics on the "new basis" is the correction of the value grand totals and subtotals back through 1925 to exclude mineral products made from materials of foreign origin, which had previously been included in some cases.

In addition to the general revision made in the *Minerals Yearbook, 1949* and *1950*, other less important revisions of the grand totals and subtotals for earlier years are often carried in later editions of the *Minerals Yearbook*. Series M 13, M 14, M 20, and M 30 present the most recently revised totals and subtotals. Since these revisions are often carried in later editions of the *Minerals Yearbook*, without full supporting commodity details, the values shown here for the individual commodities are not always strictly comparable with the totals and subtotals in all years.

In general, a major factor making for lack of long-run comparability within series, and among different series, is the failure of the basic source to use a consistent stage of production at which to measure value. Not all of the series provide a measure of value at the mining stage of production, as distinct from the manufacturing stage. Instead, value is measured

Digitized by Google

at the mining stage for some commodities and at a stage in the manufacturing process for others for which mine value figures may be difficult to collect (frequently because of the integration of mining and manufacturing production processes). Moreover, the stage at which the value of individual commodities is measured has changed from time to time. Consequently, the totals and subtotals for any year are a mixture of values at different stages in the production process and similar totals and subtotals for succeeding years may also represent different mixtures so that the comparability of the figures is significantly affected. However, double counting has generally been avoided by including a product at not more than one stage in the production process.

Another general difficulty involves geographic coverage. Totals and subtotals for 1925–1952 cover continental United States only; but individual commodity figures for 1925–1946 may include production outside continental United States. For 1952–1956, the totals and subtotals include Alaska and Hawaii, while for years prior to 1925, Alaska, Hawaii, Philippine Islands, and Puerto Rico are covered.

As is to be expected in long-time series, the completeness of coverage has improved considerably. For a discussion which deals with changes in coverage for the early years, see *Mineral Resources of the United States, 1918*, part I, pp. 1a–5a, which contains an historical description of the statistical operations of the Geological Survey, then responsible for such mineral statistics.

For figures which more closely approximate a mine-value basis for all commodities for 1899, 1909, 1919, 1929, and 1937, see Harold Barger and Sam H. Schurr, *The Mining Industries, 1899–1939; A Study of Output, Employment and Productivity*, National Bureau of Economic Research, New York, 1944, pp. 305–309. By way of comparison, the estimated mine value for all minerals presented by Barger and Schurr is (in million dollars of approximate value): 1899, $600; 1909, $1,200; 1919, $3,200; 1929, $4,100; and 1937, $3,800.

M 14–19. Value of fuels, 1880–1956.

Source: See general note for series M 13–274.

See also text for series M 13–37.

The individual commodities shown constitute for practical purposes all the mineral fuels produced. The figures for total fuels (series M 14) were taken directly from recent issues of the *Minerals Yearbook* and include, in addition, back to 1925 asphalt and related bitumens, carbon dioxide (natural), helium, and peat. These products are not fuels, but apparently are included in the total fuels figures because work dealing with them is organized within the several fuels divisions of the Bureau of Mines. Their combined values are too small to affect seriously the total fuels figures.

M 14, total value of fuels. The most important difference between the "old" and "new" basis series is the inclusion of natural gas as valued at the well in the new series as opposed to natural gas valued at the point of consumption in the old series. In 1925, when this discontinuity occurs, natural gas was not so important, nor was the difference between well value and point of consumption value so great, as to cause a major break in the series (total value of fuels for 1925, on the "old" basis was $3,059 million). See also text for series M 18.

M 15, bituminous coal and lignite. Represents total value of production f.o.b. mine. Selling costs are excluded for 1880–1936 and included for 1937–1956, except for 1939 when producers were asked to exclude them but in fact some included them. Figures include small quantities of anthracite mined in States other than Pennsylvania.

M 16, Pennsylvania anthracite. Represents total value of production f.o.b. mine. Data for 1951–1956 are not strictly comparable with figures for earlier years. The later figures include output of independent operators formerly classified as "bootleggers" but now operating under legal agreements with the owners of the coal lands. Data for 1941–1950 include some "bootleg" coal purchased by legitimate operators and prepared at their breakers.

M 17, petroleum. Represents value of crude oil at the well.

M 18, natural gas. Represents total value of "marketed production," i.e., gross withdrawals less repressuring, vented and wasted. Beginning with 1947, transmission losses and storage are included. Value is measured at the well for 1925–1956 and at the point of consumption prior to 1925. (The value at the point of consumption was $265 million in 1925.)

For some years prior to 1900 the value shown is for coal and fuel wood displaced by natural gas rather than the value of gas consumed as actually reported. For example, in 1889 the latter was $11 million.

M 19, natural-gas liquids. Represents value at the plant, and includes natural gasoline, finished gasoline, naphtha, other cycle products, and beginning with 1941, liquefied petroleum gases.

M 20–29. Value of nonmetals (except fuels), 1880-1956.

Source: See general note for series M 13–274.

See also text for series M 13–37.

M 20, total nonmetals. Figures include value of nonmetals not shown separately. Figures are heavily weighted by the value of products classified as manufactured in the Bureau of the Budget, *Standard Industrial Classification Manual.* Cement and lime, products so classified, are included instead of their raw material components. Integrated operations make it difficult to obtain a value for the raw materials, which usually are not purchased on the open market, but obtained from associated operations. The value of stone includes an indeterminate amount of manufacturing because many dimension stone quarries manufacture the stone into finished products. The value of salt also includes a substantial amount of manufacturing as defined in the *Standard Industrial Classification Manual.*

The value figures for clay essentially represent the value of clay manufactures (mainly heavy clay products, such as brick, tile, etc.) for practically the entire period. Beginning with 1947, the totals for nonmetals include the value of raw clay alone, and completely exclude the value of manufactured clay products. The exact definition of clay value (which dominated the total value of nonmetals for many years) has changed several times during the long period covered. See text below for series M 22–23.

Series M 20 has a number of discontinuities. These include changes in the method of valuing clay and inadequate coverage of sand and gravel before 1905 and clay products before 1894. Other sources of noncomparability are also present. For these reasons and because of the heavy influence of manufacturing as defined in the *Standard Industrial Classification Manual* in the total value, this series should be used with great care. By way of comparison, the mine value subtotals for nonmetals as estimated in Barger and Schurr (see text for series M 13–37) are (in million dollars of approximate value): 1899, $60; 1909, $125; 1919, $240; 1929, $500; 1937, $390.

M 21, cement. Valuation is f.o.b. mill excluding the cost of the container. Included are portland, natural, masonry-natural, slag (formerly referred to as puzzolan) and hydraulic lime cements. (See also text for series M 178 regarding coverage of prepared masonry cement and change in 1955.) For

Digitized by Google

1912–1956, figures represent total value of shipments; for 1880–1911, figures are for value of production. For 1880–1890, figures are estimates. Early decade valuation estimates not shown in the table include: 1818–1829, $0.2 million; 1830–1839, $1 million; 1840–1849, $4 million; 1850–1859, $9 million; 1860–1869, $14 million; and 1870–1879, $19 million.

M 22–23, clay. Raw clay and clay products are both shown because total nonmetals (series M 20) has been defined so as to include one or the other or parts of both at different times. For 1947–1956, series M 20 includes the value for raw clay (series M 22); for 1945–1946, it includes the value of heavy clay products, other than pottery and refractories (series M 23) and the value of raw clay sold or used, except for the value of raw clay included in the heavy manufactured products represented in series M 23 for those years. For 1936–1944, series M 20 includes the value of heavy clay products (other than pottery and refractories), as shown in series M 23, and also the value of raw clay sold (1936–1941), and sold or shipped (1942–1944) by producers, as shown in series M 22. Prior to 1936, series M 20 includes the value of manufactured clay products shown in series M 23, as representing the first marketable form of most of the clay produced.

Prior to 1944, raw clay (series M 22) was mainly restricted to "merchant clay," marketed as raw clay, excluding the very great amounts of clay converted into brick and other products before sale. In 1944, coverage was expanded in an attempt to include total clay sold or used by producers (see *Minerals Yearbook, 1944*, pp. 1326–1327). Essentially, the figures for 1936–1941 shown represent the value of raw clays sold; for 1942–1944, the values of raw clays sold or shipped; for 1945–1946 and 1950–1956, the value of all raw clays sold or used by the producers; and for 1947–1949, the value of all raw clays sold or used by the producers, except clay used in the manufacture of cement. (Although published information in *Minerals Yearbook* indicates the inclusion of clay used in the manufacture of cement only for the years 1945–1946 and 1954–1956, unpublished information from the Bureau of Mines reveals such clay is also included for 1950–1953.)

For 1936–1947, series M 22 excludes the value of fullers earth, although it is included in total nonmetals. For those years, fullers earth was recorded separately by the Bureau of Mines.

Series M 23 is a clay manufactures series (as discussed above) and prior to 1936 represents the total value of clay products. For 1936–1946, the figures represent the value of heavy clay products other than potteries and refractories.

M 24, lime. Represents the selling value, f.o.b. plant, excluding cost of container. Data for 1953–1956 are not strictly comparable with those for earlier years. Prior to 1953, the series has only partial coverage of captive plants; beginning with 1953, presumably coverage is complete for both open-market and captive tonnage production. *Mineral Resources, 1914*, vol. II, p. 363, considers the series reliable only from 1894 on, stating that: "Although the statistics of the production of lime collected by the United States Geological Survey date, in one form or another, back to 1880, reliable figures showing the extent and growth of the industry have been available only since 1894 . . . these early figures [prior to 1894] are much too large; but there is no adequate means of explaining the discrepancy. The statistics are sufficiently consistent to indicate a steady growth in quantity and, with a few exceptions, in value for 1880–1888, but in other respects they cannot be considered reliable."

M 25, sand and gravel. Represents the value of sand and gravel at the pit (or source). This is the total value of sand and gravel sold or used by the producer, although the terms "sales" and "production" are used interchangeably, stocks remain small and relatively constant from year to year. Coverage includes commercial and noncommercial (government and contractor) operations. Values of glass sand and railroad ballast are also included. Also includes ground sand for 1954–1956 (1954 value, $6 million), formerly included elsewhere in value of mineral products. Coverage of gravel was incomplete for 1902–1904.

M 26, stone, including slate. Stone sold or used by producers is valued f.o.b. quarries or mills. Slate is valued f.o.b. quarry or nearest point of shipment. Since manufacturing operations are often integrated with dimension stone quarries, the figures include a sizable, but indeterminate value for manufacturing. Stone coverage includes granite, basalt and related rocks (traprock), marble, limestone, sandstone, and other stone. For 1954–1956, includes ground sandstone, quartz, and quartzite used for abrasives and other uses (formerly included elsewhere in value of nonmetals), stone for cement and lime (value excluded from nonmetals total), and shell (not formerly covered by Bureau of Mines). Value of these three categories totaled $105 million in 1954. Both dimension stone and nondimension (crushed) stone are included. Slate includes roofing slate, millstock, flagstones, granules, flour, and other. Date for 1880–1888 are incomplete, representing building stone only.

M 27, phosphate rock. Represents the value f.o.b. mine. For 1950–1956, figures refer to marketable production; for earlier years, to phosphate rock sold or used.

M 28, salt. Represents the value f.o.b. mine or refinery of common salt sold or used by producers, excluding cost of cooperage or container. Included are dry salt, both evaporated (manufactured) and rock, and also salt in brine. For 1880–1892, many manufacturers included the value of the container in the value reported.

M 29, sulfur. Represents the total value of shipments. Coverage includes Frasch process mine output plus other mine output since 1945 and recovered elemental sulfur since 1950. Data for 1901–1903 include pyrites.

M 30–37. Value of metals, 1880–1956.

Source: See general note for series M 13–274.

See also text for series M 13–37.

M 30, total metals. Includes the value of some metals not shown separately. Adjustments in figures for years prior to 1925 have been made by Resources for the Future, Inc., Washington, D.C. Figures do not agree with those shown in the *Minerals Yearbook* prior to 1925, because the *Yearbook* figures include the value of pig iron and aluminum, both manufactured products, whereas the figures shown here include the value of iron ore and bauxite, the products of mines. A major revision of the value series in 1949 (see text for series M 13–37) substituted iron ore and bauxite for pig iron and aluminum, but the Bureau of Mines has not yet officially carried these revisions back to the years before 1925. Other relatively minor changes involving the substitution of mine values for manufactured values were made in the 1949 revision of the total metals figures, and some duplication within the totals for metals was eliminated; but because of the difficulties involved, these changes have not been applied to the pre-1925 figures shown here. However, since the iron ore and bauxite substitutions constitute the major elements in the revision,

Digitized by Google

there is no major discontinuity between the pre- and post-1925 total metals figures.

The figures for gold, silver, copper, lead, and zinc for all years are based on the smelter or refinery value of the metals, not their value at the mine. The practice of valuing these products at the manufactured stage was not altered by the 1949 revision, because the complexity of their ores makes mine values difficult to derive. However, effective with the 1949 revision, the total value for each of these metals was derived by applying to the recoverable mine production, the average selling price of the refined metal.

By way of comparison, the mine value for total metals is estimated in Barger and Schurr (cited in text for series M 13–37) for selected years (in million dollars of approximate value): 1899, $189; 1909, $329; 1919, $540; 1929, $627; 1937, $642.

M 31, iron ore. Represents total value of ore shipments. For 1906–1956, excludes ore containing 5 percent or more manganese, and for 1916–1941, excludes ore for paint. Figures for 1881, 1890, and 1891 were estimated by multiplying the arithmetic mean of the average value of the preceding year and the following year by the quantity of output for the year to be estimated.

M 32, copper. For 1947–1956, figures represent the average price of refined copper multiplied by mine production of recoverable copper. For 1880–1946, figures represent the value of the smelter output from domestic ores. For 1908–1916, figures are as valued at New York City.

M 33, lead. For 1947–1956, figures represent the average price of primary refined lead multiplied by the mine production of recoverable lead. For 1880–1946, figures represent value of refinery output from domestic ores. For 1908–1916, figures are as valued at New York City.

M 34, zinc. For 1947–1956, figures represent the average price of the smelter product multiplied by the recoverable mine output. For 1880–1946, figures represent the value of smelter output from domestic ores. For 1908–1914, figures are based on the average St. Louis quotation; for 1915–1923, figures are based on average selling price for all grades.

M 35, gold. For 1947–1956, figures represent the recoverable content of ore (mine output) multiplied by official price per fine ounce ($35). For 1880–1946, figures represent refinery or mint output multiplied by the official price. The official price of gold has been set at $35 since January 1934; prior to then it was $20.67, although the price of gold was unsettled in 1933 because the United States went off the gold standard in April of that year.

M 36, silver. For 1947–1956, figures represent the recoverable ore content multiplied by the official mint price of the refined metal. For 1880–1946, figures represent refinery or mint output multiplied by the official price.

M 37, molybdenum. Figures represent the value of shipments of molybdenum concentrates and are largely estimated.

M 38–50. Value of mineral production, imports, and exports, in constant dollars, 1900–1957.

Source: Bureau of the Census, *Raw Materials in the United States Economy: 1900–1957*, Working Paper No. 6 (forthcoming).

The figures were obtained by multiplying the physical quantity of each raw material for a given year by the average unit value of the material for 1954. For materials produced domestically, the unit value weights are average values at the mine, approximately as indicated by the 1954 Census of Mineral Industries. For materials not produced in the United States in the 1954 period, average unit value of imports was generally used. Production figures include approximately 75 mineral products which account for over 99 percent of the total value of mineral output as measured in the 1954 Census of Mineral Industries; production represents primary production only. Import and export figures include not only primary materials but also estimates of the raw material equivalents of semifabricated and fabricated products, in order to approximate the raw materials required for end-use products consumed in the United States. Thus, the mineral equivalents of the foreign trade in paints, other chemicals, and machinery were computed and added to the imports and exports of crude minerals. Such estimates affected most significantly the results for certain metallic minerals, particularly iron ore imports and exports, which were influenced by the estimated iron content of such things as machinery and vehicles. More detailed figures will be shown in the source; for example, it will show separately series for "iron and ferroalloys" and "other metals, except gold"; and for "construction materials" and "other nonmetallic minerals (except fuels)."

M 51–62. Indexes of physical volume of mineral production (Bureau of Mines), 1880–1956.

Source: 1880–1954, Bureau of Mines, *Minerals Yearbook, 1956*, vol. I, pp. 3–5; 1955–1956, Bureau of Mines, records.

These index numbers constitute an updating of the index numbers originally prepared by Y. S. Leong, "Index of the Physical Volume Production of Minerals, 1880–1948," *Journal of the American Statistical Association*, March 1950. Subsequently, Leong made revisions in his index for 1930–1948 to take account of a new natural-gas production series. Using essentially the same methods, the Bureau of Mines has brought the indexes up to date, and has converted the entire index to a 1947–49 base. Leong included 63 series in his index, representing 98 percent of the value of all minerals produced in the United States in the base period 1935–39. The number of series is smaller in the earlier years of the index partly because new minerals came into production during the long period covered, and partly because data for minerals in production were sometimes not available in the earlier years. Estimates were used in some cases when actual production data were not available. Over the long period covered, the indexes were constructed by linking 5 overlapping segments with 5 different sets of value weights (value at the mine, actual or estimated). The weighting periods used were 1889–91 (for 1880–1903); 1909–13 (for 1897–1920); 1923–25 (for 1917–1939); 1935–39 (for 1929–1948); and 1947–49 (for 1941–1956). The separate segments of the indexes were spliced to form continuous series covering the entire period by selecting a particular year as the splicing origin and deriving averages of the 2 segments for a 3- or 5-year period centered on the splicing origin.

M 63–66. Indexes of mineral production (Federal Reserve Board), 1919–1956.

Source: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, various issues.

These indexes are available monthly as well as annually. The most recent revision of the index is explained in the December 1953 issue of the *Bulletin* and the previous revision is explained in the October 1943 issue. The latest revision introduced 1947–49 as a comparison base, and the year 1947 as a weight base; also value-added weights (which had to be estimated) are used instead of the gross value weights previously used for minerals. Coverage was also increased in the latest revision. Stone and earth minerals, not previously represented, are covered with 44 series based on annual Bureau of Mines data; fuels coverage was expanded through the addition of natural gas, natural-gas liquids, and oil and gas well drilling,

Digitized by Google

to the previous coverage of anthracite, bituminous coal, and crude petroleum. Although the revision covers only the years since 1947, the Federal Reserve Board states that with respect to the total minerals index, the "continuity of measurement back to 1919 has been preserved" (*Federal Reserve Monthly Index of Industrial Production*, 1953 revision, reprint from *Federal Reserve Bulletin*, December 1953, p. 3).

The total index splices the following segments: 1947–1956 on the revised basis; 1939–1946 converted to the 1947–49 comparison base, with the old weights (1937 gross valuations) unchanged, but adjusted to accord with a 1947 relative to 1939 benchmark level, which was calculated by using estimated value-added weights based on the average for 1939 and 1947; 1919–1938 converted to the 1947–49 comparison base but leaving the old weights unchanged—1937 gross valuations for 1930–1938, 1923 gross valuations for 1923–1929, and average 1919 and 1923 gross valuations for 1919–1922.

For mineral fuels and metal mining, the Federal Reserve Board presents indexes on the 1947–49 base only for 1947–1956; in these indexes, 1947 estimated value-added weights were used. For earlier years, the Federal Reserve Board shows the indexes on a 1935–39 base, and these have been converted to a 1947-49 base for presentation here. For 1930–1946, the weights used are 1937 gross valuations, and, for earlier years, the weight periods are the same as those indicated above for the total index.

M 67–70. Indexes of mineral production (NBER), 1899–1939.

Source: Harold Barger and Sam H. Schurr, *The Mining Industries, 1899–1939: A Study of Output, Employment and Productivity*, National Bureau of Economic Research, New York, 1944, pp. 354–355.

These indexes were derived by combining the physical quantities of different products with unit mine values serving as weights. See the source, p. 272, for a technical description of the procedures used to construct these indexes.

The fuels index (series M 68) includes Pennsylvania anthracite, bituminous coal, petroleum, natural gas, and natural gasoline.

The nonmetals index (series M 69) includes asbestos, asphalt, barite, borates, bromine, fluòrspar, tripoli, garnet, pumice, ground sand, sand, gravel, sodium salts, calcium chloride, abrasive sandstone, clay, fuller's earth, stone (dimension and nondimension), talc, gypsum, pyrites, sulfur, mica, potash, magnesite, other magnesium compounds, graphite, feldspar, and phosphate rock.

The metals index (series M 70) includes gold, silver, copper, lead, zinc, iron ore, manganese, tungsten, molybdenum, mercury, and bauxite.

M 71–87. General note.

These series are expressed in terms of British thermal units in order to have a common denominator. A British thermal unit is "the quantity of heat required to raise the temperature of one pound of water 1° F. at or near its point of maximum density." The abbreviation commonly used, and employed below, is B.t.u.

M 71. Total production of mineral energy fuels, in B.t.u.'s, 1800–1956.

Source: This series is the sum of the figures for series M 72–75.

Totals have been derived for only the mineral fuels because of uncertainty as to the appropriate conversion factor to apply to hydroelectricity for comparability with the other energy sources.

M 72. Production of bituminous coal, in B.t.u.'s, 1800–1956.

Source: 1800–1849, series M 88 converted to B.t.u.'s at the same rate as data for more recent years; 1850–1885, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1890–1895, converted to B.t.u.'s from physical quantities shown in successive volumes of *Mineral Resources of the United States* and *Minerals Yearbook;* 1900–1956, *Minerals Yearbook*, annual volumes.

The B.t.u. equivalent employed as a conversion factor is that currently used by the Bureau of Mines, 13,100 B.t.u. per pound of coal. Production statistics for bituminous coal include lignite and also cover Alaska.

M 73. Production of Pennsylvania anthracite, in B.t.u.'s, 1810–1956.

Source: See source for series M 72.

The B.t.u. equivalent employed as a conversion factor is that currently used by the Bureau of Mines, 12,700 B.t.u. per pound of coal.

M 74. Production of crude oil, in B.t.u.'s, 1860–1956.

Source: 1860–1895, converted to B.t.u.'s from physical quantities shown in successive volumes of *Mineral Resources of the United States* and *Minerals Yearbook;* 1900–1956, *Minerals Yearbook*, annual volumes.

The B.t.u. equivalent used as a conversion factor is that currently used by the Bureau of Mines, 5,800,000 B.t.u. per barrel. Figures include commingled condensate.

M 75. Production of natural gas, wet, in B.t.u.'s, 1885–1956.

Source: See general note for series M 13–274.

"Natural gas, wet," refers to natural gas prior to processing at natural-gas liquid plants. Figures for 1920–1956 are termed "marketed production," and comprise gas sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas in pipelines. Gas vented and wasted and used in repressuring is excluded. Data prior to 1920 are not strictly comparable with those for later years. Apparently, for the earlier period, neither net storage change nor transmission loss was included.

Total production, before subtraction to obtain marketed production, has been continuously converted at the rate of 1,075 B.t.u. per cubic foot. To obtain marketed production, the amounts repressured, vented, and wasted have been converted at 1,035 B.t.u. per cubic foot and subtracted from the B.t.u. value of total production.

Comparability problems arise prior to 1900 because the figures for the very early period are based on the estimated quantity of coal and fuel wood displaced, and are not measures of gas produced.

M 76. Electricity produced from waterpower, at prevailing central station equivalent, in B.t.u.'s, 1900–1956.

Source: *Minerals Yearbook*, annual volumes.

Figures include installations owned by manufacturing plants and mines, as well as government and privately owned public utilities. The fuel equivalent of waterpower is calculated from the kilowatt-hours of power produced whenever this figure is available, as it is for all public utility plants since 1919. Otherwise, the fuel equivalent is calculated from the reported horsepower of installed water wheels, assuming a capacity factor of 20 percent for factories and mines and 40 percent for public utilities. In converting waterpower to its equivalent of fuel required to perform the same work, the prevailing or average performance of all fuel-burning central electric stations for each year in question has been used. This has dropped from 6.85 pounds of coal per kilowatt-hour in 1900 to 0.94 in 1956.

Digitized by Google

M 77. Electricity produced from waterpower, at direct calorific equivalent, in B.t.u.'s, 1890–1956.

Source: Converted at the rate of 3,412 B.t.u. per kilowatt-hour, direct calorific equivalent of electricity, from successive volumes of *Mineral Resources of the United States* and *Minerals Yearbook*. This represents the same basic production series as series M 76.

M 78–87. General note.

All of the consumption figures since 1920, except series M 86 and M 87, are Bureau of Mines calculated consumption estimates. The Bureau generally defines calculated consumption as production plus imports (including shipments to noncontiguous Territories) minus exports plus or minus net change in stocks. Only in the case of bituminous coal since 1933 has the Bureau derived consumption by adding together known consumption by use. (See also text for series M 108–116.) All the consumption estimates prepared by Resources for the Future, Inc., have also been derived in accordance with the above definition except for series M 87, fuel wood consumption, which has been estimated directly.

M 78. Calculated consumption of total mineral energy fuels, in B.t.u.'s, 1850–1956.

Source: This series is the sum of series M 79–84.

See also text for series M 71.

A total including fuel wood has not been shown because of the inexact nature of the available estimates and conversion factors.

M 79–80. Calculated consumption of bituminous coal and Pennsylvania anthracite, in B.t.u.'s, 1850–1956.

Source: 1850–1919, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, *Minerals Yearbook, 1956*, vol. II.

Bituminous consumption for 1850–1932 represents production plus imports minus exports plus or minus net change in stocks. That method of derivation ignores variables such as stocks at lake and tidewater docks, stocks at other intermediate storage piles between mine and consumers, and coal in transit. For 1933–1956, consumption represents the addition of known consumption by use.

See also text for series M 72 and M 73 and general note for series M 78–87.

M 81–82. Calculated consumption of crude oil and petroleum products, net imports, in B.t.u.'s, 1860–1956.

Source: 1860–1919, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, *Minerals Yearbook, 1956*, vol. II.

Net imports of petroleum products equals total imports minus total exports, a negative figure signifying an export surplus for that year. Series M 82 is a composite series which has been converted at the following standard Bureau of Mines factors: Gasoline, 5,248,000 B.t.u. per barrel; kerosene, 5,670,000; distillate fuel oil, 5,825,000; residual fuel oil, 6,287,000; wax, 5,537,280; lubricants, 6,064,800; asphalt, 6,636,000; and miscellaneous petroleum products, 5,796,000.

For 1860–1919, series M 81 and M 82 were combined and converted at varying rates at different times depending upon the relative importance of Pennsylvania grade, which has a lower B.t.u. content, compared to other grades.

See also text for series M 74.

M 83. Calculated consumption of natural gas, dry, in B.t.u.'s, 1885–1956.

Source: 1885–1919, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, *Minerals Yearbook, 1956*, vol. II.

"Natural gas, dry," refers to natural gas after it has been processed for natural-gas liquids. Figures were converted at the rate of 1,035 B.t.u. per cubic foot; the processing accounts for the lower B.t.u. content of the gas as compared with series M 75. Consumption for 1920–1956 differs from "marketed production" by net change in foreign trade, net change in storage, and extraction loss, but includes losses in transmission. For 1885–1919, consumption is defined as total production (see text for series M 75) plus imports minus exports.

M 84. Calculated consumption of natural-gas liquids, in B.t.u.'s, 1911–1956.

Source: 1911–1919, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, Bureau of Mines, *Minerals Yearbook*, vol. II.

Standard Bureau of Mines conversion factors have been used for the components of natural gas liquids: Natural gasoline, 110,000 B.t.u. per gallon; and liquefied petroleum gases, 95,500 B.t.u. per gallon.

M 85. Calculated consumption of electricity from waterpower, at prevailing central station equivalent, in B.t.u.'s, 1890–1956.

Source: 1890–1919, Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, *Minerals Yearbook, 1956*, vol. II.

Consumption differs from production by the quantity of imports. In the early years imports drop to zero.

See also text for series M 76.

M 86. Calculated consumption of electricity from waterpower, at direct calorific equivalent, in B.t.u.'s, 1890–1956.

Source: 1890–1919, in kilowatt-hours in Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming); 1920–1956, in kilowatt-hours in successive volumes of *Minerals Yearbook*. Entire series converted at the rate of 3,412 B.t.u. per kilowatt-hour, direct calorific equivalent of electricity.

This series represents the same basic consumption series as series M 85.

M 87. Calculated consumption of fuel wood, in B.t.u.'s, 1850–1956.
