Source: Resources for the Future, Inc., Washington, D. C., *Energy in the American Economy* (forthcoming).

The conversion factors used were the following: 1900–1955, 19,407,000 B.t.u. per cord; 1900, 20,154,000 B.t.u. per cord; and 1850-1895, 20,960,000 B.t.u. per cord. These conversion factors were derived from the following fuel equivalents: After 1900, 1.35 cords of wood = 1 ton of bituminous coal; in 1900, 1.30 cords of wood = 1 ton of bituminous coal, and prior to 1900, 1.25 cords of wood = 1 ton of bituminous coal (J. F. Dewhurst and Associates, *America's Needs and Resources*, New York, 1955, p. 1108).

M 88–101. General note.

Coverage of bituminous coal by the Bureau of Mines includes all subbituminous coal and lignite, and anthracite and semianthracite produced outside of Pennsylvania. These series exclude Pennsylvania anthracite and, for 1955–1956, Texas lignite. Total production of lignite in 1956 was 2.9 million of the total bituminous coal production of 500.9 million short tons. Production of small mines having an output of less than 1,000 short tons per year is not included. For all Bureau of Mines series shown here, data on Alaska are included. In 1956, Alaskan production totaled 726,801 short tons.)

M 88. Bituminous coal, total production, 1800–1956.

Source: 1800–1885, H. N. Eavenson, *The First Century and a Quarter of American Coal Industry*, Pittsburgh, 1942, pp. 426–434; 1886–1956, see general note, series M 13–274.

Bureau of Mines production data are based on detailed annual reports furnished by producers. Output not directly reported by producers, primarily that of the small mines, is obtained with some accuracy from State mine departments or railroad carloadings (*Minerals Yearbook, 1956*, vol. II, p. 29).

Beginning with 1952, series M 89 and M 90 do not add to series M 88 because auger production is included in series M 88.

Prior to 1886, production figures shown are those as derived by Eavenson and considered superior to the early Geological Survey figures, which appear in *Mineral Resources of the United States*. Prior to 1880, when the Geological Survey began its annual report system, Survey estimates of production came from the "decennial census, supplemented by records from State and trade sources. In the absence of other information, estimates were made for the intercensus years to round out the totals" (*Mineral Resources of the United States, 1923*, vol. II, p. 544). In reference to census data for these early years Eavenson states: "The early census returns about coal began in 1830, and were admittedly incomplete; the next two census results are given in value and not in tons produced, and the first really good figures began in 1880" (Eavenson, cited above, p. xiii). Eavenson's estimates were made on an individual State basis and were derived from State, county, newspaper, census, and any other documented records available.

M 89–90. Bituminous coal, underground and strip production, 1914–1956.

Source: See general note for series M 13–274.

For 1943–1956, strip pit coverage includes all mines. For 1914–1942, coverage includes power strip pits proper but excludes horse stripping operations and mines combining stripping and underground in the same operation.

M 91–93. Bituminous coal, average value, f.o.b. mine, 1880–1956.

Source: See general note for series M 13–274.

Figures represent value received at the mines f.o.b. cars. For 1880–1936, figures exclude selling expense; for 1937–1956, such costs are included. However, for 1939, *Minerals Yearbook, 1946*, states that "producers were asked to exclude . . . [them] in reporting value, but a number of them included such costs" (p. 299).

Mineral Resources of the United States, 1923, vol. II, discusses at length the problem of valuation of coal not sold but used by the producer. "Coal used at the mine, coal coked by the producing company, and coal used in some other industry by that company . . . is not sold, and the value placed upon it is either an estimate or the amount at which it is carried on the company's books. Either value is presumably the amount the coal would have brought if it had been sold or the amount other fuel . . . would have cost if it had been purchased. In other words, the values given represent returns to the operators for coal sold plus the estimated value of that not sold. The value thus fixed is more or less arbitrary and does not necessarily represent the current prices for coal sold commercially" (pp. 615–616).

For 1915–1942, the average value for strip mines represents power strip pits proper and excludes horse stripping operations and mines combining stripping and underground in the same operation. For 1943–1956, coverage includes all strip mines.

M 94. Bituminous coal, railroad freight charges per short ton, 1923–1956.

Source: See general note for series M 13–274.

This is an Interstate Commerce Commission series reproduced in the Bureau of Mines publications and more exactly defined as the "average revenue received by Class I steam railroads per net ton of revenue bituminous coal originated, as reported to the Interstate Commerce Commission" (*Minerals Yearbook, 1937*, p. 803).

M 95–96. Bituminous coal, foreign trade, 1867–1956.

Source: See general note for series M 13–274.

Figures on imports and exports were compiled by the Bureau of Mines (or Geological Survey) from records of the Bureau of the Census. Import figures are "imports for consumption." For foreign trade definitions, see introduction to Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

Figures for 1867–1885 and 1890–1914 are for fiscal years ending June 30; all other figures presumably represent calendar years. Figures for 1867–1889 were converted from long to short tons to form a continuously comparable series.

M 97. Bituminous coal, stocks, 1916–1956.

Source: See general note for series M 13–274.

For 1933–1956, figures were labeled "end-of-year stocks at industrial consumer and retail yards"; for 1916–1932, "consumers' stocks." Figures for 1916–1929 were estimated, mainly from data compiled from a list of 5,000 consumers whose stocks in 1918 bore a known relation to total stocks. (*Mineral Resources of the United States, 1929*, vol. II, pp. 778–779.)

M 98. Bituminous coal, number of mines, 1895–1956.

Source: See general note for series M 13–274.

Figures include only mines producing 1,000 tons per year and over. Some data for smaller mines based on incomplete information are available, however (see *Minerals Yearbook, 1945*, p. 906).

The figure for 1954 may not be strictly comparable with those for other years. In 1954, the Bureau of Mines cooperated with the Bureau of the Census in the canvass for such information, and Census standards were employed. *Minerals Yearbook, 1954*, vol. II, states that "The Bureau of the Census defined a mine as 'a working or group of workings at a given locality in which operations are conducted as a unit or are unified by common management or joint handling of some part of the mining or preparation process. Individual shafts, openings, or sites should not necessarily be considered as individual mines.' The Bureau of Mines has considered individual shafts, openings, or sites as individual 'mines' " (p. 27).

M 99. Bituminous coal, mechanically cleaned, 1906–1956.

Source: See general note for series M 13–274.

There are no mechanical cleaning plants at lignite mines. For 1927–1956, figures include coal cleaned at central washeries operated by consumers in Colorado and Pennsylvania. Although pneumatic cleaning began in 1919, no data were available; therefore, such cleaning is not included until 1924. Tonnage so cleaned, however, was small during this period. Figures for 1906 are probably incomplete since this is the first year in which statistics were collected.

M 100. Bituminous coal, mechanically cut underground, 1891–1956.

Source: See general note for series M 13–274.

M 101. Bituminous coal, mechanically loaded underground, 1923–1956.

Source: See general note for series M 13–274.

Data for 1923–1926 exclude tonnage handled by conveyors.

M 102–106. Bituminous coal, employment, 1890–1956.

Source: See general note for series M 13–274.

"Active period averages" exclude periods when the mine is closed and not in operation. The Bureau of Mines publishes two sets of employment statistics: One in conjunction with the Bureau's injury statistics, the other in conjunction with the Bureau's commodity statistics. The two sets have not always agreed because of somewhat different coverage. All employment figures published here are from the bituminous coal chapter of the *Minerals Yearbook* and *Mineral Resources of the United States* (not those associated with the Bureau's injury reports).

Beginning with 1952, series M 103–105 may not add to series M 102, since auger employment is included in the total but is not shown separately. Component figures for 1911 will also not add to the total because the Bureau of Mines has revised the figure for total employment, but not the component figures.

Employment data for 1946–1956 are not strictly comparable with figures for earlier years. *Minerals Yearbook, 1953*, vol. II, p. 49, describes this change as follows: "Beginning with 1946, the figures on employment represent the average number of men working daily. Each mine is asked to report the total number of man-shifts worked during the year and the number of calendar days the mine was active during the year. The total man-shifts are divided by the total days the mine was active to determine the average number of men working daily. Before 1946 each mine was asked to report the average number of men on the rolls per pay period and number of days the mine worked. In this instance men employed were multiplied by number of days to determine total man-shifts . . . . Sample tests indicate that the two sets of figures, however, are reasonably comparable . . ."

Data on the number of men employed in 1911 are from a special inquiry made by the Bureau of Mines in connection with its accident statistics.

Although data on average hours worked per day are not shown, nominal hours of work are available for most years in the sources cited above.

Figures for all other surface workers on active days (series M 105) include all surface employees at underground, strip, and auger mines other than those actually employed in the mining operation proper.

M 107. Bituminous coal, man-days idle because of strikes, 1899–1956.

Source: 1899–1926, *Mineral Resources of the United States*, annual volumes; 1927–1956, Bureau of Labor Statistics, records.

Data are believed to be substantially consistent although two different sources are used. (The Bureau of Mines figure for 1927 is 26,516,000 man-days.)

In 1943, the Bureau of Labor Statistics "established a cooperative arrangement with the Solid Fuels Administration which resulted in the receipt of additional strike leads. When this [latter] agency went out of existence, cooperative arrangements were made with coal associations and companies. Prior to 1943, undoubtedly many of the small, short work stoppages went unnoticed as they are seldom recorded by the press, but the number of workers and idleness in these stoppages is undoubtedly small." (*Work Stoppages, Bituminous Coal Mining Industry*, Report No. 95, August 1955, p. 7.)

"Memorial" stoppages which occurred in 1947 and 1952 are not included. For some early years (1899, 1901, 1903, 1907, and 1908), figures may include some anthracite since separation of the data was not possible.

M 108–116. Bituminous coal, domestic consumption by consumer class, 1917–1956.

Source: See general note for series M 13–274.

Data prior to 1933 may not be strictly comparable with those for more recent years because of significant revisions recently published and incorporated here for some of these series. Revised series are shown here for 1933–1956 for series M 112–116. See *Minerals Yearbook, 1957*, vol. II, pp. 120–121, for a description of these revisions.

M 108, total consumption. For 1933–1956, data are described by the Bureau of Mines as approximating total consumption. The Bureau states that any attempt to estimate total consumption of bituminous through the formula of production plus imports minus exports plus or minus net change in stocks omits important items such as stocks at lake and tidewater docks, stocks at other intermediate storage piles between mines and consumers, and coal in transit, since these items are not included in the stock figures. Therefore, total consumption is estimated through the addition of known consumption by consumer class.

Presumably for 1917–1932, consumption was estimated through the formula of production plus imports minus exports plus or minus net change in stocks, rather than through the addition of known consumption by consumer class. However, for these years components still add to the total consumption shown since the "all other uses" classification (series M 112–115) was obtained by subtracting the known consumption items from the total consumption estimate.

M 109, coal consumed by electric power utilities. For 1933–1956, this series is a Federal Power Commission series, and represents the latest available revised figures for bituminous coal and lignite consumed by public utility power plants in power generation, including a small quantity of coke. For 1917–1932, the series is a Geological Survey series and includes a small amount of anthracite (the Geological Survey figure for 1933 is 30,575,000 short tons). Data for 1917 and 1918 were estimated from the 1917 Census of Electrical Industries.

M 110, coal consumed by Class I railroads. For 1933–1956, figures are from the Association of American Railroads and represent consumption of bituminous coal and lignite by Class I railroads for all uses, including locomotive, powerhouse, shop, and station fuel. Data for 1917–1932, from the Interstate Commerce Commission, exclude consumption in shops, roundhouses, and stations, as well as all consumption by Class II and Class III roads. (The comparable Interstate Commerce Commission figure for 1933 was 66,198,000 short tons.)

M 111, coal consumed in coke plants. Separate series on coal consumption in beehive and byproduct ovens are also available in the sources for series M 108–116.

M 112–115, coal consumed in all other uses. For 1917–1932, figures are combined for bituminous coal consumed by cement mills, steel and rolling mills, other industrial, and retail dealer deliveries. The combined series was titled "all other uses" and was derived by subtracting the known consumption items from estimated total consumption (see text for series M 108).

Digitized by Google

M 114, coal consumed by other manufacturing and mining industries. For 1933–1956, figures are estimates based upon reports collected from a selected list of representative manufacturing plants.

M 115, coal consumption, retail deliveries to other consumers. For 1933–1956, figures are estimates based upon reports collected from a selected list of representative retailers. The figures include some coal shipped by truck from mine to final destination.

M 116, coal consumed in bunker foreign and lake vessels. This is a Bureau of the Census series and represents bunker coal loaded on vessels engaged in foreign trade. Such coal is not included in the export statistics and, therefore, is included under domestic consumption by use. Beginning 1933, lake vessels have been included.

M 117. Coke production, 1880–1956.

Source: See general note for series M 13–274.

Figures are collected through voluntary reports by coke-plant operators within continental United States. Coverage is limited to products made in high-temperature slot-type and beehive ovens. Coke made by other processes (in coal-gas retorts, by low temperature carbonization of coal, and carbonization of the residue from the refining of crude tar and petroleum) is excluded. In recent years, reports have been received from every oven-coke plant in operation and from most of the beehive plants that were in operation. Production has been estimated for the nonreporting plants (all small) and, therefore, coverage is presumed to be complete.

M 118–132. General note.

Coverage of anthracite statistics by the Bureau of Mines is limited to Pennsylvania and includes some coal from Sullivan County, Pa., which is classified as semianthracite. Information is obtained through a mail canvass of all known anthracite operators. Producers report directly about 99 percent of total production, the remaining 1 percent is estimated (see *Minerals Yearbook, 1950*, p. 353).

The presence of anthracite near the surface of the earth resulted in the development of "bootlegging"—mining without the consent of the owner of the mineral rights. This practice grew rapidly during the depression of the 1930's and although some information on "bootleg" operations was available during the 1940's, such production is not included in Bureau of Mines figures shown here. For 1941–1950, Bureau of Mines production data include only that part of "bootleg" production purchased by authorized operators and prepared at their breakers. For 1951–1956, however, output of these independent operators (no longer called "bootleggers" since they are now operating under legal agreements with the land owners) has been included. For 1951, output of this type was estimated at 1.5 million short tons. Estimates of "bootleg" production for earlier years may, however, be found in the *Minerals Yearbook*.

Employment statistics for Pennsylvania anthracite have been similarly affected by this change in coverage (see *Minerals Yearbook, 1951*, for a more complete discussion). As a result of this change in coverage, production and employment figures since 1951 are not strictly comparable with similar data for earlier years.

M 118–120. Pennsylvania anthracite production, 1808–1956.

Source: 1808–1885, H. N. Eavenson, *The First Century and a Quarter of the American Coal Industry*, Pittsburgh, 1942, pp. 426–434; 1886–1956, see general note for series M 13–274.

Total production of Pennsylvania anthracite consists of production from underground mines, strip pits, culm banks, and dredging. Since figures for the latter two methods are not separately presented here, the figures for underground and strip do not add to total production. Also, see general note for series M 118-132 for discussion of "bootleg" production and its effects on total production. Underground production for the years 1915-1926 for which actual statistics are not shown in *Mineral Resources of the United States* was calculated by deducting the amount of coal mined from strip pits from the total reported fresh-mined coal as published in successive volumes of *Mineral Resources*, 1915-1926. Some anthracite production occurred in 1800-1807, but it amounted to less than 500 tons annually.

M 121. Pennsylvania anthracite, average value, f.o.b. mine, 1880–1956.

Source: See general note for series M 13–274.

Average value per short ton f.o.b. mine includes a reported value for coal not sold but used by the producer.

M 122–123. Pennsylvania anthracite, foreign trade, 1867–1956.

Source: See general note for series M 13–274.

Figures on imports and exports were compiled by the Bureau of Mines (or Geological Survey) from records of the Bureau of the Census. Import figures are "imports for consumption." For foreign trade definitions, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

For 1886–1956, figures are on a calendar-year basis; for 1867–1885, they are for fiscal years ending June 30. In order to obtain a comparable series throughout, data for 1867–1889 were converted from long to short tons.

M 124. Pennsylvania anthracite, net change in producers' stocks, 1913–1956.

Source: See general note for series M 13–274.

Figures represent net change in producers' stocks as of December 31, except 1913–1918 when changes are as of March 31. Information on producers' stocks has existed in different forms since 1913. In recent years, information has been supplied by the Anthracite Institute and the Anthracite Committee. Beginning with 1931, only annual stock totals have been reported in *Mineral Resources of the United States* and *Minerals Yearbook* necessitating the computation of the net change series. Data for 1930–1935 are from the records of the Anthracite Institute and represent prepared coal on the ground at the breakers. Data for 1913–1930 are from the Cost Reports of the Federal Trade Commission (*Coal* No. 2, p. 27) and *Hearings* before the Freylinghuysen Coal Committee, S. Res. 126, 66th Congress, 1st Session (part 1, p. 308).

M 125–129. Pennsylvania anthracite, employment, 1870–1956.

Source: 1870–1889, Bureau of Mines, *Coal Mine Fatalities in the United States, 1870–1914*, Bulletin 115, 1916, p. 290; 1890–1956, *Mineral Resources of the United States* and *Minerals Yearbook*, annual volumes.

Figures are "active period" averages, excluding periods when the mine is not in operation. Figures are not strictly comparable for 1951–1956 with earlier years because of inclusion, since 1951, of employees of independent operators (formerly known as "bootleggers"). See general note for series M 118–132.

Data for selected years since 1943 for the average number of hours worked per day are also presented in the *Minerals Yearbook*, chapters on Employment and Injuries, and data for nominal hours of work in earlier years appear in Barger and Schurr, cited in text for series M 13–37.

M 130. Pennsylvania anthracite, number of man-days idle because of strikes, 1900–1956.

Source: See source for series M 107.

Digitized by Google

M 131. Pennsylvania anthracite, mechanization, quantity cut by machines underground, 1911–1956.

Source: See general note for series M 13–274.

M 132. Pennsylvania anthracite, mechanization, quantity loaded by machines underground, 1927–1956.

Source: See general note for series M 13–274.

Figures were first collected by the Bureau of Mines in 1929. Figures for 1927–1928 were reported by the Pennsylvania Department of Mines.

M 133–136. Crude petroleum production, average value at well, and foreign trade, 1859–1956.

Source: 1859–1954, *Mineral Resources of the United States* and *Minerals Yearbook*, annual volumes; 1955–1956, Bureau of Mines, *Annual Petroleum Statement No. 422*.

M 133, production. In recent years coverage has been virtually complete as indicated in *Minerals Yearbook, 1953*, vol. II, which states that "complete coverage of production . . . was obtained by voluntary reports from the industry, supplemented by minor estimates" (p. 358).

M 134, average value at well. "Annual canvasses provided supplemental information on the value of crude petroleum at the well" (*Minerals Yearbook, 1953*, vol. II, p. 358).

M 135, imports. For recent years, this is a Bureau of Mines series representing only shipments into continental United States. For 1932–1933 and 1913–1926, the series is noted in the source as a Bureau of the Census series; for 1927–1931, the original source is not always indicated. For 1913–1922, *Mineral Resources* identifies the figures as "imports for consumption," but for other years, the precise identification is not always specified. For foreign trade definitions, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*. This series has been shown only since 1913 because crude and topped oil have been shown separately only since July 1912 (*Mineral Resources, 1922*, vol. II, p. 390).

M 136, exports. For 1920–1956, exports include shipments to Alaska, Hawaii, Puerto Rico, and other areas administered by the United States. Prior to 1920, the figures exclude such shipments; therefore, data prior to 1920 are not strictly comparable with those for later years. (For comparison, the 1920 export figure excluding territorial shipments is 8,757.) For 1928 and earlier years, reexports of foreign crude petroleum are included; prior to 1919 such reexports were negligible. For 1916 and earlier years, the figures include all crude mineral oils. Data for 1893–1896 represent fiscal years ending June 30; all other years presumably are calendar years.

M 137. Crude petroleum, estimated proved reserves, 1899–1956.

Source: 1899–1948, American Petroleum Institute, *Petroleum Facts and Figures, 1950*, New York, 1950, p. 182; 1949–1955, same publication, 1956 issue, p. 164; 1956, *Report of the American Petroleum Institute's Committee on Petroleum Reserves*, March 6, 1957 (mimeographed).

The *Minerals Yearbook, 1956*, vol. II (pp. 330–331), states that estimated proved reserves "include only oil recoverable under existing economic and operating conditions . . . . Includes crude oil that may be extracted by present methods from fields completely developed or explored enough to permit reasonably accurate calculations. The change in reserves during any year represents total new discoveries, extensions, and revisions, minus production."

For 1946–1956, figures are for crude oil only. Previously, estimates included some condensate. (The 1945 figure on the new basis is 19,941,846,000 barrels.) The estimate for 1936 has been taken by the American Petroleum Institute from *The Lamp* (Standard Oil Company of New Jersey). Except for 1936, figures for 1935–1956 are estimates of the Committee on Petroleum Reserves of the American Petroleum Institute. For 1899–1934, figures are estimates of the American Petroleum Institute and are not based on geological surveys. The figure for 1899 is designated in the source as representing the entire period 1859–1899.

M 138–147. General note.

Bureau of Mines states, "Data on natural-gas production, consumption, and value are collected by annual questionnaires sent to producers of oil and gas, natural-gasoline-plant operators, gas-pipeline companies, and gas-utility companies . . . .

"Volumes are reported at the pressure base selected by the reporting company; however, if the reported pressure base deviates more than 5 percent from 14.65 pounds per square inch absolute at 60° F. it is corrected to this base.

"Reports are received covering approximately 75 percent of gross natural-gas production. The large number of respondents and the difficulty of contacting each small producer makes direct compilation of total production impractical. The bulk of the output of nonreporting producers is accounted for in the purchases of reporting companies." (*Minerals Yearbook, 1956*, vol. II, p. 282.)

M 138. Natural gas, marketed production, 1900–1956.

Source: *Minerals Yearbook*, annual volumes.

Figures comprise gas sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas in pipelines. They are equal to gross production minus repressuring, vented and wasted. Figures for gross withdrawals may be obtained by summation of series M 138 (marketed production), series M 140 (vented and wasted), and series M 141 (repressuring).

Figures for 1900–1919 are not strictly comparable with those for later years. Apparently, for the earlier period, neither net storage change nor transmission loss was included.

M 139. Natural gas, average value at well, 1922–1956.

Source: 1922–1935 and 1951–1956, *Mineral Resources of the United States* and *Minerals Yearbook*, annual volumes; 1936–1950, Bureau of Mines, *Information Circular 7644*, p. 3.

This series is available only back to 1922, whereas the valuation series at the point of consumption extends back much further. Currently, the two series differ substantially. For 1956, the average value at the well was 10.8 cents per thousand cubic feet while the average value at the point of consumption was 41.5 cents. However, for earlier periods, the spread was not so great.

M 140–141. Natural gas, vented and wasted, and repressuring, 1920–1956.

Source: See source for series M 139.

Figures for vented and wasted gas are partly estimated. The data are compiled from information submitted by respondents, "supplemented by estimated waste derived from figures published by the Natural Gas Reserves Committee of the American Gas Association and State conservation bodies." (*Minerals Yearbook, 1956*, vol. II, pp. 284–285.) Figures include direct waste of producing properties and residue blown to the air.

M 142. Natural gas, estimated proved reserves, 1925–1956.

Source: 1925–1954, American Gas Association, *Historical Statistics of the Gas Industry*, New York, 1956, pp. 20–21;

Digitized by Google

1955–1956, *American Gas Association Monthly*, April 1958, vol. 40, No. 4, p. 8.

The definition of proved reserves is analogous to that for crude oil (see text for series M 137). For 1945–1956, figures are estimates by the Committee on Natural Gas Reserves of the American Gas Association. For 1925–1944, the source cites Lyon F. Terry, "Our Natural Gas Reserves," *Proceedings*, Natural Gas Department of the American Gas Association, 1944, p. 133; and Exhibit No. 445, Federal Power Commission Docket G-580, 1946 (witness E. De Golyer).

M 143–147. Natural gas, consumption, 1906–1956.

Source: See source for series M 139.

Total consumption figures can be computed by summing the figures for these component series. For 1920–1956, such totals would differ from series M 138 (marketed production) by extraction loss (in producing natural-gas liquids) net change in storage, transmission loss, and net imports or exports. Before 1920, the definition of consumption as compared to production is unclear. Such totals would also differ from series M 83, natural gas, dry (expressed in terms of B.t.u.'s), which includes transmission loss.

For 1906–1935, the residential figures (series M 143) appear in the source under "domestic consumption." The industrial field figures (series M 145) include the consumption of natural gas in drilling, pumping, and operating gasoline-recovery plants (estimated).

The figures for "other industrial" consumption (series M 147) were obtained for certain of the early years by adding component data shown in the basic source. In recent years, the source identifies these figures under fuel use. The figures include consumption in petroleum refineries, natural-gas pipelines, portland cement plants, electric utilities, and other industrial plants. For 1906–1929, data for public utilities consumption came from the Geological Survey, while other components were partly estimated.

M 148. Natural gasoline and cycle products, production, 1911–1956.

Source: *Minerals Yearbook*, annual volumes.

"Statistics on the production of natural-gas liquids were collected on both monthly and annual questionnaires from all natural-gasoline plants, cycling plants, and fractionators handling natural-gas liquids. Reports were not received for the liquids recovered at pipeline compressor stations and at gas-dehydration plants. Reports were received on the production of field condensate when this material was not commingled with the crude oil. Field condensate delivered to a plant and fractionated into finished products was reported as output of finished products." (*Minerals Yearbook, 1956*, vol. II, p. 301.)

Natural gasoline figures include all natural-gas liquids except liquefied petroleum gases. They, therefore, include such products as natural gasoline, natural gasoline mixtures, finished gasoline, naphtha, condensate, kerosene, and distillate fuel produced from natural gas. Beginning with 1954, isopentane previously included in liquefied petroleum gases is also included.

M 149 and M 151. Natural gasoline and liquefied petroleum gases, average value at plant, 1911–1956.

Source: Bureau of Mines, records. Published figures exist only for total natural-gas liquids, not for the components as shown in these series.

M 150. Liquefied petroleum gases, production, 1941–1956.

Source: 1941, 1942, and 1944–1956, *Minerals Yearbook*, annual volumes; 1943, Bureau of Mines, *Monthly Petroleum Statement No. 402*.

The reporting system underlying these statistics is the same as that described in the text for series M 148.

M 152–167. Input and output of petroleum products at refineries, 1916–1956.

Source: 1916–1930, Bureau of Mines, *Petroleum Refinery Statistics, 1930*, Bulletin 367, p. 15; 1931–1955, *Minerals Yearbook*, annual volumes; 1956, *Annual Petroleum Statement No. 422*.

The Bureau of Mines collects information on the petroleum refining industry in connection with its other oil and gas statistics. Complete coverage is secured through voluntary industry reports supplemented by minor estimates.

Series M 152 is the sum of petroleum refinery inputs, and excludes unfinished oils rerun (net). Series M 156 is the sum of all finished refinery products; unfinished products are excluded except that M 157 includes unfinished gasoline beginning with 1952. For 1916–1922, this sum was not computed because of incomplete data.

For 1952–1956, jet fuel components are excluded from series M 157–159 and jet fuel included in series M 167.

The conversion factors used by the Bureau of Mines for series M 161–165 were: Wax, 280 pounds = 1 barrel; coke, 1 short ton = 5 barrels; asphalt, 1 short ton = 5.5 barrels; and still gas, 3,600 cubic feet = 1 barrel.

M 168–177. Petroleum products, imports and exports, 1920–1956.

Source: 1920–1937, Bureau of Mines, *Monthly Petroleum Statement No. 402;* 1938–1955, *Minerals Yearbook*, annual volumes; 1956, *Annual Petroleum Statement No. 422*.

These figures represent imports and exports of continental United States. Thus, imports exclude imports into Territories and exports include shipments to Territories. The figures are compiled by the Bureau of Mines mainly from Department of Commerce records.

Total imports (series M 168) also include motor fuel, kerosene, lubricants, wax, asphalt, and other miscellaneous petroleum products not separately shown here. Total exports (series M 171) also include petroleum coke, petroleum asphalt, and other miscellaneous products not separately shown here. For 1932–1937, natural gasoline exports are excluded. For other years, they are included in gasoline (series M 172).

M 178–194. Nonmetals, 1818–1956.

Source: Except as noted below, successive *Mineral Resources of the United States* and *Minerals Yearbook*, annual volumes.

Of the large number of nonmetals, excluding fuels, only the more important ones and those for which adequate data exist have been included here. Although raw clays are among the more important nonmetals, the statistical series available are so inadequate as to result in their exclusion. For many commodities adequate production or shipments series exist and have been shown but satisfactory long-run average value or price series may not exist. Import and export series have been shown only where they are of considerable importance to the industry. Unless otherwise stated, figures for imports and exports were compiled by the Bureau of Mines (or Geological Survey) from records of the Bureau of the Census. For foreign trade definitions, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

M 178, cement shipments. Represents shipments of hydraulic cement for 1912–1956; for 1818–1911, represents production. Coverage includes natural cement since 1818, Portland cement beginning with 1870, slag cement (formerly referred to as puzzolan cement) beginning with 1896, and

488910 O - 60 - 23

Digitized by Google

hydraulic lime cement beginning with 1934. Includes prepared masonry cement made at natural- and slag-cement plants, and beginning with 1955, prepared masonry cement made at portland-cement plants. For 1818–1890, figures are estimated; for 1891–1956, they are based on practically complete returns from all producers (*Minerals Yearbook*, Statistical Appendix, 1935, pp. 178–179). For 1921–1956, the figures have been reported in barrels of uniform weight of 376 pounds. However, prior to 1921, the reports were not always uniform (see *Mineral Resources of the United States, 1916*, vol. II, pp. 342–343).

Figures include Hawaiian production for 1945–1946 and Puerto Rican production for 1939–1956.

M 179, average value of portland cement. Represents average value per 376-pound barrel of shipments from mills; value is that received f.o.b. mills excluding cost of the container. Figures for 1945–1946 include Hawaii and for 1939–1956, include Puerto Rico. Prior to 1926, figures were identified as "average factory value per barrel in bulk."

Portland cement shipments represented about 99 percent of the totals in series M 178 for 1953 and 1954, and between 94 and 95 percent for 1955 and 1956. (See text for series M 178 regarding change in coverage in 1955.)

M 180, crude gypsum mined. Represents crude gypsum mined and ready for calcining or for uncalcined use. Except for the first few years, coverage is believed to be complete. Excludes byproduct gypsum.

M 181, lime sold by producers. Since 1953, includes that used by producers. Includes quicklime, hydrated lime, and dead-burned dolomite. For all but the most recent years, the series represents mainly "open-market" sales and excludes most "captive" tonnage. For 1921–1952, only small quantities of "captive" tonnage were included, but beginning with 1953, coverage is assumed to be complete. For some years prior to 1921, the figures include lime produced and used by soda ash manufacturers. Data for 1889–1903 are not available, and the figures for 1880–1888 are considered much too high (see text for series M 24).

M 182, lime, average value per short ton. Represents the selling value f.o.b. plant excluding the cost of containers. Values for 1882–1888 were converted from average value per barrel at the kiln to an average value per short ton. The conversion factor used was 200 pounds = 1 barrel (*Mineral Resources of the United States, 1904*, p. 840). See also text for series M 24 and M 181.

M 183, sand and gravel sold or used. Includes both sand and gravel since 1905. For 1904, most sand producers were included, while for 1902, coverage was only partial. Data include commercial and government-and-contractor operations. For 1954–1956, includes ground sand (721,000 short tons in 1954). See also Bureau of Mines, *Development of the Sand and Gravel Industry*, Information Circular No. 7203, 1942.

M 184, stone sold or used by producers. Includes both dimension and crushed or broken stone and for 1916–1953, excludes that used for abrasives, lime, and cement. For 1954–1956, includes stone used for abrasives and in making cement and lime, and shell for various uses (95 million tons in 1954). Coverage includes granite, basalt, marble, limestone, sandstone, and others such as mica, schist, conglomerate, argillite, and various light-colored rocks.

M 185, sulfur production from Frasch mines. Although, for most years, virtually all of sulfur production has been from Frasch process mines, these figures do not represent total sulfur output. At present, quantities of sulfur are obtained from other mines, are recovered as elemental sulfur from coal and natural and refinery gases, in pyrites (see series M 188), and as byproduct sulfuric acid and other byproduct sulfur compounds. In 1956 (in terms of thousands of long tons of sulfur content), Frasch production totaled 6,424; other mines, 60; recovered elemental, 465; pyrites, 432; sulfuric acid, 348; and other byproduct compounds, 89.

M 186–187, sulfur, crude imports and exports. Imports represent imports of crude sulfur and sulfur ore. As reproduced in *Minerals Yearbook*, the precise import definition was not always specified for 1937–1956. Prior to 1937, however, figures are for "imports for consumption."

Although no imports of sulfur ore were reported for most of the 1940's, processors stated that during 1941–1945 at least 2,000 tons of sulfur ore were imported from Mexico. Figures for 1867–1887 are on a fiscal-year basis ending June 30; for 1888–1956, on a calendar-year basis. For 1867–1884, pyrites imports are presumably included.

Exports of crude sulfur have been separately classified since 1905. The first shipment occurred in 1904 when 3,000 tons were shipped from Louisiana to France (*Mineral Resources of the United States, 1904*, p. 1079).

M 188, pyrites production. Figures for 1922–1927 have been corrected for flotation concentrates (*Mineral Resources of the United States, 1931*, p. 145).

M 189, pyrites imports. For recent years, figures are for pyrites containing over 25 percent sulfur. For early years, the restriction of not more than 3.5 percent copper content was placed on the import classification. For 1888–1890, pyrites were included under imports of iron ores. Prior to 1884, pyrites imports were classed with sulfur ore.

For 1904–1931 and 1935–1956, figures are for "imports for consumption." For 1884–1903 and 1932–1934, the precise definition of the import series is not always specified.

M 190, salt sold or used by producers. Coverage includes evaporated salt, rock salt, and the salt content of brine production.

M 191, potash sold by producers. Expressed in terms of K_2O equivalent, which is the standard basis for comparison of different salts of widely varying composition.

M 192, potash imports. Represents crude and refined potash materials and is expressed in terms of approximate K_2O equivalent. Figures are for "imports for consumption" and were first tabulated by the Department of Commerce in 1913 (see *Mineral Resources*, vol. II, 1917, p. 401). For 1905–1912, figures are based on information in a fertilizer industry report by the Federal Trade Commission.

M 194, phosphate rock exports. For 1940–1953, figures are from Bureau of Mines, *Mineral Facts and Problems*, Bulletin No. 556, p. 689. Generally, figures include high grade hard rock, land pebble, and other (colloidal matrix, soft phosphate rock, and Tennessee, Idaho, and Montana rock). However, sintered matrix is included only for selected years, while for 1941–1945 Florida soft rock, colloidal, and sintered matrix are excluded.

M 195–197. Iron ore, usable, production and shipments, 1860–1956.

Source: 1860–1898 and 1907–1956, *Mineral Resources of the United States* and *Minerals Yearbook*, annual volumes; 1899–1906, see source for series M 67–70, p. 278.

The Bureau of Mines publishes several iron ore production series. Crude iron ore production represents the mine product before treatment for removal of waste constituents. Figures for usable iron ore production shown here represent such output after treatment.

Digitized by Google

Ore varieties included are hematite, brown ore, and magnetite. For 1942–1956, figures include byproduct material from pyrites. For 1907–1956, coverage is restricted to ore containing less than 5 percent manganese. Prior to 1907, Bureau of Mines data include ores with a higher manganese content. However, the Barger-Schurr data presented here for 1899–1906 assures comparability back to 1899. For 1860–1898, figures very probably include ores with a higher manganese content.

Data for 1882–1888 are estimated. For 1885–1888, estimates are for consumption, not production, of domestic ores. Corresponding consumption estimates (in thousands of long tons) for 1882–1884 are: 1882, 8,700; 1883, 8,800; and 1884, 7,718. Figures for 1875 and 1881 were estimated by I. I. Bell, *Principles of the Manufacture of Iron and Steel*, 1884, p. 451, while figures for 1860, 1870, and 1880 are from decennial census reports.

M 198. Iron ore, average value of shipments, 1889–1956.

Source: See general note for series M 13–274.

Figures represent average valuation of shipments f.o.b. mine.

M 199. Iron ore, price, Mesabi, non-Bessemer, 1894–1956.

Source: American Metal Market, *Metal Statistics*, New York, 1919 and 1957 editions.

Prices are those at Lake Erie docks.

M 200–201. Iron ore, foreign trade, 1872–1956.

Source: See general note for series M 13–274.

Figures were compiled by the Bureau of Mines (or Geological Survey) from records of the Bureau of the Census. For 1935–1956, figures are for "imports for consumption"; for 1872–1934, sources (used here) do not always specify the precise definition of imports. For definitions of foreign trade, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

For some years during the 1940's, some pyrites cinder was included in imports. For 1879–1956, import data represent calendar years; but for 1872–1878, figures are for fiscal years ending June 30.

M 202–203. Iron ore production, by mining method, underground and open pit, 1909–1956.

Source: 1909–1929, N. Yaworski, O. E. Kiessling, C. H. Baxter, L. Eaton, and E. W. Davis, *Technology, Employment, and Output per Man in Iron Mining*, WPA-NRP Report E-13, Philadelphia, June 1940; 1930–1956, see general note for series M 13–274.

For 1942–1956, production is in terms of crude iron ore production. For 1909–1941, it is in terms of usable iron ore. For 1909–1940, some underground production may be included in the open pit figures; and, for a few other years, the statistical allocation of production by method accounted for somewhat less than the total production.

M 204–206. Iron ore employment, 1880–1956.

Source: 1880–1922, see source for series M 202–203 for 1909–1929, pp. 206, 215; 1923–1956, see general note for series M 13–274.

Figures are "active period averages," excluding periods when the mine was not in operation. Slight variations occur in coverage in some of the years. Figure for 1902 was estimated.

M 207. Pig iron shipments, 1810–1956.

Source: See general note for series M 13–274.

For 1910–1956, figures represent shipments; for 1810–1909, figures represent production. *Mineral Resources of the United States*, vol. I, 1910, p. 93, states: "The statistics for 1854 and all succeeding years [through 1909] were collected by the American Iron and Steel Association; those for 1810, 1840, and 1850 are census figures; those for the other years are largely estimates by early statisticians." Figures exclude blast furnace output of ferroalloys.

M 208. Pig iron, average price, 1799–1956.

Source: American Metal Market, *Metal Statistics*, New York, editions for 1910, 1919, 1930, 1940, and 1957.

Several pig iron price series have been spliced together for presentation. For 1799–1843, the series shown is titled "charcoal pig iron," while for 1844–1907, the series is titled No. 1 Foundry, Philadelphia. For 1908–1956, quotations of "basic f.o.b. Valley furnaces" are shown. Price data are available for No. 1 Foundry, Philadelphia, to 1956, but it was considered preferable to show the price of "basic" pig iron, f.o.b. Valley for recent years (available only since 1908) because of its predominant importance today, and to splice this series with other price data for earlier years. The series spliced together do exhibit similar price movements for years in which overlap occurs. For 1799–1843, the series which is titled "charcoal" pig iron is noted in the source as representing best pig iron for 1799–1827, average of grades for 1828–1833, gray iron for 1834–1840, and No. 1 Foundry for 1841–1843. For 1844–1907, the series which is titled No. 1 Foundry, Philadelphia, is noted as referring to several different grades during the period; for 1844–1895, the series refers to No. 1 anthracite Foundry iron.

M 209–210. Pig iron imports and exports, 1922–1956.

Source: See general note for series M 13–274.

Figures were compiled by the Bureau of Mines (or the Geological Survey) from records of the Bureau of the Census. Prior to 1922, pig iron imports and exports were not shown separately from ferroalloys. For 1922–1932, the precise definition of imports was not always specified in *Minerals Yearbook*. For 1933–1956, figures are for "imports for consumption." For definitions of foreign trade, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

M 211–224. Ferroalloying metals, 1868–1956.

Source: See general note for series M 13–274.

Foreign trade figures are presented either for imports or exports, depending on the main direction of United States trade in the commodity. Unless otherwise stated, figures on imports and exports were compiled by the Bureau of Mines (or the Geological Survey) from records of the Bureau of the Census. The specific import series shown is either "imports for consumption" or "general imports" as indicated in the notes for the individual series. However, although not always indicated in the sources (used here), "imports for consumption" as shown in these series exclude imports for manufacture in bond and for subsequent export (classified under "imports for consumption" by the Bureau of the Census). For definitions of foreign trade, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

M 211, manganese ore domestic output (gross weight). For 1910–1956, figures represent mine shipments; for 1880–1909, they represent production. Coverage includes metallurgical, battery, and miscellaneous ores. For 1915–1956, figures include only ore containing 35 percent or more manganese; for 1880–1914, the percentage was 40. (See Barger and Schurr, cited above, for series M 67–70.)

M 212, manganese ore imports (gross weight). For recent years, figures are restricted to ores containing at least 35 percent manganese; for earlier periods, the manganese content is

Digitized by Google

not specified. For 1934–1956, figures represent "imports for consumption." For 1868–1933, the sources (used here) do not always specify a precise definition.

For 1868–1888, figures represent only Canadian shipments to this country; figures for total imports for this period are not available. For 1868–1872, figures are for fiscal years ending June 30. (Imports during fiscal 1873 were 939 short tons.)

M 213, chromite domestic output (gross weight). These figures represent shipments. Data for 1880–1889 are noted as estimates, while for 1890–1910, data are described as having an industry coverage of 95 percent. For 1910–1956, coverage is virtually complete. Prior to 1880, cumulative output (all from Pennsylvania and Maryland) amounted to 224,000 short tons.

M 214, chromite imports (gross weight). For 1884–1910 and 1938–1955, figures are for "imports for consumption." For 1911–1937, the sources (used here) do not specify a precise definition. For 1884–1885, figures are for fiscal years ending June 30.

M 215, tungsten concentrates domestic output (tungsten content). For 1910–1956, figures represent shipments. For 1900–1909, data are called "production." *Mineral Resources of the United States*, vol. I, 1910, p. 740, states that "The production of tungsten ores in this country from year to year can be fairly compared . . . only since and beginning with 1906, as before that date no effort had been made to reduce the ores to a common basis of concentration." Production figures, however, do exist back to 1900 even though considered unreliable. Figures for 1900–1909 were converted from tungsten concentrates to tungsten content on the basis of one short ton of 60 percent WO_3 containing 951.72 pounds of tungsten.

M 216, tungsten concentrates imports. For 1923–1956, figures are in terms of tungsten content; for 1912–1922, gross weight. Figures are for "imports for consumption," except for 1934–1935, for which *Minerals Yearbook* does not specify a precise definition.

M 217, molybdenum ores and concentrates domestic output (molybdenum content). Figures shown are for shipments and are believed to represent complete coverage of the industry.

M 218, molybdenum ores and concentrates exports (molybdenum content). Figures include roasting concentrates. Export figures are not available prior to 1940 because molybdenum was not separately recorded in the export statistics, except that for 1939 gross weight of exports was recorded (see *Foreign Commerce and Navigation, 1939*, p. 520, and *Minerals Yearbook, 1940, Review of 1939*, p. 621). However, exports were of substantial importance.

M 219, vanadium ores and concentrates domestic output (vanadium content). Data shown are for shipments. For 1934–1935, figures represent the vanadium content of carnotite ores only (Bureau of Mines was not at liberty to publish other data); for 1927–1931, data are not available because publication would disclose individual returns. Production occurred prior to 1911, but data for the period are not available. Mine shipments of ores and concentrates for 1940–1956 were measured by receipts at mills and Government purchasing depots. In 1955, the *Minerals Yearbook* began to present (including data for the preceding 10 years) a recoverable vanadium production series. (In 1955, recoverable vanadium content totaled only 6,572,000 pounds compared to a total vanadium content of mine output of 9,965,000 pounds.)

M 220, vanadium ores and concentrates imports. For 1934–1955, figures are in terms of vanadium content; for 1918–1933, in gross weight. (In 1934, the vanadium content equaled 414,000 pounds compared to the gross weight of 3,508,000 pounds.) Figures are for "imports for consumption". The figure for 1918 represents July through December only (prior to 1918 imports of vanadium were not separately recorded).

M 221–224, nickel (content). The United States has been largely dependent on imports of ore, metal, and matte plus domestic secondary recovery from scrap for its supply of nickel. Some small quantities are also recovered as byproduct production of copper refining (in 1956, 623 short tons). Production from domestic ore has been of minor importance. However, in the past few years it has increased substantially (1953, 11 tons; 1954, 2,006 tons; 1955, 4,411 tons; 1956, 7,392 tons).

M 221, nickel secondary production (nickel content). For 1916–1918, coverage is incomplete, since the production of one large firm is only partly covered.

M 223, nickel imports (nickel content). Most nickel imports come from Canada. In 1956, 93 thousand out of 107 thousand short tons of metal, and all ore and matte imports were from Canada. Figures were compiled by the Bureau of Mines (or the Geological Survey) from records of the Bureau of the Census except that for 1950–1956, they include refinery residues, data on which are reported to the Bureau of Mines by importers. For 1926–1956, figures are for "imports for consumption"; for 1911–1925, *Mineral Resources of the United States* does not specify a precise definition. For 1926–1956, the nickel content is noted as estimated.

M 224, nickel, price, electrolytic (cents per pound). For 1913–1927, the source states that figures were computed from data from one large nickel company (by dividing the gross amount received by the total quantity sold). For 1925–1927, computed prices are for December 31; for 1913–1924, prices are for March 31. (The 1925 March 31 quotation was 28.83 cents per pound.) For 1928–1941, quotations are for 2-ton minimum lots in New York City. (The New York quotation for 1942 is 35 cents per pound compared to that of 31.5 cents in Canada.) For 1942–1956, figures represent price quotations to United States buyers by the International Nickel Co., Inc., for electrolytic nickel in carlots f.o.b. Port Colbourne, Canada. For 1942–1947, a duty of 2½ cents per pound is included in the quotation, and for 1948–1956, a duty of 2¼ cents is included.

M 225–230. Copper production, imports, and exports, 1845–1956.

Source: See general note for series M 13–274.

For maximum usefulness it is necessary to understand the interrelationships among the individual series shown for production and foreign trade. Figures are shown for different stages of the production process. Mine output is represented by the recoverable copper content of domestic ores mined. The total domestic output of primary metal from domestic and foreign ores (i.e., excluding secondary recovery from scrap) is represented by primary refinery output. The difference between primary refinery output and the recoverable copper content of mine output in any year is accounted for to some extent by time lags and changes in stocks in the different production stages and by the failure of mine output to include byproduct copper recovered in small amounts from other ores; but mainly, the difference measures the amount of new copper produced in the United States from foreign ores, concentrates, and other unrefined materials.

In addition to copper from primary sources, domestic supply includes copper recovered from scrap (called secondary production) either as unalloyed copper or in alloys and compounds. Two series are shown for secondary output: Total secondary production and recovery from old scrap only. The figures on

Digitized by Google

old scrap measure what the junk pile contributes to metal supply each year, while the difference between old scrap and total secondary production is new scrap—a body of material which, in effect, is continuously being recycled in the production and fabrication of copper metal and does not constitute a true addition to supply at any time.

Primary and secondary output together measure the supply of metal in the United States produced by domestic refiners from foreign and domestic ores and scrap. To measure the supply of refined metal available for consumption in the United States it is necessary also to account for foreign trade; hence, import and export series for the refined metals are shown. Figures on imports and exports were compiled by the Bureau of Mines (or the Geological Survey) from the records of the Bureau of the Census. For definitions of foreign trade, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

M 225, copper production, mine (recoverable content). For 1906–1956, figures refer to the estimated recoverable copper content of domestically mined ores in continental United States and Alaska; for 1845–1905, figures represent smelter production of copper from domestic ores. The statistical differences between the two series are slight. They reflect time lags and changes in stocks in the two stages of production, and also small amounts of byproduct copper recovered at the smelter but not estimated as part of the recoverable content of mine output. (The comparable smelter figure for 1906 equals 458,903 short tons.)

M 226, copper production, primary refined from domestic and foreign ores. Figures represent total primary refinery production from both domestic and foreign ores in continental United States and Alaska.

M 227, copper secondary production, total. Figures represent secondary production from both new and old scrap.

M 229, copper refined imports. Figures represent imports of refined copper only. Imports of copper ore, concentrates, and various unrefined copper metallic materials have historically been of much greater significance than imports of copper refined in ingots, plates, or bars. Within the scheme here used for presenting copper data an approximation of unrefined imports can be obtained by subtracting recoverable content of mine output (series M 225) from primary refinery output (series M 226). For 1934–1956, figures are for "general imports"; for 1916–1933, the sources (used here) do not always specify a precision definition. Although the figures represent imports of refined copper, there have been minor changes in coverage, due to classification shifts during the long period covered.

M 230, copper refined exports. Although the figures represent exports of refined copper, there have been minor changes in coverage, due to classification shifts during the long period covered.

M 231. Copper price, New York, electrolytic, f.o.b. refinery, 1850–1956.

Source: 1850–1859, *Mineral Resources of the United States*, vol. I, 1929, p. A 123; 1860–1956, American Metal Market, *Metal Statistics*, 1919 and 1957 editions.

For 1850–1859, figures are for an unspecified grade of copper. The source cites Weed's *Copper Handbook*, vol. XI, p. 1339, as the basis for these data. For 1860–1899, figures refer to the New York price of Lake copper. In 1900, this price was 16.70 cents as compared with the electrolytic quotation of 16.54 cents. For 1900–1956, data are the average New York prices for electrolytic copper f.o.b. refinery.

M 232–237. Lead production, imports, and exports, 1801–1956.

Source: See general note for series M 13–274, except 1801–1927 for series M 233. Series M 233, 1801–1927, Bureau of Mines, *Economic Paper No. 5*, L. A. Smith, "Summarized Data of Lead Production," 1929, pp. 12–14.

The text for series M 225–230 above, which discusses the interrelationships among the copper production and foreign trade series, is also generally applicable to lead. The description of the method of and sources for the compilation of the foreign trade statistics also applies.

M 232–233, lead production. Series M 232 represents the estimated recoverable lead content of domestic mine output; series M 233 represents the total primary refinery output from both domestic and foreign ores and base bullion. The two series differ by the amounts of ore and unrefined lead which are imported into this country for domestic refining (covered in series M 233) and by the amounts of lead ore and concentrates consumed outside the refineries for such products as antimonial lead and lead pigments and salts (covered in series M 232). Other lesser differences between the two series reflect time lags, and differences in stock changes, at the two stages of production.

Series M 233 includes refined lead from foreign base bullion for 1891–1956 and lead refined domestically from foreign ore for 1886–1956.

M 234, lead, total secondary production. Figures include secondary production from both new and old scrap. They include lead recovered as refined metal and in antimonial lead and other alloys.

M 236, lead imports. Figures are for "imports for consumption" of refined lead in pigs and bars. However, although not always so indicated in the sources (used here), "imports for consumption" as shown in this series excludes imports for manufacture in bond and for subsequent export (classified under "imports for consumption" by the Bureau of the Census).

Although the figures purport to refer to refined lead in pigs and bars, the specific items included change frequently over the long period, and can be identified only by referring to the basic sources. For example, for 1867–1934, imports of old lead are also covered. Figures for many recent years include lead received by the Government and held in stockpile.

For 1867–1886, data are for fiscal years ending June 30.

M 237, lead exports. Figures represent exports of refined lead in pigs and bars. For 1909–1915, exports of lead refined domestically from foreign ores are not included. During this period, all such exports were recorded in the statistics of exports not as refined metal, but as ore and concentrates, i.e., the form in which they were imported. Hence, the figure for 1914 represents only exports of refined metal from domestic ore.

Although the figures purport to refer to refined lead in pigs and bars, the specific items included change frequently over the long period, and can be identified only by referring to the basic sources. For example, for 1920–1936, exports of old or scrap lead are also included. For 1851–1868, data are for fiscal years ending June 30.

M 238. Lead, price of pig lead at New York, 1812–1956.

Source: 1812–1879, W. R. Ingalls, *Lead and Zinc in the United States*, New York, 1908, p. 203; 1880–1956, American Metal Market, *Metal Statistics, 1957*, New York, 1957, pp. 507–509.

Price quotations are generally available both in St. Louis and in New York. New York prices are shown because of its proximity to the larger market.

Digitized by Google

M 239–244. Zinc production, imports, and exports, 1858–1956.

Source: See general note for series M 13–274, except 1858–1881 for series M 240. Series M 240, 1858–1881, Bureau of Mines, *Economic Paper No. 2*, E. W. Pehrson, "Summarized Data of Zinc Production," 1929, p. 19.

The text for series M 225–230, which discusses the interrelationships among the copper production and foreign trade series, is also generally applicable to zinc. The description of the method of, and sources for, the compilation of the foreign trade statistics also applies.

M 239–240, zinc production, mine (recoverable content) and primary smelter slab zinc. Series M 239 represents the estimated recoverable zinc content of domestic mine output; series M 240, the total primary smelter output (including electrolytic plants) from both domestic and foreign ores and base bullion. The two series differ by the amounts of ore and unsmelted zinc imported into this country for domestic smelting (covered in series M 240), and by consumption of zinc ore and concentrates outside the smelter directly in the production of zinc dust and zinc pigments and salts (covered in series M 239). Other lesser differences between the two series reflect time lags, and differences in stock changes, at the two stages of production. Coverage includes continental United States and Alaska.

For 1858–1903, smelter output (series M 240) is that from domestic ores only. For 1904–1905, an unknown quantity of smelter output from foreign ore is included. For 1906–1956, output from both domestic and foreign ores and base bullion is included.

M 241, zinc, total secondary production. Includes secondary production from both new and old scrap.

M 243, zinc imports. Figures are for "imports for consumption" of zinc blocks, pigs, and slabs. However, although not always so indicated in the sources, they exclude imports for manufacture in bond and for subsequent export (classified as "imports for consumption" by the Bureau of the Census).

For 1867–1885, figures are for fiscal years ending June 30.

M 244, zinc exports. Figures represent exports of zinc in blocks, pigs, and slabs. The specific items included, however, changed frequently over the long period and can be identified only by referring to the basic sources.

For 1864–1885, figures are for fiscal years ending June 30.

M 245. Zinc, price of slab zinc at New York, 1853–1956.

Source: 1853–1864, *Mineral Resources*, vol. I, 1929, p. A 123; 1875–1879, W. R. Ingalls, *Lead and Zinc in the United States*, New York, 1908, p. 342; 1880–1956, American Metal Market, *Metal Statistics, 1957*, New York, 1957, pp. 581–583.

Quotations for slab zinc are available both at St. Louis and in New York. New York prices are shown because of its proximity to the larger market.

M 246–247. Gold and silver production, 1792–1956.

Source: 1792–1834 and 1845–1903, Treasury Department, *Annual Report of the Director of the Mint, 1910*, p. 99; 1835–1844, for series M 246, Bureau of Mines, *Economic Paper No. 6*, R. H. Ridgway, "Summarized Data of Gold Production," 1929, p. 14; for series M 247, Bureau of Mines, *Economic Paper No. 8*, C. W. Merrill, "Summarized Data for Silver Production," 1930, p. 18; 1904–1956, Bureau of Mines, records.

For 1792–1903, figures represent production measured at the refinery stage; for 1904–1956, they represent production measured at the mining stage. The refinery figures are from the Bureau of the Mint and measure the metal from domestic ores and concentrates actually recovered in marketable form. The mine output figures are from the Bureau of Mines and measure the recoverable gold and silver content of domestically produced ores, concentrates, and bullion. Differences between the two series primarily result from time lags between the two stages of production. Other differences exist because of the difficulty at the refining stage of determining the domestic or foreign origin of the ore. The Bureau of Mines figures are defined as "calculated upon the basis of recovered or recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced." (*Minerals Yearbook, 1950*, p. 564.) Bureau of the Mint data are defined as "official estimates of production of gold and silver in the United States . . . based upon arrivals at United States mints and assay offices and at privately owned refineries" (same source, p. 580).

Data include both lode and placer production in Alaska and continental United States but exclude production in all other Territories and possessions. The weight unit for both gold and silver is the fine troy ounce of 480 grains. No price series is shown for gold. In 1934, its official value was changed from $20.67 to $35 per fine ounce.

M 248. Silver, New York average price, 1850–1956.

Source: 1850–1883, *Mineral Resources of the United States*, vol. I, 1929, p. A 123; 1884–1956, American Bureau of Metal Statistics, *Yearbook, 1933*, and *Yearbook, 1956*, New York, 1934 and 1957, respectively.

In recent decades, most silver sold at this price has been of foreign orgin since the U.S. Treasury buys domestically mined silver at a fixed price (in 1954, $0.9050505 per fine ounce). For more complete information, see Bureau of the Mines, *Mineral Facts and Problems*, Bulletin 556, p. 791.

M 249–258. Bauxite, aluminum, and magnesium, 1886–1956.

Source: See general note for series M 13–274, except for series M 255. Series M 255, American Bureau of Metal Statistics, *Yearbook, 1933*, and *Yearbook, 1956*, New York, 1934 and 1957, respectively.

Figures on imports and exports were compiled by the Bureau of Mines (or Geological Survey) from records of the Bureau of the Census. The imports figures represent either "imports for consumption" or "general imports" as indicated in the notes for the individual series. However, although not always so indicated in the sources (used here), "imports for consumption" exclude imports for manufacture in bond and for subsequent export (classified as "imports for consumption" by the Bureau of the Census). For definitions of foreign trade, see introduction in Bureau of the Census, *Foreign Commerce and Navigation of the United States, 1946*.

M 249, bauxite domestic output. Figures represent production for 1919–1928 and 1940–1956, production or shipments for 1929–1934 (the terms are used interchangeably during this period), and shipments for all other years. For 1935–1956, figures are in terms of "dried bauxite equivalent"; for 1889–1934, they refer to bauxite "as shipped." Because of the widely differing moisture content of the different forms (crude, dried, and calcined), dried bauxite equivalent yields a more comparable measure of the quantity of bauxite produced or shipped.

Figures for 1889–1918 are from the 1918 volume of *Mineral Resources of the United States*, vol. I, p. 516, and are titled "shipments as revised by producers, December 1919." The source states that the figures "are believed to represent more accurately [than other available figures] the condition of the industry" (same source, p. 514).

M 250, bauxite imports. Imports of bauxite are of great importance; exports are insignificant. Figures represent

Digitized by Google

"imports for consumption" for 1938–1942 and 1946–1956. For 1898–1937 and 1943–1944, the source does not always specify a precise definition.

For 1934–1950, the figures are in terms of "dried bauxite equivalent," an adjustment in the Department of Commerce series made by the Bureau of Mines. Figures entirely adjusted to the dried bauxite equivalent are not available for other years. However, for 1952–1956, figures for imports from Jamaica (which have a high moisture content) have been adjusted and the remaining imports presumably include only a small amount of undried bauxite.

M 251, aluminum primary production. For 1896–1906, figures represent fiscal years ending August 31. Production for September-December 1906 totaled 2,734 short tons.

M 252–253, aluminum secondary production. Total secondary production represents recoverable content from both old and new scrap processed. For 1954–1956, figures represent recoverable aluminum content and are not strictly comparable with those for previous years which are for recoverable aluminum-alloy content.

M 254, aluminum imports, crude and semicrude. Aluminum imports include metals and alloys, crude; scrap; and plates, sheets, bars, etc. Figures are for "imports for consumption" for all years except 1911–1912, for which they represent "general imports." There have been minor changes in the description of coverage of the figures but the general description of imports of crude and semicrude is uniform throughout.

Exports have not been shown since they are minor as compared with imports. In 1956, exports of crude and semicrude, including scrap, the major component, totaled 68,032 short tons as compared with imports of 264,975.

M 255, aluminum, price of primary ingot. Represents average price of primary ingot in New York City.

M 256, magnesium primary domestic output. For 1939–1956, figures represent production; for 1915–1938, data are for new ingot sold or used. For 1943–1944, magnesium content of incendiary mixtures produced directly is excluded.

M 257–258, magnesium secondary domestic output. Secondary production of magnesium is expressed in terms of ingot equivalent and represents the recoverable magnesium and magnesium-alloy content of scrap processed. Total secondary output includes recoverable content of both old and new scrap processed.

M 259–264. Injuries and fatalities in all coal mining, 1870–1956.

Source: 1870–1954, Bureau of Mines, *Injury Experience in Coal Mining* and its predecessor, *Coal-Mine Accidents in the United States* (both issued as annual bulletins, with few exceptions, although the latter first appeared as a Technical Paper); 1955–1956, Bureau of Mines, records.

M 259–260, injuries, fatal and nonfatal. The Bureau of Mines began to gather information on nonfatal injuries in 1930. Data on number of fatalities go back to 1870 for anthracite and to 1874 for bituminous coal; availability of information on fatalities for the 19th century and the early years of the 20th century depended on the existence of State records, which, in turn, depended mainly on whether the States had mine inspection services.

For 1870–1909, the record of fatalities is incomplete for bituminous coal. Coverage appears to be high between 1901 and 1909—the records cover in the neighborhood of 98–99 percent of all production. Between 1895 and 1900, the fatality records cover about 95 percent of all production; by 1890, this percentage had fallen to almost 90 percent. Before 1890, coverage seems to fall off considerably, particularly in the 1870's. For example, coverage of Pennsylvania bituminous coal mines does not begin until 1877. Records for Maryland and Ohio extend back to 1876 and 1874, respectively, while partial records are available for Virginia as early as 1839. Incompleteness since 1870 applies only to bituminous coal. Pennsylvania anthracite records are complete since 1870, with partial data available for 1847 and 1869 (Bureau of Mines Bulletin No. 115, pp. 7–9, 105).

Additional detail is available in the source bulletins as to the causes of injury, and information is shown classifying the nonfatal injuries into the categories of "permanent total disability," "permanent partial disability," and "temporary total disability."

M 261–264, frequency rates, fatal and nonfatal. The employment statistics used in deriving the injury and fatality frequency measures since 1890 are based on canvasses conducted by the Bureau of Mines (or the Geological Survey) with occasional figures from the Census of Mineral Industries. Although these underlying employment data are not presented here, they are available in the source bulletins. For almost all years between 1890 and the early 1930's, the underlying employment figures are those shown in series M 102–105 and M 123–128. In subsequent years, separate employment figures, collected on accident canvasses, were used for deriving the frequency rates. The latter employment figures differ somewhat from those shown in the bituminous and anthracite series (series M 102–105 and M 125–128). For 1870–1889, the frequency rates are based on employment statistics collected by the States which were less complete and presumably less accurate and comparable than those resulting from the Bureau's own canvasses in subsequent years.

M 261–262, frequency rates per million man-hours, fatal and nonfatal. The figures on man-hours of employment on which these ratios are based were derived as follows: Producers began reporting man-hours of employment to the Bureau of Mines in 1930, but during the early 1930's many mines left the man-hours question unanswered and even in the 1940's the man-hours were not always reported. For those mines not reporting man-hours, the Bureau estimated the figure by multiplying the average number of employees (active period average) by the number of days on which the mine was active, and then multiplying the product by the number of hours constituting a standard work shift in the particular mine. This method, with certain variations, was used by the Bureau to estimate man-hours in all years prior to 1930, when no direct information on man-hours was collected. Estimated man-hours, although reasonably accurate, suffered from two major shortcomings: (1) The number of active days was generally determined by the number of days on which the tipple was active; this omitted days on which no coal was brought to the surface, although on such days men were often employed under ground in loading coal or in repair or maintenance work, and (2) the standard work shift did not apply to all occupations, and many miners were irregular in observing standard working hours (see source, Bulletin 380, pp. 8–9; and Bulletin 283, p. 64).

The 1943 bituminous coal mine wage agreement made portal-to-portal time the basis for pay rather than face or working time hours. Since 1944, only portal-to-portal man-hours have been reported. Conversion factors were applied to man-hour data for underground bituminous employees back to 1930. No such adjustment was made, however, for surfacemen at underground mines or strip mine employees in the bituminous industry. No adjustment was deemed necessary in the anthracite industry.

Digitized by Google

M 263–264, fatalities per 1,000 300-day workers, and per 1,000 employed. The 300-day worker basis was derived by converting the average number of employees (active period average) according to the ratio between active mine days and 300 days. For the very early years, information on active days was not available, hence the simple measure of fatalities per 1,000 was employed.

For 1888 and earlier years, corresponding employment data are not available for all recorded fatalities. The rates are based on those fatalities for which corresponding employment data do exist. Apparently, comparable fatality and employment data exist for all Pennsylvania anthracite back through 1870.

Source bulletins also show fatality rates per million tons mined.

M 265–268. Injuries and fatalities in quarrying and related industries, 1911–1956.

Source: 1911–1953, Bureau of Mines, *Injury Experience in the Quarry Industry*, Bulletin No. 566, 1956; 1954, same publication, Information Circular No. 7842, 1958; 1955–1956, Bureau of Mines, records.

Separate figures are shown in the basic source according to the kind of rock produced and also for stone classified as dimension and nondimension. Nondimension stone includes all stone used in unshaped or irregular form, as for roadbuilding and cement and lime manufacture; dimension stone includes all stone that is cut or shaped for building or monumental purposes. By far, the major share of employment is in nondimension stone. The figures also cover crushing, screening, rock dressing, and the manufacture of cement and lime, insofar as these operations are conducted by the quarry companies; except for crushing and screening, these operations are classified as manufacturing in the *Standard Industrial Classification Manual*. On the other hand, quarries producing sand, gravel, and clay are excluded.

The source states that the data are comparable only since 1916 because information reported for prior years was obviously incomplete as to number of injuries, especially those causing disability for only one or two days. Additional detail is available in the source as to the causes of injuries, and the classification of nonfatal injuries, into the categories of "permanent total," "permanent partial," and "temporary total," the latter category being further divided, for 1915–1929, into the subclasses, "temporary disabilities lasting more than 14 days" and "temporary disabilities lasting more than the remainder of the day on which the accident occurred, but not exceeding 14 days."

The employment data used in deriving the injury and fatality frequency measures are comparable with the injury data. However, they must be carefully evaluated before they are used for other purposes. For an extensive discussion of the inadequacies of the underlying employment data see Barger and Schurr, cited earlier in the text for series M 13–37; see especially appendix C, pp. 377–393 of this publication.

M 269–274. Injuries and fatalities in metal and nonmetal mines, 1911–1956.

Source: 1911–1954, Bureau of Mines, *Injury Experience in the Metal and Nonmetal Industries*, and its predecessors: *Metal and Nonmetal Mine Accidents in the United States* and *Metal Mine Accidents in the United States* (all issued annually, with some exceptions, although the latter first appeared as a Technical Paper); 1955–1956, Bureau of Mines, records.

Employment and injury data for metal and nonmetal mines have been collected by the Bureau of Mines annually since 1911. Reports received by the Bureau are voluntary and cover all States and Alaska.

Separate figures are shown in the basic source by type of mining method and by cause of injury. Over the entire period, there have been numerous changes in the classification systems used. In addition, data are given by kind of mine, as follows: Copper, iron ore, lead-zinc, gold-silver lode, gold placer, miscellaneous metal mines, and nonmetal mines. Included under miscellaneous metal mines are those working ores of quicksilver, manganese, tungsten, vanadium, chromium, and other metals plus pyrite mines (the cinder is used in metallurgical works for its iron and copper content) and bauxite mines (the primary source of aluminum). The nonmetallic group includes mines that produce asbestos, asphaltum, barite, borax, emery, feldspar, fluorspar, garnet, graphite, gypsum, lithium, magnesite, mica, mineral paint, phosphate rock, potash, quartz, salt, soapstone, sulfur, talc, and tripoli.

Additional detail is available in the source bulletins as to the causes of injuries, and information is shown subclassifying the nonfatal injuries. For 1930–1956, nonfatalities have been recorded as temporary or permanent with the latter subdivided into total and partial disability. For 1915–1919, temporary injuries were separated into "serious"—of more than 14 days duration, and "slight"—of more than 1 but less than 14 days duration. For 1911–1914, nonfatalities were simply divided into "serious"—of more than 20 days duration, and "slight"—of more than 1 but less than 20 days duration.

Frequency rate measures were originally expressed per 1,000 men employed. Shortly thereafter, in an attempt to secure a uniform time basis for comparison, the Bureau of Mines began to express all frequency rates on a 300-day worker basis (derived by converting the average number of employees on active days according to the ratio between active mine days and 300 days). These rates were extended back through 1911. Rates per million man-hours of exposure are not available prior to 1931 in the reports, although partial man-hour data by length of shift are available from 1921–1930.

The employment data used in deriving the injury frequency measures are comparable with the fatality and injury records. However, they do not necessarily reflect total employment within the industry. Despite incomplete coverage, the data are considered by the Bureau to be representative of hazard exposure.

[1] The gross value of shipments contains duplication due to the transfer of crude minerals from one establishment to another for preparation. The figures for net shipments exclude this duplication. Figures for 1954 exclude the value of shipments for the uranium-radium-vanadium ores industry.

[2] Received for preparation, supplies, purchased fuels and electric energy, and contract work. For 1954, represents purchased fuel only and excludes the cost of uranium-radium-vanadium ores received for preparation. For 1939, includes the value of fuels produced and used at the same establishment for power or heat.

[3] Except for value of shipments and value added, excludes data for dimension stone dressing plants operated in conjunction with quarries. The value added in dressing stone at such operations was $8 million; this value has been included in the value of shipments and value added in mining.

[4] Not available.

[5] Includes data for 334 employees, paid $1.1 million, at central offices which could not be distributed by industry.

[6] Includes data for quarries and associated lime plants producing lime valued at $9 million.

[7] Figures for all other employees are included with those for production and development workers.

[8] Excludes figures for operations not engaged in producing stone for building purposes.

[9] Figures for 27 nonproducing establishments in the nonmetallic minerals (except fuels) mining industries are included with those for the metal mining industries.

[10] Figures for 19 establishments in the metal mining industries are included with those for the nonmetallic minerals (except fuels) mining industries.

[11] Less than $5000,000.

[1] Includes additional mineral products not shown separately, therefore components frequently will not add to group totals.
[2] Excludes certain clays, value of which is included in total nonmetals.
[3] Value of clays used in cement is included here, but is not included in total value of nonmetals. It has been excluded from the total value of nonmetals (series M 20) to avoid double counting since it constitutes part of the value of cement, series M 21.
[4] Estimated.
[5] Only incomplete figures available; these are included in total nonmetals.
[6] Not available separately; included with value of stone (series M 26).
[7] Less than $0.5 million.
[8] As of 1954, sand and sandstone (ground) are, for the first time, included with series M 25 (sand and gravel) and M 26 (stone), respectively.
[9] Includes value of stone used for cement or lime, excluded from total nonmetals (series M 20).

Series M 71–87. Production and Calculated Consumption of Mineral Energy Fuels, Electricity From Waterpower, and Fuel Wood, in B.t.u.'s: 1800 to 1956

[In trillions of British thermal units. A British thermal unit (B.t.u.) is the quantity of heat required to raise the temperature of one pound of water 1°F. at or near its point of maximum density]

Year	Production							Calculated consumption									
	Mineral fuels					Electricity from waterpower		Mineral fuels							Electricity from waterpower		Fuel wood
	Total mineral fuels	Bituminous coal	Pennsylvania anthracite	Crude oil	Natural gas, wet	At prevailing central station equivalent	At direct calorific equivalent	Total mineral fuels	Bituminous coal	Pennsylvania anthracite	Crude oil	Petroleum products, net imports [1]	Natural gas, dry	Natural gas liquids	At prevailing central station equivalent	At direct calorific equivalent

1876	46	1872	25				

[1] Not strictly comparable with years prior to 1954. Estimated comparable totals should include an additional 232,920 long tons in 1954; 277,860, in 1955; and 292,520, in 1956.
[2] Less than 500 long tons. [3] Not available. [4] Tonnage calculated from combined total of domestic sulfur and sulfur content of pyrite produced.
[5] Quantity derived from figures in metric tons (*Mineral Resources of the United States, 1903*, p. 1081). [6] None mined.

Series M 211–224. Ferroalloying Metals—Manganese, Chromite, Tungsten, Molybdenum, Vanadium, and Nickel: 1868 to 1956

[Quantities in short tons and metallic content, except where specified as gross weight]

Year	Manganese ore (35% or more Mn) (gross weight)		Chromite (gross weight)		Tungsten concentrates		Molybdenum ores and concentrates		Vanadium ores and concentrates (1,000 pounds)		Nickel			
											Production, secondary			
	Domestic output	Imports	Domestic output [1]	Imports	Domestic output	Imports [2]	Domestic output	Exports	Domestic output	Imports [3]	Total	From old scrap	Imports	Price, electrolytic (cents per pound)

[1] Imports of refined copper from Chile, as reported by the Chile Exploration Co., were included by *Mineral Resources of the United States* in place of those of the Bureau of Foreign and Domestic Commerce which were considered too low.

[2] Includes some refined copper imports.

[1] Includes sheets and pipes; figures not available separately.
[2] Not available.
[3] Comprises reclaimed scrap; no recorded imports of pigs and bars.
[4] Excludes output of Virginia (Bureau of Mines was not at liberty to publish).

[1] Man-hours for 1911–1923 computed on assumption that weighted average length of workday was 9.86 hours, as shown by reports from representative operating companies for 1924.

[2] Man-hours not available prior to 1931.

[3] Figures for 1930–1956 are on a portal-to-portal basis; earlier years are on a working-time basis. The 1930 frequency rate for fatalities per million man-hours on a portal-to-portal basis was 1.9, the working-time rate was 2.1.

[4] Injury rate for years before 1916 are believed not to be representative, owing to probable incompleteness of reports of slight or minor injuries.

[5] Accident reports for mines in the gold, silver, and miscellaneous metal group are not complete as to nonfatal injuries before 1916.

[6] Fatalities per million man-hours are available for bituminous coal back to 1906 as follows: 1910, 2.1; 1909, 2.1; 1908, 2.1; 1907, 2.5; 1906, 1.8 (Bureau of Mines Bulletin 456, p. 103). Fatalities per million man-hours are available for anthracite back to 1903 as follows: 1910, 1.7; 1909, not available; 1908, 2.2; 1907, 2.1; 1906, 2.0; 1905, 2.0; 1904, 2.1; 1903, 1.9 (Bureau of Mines Bulletin 115, p. 288. Converted from per thousand 2,000-hour workers to per million man-hours).

[7] Data reflect only Pennsylvania anthracite fatalities; data for bituminous coal mining are not available prior to 1874.

Construction and Housing

CONSTRUCTION (Series N 1–105)

N 1–28. Value of private and public construction, 1915–1957.

Source: Department of Labor and Department of Commerce, "Construction Volume and Costs, 1915–1956," *Statistical Supplement to Construction Review*, and various monthly issues of *Construction Review* for 1957 and 1958.

On July 1, 1959, full responsibility for compiling and publishing these estimates was placed in the Department of Commerce. Prior to that date, the Department of Labor was responsible for the estimates of value of private housekeeping residential construction and of all public construction, and the Department of Commerce was responsible for the estimates of all other new construction, of maintenance and repair expenditures, and of expenditures in 1947–49 prices for all types of construction.

Specific definitions of the terms used here are given in the source. The estimates exclude expenditures for drilling of oil, gas, and water wells (included in the construction component of estimates of the gross national product). New construction includes structural additions and alterations; but the estimates for these items are less reliable than the estimates for other items included in the total.

Estimates of construction expenditures measure the value of work put in place on all structures and facilities under construction during a given period regardless of when work on each individual project was started. These figures represent a summation of: Costs of materials actually incorporated into structures and facilities during the given period regardless of when such materials were purchased or delivered to the site; costs of labor performed during the period; and proportionate allowances for overhead costs and profits on construction operations. Thus, the value-in-place estimates differ from the total value of contracts awarded during a given period and the total value of housing units started during the same period because the latter two items represent the total completed value of construction being undertaken currently.

Since most construction is done on order, sales costs and selling profits in the ordinary trade sense are uncommon. Those selling costs and profits which do arise in connection with housing construction done on a speculative basis, however, are not included in the value of construction. The estimates include the value of force-account work (construction done by governmental agencies or nonconstruction firms with a separate work force, not under contract) and the value of work done by owners or their families on their own homes, farm buildings, etc.

The source publication comments as follows on the reliability of these data: "The degree of error in the estimates . . . cannot be measured statistically and, because of the uneven quality of the basic source data, the accuracy of the figures may vary considerably between types . . . . Moreover, the degree of accuracy . . . has varied with the resources available for searching and processing appropriate secondary data, and for conducting pertinent original surveys. In general, the larger the coverage of the expenditures the more reliable are the figures."

Estimates of the value of new construction by States are available only for 1939–1952 in Department of Commerce, *Construction and Building Materials, Statistical Supplement*, "New Construction by Regions and States, 1939–1952."

N 1–3, total construction, total new, and total new private construction. Series N 1 represents a summation of series N 2 and N 28. Series N 2 represents a summation of series N 3 and N 17. Series N 3 represents a summation of series N 4, N 5, N 9, N 10, and N 16.

N 4, new private residential construction (nonfarm). Figures comprise expenditures for new housekeeping dwelling units (also known separately as series N 115) and additions and alterations to such structures, and for new nonhousekeeping buildings such as hotels, motels, dormitories, tourist courts, and vacation cottages.

For housekeeping residential construction, the estimates for 1941–1957 are based on monthly reports of the value of new dwelling units authorized by local building permits and on monthly field surveys in a sample of areas not issuing building permits. Values in building permit reports are adjusted to reflect the construction cost of dwelling units in all permit-issuing places, reporting and nonreporting, to compensate for the typical understatement of costs in permits, and to allow for lapses of permits. The permit and nonpermit segments are then combined and further adjustments are made to cover architect and engineering fees and site development costs not covered elsewhere. An expenditure pattern is developed for these adjusted estimates of total costs to estimate the amount of work put in place in the months following start of construction (see text for series N 106–115). For 1921-1940, the data are based mainly on the value of permits issued during each year, with rough adjustments for nonreporting permit areas and nonpermit areas and for the other items mentioned above. Only slight adjustment is made for year-to-year differences in the amount of carryover of expenditures for units started near the end of the year. The estimates for 1915–1920 are projected back from the 1921–1922 average by using link relatives indicated by year-to-year changes in the value of residential building contracts awarded as reported by the F. W. Dodge Corporation. For a series beginning in 1889, see series N 115.

Private residential construction is the only type of construction activity for which the source publishes estimates of additions and alterations separately, and the data cover housekeeping structures only. For a discussion of the problems of estimating dependable data on residential additions and alterations, see Marvin Wilkerson, "Revised Estimates of Residential Additions and Alterations, 1945–56," *Construction Review*, June 1957. For a rough segregation of residential construction expenditures into 1- to 4-family dwellings and multifamily dwellings, see Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, Princeton University Press, 1955, table R-28.

For nonhousekeeping residential construction, the sources and estimating procedures are the same as those for private nonresidential building (see below).

488910 O - 60 - 25

Digitized by Google

N 5–8, new private nonresidential buildings. Estimates are based on monthly records of the value of contract awards in the 37 States east of the Rocky Mountains, as compiled by the F. W. Dodge Corporation (see text for series N 68–74). These are adjusted for undercoverage in the 37 States, cancellations, and duplication of construction reported by public utilities (series N 10–15), and are expanded to cover the 11 Western States by reference to building permit and various contract award reports. The adjusted value of monthly contract awards is converted to monthly estimates of expenditures on the assumption that all projects are started in the month following the contract award and on the basis of an expenditure pattern over subsequent months. This pattern varies between types of construction and is derived from surveys made during World War II and the immediate postwar years.

N 9, farm construction. Annual estimates of total expenditures on farm buildings and a classification of the total into expenditures on operators' dwellings and expenditures on other farm structures are prepared by the Agricultural Marketing Service. They are based chiefly on data from sample surveys of construction expenditures of farm operators for 1934–1937, 1939, 1946, and 1949. Estimates for other years are made by interpolation and extrapolation, based in part on inference from data on farm electric lighting systems, silos, domestic water systems, etc., reported annually in Bureau of the Census, *Facts for Industry—Farm Machines and Equipment*. The bulk of the dollar amounts involved, however, for these years, represents approximations based on changes in indexes of farm construction costs and such indicators as estimated consumption of lumber on farms, sales of building materials in rural areas, and nonfarm residential construction. The separation of estimated expenditures for maintenance and repairs from new construction expenditures is based upon relationships indicated in the source material.

N 10, total, public utilities. This series is the sum of series N 11–15.

N 11, railroad (including local transit). Railroad estimates are based on an annual summary of construction expenditures prepared by the Interstate Commerce Commission from reports by all Class I railroads adjusted upward to represent all classes of railroads. Local transit estimates of capital and maintenance expenditures are from the *Transit Fact Book*, annual publication of the American Transit Association. Outlays by municipally owned transit companies have been deducted from these expenditures. For both railroads and local transit, the estimates for 1915–1921 are extrapolations based on miles of track added or rebuilt.

N 12, petroleum pipeline. Capital expenditures on pipelines for 1919–1957 were obtained from the reports filed with the Interstate Commerce Commission. Adjustment was made for the purchase of existing lines and for expenditures by companies not required to file information with the Commission. Only rough estimates by the Bureau of Foreign and Domestic Commerce are available for 1915–1918.

N 13, electric light and power. For 1937–1957, annual additions to electric plants reported to the Federal Power Commission were adjusted to include small companies not reporting and to allow for work in progress and existing property purchased. For 1921–1936, data from the Edison Electric Institute were used. For 1915–1920, the data are based on an estimated year-by-year distribution of the 5-year increments in plant and equipment derived from data reported in the Census of Electrical Industries for 1912, 1917, and 1922.

N 14, manufactured and natural gas. For 1929–1957, annual data published by the American Gas Association were adjusted to eliminate equipment expenditures. For 1915–1928, estimates were obtained by extrapolation on the basis of year-to-year changes in the fixed capital accounts of 50 large gas companies.

N 15, telephone and telegraph. Estimated construction expenditures of the telephone industry for 1915–1957 were obtained from the American Telephone and Telegraph Co. Construction expenditures of the telegraph industry were derived from capital expenditures reported by the Western Union Telegraph Co. for 1927–1957 and by the Postal Telegraph and Cable Co. for 1919–1943. Extrapolation back to 1915 was made on the basis of annual increments in the value of plant and equipment.

N 16, all other private construction. This series includes unclassified items such as private dams and reservoirs, sewer and water installations, roads, bridges, and parks and playgrounds.

N 17, total new public construction. These data represent a summation of series N 18–19 and N 23–27. The distinction between private and public construction is made on the basis of ownership rather than source of funds. Some types of private institutional construction involve Federal, State, or local aids to projects built by nonprofit organizations. To this extent, the public construction estimates do not account for all public expenditures for new construction.

N 18, public residential construction. The estimates are based on reports of the Public Housing Administration, the New York City Housing Authority, and other State and local agencies. They include direct Federal construction during World War I, the depression of the 1930's, defense, and World War II periods; the Federal low-rent public housing program initiated in 1937 and executed by State and local agencies with Federal loans and grants; similar programs executed by State and local agencies without Federal aid; and the Veterans Temporary Re-Use Housing Program of the Federal Government initiated in 1945 and terminated in 1950. For the number of dwelling units under the major programs, see series N 116–124.

N 19–22, public nonresidential buildings. For Federal construction and State and local projects under Federal-aid programs, the estimates are based on reports of Federal agencies since 1941. For prior years, and for public construction other than Federal or Federal-aid projects, they are derived from the compilations of contract awards by the F. W. Dodge Corporation, adjusted as explained in the text for series N 5–8.

N 23, military facilities. Estimates for 1940–1957 are based on monthly reports by the Department of Defense. Navy Department construction expenditures for 1915–1936 were derived from special tabulations of the Bureau of Supplies and Accounts. Expenditures of the Navy for 1937–1939 and the War Department for 1915–1939 are based upon expenditures shown in various issues of Bureau of the Budget, *Budget of the United States Government*.

N 24, highways, roads, and streets. For 1921–1957, estimates for State-administered highways are based on annual reports of the Bureau of Public Roads adjusted to include expenditures by county, municipal, and other local bodies. The adjustments are based upon ratios developed from the analysis of total highway construction and State highway construction. Estimates for 1915–1919 are derived from the 1920 *Yearbook of Agriculture*. The 1920 estimates are obtained by straight-line interpolation.

N 25, sewer and water systems. For 1915–1942, estimates are based upon data published annually in Bureau of the Census, *Financial Statistics of Cities*. Using the expenditure patterns of the city-size groups reporting, expenditure ratios

Digitized by Google

were derived for the smaller municipalities and rural incorporated areas. For 1943–1957, estimates are based upon contracts awarded as reported by the F. W. Dodge Corporation with adjustments for undercoverage.

N 26, conservation and development. For 1915–1942, expenditures for reclamation, improvement of rivers and harbors, and flood control work are derived from annual reports of the Corps of Engineers and the Bureau of Reclamation. The fiscal-year basis of the reports are converted to calendar year by taking one-half of the figure for each fiscal year included within that calendar year. For 1943–1957, estimates are based upon project reports furnished by the same two agencies. Tennessee Valley Authority expenditures are available in its annual reports. Bureau of Indian Affairs, Forest Service, National Park Service, and Soil Conservation Service expenditures are derived from special tabulations prepared by those agencies, and from the Bureau of the Budget, *Budget of the United States Government.*

The estimates, with minor exceptions for earlier years, refer only to expenditures by the Federal Government. State and local government expenditures for this type of construction are included in "all other public" (series N 27).

N 27, all other public construction. This series combines "miscellaneous public service enterprises" and "all other public construction" shown separately in the source. Construction expenditures by Federal agencies not included in other series are, for the most part, based on monthly or quarterly reports of the agencies or, in cases of minor or occasional construction work, derived from fiscal-year data in the Bureau of the Budget, *Budget of the United States Government.* Outlays for municipal public service enterprises were obtained directly from the municipalities or estimated from information reported in Bureau of the Census, *Financial Statistics of Cities.* Current miscellaneous public construction estimates, other than those of the Federal Government, are derived primarily from reports of contracts awarded, compiled by the F. W. Dodge Corporation, from the *Engineering News-Record,* and from other publications reporting contract awards.

N 28, maintenance and repair. The estimates are, in general, much less reliable than those for new construction and, to judge from past revisions and occasional partial surveys, probably understate actual expenditures.

Estimates of nonfarm residential building for 1947–1957 are based on the annual *Survey of Consumer Finances* of the Board of Governors of the Federal Reserve System, the consumer expenditure survey for 1950 by the Bureau of Labor Statistics, and a 1950 survey of outlays of owners of tenant-occupied dwelling units by the Office of the Housing Expediter (conducted for purposes of rent control). Data for earlier years are based on estimates of the value of all residential properties and on ratios of maintenance and repair expenditures to value. These ratios are derived from various studies, such as surveys of consumer purchases by the Department of Agriculture and the Department of Labor, and wartime surveys made for purposes of rent control.

Estimates for nonresidential building are based on corporate income tax returns covering manufacturing activities; cost analyses for office buildings in the National Association of Building Owners and Managers, *Experience Exchange Reports;* and reports by State school agencies to the Office of Education.

Other maintenance expenditures are estimated from the same sources used for the new construction figures. See text for series N 9–16 and N 19–27.

The source also presents maintenance and repair expenditures for major classes of construction.

N 29–54. Value of new private and public construction, in 1947–49 prices, 1915–1957.

Source: See source for series N 1–28.

Measurement of construction expenditures in constant prices is an indirect way of approximating changes in the physical volume of construction. These estimates are based on a deflation of each type of construction by an appropriate construction cost index. For a description of the cost indexes used for each type of construction, see the source publication.

N 55–58. Public construction, by source and type of funds, 1915–1957.

Source: See source for series N 1–28.

The source also presents detailed data by types of public construction. For bases of estimates, see text for series N 18–27.

N 59–60. New construction expenditures, 1869–1955.

Source: Simon Kuznets, *Capital in the American Economy: Its Formation and Financing* Statistical Supplement, appendix B, Princeton University Press (*in press*).

For 1869–1938, these figures supersede a similar series in the same author's *National Product Since 1869,* National Bureau of Economic Research, 1946, p. 99. The main conceptual difference for 1915–1955 between these series and the annual estimates for series N 2 is the inclusion here of the cost of oil and gas wells drilled.

While estimates of construction expenditures based upon more direct measures of construction activity are generally preferred, estimates derived from the output of construction materials may be carried back for a considerable period.

For 1869–1914, the estimates for new construction other than oil and gas wells are derived from estimates for the output of construction materials destined for domestic consumption presented in William H. Shaw, *Value of Commodity Output Since 1869,* National Bureau of Economic Research, 1947, for 1869, 1879, and 1889–1914. Interpolation between the census estimates for 1869, 1879, and 1889 was made on the basis of sample data, described in Kuznets, *National Product Since 1869,* p. 99. For the cost of oil and gas wells drilled, the estimates for 1869–1914 (averages of annual estimates in 1929 prices) were extrapolated from the 1919 figure given in Simon Kuznets, *National Income and Its Composition, 1919–1938,* National Bureau of Economic Research, 1941, p. 645.

For 1915–1955, the estimates for new construction other than oil and gas wells are the sum of gross capital formation in housekeeping residential construction (as shown in Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects,* Princeton University Press, 1956, table B-6); and expenditures for all nonresidential construction (series N 2 minus series N 4). For the cost of oil and gas wells drilled, the estimates for 1919–1928 in 1929 prices represent an extrapolation of the 1929 figure by the series on cost in 1935 prices described in *National Income and Its Composition* (cited above), p. 645. The estimates for 1929–1955 both in current and 1929 prices, are from *Construction and Building Materials, Statistical Supplement,* May 1954, and from subsequent issues of *Construction Review.*

N 61–67. General note.

While comprehensive estimates of construction expenditures by types of construction, such as presented in series N 1–28, are generally preferred for most purposes, building permit data are available for a considerably longer period. Permit values are based on estimates by builders of the costs of building for which permits are granted or plans filed. Permit data generally cover private, rather than public, construction; building, rather than nonbuilding, types of construction; and

Digitized by Google

are generally limited to construction within the corporate limits of the cities covered. On the average, the cost of the projects covered is underestimated; small projects are generally not covered at all. Permit data are less frequently available for smaller cities and for earlier years. It follows that building permit data in unadjusted form are unsatisfactory as measures of the total absolute volume of new construction. Permit data are often more satisfactory when used in the form of relatives or indexes of permit values, as in the case of series N 61–64.

Although the absolute amount of construction activity is not adequately indicated by early permit data, the data clearly indicate the presence and approximate timing of cycles in private building. However, the relatively few cities upon which permit indexes are based during the earlier years suggests caution in the drawing of quantitative conclusions, particularly as to the amplitude of building cycles. Nonbuilding construction of various types and public building construction have fluctuated somewhat differently from building permit indexes, so that the data available for the analysis of cycles in total new construction over an extended period of years are particularly inadequate. The mere comparison of the various series on building permits purporting to measure roughly the same type of activity should warn the user against placing too much confidence in the data.

N 61. Index of building permit values, 1868–1939.

Source: Clarence D. Long, Jr., *Building Cycles and the Theory of Investment*, Princeton University Press, 1940, pp. 213–223.

This index was obtained by averaging the monthly indexes given in the source. The number of cities covered by the index has ranged from 1 to 37 (or 33 if all the boroughs of New York City are combined). For a list of cities and years covered, see source. The aggregate permit volume each year was divided by the aggregate volume for the same cities in 1930. Thus, the base used was a shifting one. For additional explanation, see general note for series N 61–67 above.

N 62–63. Building permit index, 1875–1933.

Source: William H. Newman, "The Building Industry and Business Cycles," *The Journal of Business of the University of Chicago*, copyrighted by University of Chicago, vol. VIII, No. 3, pp. 63–71.

These are annual indexes and annual averages of monthly indexes. Series N 62 is based on Bradstreet's building permit values, 120 identical cities, 1911–1933; Babson's monthly values of building permits in 20 cities, 1903–1910; Ayres' permits in 50 cities, 1900–1902; and permit data from 13 cities, 1875–1900. Series N 63 is obtained from series N 62 by the use of the following building cost indexes: The American Appraisal Co.'s building construction cost index, 1913–1933; an arithmetic average of the American Appraisal Co.'s cost indexes for frame, brick, and reinforced concrete buildings, 1900–1913; and an average of the frame- and the brick-building cost indexes, 1875–1900. For additional explanation, see general note for series N 61–67, above.

N 64. Index of new building permit values (Riggleman–Isard index), 1868–1933.

Source: Miles L. Colean and Robinson Newcomb, *Stabilizing Construction: The Record and Potential*, McGraw-Hill, 1952, appendix N, table 2.

This index is based on the per capita value of building permits as estimated in an unpublished doctoral dissertation by John R. Riggleman, *Variations in Building Activity in United States Cities*, Johns Hopkins University, 1934. Riggleman's estimates, in turn, are based on data for 10 cities in 1868, which were augmented to cover 70 cities in 1900 and subsequent years (counting the 5 boroughs of New York City separately). For the cities covered, see the source, appendix N, table 4, footnote c, p. 240. By eliminating the population adjustment and weighting the data on the basis of the relative volume of activity from 1920 to 1929 in the areas covered, Isard developed a series more comparable to that of Long (series N 61) in general movement (see Walter Isard, *The Economic Dynamics of Transport Technology*, unpublished doctoral dissertation, Yale University, 1947). The source also carries the data back to 1830, with decreasing credibility.

N 65. Index of dollar volume of new construction (Newcomb index), 1868–1914.

Source: See source for series N 64, appendix N, table 3.

This index is based on a 3-year moving average of the figures for series N 64 for 1868–1878, and on a 3-year moving average of the figures for series N 61 for 1879–1914, adjusted by (1) weighting residential building at one-third instead of approximately one-half used by Long (series N 61) and (2) changing the base to 1920–29=100. The purpose of these adjustments by Robinson Newcomb of the original series is to make their year-to-year movement more closely comparable to that of construction expenditures which fluctuate less than building permits, and to reduce the weight of residential construction for early years to that found in the official estimates of construction expenditures beginning in 1915 (series N 1–28). Newcomb notes that the index figures for 1868–1914 are suggestive only, since the raw data are not sufficient for a reliable index. The source extends the index to 1951 by using the official estimates of construction expenditures (series N 1–28).

N 66–67. Index of urban dwelling units (Blank index), 1870–1929.

Source: David M. Blank, *The Volume of Residential Construction, 1889–1950*, National Bureau of Economic Research, Technical Paper 9, 1954, table 11.

This index is based on building permit data covering Manhattan for 1870–1874 and gradually augmented to cover 67 cities in 1900 and 314 in 1929. For list of cities and years covered, see source, table 23. This is a chain index computed by first deriving relatives of the aggregate number of dwelling units authorized and the aggregate permit valuation of such units in identical cities in the sample between pairs of successive years. The data are unadjusted for lapses of building permits (with certain exceptions for New York City) and for understatement of valuations in building permits. The valuations are not converted to a work-put-in-place basis to reflect construction expenditures.

N 68–74. Construction contracts awarded, 1925–1956.

Source: F. W. Dodge Corporation, New York, N. Y.

Construction contract statistics, for all categories except privately owned 1- and 2-family houses, compiled by the F. W. Dodge Corporation are based exclusively upon project news reports gathered daily by the Corporation's field staff operating in the 37 Eastern States. This field staff contacts owners, architects, engineers, contractors, financial institutions, real estate brokers, and others able to supply reliable information on construction projects. The figures include new construction, additions, and major alterations at the time the general contract is awarded or when work is about to start if there is no general contract. The figures exclude maintenance and repair work, farm building, shipbuilding, and a sizable proportion of force-account work done by firms and public agencies.

The method of compiling construction contract statistics for privately owned 1- and 2-family houses in the 37 Eastern States was changed effective January 1, 1957, and figures for 1947–1956 have been revised to approximate comparable

Digitized by Google

coverage. This revision also affects total construction for the same years. Prior to 1947, the data were based exclusively upon project news reports gathered daily by the corporation's field staff operating in the 37 Eastern States, and have not been revised. For 1957, contract statistics of the 37 Eastern States for the privately owned 1- and 2-family house segments of residential building are based upon building permit information in standard metropolitan areas and a great number of other selected counties plus sampling in the less active areas. All building permit data are adjusted to approximate realistic construction costs.

The 11 Western States not covered are: Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California. The District of Columbia is included in the covered area.

Beginning 1957, the source extended coverage for its contract statistics to all of the 48 States. Dodge also publishes these figures in greater detail in *Dodge Construction Statistics Services*, monthly.

N 75–84. Engineering construction contracts awarded, by type, 1930–1957.

Source: *Engineering News-Record*, McGraw-Hill Publishing Company, New York, various issues.

Data are based on weekly reports by a field staff in 75 centers covering 48 States and the District of Columbia. The following types of construction are included: Water supply, sewers and waste disposal, bridges, streets and roads, earthwork and waterways, public buildings, mass housing, commercial and industrial buildings, and an unclassified category. Only larger projects are included, and the minimum cost of projects covered by the reports has varied over time. For 1955–1957, the minimum cost of projects covered was $44,000 for water supply, earthwork and waterways, and unclassified private construction; $73,000 for other public works; $93,000 for industrial buildings; and $844,000 for other private and public buildings, including mass housing. Thus, a large segment of home building and smaller construction projects of all types are excluded. Because of the emphasis on heavy engineering works in this series and the difference in geographic coverage, as well as other reasons, the series is not comparable to series N 68–74.

N 85–103. Construction cost indexes, 1913–1957.

Source: Series N 85–102, see source for series N 1–28 (except for 1957 for series N 93–94, Agricultural Marketing Service, records). Series N 103, see source for series N 64, appendix Q.

Construction cost indexes are useful in the conversion of construction expenditure data from current prices to constant prices and in the study of cost trends. However, no single cost index is satisfactory for all types of construction since the movements of cost differ for different types of construction. Series N 85, however, is a composite index weighted by the relative importance of the major classes of construction.

Construction cost indexes generally are not fully adequate for the making of cost comparisons over an extended period of time. Changes in the productivity of and the proportions used of the various productive factors cannot be allowed for easily in the assignment of weights to labor, materials, and other cost items. An aggregative index proportional to the total construction cost of a standardized project, or a component part thereof, is not easily computed for most types of construction and suffers from the disadvantage of the probable eventual obsoleteness of any adequately specified standard project. For further discussion, see chapter IV of source cited above for series N 103; Lowell J. Chawner, "Construction Cost Indexes as Influenced by Technological Changes and Other Factors," *Journal of the American Statistical Association*, 1935, vol. 30, pp. 561–576; and Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate*, Princeton University Press, 1956, appendix C.

N 85, Department of Commerce composite cost index. This index is a combination of various indexes weighted by the relative importance of the major classes of construction. It is an implicit index computed by dividing the total estimate of new construction activity in current prices by the total expressed in 1947–49 prices. Since the total in 1947–49 prices is obtained by adding the estimates for the separately deflated classes of construction, the composite cost index is the equivalent of a variably weighted index, reflecting changes not only in the component indexes, but also in the relative importance of the major classes of construction which are used as weights. For 1945–1956, the index is an average of the 12 monthly indexes.

N 86, American Appraisal Company index. This index is compiled on the basis of a detailed bill of quantities of material and labor required for typical frame, brick-wood frame, brick-steel frame, and reinforced concrete buildings with allowances for contractor's overhead and profit, in various cities throughout the United States. Workmen's compensation and liability insurance, unemployment insurance, and old-age pension factors are included. The index covers the structural portion of the buildings, but does not include the fixtures such as plumbing, heating, lighting, and elevators. The material and labor costs are recomputed monthly in accordance with average prices and wages supplemented by personal investigation of appraisers and information from clients and others as to actual costs. These computations automatically result in weighted averages for the individual buildings. Arithmetic averages are computed for the individual buildings and cities to obtain the city and national averages. The latter cover 24 cities prior to 1925 and 30 cities since that time. The index reflects changes in average price levels but does not reflect costs resulting from overtime wages and bonuses during boom periods or sacrifice prices and omissions of overhead costs and profits during depression periods.

N 87, Associated General Contractors index. This index is a combination of indexes of wages and materials weighted in the proportion of 40 percent for wages and 60 percent for materials. Wages used in computing this index are for hod carriers and common laborers, and the material prices are those for sand, gravel, crushed stone, Portland cement, common brick, lumber (all weighted equally), hollow tile (weighted ½), and structural and reinforcing steel (both together weighted ½). Wages and prices are reported by the 12 district offices of the Association as of the 15th of each month.

N 88–90, E. H. Boeckh and Associates indexes. These indexes are based on separate computations for 10 types of buildings in 20 cities (comparable indexes are currently available from the compilers for a total of more than 40 cities). The basic list of items covered includes current local prices for common brick, common lumber, Portland cement, structural steel, common labor, brickmasons, carpenters, structural ironworkers, plasterers, and miscellaneous which includes many specialized items such as heating and plumbing equipment, paint, glass, and hardware. Wage rates are adjusted to reflect efficiency of local labor. State and local sales taxes and Social Security payroll taxes are included. The weights assigned to the different items vary among the 10 types of buildings. An unweighted arithmetic average of the individual indexes for the 20 cities for each of the 10 types of buildings has been computed and these have been further consolidated into the 3 series shown here. The residential index is an unweighted average of the indexes for frame residences and for brick residences; the apartment, hotel, and office building index

Digitized by Google

is an unweighted average of the indexes for brick and wood, brick and concrete, and brick and steel apartment, hotel, and office buildings; the commercial and factory buildings index is an unweighted average of the indexes for frame, steel, brick and wood, brick and steel, and brick and concrete commercial and factory buildings.

N 91–92, *Engineering News-Record* indexes. The index of construction costs is comprised of (1) steel, which until 1938 was the base price of structural steel shapes at Pittsburgh and beginning in 1938 is a weighted average of steel prices at Pittsburgh, Gary, and Birmingham; (2) cement, which until 1948 was the consumers' net price, f.o.b. Chicago, and beginning in 1948 is the ENR 20-city average of bulk cement prices; (3) lumber, which until 1936 was 12 x 12 long leaf yellow pine, wholesale, at New York, and beginning in 1936 is a composite 20-city price average of 2 x 4 Douglas fir and southern or local pine in carload lots; and (4) common labor rate paid in the steel industry for 1913-1920 and since 1920 the average common labor rate in construction (ENR 20-city average of wage rates in force). The 4 components are weighted according to their relative importance in the national economy in 1913. The index of building costs is identical to the index of construction costs for all components except wage rates, where the trend of skilled labor wage rates is substituted for common labor wage rates. For a detailed description of these two indexes, see *Engineering News-Record*, September 1, 1949, issue.

N 93–94, Agricultural Marketing Service farm construction cost indexes for dwellings and service buildings. This is a weighted index of farm wage rates and prices paid for materials. In compiling the index of farm dwelling construction costs, prices paid by farmers for building materials are given a weight of 73 percent, farm wage rates a weight of 27 percent. For farm service building construction, the corresponding weights are 78 and 22 percent. The wages paid by farmers for labor for building construction and repairs are higher than the wages paid for ordinary agricultural labor, but they probably fluctuate more comparably to farm labor wage rates than to urban union wage rates.

N 95, George A. Fuller Company index. This is a composite index of 36 major cost elements, in 3 commercial type buildings, including structural elements, elevators, wiring, heating, and ventilating. The figures shown are based upon annual averages (of irregularly compiled indexes) computed and published by the *Engineering News-Record*.

N 96–98, Handy's public utility construction cost indexes (compiled by Whitman, Requardt and Associates, Baltimore). These indexes measure changes in construction costs of utility buildings, gas plants, and electric plants. Cost trends of reinforced concrete utility building construction and brick utility building construction are reported semiannually by geographic regions. A single index is computed by averaging the figures for the first, middle, and end of each year for each region and then combining the regions for a United States average. Cost trends of gas plant construction and of steam-operated electric plant construction are also reported semiannually by geographic regions. A single index for each is computed in the same manner as for utility buildings.

N 99–100, Interstate Commerce Commission indexes. The railroad construction cost index is the weighted average for the entire United States of 31 separate indexes for individual operations important in railroad construction. Separate indexes covering items such as grading, tunnel excavation, bridges, ballast haul, and tracklaying and surfacing, were developed largely from analysis of major construction contracts covering a period of more than 30 years. The indexes for materials accounts—such as ties, rails, other track material, ballast, and fences—were based on studies of carriers' returns, joint studies made with the various railroad committees, well-known engineering and trade publications, contracts covering major construction projects over a period of 30 years, and other information furnished by individual carriers.

N 101, Bureau of Public Roads, highway index. This index is based upon a record of quarterly variations in contract unit bid prices maintained by the Public Roads Administration since 1922. Cost indexes are based on average annual construction on State and Federal aid highway systems during 1925–1929. Average costs for these years are taken as 100 percent. For this period, the total quantity and contract cost of each of the principal cost-controlling contract items were summarized and divided by the total mileage of construction. This operation provided average quantities of each type of work involved per average gross or composite mile of construction. Since unit prices and construction volumes vary not only from State to State but also from year to year, the percentage of each item contributed during this 5-year period by each State was adopted as the contributing State base. The current cost index thus indicates the relative costs at which the average quantities placed per mile in 1925–1929, with the same State distribution, could be replaced today at current contract bid prices. Figures for 1915–1922 were extrapolated by the Department of Commerce by means of a weighted average of the Interstate Commerce Commission indexes for grading; tunnel and subway excavation; bridges, covers, and trestles; and ballast.

N 102, Turner Construction Company index. This index is based on the building cost experience of the Turner Construction Company in eastern cities applied to these factors: Labor rates, material prices, productivity of labor, efficiency of plant and management, and competitive conditions.

N 103, average of contractor indexes of construction cost. This is an average of 4 contractor indexes shown separately in the source. In contrast to the common indexes of construction costs, which usually represent a combination of wages and materials prices according to a fixed relationship and may not take adequate account of changes in efficiency, the contractor indexes are based on estimates of the actual cost for erecting comparable structures. The comparison of these indexes with the common indexes may suggest changes in cost that result from changes in efficiency. For a fuller discussion, see the source, pp. 69–74, and Grebler-Blank-Winnick, appendix C (cited above).

N 104. Building cost index, Riggleman, 1868–1933.

Source: See source for series N 64, appendix N, table 4.

The index is from an unpublished doctoral dissertation by John R. Riggleman, *Variations in Building Activity in United States Cities*, Johns Hopkins University, 1934, appendix I. The index was constructed on the basis of several sources, including the American Appraisal Company's cost of industrial buildings in eastern cities to 1903 and the *Engineering News-Record* construction cost index for 1904–1933. The figures for earlier years are less reliable than those for later years, and should be used with caution. The source also presents the index back to 1830.

N 105. Residential construction cost index, Blank, 1889–1933.

Source: David M. Blank, *The Volume of Residential Construction, 1889–1950*, National Bureau of Economic Research, Technical Paper 9, 1954, table 21.

For 1889–1914, the index is based on weighted averages of building trade wages and building materials prices, more fully described in the source. For 1915–1933, the index is the Boeckh residential construction cost index shown as series N 88, converted to the 1929 base. The figures for earlier years are less reliable than those for later years and should be used with caution.

[1] Public industrial and commercial building not segregable from private construction, 1915–1932; amount believed negligible. Beginning 1933, public commerical buildings are included under other nonresidential.
[2] Excludes building by privately owned public utilities.
[3] Includes construction with REA funds.
[4] Not available.
[5] Includes sewer and water systems, roads, bridges, and miscellaneous nonstructural items such as parks and playgrounds.
[6] Includes publicly owned parks and playgrounds, memorials, etc.
Includes work relief expenditures in the years 1933–1943.

[1] Public industrial and commercial building not segregable from private construction, 1915–1932; amount believed negligible.

[2] Excludes building by privately owned public utilities.

[3] Not available separately.

[1] Includes bridges under private contracts amounting to $9,426,000 in 1957.
[2] Includes contracts awarded for atomic energy plants as follows (in millions): 1949, $247; 1950, $2,020; 1951, $123; 1952, $2,829; 1953, $72; 1954, $19; 1955, $131; 1956, $86; 1957, $64.
[3] Deduct $400 million for cost savings on Portsmouth, Ohio, atomic energy plant originally estimated to cost $1.2 billion.
[4] Add $1,357 million for atomic bomb plants.
$1,300 million cancelled by WPB.

HOUSING (Series N 106–203)

N 106–115. Permanent dwelling units started in nonfarm areas, number and expenditures, 1889–1957.

Source: 1889–1919, David M. Blank, *The Volume of Residential Construction, 1889–1950*, Technical Paper 9, National Bureau of Economic Research, 1954; 1920–1952, Department of Labor, Bulletin No. 1146, *Construction During Five Decades;* 1953–1956, Department of Labor and Department of Commerce, "Construction Volume and Costs, 1915–1956," *Statistical Supplement to Construction Review;* 1957 (except series N 109–111), various monthly issues of *Construction Review*, 1957 and 1958. Series N 109–111, Department of Labor, Bulletin No. 1260, *Nonfarm Housing Starts, 1889–1958*, p. 16.

The data for 1920–1929 are from David L. Wickens and Ray R. Foster, *Nonfarm Residential Construction, 1920–1936*, National Bureau of Economic Research, Bulletin 65, 1937. The data for 1930–1936 for privately financed dwelling units represent a revision by the Bureau of Labor Statistics of the Wickens-Foster data; the 1937–1939 data are the same Bureau's annual estimates based on building permits, and for 1940–1957 are derived from its monthly estimates based on building permits and supplemented by sample surveys of housing starts in nonpermit-issuing areas. All the data are estimates; for earlier periods, the estimates are cruder. For recent periods, approximately 85 percent of the total is derived from building permits (with fairly limited nonsampling errors) received from practically all permit-issuing places. The sampling error in the nonpermit segment is estimated by BLS to be between 5 and 7 percent.

For methods used by Blank and Wickens-Foster, see the sources. Blank's data are based on a comprehensive tabulation of historical building permit data collected by the Works Progress Administration and made available by the Bureau of Labor Statistics. For methods used by BLS, see BLS Bulletin No. 1168, *Techniques of Preparing Major BLS Statistical Series*, December 1954, chapter 2.

Basically, the procedures more or less common to all annual estimates for privately financed dwelling units involve (1) expansion of reported building permit data for urban places to cover nonreporting places, on the basis of population relationships, (2) expansion of data for urban areas to cover rural nonfarm housing starts, also on the basis of population relationships or building rates, (3) adjustments for lags, lapses of permits, and underreporting, (4) adjustments for undervaluation of costs in building permits, and (5) conversion of adjusted costs to estimates of work put in place to allow for carryover of expenditures from one year to the next.

For a description of the bases for estimating publicly financed dwelling units, see text for series N 112–113.

The dwelling units covered in these series are permanent housekeeping units in new residential structures. Excluded are temporary units; accommodations without housekeeping facilities such as transient hotels, dormitories, and club houses; trailers, houseboats, sheds, and shacks used for dwelling purposes; units provided by conversion of existing structures at the original site; and dwelling units in nonresidential structures such as factories, warehouses, or public buildings.

For regional estimates of the number of new private nonfarm dwelling units started, 1920–1950, see Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects*, Princeton University Press, 1956, table H-1. Regional estimates for later years appear in current reports of the Bureau of Labor Statistics and in the *Annual Report* of the Housing and Home Finance Agency.

N 107–108, new nonfarm dwelling units started, by location. The term, "urban" was applied to all incorporated places with a population of 2,500 or more and to a relatively small number of areas urban under special rule. "Rural-nonfarm" housing includes all housing (except farm housing) in unincorporated areas and in incorporated places of less than 2,500 inhabitants. This classification for 1920–1929 was based on the 1930 Census of Population and for 1930–1953 on the 1940 Census. It was abandoned in 1954 because of the difficulties of resolving differences between the geographic areas used for building permit systems and the urban areas as newly defined in the 1950 Census. Beginning in 1950, BLS has classified housing starts by those within and outside the standard metropolitan areas (see source for 1957).

N 109–111, new nonfarm dwelling units started, by type of dwelling. The category, "2-family dwellings," includes 1-family dwellings with stores, and the category "multifamily dwellings" includes dwellings both with and without stores. A 1-family dwelling may be detached, semidetached, or one of a continuous row.

N 112–113, new nonfarm dwelling units started, by ownership. For bases of estimates for privately financed dwelling units, see text for series N 106–115. The data for publicly financed units are based on reports of Federal, State, and local agencies to the Bureau of Labor Statistics on contract awards, or actual starts, or "proceed orders." The criterion for classifying dwelling units as public is ownership of the facilities rather than the source of funds. Thus, low-rent housing projects owned by local housing authorities are classified as public even though they may be financed by local bonds issued to private investors, and military housing units owned by the Department of Defense are also classified as public even though they may be financed by mortgages held by private lending institutions. Figures exclude temporary dwellings built during the defense period (1940's) and World War II, veterans temporary re-use housing (see text for series N 122–124), and temporary structures on military posts and similar installations.

N 114–115, expenditures for new nonfarm dwelling units. Units covered are housekeeping units only. Figures, therefore, differ from those for series N 4, residential nonfarm expenditures, which also include expenditures for nonhousekeeping units such as transient hotels, motels, dormitories, and clubhouses. For procedures used to estimate expenditures, see text for series N 4.

N 116–124. Dwelling units in Federal programs, 1935–1957.

Source: 1935–1956, Housing and Home Finance Agency, *Annual Report*, 1956, tables A-6, A-37, A-42, and A-54; 1957, *Annual Report, 1957*, tables A-7, A-48, A-53, and A-68.

Figures are based on reports of the agencies administering the programs. The Federal Housing Administration and the Veterans Administration are agencies which insure or guarantee loans made by private lenders.

Digitized by Google

N 116–117, private units started under FHA and VA. Data are based on monthly reports of the Federal Housing Administration and the Veterans Administration. These reports are based on the first of several inspections of newly started units required by the agencies, the timing of which coincides roughly with the definition of housing starts by the Bureau of Labor Statistics.

The figures may be used roughly to derive the units started under FHA and VA as a percentage of all private housing starts. However, an unknown number of units started under FHA or VA inspection is sold later for cash or with conventional (uninsured or unguaranteed) mortgage loans. On the other hand, the number of units started under the FHA program understates the role of FHA inasmuch as previously unoccupied (new) houses, for which the builder did not apply for FHA insurance before construction, are classified by FHA as "existing construction" when the houses are sold later with FHA-insured loans. In 1956, about one-fifth of the FHA units classified as "existing construction" were previously unoccupied (new). For these and other problems of coverage and comparability, see Department of Commerce and Department of Labor, *Construction Review*, "FHA and VA Housing Statistics and the Housing Market," June 1957.

N 118–121, private units covered by loans under FHA and VA. Data are based on monthly reports of the Federal Housing Administration and the Veterans Administration, and refer to loans on both new and existing construction at the time such loans are closed or actually insured. The FHA category, "homes," includes 1- to 4-family dwellings; the category "rental projects" includes dwellings with 5 or more dwelling units. Practically all VA loans are on single-family dwellings. The VA program was authorized in 1944 and the small 1944 activity is included in 1945.

N 122–124, public units completed for occupancy. Data are based on monthly reports of the Public Housing Administration. Figures are for completed units, include temporary dwellings, and are limited to Federal programs. Consequently, they are not comparable to figures for series N 113, which are for starts, cover only permanent units, and include all public units, State and local as well as Federal.

N 125–128. Nonfarm dwelling units standing and selected components of change, 1890–1956.

Source: 1890–1950, Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects*, Princeton University Press, 1956; 1956, Bureau of the Census, *National Housing Inventory, Components of Change: 1950–1956*.

Estimates do not represent all components of change in the nonfarm housing inventory; that is, the units added through new construction or conversion minus the units demolished during a certain period do not equal the net change in the inventory during the same period. This difference is due mainly to the following factors: (1) The net change in the nonfarm housing inventory reflects the reclassification of farm dwellings, as farmland is absorbed in suburban and urban development; (2) the inventory includes temporary dwelling units, seasonal units, shacks, trailers, and dwellings in nonresidential buildings such as factories or warehouses, which are not included in the estimates of housing starts; (3) the periods of the inventory estimates are not fully reconcilable with the calendar-year estimates of new or converted units and of demolitions; (4) minor changes in Census definitions; and (5) deficiencies of estimates, particularly for conversions and demolitions. For a reconciliation of the net change in inventory and the various components of change for 1930–1939, see Bureau of Labor Statistics, Serial No. R. 1421, "Housing and the Increase in Population," 1942. For a similar reconciliation for 1940–1949, see Grebler-Blank-Winnick (cited above), appendix A and appendix D, especially table D 4.

N 125, dwelling units standing. Estimates for 1890–1920 are based on David L. Wickens, *Residential Real Estate*, National Bureau of Economic Research, 1941, p. 55. The 1890 and 1900 estimates apply to June 1, the 1910 estimate to April 15, and the 1920 estimate to January 1. The data were derived by dividing Wickens' estimates of nonfarm private families (now termed households) by the occupancy ratios implicit in Wickens' vacancy ratios. The estimate for 1930 applies to April and is based on figures in the BLS Bulletin, Serial No. R. 1421 (cited above), p. 12. The 1940 and 1950 figures apply to April 1 and are from the *Sixteenth Census of the United States: 1940, Housing*, vol. II, part 1, p. 10, and *U.S. Census of Housing: 1950*, vol. I, p. 3. The 1956 figure applies to December 31 and is based on a sample survey conducted by the Bureau of the Census.

N 126–127, units added during period. For certain periods, the number of "new units" shown for series N 126 varies from the estimated number of permanent dwelling units started as shown for series N 106. Only for 1890–1919 is there exact agreement as both series for this period are based on the same sources using the same concepts and definitions. A slight difference for 1920–1929 is due to varying estimates for the year 1920. The differences for later periods reflect mainly the factors outlined above in the text for series N 125–128 under (2) and (5), i.e., units reported built during a given period by the Census Bureau include certain types of dwellings not included in estimated housing starts, and estimates are deficient.

N 128, units demolished during period. The 1940–1949 estimate is designated in the source as a "preliminary estimate by an interdepartmental committee of Federal agencies," but no revision of it was made thereafter.

N 129–132. Nonfarm residential wealth, 1889–1953.

Source: See Grebler-Blank-Winnick source for series N 125–128, table D-1, columns 1, 2, 4, and 5.

Estimates are for housekeeping dwellings, i.e., do not cover transient hotels, clubs, motels, dormitories, and similar facilities. For an alternative estimate of nonfarm residential wealth, see series F 197–246.

N 130–131, structures. The value of structures in 1929 dollars was obtained by adding to an estimate for the end of 1889 annual estimates of net capital formation in constant dollars (shown in table B-8 of the source). The initial estimate for the end of 1889 is based on the average value of owner-occupied nonfarm mortgaged homes reported in the 1890 Census Report, *Real Estate Mortgages* (see pp. 364–365 of the source). The value of structures in current dollars was obtained by adjusting the value in constant dollars by use of the construction cost index given in series N 88 and N 105.

N 132, land. Estimates are based on ratios of land value to total property value, i.e., land and structures, which are estimated to have declined from 40 percent in 1890 to 16.9 percent in 1953, with the move to the suburbs accounting for most of this trend. According to the source (appendix D, p. 364), the ratios are "based on FHA appraisal data and tax assessment data from a number of cities which permit the separation of residential from other real estate. These data do not extend back of the thirties but, together with the benchmark estimate for the twenties and one for 1907, are sufficient to approximate both the level of the ratio and the direction of the trend." The estimates are fully explained in Louis Winnick, *Wealth Estimates for Residential Real Estate*,

N 133–138. Comparison of residential wealth estimates, 1890–1950.

Source: See Grebler-Blank-Winnick source for series N 125–128, table D-3.

There are basically two procedures for estimating residential wealth (as well as other wealth components). One procedure uses a benchmark estimate of wealth in an initial year and adds to it the yearly net capital increments. This procedure yields cumulated wealth estimates (series N 133–135). The other procedure is based on census or similar estimates of wealth at different dates (benchmark wealth estimates, series N 136–138). For a description of the conceptual and estimating problems involved in these two procedures and for the sources of the estimates, see appendix D of the source.

The juxtaposition of wealth estimates derived by various methods indicates clearly the fairly large variations that may result from the employment of these methods, and should caution the user against placing excessive confidence in any particular wealth figures.

N 139–146. Occupied dwelling units and tenure of homes, 1890–1956.

Source: 1890–1950, except 1910 and 1945, *U. S. Census of Housing: 1950*, vol. I, part 1, tables J and L; 1945, Bureau of the Census, *Special Census Reports on Housing*, "Characteristics of Occupied Dwelling Units for the United States: November 1945," series H 46, No. 1; 1956, Bureau of the Census, *National Housing Inventory, Components of Change: 1950–1956*. The 1910 figure for farm population (series N 140) is an estimate which appears in Truesdell, Leon E., *Farm Population of the United States, 1920*, Bureau of the Census, Census Monographs VI, Washington, D.C., 1926, p. 45. The 1910 figure for nonfarm population was derived by subtracting the estimated farm population from the total population.

The first nationwide Census of Housing was taken in 1940. In 1940, 1950, and 1956, a dwelling unit was defined in general as the living quarters occupied or intended for occupancy by one household. The presentation of figures in this series for 1890 to 1930 rests on the fairly close correspondence between the concept of occupied dwelling unit used in the Housing Censuses since 1940 and concepts used in previous Censuses of Population. Perfect comparability of all the figures in the series is not possible because of various relatively minor changes in definition. The figures for 1890, 1910, and 1920 include the small number of institutions, hotels, military installations, dormitories, etc., which are not included in the counts for any of the other years. For 1940, the count of occupied dwelling units includes those living quarters with 5 lodgers or more whereas for 1950 and 1956 such living quarters are not included.

For all years, the figures for population per occupied dwelling unit were obtained by dividing the total population by the number of occupied dwelling units. The 1950 figure shown here is not identical with the "population per occupied dwelling unit" as shown in the 1950 Census volumes because the latter figure was derived by dividing the total population living in occupied dwelling units by the number of occupied units.

The number of occupied dwelling units is closely comparable to the number of households as shown in series A 255. Since 1950, the number of occupied dwelling units has been identical by definition to the number of households. The small difference in 1950 between the number of households and the number of occupied dwelling units is due to occasional errors in the separate tabulation processes of the Census of Population and the Census of Housing. In 1940, small differences existed by definition between the number of occupied dwelling units and the number of households. The usual occupants of a dwelling unit who were temporarily away and were enumerated elsewhere were included in the count of households but their dwelling unit was not considered to be occupied. In addition, a small number of lodginghouses in 1940 (those with 11 or more lodgers) were counted as occupied units, but the heads of these units were not counted as household heads. The figures shown for occupied dwelling units for 1890–1930 are identical to those shown for heads of households in series A 255.

With reference to the farm-nonfarm classification, enumerators in the National Housing Inventory of 1956 and the 1950 Census were specifically instructed to base the classification of a dwelling unit on the respondent's answer to the question, "Is this house on a farm?" Farm residence is, therefore, determined without regard to the occupation of the members of the household. Dwelling units located on farmland for which cash rent was paid for the house and yard only, and dwelling units on institutional grounds and in summer camps and tourist courts, were classed as nonfarm, regardless of the answer to the foregoing question.

For 1930–1950, "farm" consists of rural-farm units only. The classification "rural farm" used in the 1950 Censuses differs slightly from that used in 1940. As a result, there was, in 1950, an expansion in the urban fringe of cities, tending to reduce the number of farms. On the other hand, in 1940 some areas were classified as urban under special rule which were not so classified in 1950. Thus, the differences partly offset each other. In addition, the number of farms was reduced in 1950, by the exclusion of renter-occupied units on farms paying rent for the use of house and yard only.

A dwelling unit is classified as owner occupied if it is owned wholly or in part by the head of the household or by some related member of his family living in the dwelling unit. All other occupied units are renter occupied whether or not cash rent is actually paid.

N 147–149. General note.

The development of price indexes for any kind of urban real estate is unusually difficult because of the great heterogeneity of the product and the local nature of real estate markets. The problem of heterogeneity is somewhat less serious in the case of 1-family houses. For a discussion of the conceptual difficulties of using construction cost indexes for measuring price changes for homes and of distinguishing between prices for new and old homes, see Grebler-Blank-Winnick (cited as source for series N 125–128), appendix C. Only a few attempts have been made to measure price changes of urban real estate. For additional data of this type, see Herman Wyngarden, "An Index of Local Real Estate Prices," *Michigan Business Studies*, vol. 1, No. 2, University of Michigan, Bureau of Business Research, 1927; William M. Hoad, *Real Estate Prices, a Study of Residential Real Estate Transfers in Lucas County, Ohio*, unpublished doctoral dissertation, University of Michigan, 1942; and data for Cleveland and Seattle given in Grebler-Blank-Winnick, table C-2. See also Ernest M. Fisher, *Urban Real Estate Markets: Characteristics and Financing*, National Bureau of Economic Research, 1951, pp. 51–56.

N 147–148. Price indexes for 1-family owner-occupied houses, 1890–1934.

Source: See Grebler-Blank-Winnick source for series N 125–128, tables C-1 and C-3.

Unadjusted figures were derived from detailed information for a sample of residential properties in 22 cities in Department of Commerce, *Financial Survey of Urban Housing, 1937*.

488910 O - 60 - 26

Digitized by Google

This survey, among other things, ascertained the value of the property in 1934, the year of acquisition by the then-present owner, and original cost to the owner at time of acquisition, regardless of whether the house was new or old at that time. From these data, a relative for each year was calculated for each city, based on the ratio of the total acquisition cost of the single-family owner-occupied houses acquired in each given year in a given city to their value in 1934. The unadjusted figures are median relatives derived from the data for all of the 22 cities and are subject to a downward bias due to the changing age structure of properties included in each year's sample, and to an upward bias due to value increments in the form of structural additions and alterations. The adjusted figures are corrected for the resulting net downward bias, by allowing 1¾ percent compound annual depreciation. See the source, appendix C, for details of correction.

N 149. Median asking price for existing 1-family houses, Washington, D.C., 1918–1947.

Source: Ernest M. Fisher, *Urban Real Estate Markets: Characteristics and Financing*, National Bureau of Economic Research, 1951, table 6.

This series represents the results of an experimental study by the National Housing Agency (predecessor of the present Housing and Home Finance Agency) of a sample of newspaper advertisements. Similar experimental indexes, but for shorter periods, were developed for 100 metropolitan areas. The principal limitations of the study, fully recognized by the originating source, are as follows: (1) Because of the changing composition of the sample, the type of houses included may vary from period to period. Consequently, fluctuations in median prices may be due either to change in asking prices or to change in the type of houses advertised; (2) because of the omission of houses advertised without listing price and of houses sold without newspaper advertisement, a sizable segment of total sales is not considered in the series; and (3) there may be cyclical differences in the spread between asking prices and selling prices.

N 150–160. Nonfarm residential mortgage debt, by type of holder, 1890–1956.

Source: 1890–1952, see Grebler-Blank-Winnick source for series N 125-128; 1952–1956, Saul B. Klaman, *The Volume of Mortgage Debt in the Postwar Decade: Appraisal and Development of Statistics*, Technical Paper 13, National Bureau of Economic Research, 1958.

The Grebler-Blank-Winnick estimates are based largely on Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, Princeton University Press, 1955. Because of the paucity of reliable data, particularly for earlier years, and the consequent employment of ratios found for benchmark years and interpolations or extrapolations, the estimates must be used with caution. The Grebler-Blank-Winnick figures were slightly modified to take account of later revisions by the Federal Home Loan Bank Board of its estimates of debt on 1- to 4-family houses for 1938-1952; see Federal Home Loan Bank Board, *Estimated Home Mortgage Debt and Financing Activity, 1955* (release, March 1956).

The study by Klaman contains alternative estimates for 1945–1952 which are not entirely comparable with the figures shown here. Because of new information and improved estimating techniques, these data are superior to those in Grebler-Blank-Winnick for overlapping years. The differences reflect mainly lower estimates by Klaman for the mortgage debt on multifamily residences and are fully explained in Klaman's paper. The Klaman paper presents also a comprehensive methodology and a more detailed classification of mortgage debt estimates. See also J. E. Morton, *Urban Mortgage Lending: Comparative Markets and Experience*, Princeton University Press, 1956.

N 150, total residential mortgage debt, including real estate bonds. For the basis of estimates exclusive of real estate bonds, see text for series N 151. For 1910–1949, the underlying estimates for real estate bonds outstanding on residential property are those of Goldsmith, table R-43. For 1950–1952, figures are estimates based on extrapolation of Goldsmith's data for 1946–1949 for total bonds and assume that 40 percent of these were secured by residential property. This is the ratio applied by Goldsmith for 1910–1949. For the 1890–1909 figures, it was assumed that there were no residential real estate bonds outstanding.

N 151, total residential mortgage debt, excluding real estate bonds. For 1890–1920, figures are based on Goldsmith's estimates of the residential mortgage debt (table R-40) for 1890 and 1920 modified as explained in appendix L of Grebler-Blank-Winnick. The annual estimates between 1890 and 1920 are derived, following Goldsmith's procedures, by interpolating the ratios of nonfarm residential to total nonfarm mortgage debt between the ratios for the two benchmark years. For 1921–1924, figures are those of Goldsmith, derived by interpolation between the 1920 estimate and the 1925 estimate, except that revised data of the Federal Home Loan Bank Board for the 1925 debt on 1- to 4-family houses were used. For basis of 1925–1952 figures, see text for series N 161–163 and N 164–165.

N 152–153, noninstitutional and institutional residential mortgage debt. Noninstitutional figures represent the difference between series N 153 and N 151. Institutional figures are the sum of series N 154–160. The estimates for noninstitutional debt are probably the weakest component from the viewpoint of reliability. They represent largely a residual derived from the independent estimates of total debt and those of institutional holdings.

N 154, residential mortgage debt held by commercial banks. For 1896–1924, figures are based on estimates of total nonfarm mortgages of operating and closed commercial banks shown in Grebler-Blank-Winnick, tables N-10 and N-12, with the 1925 ratio of residential to total nonfarm mortgages for operating banks applied to the entire period. For 1925–1952, figures represent the sum of (1) estimates of the Federal Home Loan Bank Board of the holdings of mortgages on 1- to 4-family dwellings by operating commercial banks, plus those of closed banks (given in Grebler-Blank-Winnick, table N-12), and (2) estimates of the Federal Home Loan Bank Board for 1925–1934 and of the Board of Governors of the Federal Reserve System for 1935–1952. For 1953–1956, figures are from Klaman, table 4.

N 155, residential mortgage debt held by mutual savings banks. For 1896–1924, figures are based on estimates of total nonfarm mortgages held by mutual savings banks shown in Grebler-Blank-Winnick, table N-8, and on the application of the 1925 ratio of residential to total nonfarm mortgages. For 1925–1938, figures are the sum of (1) estimates of the Federal Home Loan Bank Board for mortgages on 1- to 4-family dwellings and (2) estimates of multifamily residential mortgages based on recent ratios of such mortgages to total nonfarm mortgages other than those on 1- to 4-family dwellings. For 1939–1952, figures are from *Federal Reserve Bulletin*, March 1954, p. 289 and for 1953–1956, are from Klaman, table 4.

N 156, residential mortgage debt held by savings and loan associations. For 1896–1924, figures are from Goldsmith, table M-4. For most of the period, these estimates are derived by applying to aggregate assets of savings and loan

Digitized by Google

associations the ratio of mortgage loans obtained from a sample of States accounting for nearly two-thirds of aggregate savings and loan assets. For 1925–1950, figures are estimates of the Federal Home Loan Bank Board plus the holdings of closed savings and loan associations as given in Grebler-Blank-Winnick, table N-12. For 1951 and 1952, figures are estimates of the Federal Home Loan Bank Board.

N 157, residential mortgage debt held by life insurance companies. For 1896–1924, figures are based on estimates of total nonfarm mortgages held by life insurance companies, given in Grebler-Blank-Winnick, table N-9, and application of the 1925 ratio of residential to total holdings. For 1925–1952, figures are the sum of (1) Federal Home Loan Bank Board estimates of holdings of mortgages on 1- to 4-family dwellings and (2) estimates of mortgages on multifamily residential property. The latter are from Goldsmith, table M-10, for 1925–1937; from *Mortgage Investments of Life Insurance Companies*, a release of the Federal Home Loan Bank Board, 1951, for 1938–1951; and from the Institute of Life Insurance for 1952. For 1953–1956, figures are from Klaman, table 4.

N 158, residential mortgage debt held by HOLC. Figures are from reports of the Home Owners' Loan Corporation and include outstandings on both original HOLC loans and on loans originating from the sale of property acquired by HOLC through foreclosure or similar proceedings.

N 159, residential mortgage debt held by FNMA. Figures are from reports of the Federal National Mortgage Association and cover all programs of that agency. Under law, only mortgage loans insured by the Federal Housing Administration or guaranteed by the Veterans Administration are eligible for purchase by FNMA.

N 160, residential mortgage debt held by other institutions. This series combines data given separately in the source for insurance companies other than life, mortgage companies, and installment investment companies. For bases of estimates, see the source.

N 161–163. Nonfarm residential mortgage debt on 1- to 4-family structures, 1925–1956.

Source: Housing and Home Finance Agency, *Annual Report, 1956*, table A-24.

The total debt on 1- to 4-family structures is estimated by the Federal Home Loan Bank Board (annual releases, "Estimated Home Mortgage Debt and Financing Activity"). Mainly because such property may be owner occupied, tenant occupied, or vacant, the data are not comparable to the 1940 and 1950 Census figures on mortgage debt of owner-occupied dwellings. The estimates are based on reports to the Federal Home Loan Bank Board of savings and loan associations, mortgage investment data reported by life insurance companies, information on mutual savings banks' holdings from call reports and other data collated by the Bank Board, similar information collated by the Board of Governors of the Federal Reserve System for commercial banks, financial statements of the Home Owners' Loan Corporation and the Federal National Mortgage Association, and less reliable information for holdings of individuals and others. The latter group includes mortgages held by trusts and trust departments of commercial banks, pension funds, philanthropic and educational institutions, casualty and fire insurance companies, real estate and mortgage companies, RFC Mortgage Company, FHA and Veterans Administration, and individuals. The estimates for holdings of individuals and others are based on residential finance surveys of the Bureau of the Census, trends in nonfarm mortgage recordings, FHA and VA records, and other information. See source for data by type of mortgagee.

The data for government-underwritten mortgages are the outstanding balances of loans insured by the Federal Housing Administration and guaranteed by the Veterans Administration, as estimated by these agencies from their records.

For rough estimates of mortgage debt on 1- to 4-family structures for 1890–1924, see Goldsmith's *A Study of Saving* . . . (cited in text for series N 150–160), vol. I, table R-34.

N 164–165. Nonfarm residential mortgage debt on multifamily structures, 1925–1956.

Source: See source for series N 161–163.

The estimates for total multifamily structures represent revisions of those in Grebler-Blank-Winnick, table L-4, which were undertaken by the Board of Governors, Federal Reserve System. Because of these revisions, the sum of series N 161 and N 164 does not equal the totals shown in series N 151.

The data for FHA-insured mortgages are estimates of the Federal Housing Administration based on records.

N 166–178. General note.

While the annual changes in the amount of residential mortgage debt outstanding (series N 150–165) indicate the net flow of funds, measures of the gross flow of funds are useful for many purposes. However, these measures are far from adequate, as will be apparent from the text below. For estimates of the gross flow of funds into *new* residential construction for 1911–1955, see Grebler-Blank-Winnick (cited above for series N 125–128), appendix M and table 80.

N 166–172. Nonfarm mortgage loans on 1- to 4-family houses, by type of lender, 1925–1950.

Source: See Grebler-Blank-Winnick source for series N 125–128, table N-13. (Figures are from Federal Home Loan Bank Board, *Estimated Home Mortgage Debt and Lending Activity, 1950.*)

These series represent only rough approximations except for HOLC and for savings and loan associations since the late thirties. The estimates were based on scattered reports of national and State supervisory authorities, special reports to the Home Loan Bank Board by life insurance companies, and, for 1939–1950, on mortgage recordings figures (series N 173–178). Estimates for the earlier years, and for "individuals and others" throughout, are highly tentative.

N 173–178. Nonfarm mortgage recordings of $20,000 or less, 1939–1957.

Source: See source for series N 161–163, table A-28. (See also Federal Home Loan Bank Board, *Savings and Home Financing Source Book*, 1956 and 1958 issues.)

Estimates are computed on the basis of monthly reports of cooperating institutions. These reports cover approximately 450 areas containing more than one-half of the total nonfarm 1- to 4-family dwelling units. Activity in the remaining areas is estimated usually by reference to the closest reporting area. To relate the series as closely as possible to home-financing operations, it is limited to mortgages of $20,000 or less. But it includes small mortgages secured by nonresidential real estate and omits large mortgages secured by residences.

The *Savings and Home Financing Source Book, 1956*, contains the following: "Since almost every mortgage is recorded, the series provides an adequate means of determining trends in real estate financing activity, as well as the role being played by various types of lenders. Summaries are made on the basis of the originating mortgagees, and, for this reason, assignments of mortgages are not reflected in the series. To the extent that certain lenders (e.g., insurance companies) purchase mortgages originated and recorded by other lenders

Digitized by Google

(e.g., mortgage companies), the recording statistics may overstate or understate the importance of a particular type of lender as the ultimate source of mortgage credit. It should also be pointed out that mortgage recording data are not directly comparable with estimates on home mortgage lending; the periods covered are not necessarily the same, because lending statistics are reported as of the date of loan commitment, while recording figures reflect the actual date of mortgage registration. Furthermore, alterations in the terms of an existing contract may necessitate a new registration. In the case of refinancing an institution's own mortgage, for example, the face amount of the instrument would appear in the recording totals, whereas only that portion which represented an increase of funds loaned would be included in the lending figures."

N 179–188. Major Federal housing finance programs, 1934–1957.

Source: 1934–1956, see source for series N 161–163, tables A-36, A-38, A-42, A-47, and A-50; 1957, Housing and Home Finance Agency, *Annual Report, 1957*, tables A-47, A-49, A-58, and A-63.

The figures are based on records of the Federal Housing Administration, Veterans Administration, Federal National Mortgage Association, and Federal Home Loan Bank Board.

N 179–184, loans made with FHA insurance. Figures are from Federal Housing Administration. Homes include 1- to 4-family houses. Projects include multifamily housing. Under law, only new multifamily projects are eligible for FHA-insured mortgage loans, although such projects are later eligible for refinancing loans. For the FHA classification of new and existing houses, see text for series N 116–117.

N 185, home mortgage loans made with VA guaranty. Figures are from Veterans Administration and show the total principal amount of loans, not the guaranteed portion which is smaller. In addition to the loans made by private lenders under its guaranty program, the Veterans Administration since fiscal year 1951 has made direct loans for home purchase to veterans in certain areas. The cumulative amount of direct loans disbursed through December 31, 1956, was $600 million.

N 186–187, purchases and sales of the Federal National Mortgage Association. Figures are from Federal National Mortgage Association and include all programs of this agency. Only mortgage loans insured by the Federal Housing Administration or guaranteed by the Veterans Administration are eligible for purchase.

N 188, advances outstanding of the Federal Home Loan Banks. Figures are from Federal Home Loan Bank Board and represent advances to member institutions of the Federal Home Loan Bank System, mainly savings and loan associations.

N 189. Nonfarm real estate foreclosures, 1926–1957.

Source: See source for series N 161–163, table A-31.

Estimates are based on an ever growing number of counties, cities, townships, or other governmental divisions. There were reports for approximately 1,400 of these units in 1957. The reporting areas include approximately three-fifths of all nonfarm 1- to 4-family dwelling units. Foreclosures in the remaining areas are estimated usually by reference to the closest reporting area. Figures represent the number of nonfarm properties, residential and nonresidential, acquired by mortgage lenders through foreclosure proceedings; they do not include voluntary transfers to such lenders in lieu of foreclosure.

N 190–195. Mortgage status of nonfarm owner-occupied dwelling units, 1890–1956.

Source: Series N 190–194, *U. S. Census of Housing: 1950*, vol. I, part 1, and Bureau of the Census, *National Housing Inventory, 1956*, vol. II. Series N 195, 1890–1950, see Grebler-Blank-Winnick source for series N 125–128, table 59 (based on census data for value and debt); 1956, same as for series N 190–194.

For 1940, 1950, and 1956, the mortgage statistics are for owner-occupied dwelling units in 1- to 4-family dwelling unit structures without business. For 1890–1920, they are for owner-occupied units in all types of structures. These differences are not large enough to invalidate comparisons.

N 196–203. Selected assets and liabilities of savings and loan associations, 1900–1957.

Source: Federal Home Loan Bank Board, *Savings and Home Financing Source Book, 1959*, p. 10; except series N 198 and N 201 for 1922–1929, *Trends in the Savings and Loan Field*, 1948, p. 7.

Figures were compiled from the following sources: 1900–1933, U.S. Savings and Loan League, Chicago, Ill.; for insured associations, 1934–1949, annual supervisory reports; 1950–1957, monthly supervisory reports; and for uninsured associations 1932–1955, annual supervisory reports. Resources of associations in liquidation are not included.

Manufactures

P 1–10. Manufactures summary, 1849–1954.

Source: *U.S. Census of Manufactures: 1954*, vol. II, part 1, p. 3.

The basic source of comprehensive data on manufactures has been the *Census of Manufactures* conducted by the Bureau of the Census. The first *Census of Manufactures* covered 1809. A census was taken at 10-year intervals thereafter to 1899 (with the exception of 1829), at 5-year intervals for 1904–1919, and biennially for 1921–1939. The census was suspended during World War II, but was resumed for 1947. Legislation enacted in 1948 provided for a *Census of Manufactures* every 5 years, with annual sample surveys authorized for interim years. The 1954 Census was the first to be taken as a result of this legislation. Annual Surveys of Manufactures were taken for 1949–1953 and 1955–1957.

The reporting units in each census have been establishments (series P 1) rather than legal entities or companies. Conceptually, an establishment is a geographically isolated manufacturing unit maintaining independent bookkeeping records, regardless of its managerial or financial affiliations. An establishment may be a single plant, a group of closely located plants operated as a unit, or a group of closely located plants operated by a single company without separate records for each. The establishment is also the basic unit of industrial classification, being assigned to an industry on the basis of its reported product of chief value.

There have been changes in scope from one *Census of Manufactures* to another. For "factories and hand and neighborhood industries," data for 1849–1899 are for all establishments with products valued at $500 or more. For "factories, excluding hand and neighborhood industries," data for 1899–1919 are for establishments reporting value of shipments of $500 or more; for 1921–1939, for establishments reporting value of shipments of $5,000 or more, while data for 1947 and 1954 are for establishments employing one or more persons at any time during the census year. These changes in the minimum size limit have not appreciably affected the historical comparability of the census figures except for data on number of establishments.

There have also been a number of changes in the definition of manufacturing industries. Among the more important were changes in the treatment of "railroad repair shops" and "manufactured gas." These industries are included in the figures for 1899–1933, but excluded for 1935–1954. When the change results in the omission of an entire industry for which separate tabulations are available during each census, the adjustments are usually carried back through the previous censuses.

Employee figures (series P 3–4) for 1939–1954 exclude personnel reported by manufacturing establishments as in distribution and in construction work (the 1939 and subsequent censuses required separate reporting for such employees). Therefore, the employee figures for earlier years probably are not strictly comparable with those for 1939–1954. It is not known how many of the wage earners and the salaried employees reported in previous censuses were engaged in distribution and construction, and how many were engaged in manufacturing. The figures for "nonproduction employees" are derived by subtracting the figures for "production and related workers" from those for "all employees." The category, "all employees," comprises all full-time and part-time employees on the payrolls of operating establishments who worked or received pay for any part of the pay period ended nearest the 15th of the month or months specified on the report form. Officers of corporations are included as employees; proprietors and partners of unincorporated firms are, however, excluded from the total. In recent censuses, employment at separate administrative offices and auxiliary units is excluded from this category.

There has not been a consistent treatment of employees in central administrative offices. The latter is defined as offices which operate one or more manufacturing plants located in a city or cities other than that in which the administrative office is located. For the Censuses of 1909–1923, data on employees in such offices were collected on a separate "administrative schedule" and were tabulated and included with those for salaried employees (and, therefore, with all employees) of the manufacturing plants. Thereafter, these data were collected and tabulated only for the Censuses of 1925, 1929, 1937, and 1954. For the 1947 Census, the data were collected but not tabulated. The figures for nonproduction employees (series P 3) for 1925 and 1929 include employees in central administrative offices. To make the 1937 figure for nonproduction employees more comparable to the figures for 1929 and earlier years (except 1927), 130,854 employees in central administrative offices should be added to the 1937 figure (*1937 Census of Manufactures*, p. 1652), and to make the 1954 figure more comparable to the figures for 1929 and earlier years (except 1927), 474,256 employees in administrative and auxiliary units should be added to the 1954 figure (*U.S. Census of Manufactures: 1954*, vol. II, part 1, p. 2).

Production and related workers (series P 4) are defined as workers (up through the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivering), maintenance, repair, janitorial, watchman services, product development, auxiliary production for plant's own use (e.g., power plant), recordkeeping, and other services closely associated with these production operations at the establishment covered by the report. Supervisory employees above the working foreman level are excluded from this category.

Decennial estimates of wage earners (production and related workers) excluding hand and neighborhood industries have been prepared for 1869–1899 by John W. Kendrick and Maude Pech for the National Bureau of Economic Research. The following is the estimated number of wage earners for each of these years: 1869, 1,803,000; 1879, 2,454,000; 1889, 3,562,000; 1899, 4,496,000. This estimate for 1899 differs from the official Census Bureau estimate (series P 4) by only one-tenth of one percent. For details of estimating procedure, see John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, New York, appendix D (forthcoming).

Figures for "value added by manufacture" (series P 8) are obtained by subtracting the cost of materials, supplies, containers, fuel, purchased electric energy, and contract work, from the value of shipments of manufacturing establishments. This procedure avoids the duplication in the "value of

Digitized by Google

shipments" figures which result from the use of products of some establishments as materials by others. The "value added by manufacture" concept should not be confused with "national income originating in manufacturing," as presented in the national income estimates compiled by the Office of Business Economics. The latter is obtained by subtracting from the value of shipments not only the cost of materials, but also such other costs as depreciation charges, State and local taxes (other than corporate income taxes), allowance for bad debts, and purchases of services from nonmanufacturing enterprises such as services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc. It is, therefore, a more "net" concept of value added than that used in the *Census of Manufactures*. Value added by manufacture in 1954, for example, exceeded national income originating in manufacturing, as estimated by the Office of Business Economics, by 30 percent.

Robert E. Gallman has prepared estimates of value added for the census years 1839 to 1879 by adjusting manufacturing totals to exclude nonmanufacturing industries and by correcting for industries omitted from or poorly covered by the various censuses. These estimates are extrapolations based on data prepared by Richard A. Easterlin and published in "Estimates of Manufacturing Activity," *Population Redistribution and Economic Growth, United States, 1870–1950*, vol. I, by Everett S. Lee, Ann Ratner, Carol P. Brainerd, and Richard A. Easterlin, American Philosophical Society, Philadelphia, 1957, pp. 635–681. The following are Gallman's estimates:

Table I. Value Added by Manufacturing

[In millions of dollars]

Year	Current prices	Prices of 1879
1899	5,044	6,252
1889	3,727	4,156
1879	1,962	1,962
1869	1,631	1,078
1859	815	859
1849	447	488
1839	240	190

P 11. FRB index of manufacturing production, 1919–1957.

Source: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, April 1958, p. 476.

In the 1953 revision of this index, annual indexes of physical production based on about 1,400 separate product and industry series were constructed beginning with 1947. About 62 percent of the index is based on figures relating to quantities produced or shipped; figures on quantities of materials consumed by, delivered to, or produced mainly for certain industries account for about 12 percent. The remaining 26 percent is represented by estimates based on several types of data, including deflated value figures and man-hour figures with adjustments for estimated changes in output per man-hour. Man-hour figures account for only 4 percent. For weights and data used and description of method, see *Federal Reserve Bulletin*, December 1953, pp. 1239–1291. This series is extended back from 1947 to 1919 on the basis of the Federal Reserve Board series used prior to 1953 (1935–39= 100) after taking account of new levels established for 1947 relative to 1939 by the Census-Federal Reserve study of manufactures published in 1952 (see *Census of Manufactures: 1947, Indexes of Production*). These adjustments were relatively small, indicating that the 1947 levels of the old monthly and annual indexes for these aggregates were fairly accurate.

P 12. NBER index of manufacturing production, 1899–1919.

Source: Bureau of the Census, records.

These data were prepared by extending and shifting the production indexes originally prepared from Census of Manufactures data by Solomon Fabricant, National Bureau of Economic Research. The original data were first presented in Solomon Fabricant, *The Output of Manufacturing Industries, 1899–1937*, National Bureau of Economic Research, New York, 1940. These indexes cover only those years for which a Census of Manufactures was taken. Because of the inadequacy of data for most groups, no attempt was made to interpolate between intercensal years. For details of method of construction, see Fabricant's book, chap. 2 and appendix A.

P 13. Frickey index of manufacturing production, 1860–1914.

Source: Edwin Frickey, *Production in the United States, 1860–1914*, Harvard Economic Studies, Harvard University Press, 1947, p. 54.

In the derivation of these indexes, Frickey employed the weighted arithmetic mean of quantity relatives. With respect to weighting, he took the value-added principle as his standard and conformed to this standard as nearly as possible with existing data. For details on constituent series, see the source, appendixes A and B.

Making use of the figures for series P 11–13 and other data, John W. Kendrick has constructed an index of manufacturing, with 1929 as the base, for benchmark years 1869, 1879, and 1889, and annually thereafter through 1953. See appendix table D-II for figures and appendix D for description of this index in Kendrick's *Productivity Trends in the United States*, National Bureau of Economic Research, New York (forthcoming).

P 14–16. Capital in manufacturing industries, in book value (NBER), 1879–1953.

Source: Daniel Creamer, Sergei Dobrovolsky, and Israel Borenstein, *Capital in Manufacturing and Mining: Its Formation and Financing*, Princeton University Press (forthcoming), appendix A, tables 8 and 9.

Estimates for 1879–1919 are based on data in various reports of the Census of Manufactures. For 1929–1953, the estimates are based on balance sheet data of corporations (raised to the level of all firms) published by the Internal Revenue Service (formerly Bureau of Internal Revenue) in *Statistics of Income*. Fixed capital includes land, buildings, and equipment (all net of depreciation). Working capital includes all other assets, other than investments in securities (chiefly cash, accounts and notes receivable, and inventories). Structures and equipment owned by the Federal Government but operated by private firms are excluded in all years. For a detailed description of data, adjustments and limitations, see appendix A, section A, of source.

P 17–19. Capital in manufacturing industries, in 1929 dollars (NBER), 1879–1953.

Source: See source for series P 14–16.

Figures were derived by dividing the estimates of capital in book values (series P 15–17) by price indexes of book values expressed in 1929 prices. The latter are the implicit indexes derived by dividing the sum of the reported book values of the 15 major groups comprising all manufactures by the sum of the book values expressed in 1929 prices of the 15 major groups. For derivation of the deflators for each of the 15 major groups, see text for series P 30–133.

P 20–23. Real net value of assets in manufacturing, in 1947 dollars (Department of Commerce), 1928–1955.

Source: Office of Business Economics, *Survey of Current Business*, "Manufacturing Investment Since 1929," November 1956, p. 14.

Estimates are for privately owned structures and equipment assets in manufacturing establishments, and represent the undepreciated value remaining in past acquisitions. The latter were derived from the estimates of gross private domestic investment in newly constructed industrial buildings and producers' durable equipment that are included in the gross national product estimates of the Department of Commerce. The outlays on structures were adjusted to benchmarks, based mainly on expenditures for new plant construction by establishments included in the Census of Manufactures, and were supplemented by data on business purchases of Government surplus plant. The manufacturing purchases of equipment resulted from applying an allocation percentage to the total business purchases of each type of producers' durable equipment. The expenditures on equipment reported in the Bureau of the Census 1951 Annual Survey of Manufactures were used as a benchmark for these equipment purchases estimates. Purchases of structures and of equipment were converted to constant (1947) cost by the indexes used to deflate the corresponding components of the gross national product.

Depreciation at constant cost has been estimated by applying information on the length of useful lives to the constant dollar purchases of structures and equipment. Depreciation was allocated over the useful life by the straight-line method, which allots an equal amount of depreciation to each year. Net assets at constant cost were derived by adding up past purchases, and deducting the accumulated depreciation of these purchases. The useful life information was drawn largely from *Income Tax, Depreciation and Obsolescence, Estimated Useful Lives, and Depreciation Rates*, Bulletin F, Internal Revenue Service.

For additional information, see the source.

P 24–29. Capital expenditure for structures and equipment, 1915–1955.

Source: 1915–1929, see Lowell J. Chawner, "Capital Expenditures for Manufacturing Plant and Equipment—1915 to 1940," Office of Business Economics, *Survey of Current Business*, March 1941, pp. 10–11; 1929–1955, see source for series P 20–23, p. 9.

For 1929–1955, private purchases of structures and equipment for manufacturing establishments were derived from the estimates of gross private domestic investment in newly constructed industrial buildings and producers' durable equipment that are included in the gross national product estimates of the Department of Commerce. The outlays on structures were adjusted to benchmarks, based mainly on expenditures for new plant construction by establishments included in the Census of Manufactures, and were supplemented by data on business purchases of Government surplus plants. The manufacturing purchases of equipment resulted from applying an allocation percentage to the total business purchases of each type of producers' durable equipment. The expenditures on equipment reported in the Bureau of the Census 1951 Annual Survey of Manufactures were used as a benchmark for the equipment purchases estimates.

For 1915–1929, the plant expenditures (series P 25) refer to buildings (including heating, plumbing, and similar accessory equipment), and other fixed structures such as vats, blast furnaces, and docks. The estimates of factory building construction are based primarily on F. W. Dodge Corporation contract awards adjusted upward on the basis of information from other sources to take care of underenumeration and regions not covered by the Dodge reports. Estimates of plant construction other than buildings were derived by allocating to manufacturing capital a portion of the value of the products included as reported by the Bureau of the Census. The absolute magnitude of this series depends in an important degree upon allowances for markup and for installation and transportation costs, and allowances for underreporting.

The equipment expenditures (series P 26) refer to movable equipment, and are based on Census of Manufactures data. For 1915–1922, allowance was made for underreporting. Those items not used entirely in manufacturing were allocated on the basis of data from trade associations and specialists in the various machinery industries. For 1923–1955, intercensal year interpolations were made on the basis of a Bureau of Labor Statistics index of payrolls of industrial machinery manufacturers. For the intercensal years between 1914 and 1919, estimates were made by using annual reports from five States. The series was then adjusted for imports and exports, inventory changes, for the differences between factory costs and cost to the industrial purchaser, and census under enumeration.

For 1929–1955, purchases of structures and of equipment were converted to constant (1947) cost by the indexes used to deflate the corresponding components of the gross national product. For 1915–1928, current year estimates were adjusted for price changes using appropriate indexes of actual costs of "shop machinery," "shops and engine houses," and similar items compiled by the Bureau of Valuation, Interstate Commerce Commission.

P 30–133. Total capital in major branches of manufactures, in book value and in 1929 dollars, 1879–1948.

Source: See source for series P 14–16, appendix A, table 8.

For the definition of total capital in book values, see text for series P 14–16.

The general procedure for deflating capital is to derive a composite index of prices underlying book values of buildings, machinery and equipment, and working capital for each of 15 major industrial groups. A construction cost index weighted by volume of construction depreciated over 50 years is used to represent the changes in the book value of land and buildings. This component of the composite index is identical for all 15 groups. For machinery and equipment, a price index of general machinery and equipment is used for all 15 groups, but in each group the index is weighted by volume of machinery and equipment produced, depreciated according to length of life typical for a given industry as reported by the Internal Revenue Service in *Income Tax, Depreciation and Obsolescence, Estimated Useful Lives, and Depreciation Rates*, Bulletin F (rev. January 1942). Because of these changing industry weights, a different deflator for machinery and equipment is obtained for each major group. The wholesale price index of the output of a given major industry is used to deflate working capital.

These 3 component indexes for each major group were combined into a composite price index for deflating *total capital* by computing the weighted harmonic mean of the 3 indexes. The weights used for 1879–1937, inclusive, were the average relative importance of the components in 1889, 1899, and 1904, as shown by Census Bureau data. Limited evidence indicates that there was little change in the relative importance of these 3 asset components from 1879 to 1937. By 1948, there were significant changes in their relative importance and new weights were used, based on balance-sheet data reported in Internal Revenue Service, *Statistics of Income*, 1948 and 1953 issues, part 2. The composite index for the major group was also

Digitized by Google

applied to the total capital of minor industries within the group. For a full derivation of these price indexes, see source, appendix A, section B1.

P 134–137. Legal form of ownership of manufacturing establishments, 1899–1954.

Source: 1899, *Census of Manufactures: 1905*, part I, p. liv; 1904 and 1909, Thirteenth Census of the United States, 1910, *Manufactures: 1909*, vol. VIII, p. 135; 1914 and 1919, Fourteenth Census of the United States, 1920, *Manufactures: 1919*, vol. VIII, p. 108; 1929, Fifteenth Census of the United States, 1930, *Manufactures: 1929*, vol. I, p. 95; 1939, Sixteenth Census of the United States, 1940, *Manufactures: 1939*, vol. I, p. 229; 1947, *Census of Manufactures, 1947*, vol. I, p. 149; 1954, *U. S. Census of Manufactures: 1954*, vol. I, Bulletin MC-204-1, chapter IV (processed).

Percentages were computed from figures published in the various Bureau of the Census reports cited as sources.

P 138–146. Wage earners, by sex, 1869–1919.

Source: 1869–1899, Twelfth Census of the United States, 1900, Census Reports, vol. VII, *Manufactures*, part I, p. cxxvi; 1899–1904, Special Reports of the Census Office, *Manufactures, 1905*, part 1, p. lxxi; 1909–1919, Fourteenth Census of the United States, 1920, *Manufactures, 1919*, vol. VIII, p. 20.

P 147–168. Indexes of manufacturing production, by industry group, 1947–1957.

Source: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, December 1953 and later issues.

As the text for series P 11 indicates, this series is the successor series to the indexes based on 1935–39=100.

P 169–186. Indexes of manufacturing production, by industry group, 1899–1954.

Source: Bureau of the Census, records.

See text for series P 12.

For a listing of changes in industry classifications as of 1947, see *Census of Manufactures, 1947, Indexes of Production*, footnote to table 1, p. 1. For an annual index of durable and nondurable production (1899 = 100) for 1860–1914, see text for series P 13.

P 187. Wheat flour produced, 1860–1956.

Source: 1860–1914, see source for series P 13, pp. 8–9 and 135–139; 1915–1929, Arthur F. Burns, *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, pp. 299 and 339; 1931 and 1933, Solomon Fabricant, *The Output of Manufacturing Industries, 1899–1937*, National Bureau of Economic Research, New York, 1940, p. 395 (data from Census of Manufactures); 1935–1956, Agricultural Marketing Service, Agriculture Handbook No. 62, *Supplement for 1956 to Consumption of Food in the United States, 1909–52*, p. 106.

Reported data in hundred weights converted to barrels containing 196 lbs. of flour. These estimates are based on commercial production of wheat flour reported by the Bureau of the Census. They include flour milled in bond from foreign wheat plus the estimated flour equivalent of farm wheat ground for flour or exchanged for flour for farm household use as reported by Agricultural Marketing Service.

P 188. Refined sugar produced, 1860–1955.

Source: 1860–1914, see source for series P 13, pp. 8–9 and 139–143; 1919–1933, see Solomon Fabricant, pp. 382 and 387, cited as source for series P 187; 1934–1945, Department of Agriculture, *Agricultural Statistics, 1952*, p. 111; 1946–1955, *Agricultural Statistics, 1956*, p. 83.

Figures represent production in cane-sugar refineries and in beet-sugar factories.

P 189. Coffee imported, 1860–1957.

Source: 1860–1914, see source for series P 13, pp. 8–9 and 143–144; 1915–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 187; 1930–1947, Bureau of the Census, *Foreign Commerce and Navigation of the United States*; 1948–1957, same agency, *Quarterly Summary of Foreign Commerce of the United States*, for those years.

The data for 1860–1933 are described as net imports (general imports) minus foreign trade; for 1934–1956, they are described as imports for consumption minus foreign exports. However, on duty-free commodities, like coffee, general imports equal imports for consumption.

P 190. Canned corn produced, 1885–1957.

Source: 1885–1929, see Arthur F. Burns, pp. 300–301 and 341, cited as source for series P 187; 1930–1951, Department of Agriculture, *Agricultural Statistics, 1952*, p. 322; 1952–1955, *Agricultural Statistics, 1956*, p. 251; 1956–1957, National Canners Association, *Canned Food Pack Statistics, 1957*, p. 16.

A case consists of 24 No. 2 cans. Figures for 1930–1955 are compiled mainly from reports of the National Canners Association.

P 191. Canned tomatoes produced, 1885–1957.

Source: 1885–1929, see Arthur F. Burns, pp. 300–301 and 341, cited as source for series P 187; 1930–1957, see source for series P 190.

A case consists of 24 No. 2 cans. The figures for 1885–1929 were published in the unit case of 24 No. 3 cans. They have been converted to a unit case of 24 No. 2 cans by multiplying by the factor of 1.707. The conversion factor is taken from National Canners Association, *Canned Food Pack Statistics: 1940, part 1—Vegetables*, Washington, D.C., March 1941, p. 19. Figures for 1930–1955 are compiled mainly from reports of the National Canners Association.

P 192. Fermented malt liquor produced, 1870–1957.

Source: 1870–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 187; 1930–1932, Internal Revenue Service (formerly Bureau of Internal Revenue), records; 1933–1938, Bureau of the Census, *Statistical Abstract of the United States, 1942*, p. 944; 1939–1945, *Statistical Abstract, 1946*, p. 859; 1946–1952, *Statistical Abstract, 1953*, p. 810; 1953–1956, *Statistical Abstract, 1957*, p. 805; 1957, *Statistical Abstract, 1958*, p. 796.

The unit "barrel" contains 31 wine gallons. Primary source of the data is the *Annual Report of the Commissioner of Internal Revenue*. For 1921–1933, only cereal beverages were permitted to be produced.

P 193. Distilled spirits produced, 1870–1955.

Source: 1870–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 187; 1930–1933, Department of Commerce, *Statistical Abstract of the United States, 1936*, p. 787; 1934–1941, *Statistical Abstract, 1942*, p. 944; 1942–1955, Internal Revenue Service (formerly Bureau of Internal Revenue), records.

The computation of taxable gallons excludes all fractional parts of a proof gallon less than one-tenth. Figures are for years ending June 30 and include data for Hawaii; beginning 1928, they also include data for Puerto Rico. Figures for all years include ethyl alcohol. Primary source of figures is the Internal Revenue Service (formerly Bureau of Internal Revenue).

P 194. Manufactured tobacco and snuff produced, 1870–1957.

Source: 1870–1879, see source for series P 13, pp. 14–15 and 192–193; 1880–1929, see Arthur F. Burns, pp. 296–297,

Digitized by Google

cited as source for series P 187; 1930–1937, Bureau of the Census, *Statistical Abstract of the United States, 1938*, p. 802; 1938–1951, *Statistical Abstract, 1953*, p. 812; 1952–1956, *Statistical Abstract, 1958*, p. 798; 1957, *Statistical Abstract, 1959*, p. 804.

Primary source of the figures is the *Annual Report of the Commissioner of Internal Revenue.*

P 195. Cigars produced, 1870–1957.

Source: 1870–1879, see source for series P 13, pp. 14–15 and 189–191; 1880–1929, see Arthur F. Burns, pp. 298–299, cited as source for series P 187; 1930–1937, Bureau of the Census, *Statistical Abstract of the United States, 1938*, p. 802; 1938–1951, *Statistical Abstract, 1953*, p. 812; 1952–1953, *Statistical Abstract, 1955*, p. 823; 1954–1956, *Statistical Abstract, 1958*, p. 798; 1957, *Statistical Abstract, 1959*, p. 804.

Primary source of the figures is the *Annual Report of the Commissioner of Internal Revenue.* For 1870–1953, figures exclude cigars weighing not more than 3 pounds per 1,000.

P 196. Cigarettes produced, 1870–1957.

Source: 1870–1879, see source for series P 13, pp. 14–15 and 192; 1880–1929, see Arthur F. Burns, pp. 298–299, cited as source for series P 187; 1930–1957, see sources cited for these years for series P 195.

Figures represent large and small cigarettes and small cigars for 1870–1953, excluding those manufactured in bonded manufacturing warehouses. For 1953–1957, small cigars are excluded.

P 197. Raw cotton consumed, 1860–1957.

Source: 1860–1909, Bureau of the Census, *Bulletin 160, Cotton Production and Distribution, 1926*, p. 49; 1910–1945, *Bulletin 188, Cotton Production and Distribution, 1946*, pp. 26–31; 1946–1949, *Statistical Abstract of the United States, 1953*, p. 814; 1950–1957, *Statistical Abstract, 1958*, p. 802.

Data are for years ending August 31 through 1910, July 31 thereafter. Figures are in running bales, except that figures for 1860–1870 are in equivalent 500-pound bales. Data include linters for 1909–1957; exclude linters for 1860–1908.

P 198. Wool consumed, 1922–1957.

Source: 1922–1945, Bureau of the Census, *Statistical Abstract of the United States, 1946*, p. 655; 1946–1957, *Statistical Abstract, 1958*, p. 803.

Figures relate to scoured wool plus greasy wool reduced to a scoured basis, assuming average yields varying with class, origin, grade, and whether shorn or pulled. For 1946–1957, includes raw wool consumed in woolen and worsted systems only. Primary source of the figures is the Bureau of the Census.

For a series on apparent consumption of all wool, 1870–1929, see Arthur F. Burns, pp. 296–297, cited as source for series P 187.

P 199. Unmanufactured silk imports for consumption, 1883–1957.

Source: 1883–1929, see Arthur F. Burns, pp. 294–295, cited as source for series P 187; 1930–1931, Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the U. S.*, vol. I, for respective years; 1932, Bureau of the Census, *Statistical Abstract of the United States, 1940*, p. 732; 1933–1949, *Statistical Abstract, 1950*, p. 638; 1950–1957, *Statistical Abstract, 1958*, p. 887.

Figures are derived by subtracting foreign exports from general imports of all types of unmanufactured silk. Spun silk is not included.

For a series on raw silk imports (excluding silk from cocoons and waste) for 1860–1914, see source for series P 13, pp. 8–9 and 153–155; and for 1870–1929, see Arthur F. Burns, cited above.

P 200. Packaged rayon and acetate yarns produced, 1911–1957.

Source: 1911–1955, Textile Economics Bureau, Inc., *Textile Organon—Base Book of Textile Statistics*, vol. XXIX, No. 1, January 1958, p. 15; 1956 and 1957, Textile Economics Bureau, Inc., records.

Figures represent packaged or baled production ready for sale or fabrication and exclude staple, tow, waste, and other rayon and acetate products. Data for rayon relate to manmade fibers produced by the viscose, cuprammonium, and nitrocellulosic (discontinued after 1934) processes. Rayon horsehair and straw are included in the filament yarn figures for 1952–1957 (for 1940–51, production of these items averaged just under 1 million pounds per year). Acetate means manmade fibers composed of cellulose acetate.

For 1941–1957, figures for rayon and acetate are as actually reported by the entire industry; earlier data are estimated totals based on reports obtained from 86 percent or more of the industry, with adjustments for complete coverage in accordance with information from the Census of Manufactures.

P 201–202. Men's and women's leather shoes produced, 1899–1954.

Source: 1899–1919, see Solomon Fabricant, cited as source for series P 187; 1921–1945, Department of Commerce, *Statistical Abstract of the United States*, various issues, 1929–1946; 1947–1954, Bureau of the Census, records.

Figures represent pairs of leather uppers for men's and women's shoes. They do not include youths' and boys', misses', children's, infants', athletic, part leather, or nonleather shoes. For 1930–1954, figures for men's shoes are not strictly comparable with earlier years because large quantities of heavy footwear included with men's shoes for later years were included with athletic shoes for earlier years.

P 203–207. Steel ingots and castings produced, 1867–1957.

Source: Department of Commerce, *Statistical Abstract of the United States*, various issues, 1908–1958.

Primary source of figures is the *Annual Statistical Report* of the American Iron and Steel Institute. For 1934–1957, figures include only that part of steel castings made in foundries producing steel ingots.

P 208. Rolled iron and steel produced, 1885–1957.

Source: 1885–1929, see Arthur F. Burns, p. 300, cited as source for series P 187; 1930–1957, Bureau of the Census, *Statistical Abstract of the United States*, various issues, 1947–1958.

Primary source of the figures is the *Annual Statistical Report* of the American Iron and Steel Institute. Figures include rails, plates and sheets, merchant bar and skelp production, wire rods, and structural shapes.

P 209. Tinplate consumption, 1871–1957.

Source: 1871–1929, see Arthur F. Burns, p. 296, cited as source for series P 187; 1930–1957, American Iron and Steel Institute, *Annual Statistical Report*, various issues, 1932–1957.

Figures include both tinplate and terneplate. For 1871–1899, figures are for production plus imports; for 1900–1957, production plus imports minus exports.

P 210. Rails produced, 1860–1957.

Source: 1860–1914, see source for series P 13, pp. 10–11 and 157–158; 1915–1929, see Arthur F. Burns, pp. 294–295,

488910 O - 60 - 27

Digitized by Google

cited as source for series P 187; 1930–1957, American Iron and Steel Institute, *Annual Statistical Report*, various issues, 1930–1957.

Figures include both iron and steel rails, rerolled rails, and girder and high T rails. Rails are a component of "rolled iron and steel" (series P 208). For 1860–1867, figures include production of iron rails only.

P 211. Structural iron and steel shapes produced, 1879–1957.

Source: 1879–1914, see source for series P 13, pp. 10–11 and 158; 1915–1957, American Iron and Steel Institute, *Annual Statistical Report*, various issues, 1927–1957.

Structural shapes are a component of "rolled iron and steel" (series P 208).

P 212. Common and face brick produced, 1869–1957.

Source: 1869–1899 (decennially), 1904, 1909, 1914, 1919–1939 (biennially), 1947, and 1954, *Census of Manufactures*, reports for various years; 1894–1912, *Mineral Resources of the United States, 1900–1913*, various issues; 1913–1956, Bureau of the Census, *Statistical Abstract of the United States*, various issues, 1925–1958; 1957, Bureau of the Census, *Facts for Industry*, series M 32D.

The figures for 1869 and 1879 are for common brick only. For 1889, 1899, and 1904, the production of "fancy or ornamental brick" has been added to the production of "face brick," the reason being that "the best grade of 'face' or 'front' brick appears to have been classified as 'fancy or ornamental' brick" in these years. Beginning with 1943, common and face brick are classified as "unglazed" brick.

P 213. Locomotives produced, 1880–1945.

Source: 1880–1929, see Arthur F. Burns, pp. 300–301, cited as source for series P 187; 1930–1945, American Railway Car Institute, *Railway Age, Annual Statistical and Outlook Number*, January 6, 1945, p. 91, and *Annual Statistical and Outlook Number*, January 5, 1946, p. 88.

For 1905–1945, Canadian output is included although the U. S. output is shown separately beginning with 1929 (see, for example, *Railway Age, Annual Statistical Number*, January 4, 1947). For 1880–1911, locomotives built in railroad repair shops are excluded. For 1942–1944, figures exclude locomotives built for U. S. Government and for lend-lease program.

This series was discontinued when the new traction power was supplied almost exclusively by Diesel units. A locomotive may be composed of one or more Diesel units.

P 214. Railroad freight cars produced, 1871–1957.

Source: 1871–1914, see source for series P 13, pp. 14–15 and 193–196; 1915–1919, American Railway Car Institute, *Railway Age, Annual Statistical and Outlook Number*, January 7, 1939, p. 83; 1920–1957, *Railway Age, Annual Statistical and Outlook Number* (most recently entitled *Review and Outlook*), various issues, 1950–1958.

For 1920–1957, figures represent "freight cars delivered." For 1871–1919, figures represent domestic production of freight cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops.

P 215. Railroad passenger cars produced, 1871–1957.

Source: 1871–1914, see source for series P 13, pp. 14–15 and 196–197; 1915–1957, see source for series P 214.

For 1920–1957, figures represent "passenger train cars delivered." For 1871–1919, figures represent domestic production of passenger cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops.

P 216–217. Horse-drawn vehicles produced, 1899–1954.

Source: 1899–1937, see Solomon Fabricant, p. 585, cited as source for series P 187; 1939–1954, *Census of Manufactures*, reports for 1939, 1947, and 1954.

For 1899–1914, figures for farm wagons, trucks, and business vehicles include patrol wagons, ambulances, handcarts, and pushcarts; for 1919–1925, they exclude mail carrier wagons and public conveyances and relate to products made within the industry (as classified by the Bureau of the Census); for 1927–1954, figures relate to all products made regardless of the industry classification of the establishment.

For 1899–1925, figures for carriages, buggies, and sulkies exclude sulkies; for 1933, include two-wheeled carts.

P 218. Bicycles produced, 1899–1954.

Source: 1899–1937, see Solomon Fabricant, p. 590, cited as source for series P 187; 1939–1954, see source for series P 216–217.

For 1899–1921, figures relate to products made within the industry (as classified by the Bureau of the Census); for 1923–1954, figures relate to all products made regardless of the industry classification of the establishment.

P 219. Pneumatic tires and casings produced, 1914–1954.

Source: 1914–1937, see Solomon Fabricant, p. 480, cited as source for series P 187; 1939–1954, see source for series P 216–217.

Figures exclude tires for bicycles and motorcycles.

P 220. Light products of distillation, 1880–1956.

Source: 1880 and 1889, see *Twelfth Census of the United States*, vol. X, *Manufactures*, part IV, p. 685; 1899–1927, see Solomon Fabricant, p. 517, cited as source for series P 187; 1929–1956, Office of Business Economics, *Business Statistics, 1957, Biennial Edition*, a supplement to the *Survey of Current Business*, p. 173.

These figures relate essentially to the production of gasoline and naphtha. Figures for 1880–1927 and for 1929–1956 are not strictly comparable. The figure for 1929 on a basis comparable with preceding years is 18.4 billion gallons. For 1953–1956, figures for jet fuel are excluded.

The sum of the monthly average production of barrels of gasoline and naphtha from crude oil and natural gas liquids is multiplied by 12 to obtain the annual total. The latter is converted to gallons on the assumption of 42 gallons per barrel. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 221. Illuminating oils (kerosene) produced, 1899–1956.

Source: 1899–1927, see Solomon Fabricant, p. 517, cited as source for series P 187; 1929–1956, see source for series P 220, p. 172.

Figures for 1899–1927 and for 1929–1956 are not strictly comparable. The figure for 1929 comparable with the preceding years is 2.34 billion gallons. For 1953–1956, figures exclude jet fuel.

The monthly average production of barrels of kerosene is multiplied by 12 to obtain the annual production. The latter is converted to gallons on the assumption of 42 gallons per barrel. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 222. Fuel oils produced, 1899–1956.

Source: 1899–1927, see Solomon Fabricant, p. 517, cited as source for series P 187; 1929–1956, see source for series P 220, p. 171.

Figures for 1899–1927 and for 1929–1956 are not strictly comparable. The figure for 1929 comparable with the preceding

Digitized by Google

years is 16.4 billion gallons. For 1953–1956, jet fuels are excluded.

The sum of the monthly average production of barrels of distillate and residual fuel oil is multiplied by 12 to obtain the annual total. The latter is converted to gallons on the assumption of 42 gallons per barrel. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 223. Lubricating oils produced, 1899–1956.

Source: 1899–1927, see Solomon Fabricant, p. 518, cited as source for series P 187; 1929–1956, see source for series P 220, p. 173.

Figures for 1899–1927 and for 1929–1956 are not strictly comparable. The figure for 1929 comparable with preceding years is 1,554 million gallons.

The monthly average of barrels produced is multiplied by 12 to obtain the annual production. The latter is converted to gallons on the assumption of 42 gallons per barrel. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 224. Paraffin wax produced, 1880–1956.

Source: 1880 and 1889, see *Twelfth Census of the United States*, vol. X, *Manufactures*, part IV, p. 685; 1899–1927, see Solomon Fabricant, p. 518, cited as source for series P 187; 1929–1956, see source for series P 220, p. 175.

For 1929–1956, figures are labelled petroleum wax. The monthly average of barrels produced is multiplied by 12 to obtain the annual production. The latter is converted to gallons on the assumption of 280 pounds per barrel and 7.5 pounds per gallon. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 225. Super-phosphate produced, 1860–1957.

Source: 1860–1954, Department of Agriculture, *Statistics on Fertilizers and Liming Materials in the United States*, Statistical Bulletin No. 191, p. 43, April 1957; 1955–1957, Bureau of the Census, *Facts for Industries*, series M19D-06 and M19D-08.

P 226. Sulfuric acid produced, 1899–1956.

Source: 1899–1925, Bureau of the Census, records; 1929–1956, see source for series P 220, p. 119.

Figures are combined totals for sulfuric acid produced by the contact and chamber processes, including spent acid fortified in the contact plants with the simultaneous production of new acid. Production of Government-owned plants, which was large during the war period, is not included for that period; for the most part, this production was available only for military use. However, for 1954–1956, appreciable amounts of sulfuric acid produced in Government-owned privately operated plants are included. Figures for 1946–1950 include estimates based on annual totals of byproduct operations of a few smelters reporting to the Bureau of Mines; the estimated data included vary from 4 percent in 1946 to 2 percent in 1950. For 1899–1939, figures are based on reports of the Census of Manufactures; they are shown in those reports on a 50° Baume basis but are here converted to 100 percent H_2SO_4. Beginning January 1948, figures are not strictly comparable with earlier data because of the inclusion of additional plants; however, the addition of these plants increased the production of the specified chemical by less than 3.5 percent.

P 227. Soda ash produced, 1890–1954.

Source: 1890, *Twelfth Census of the United States*, vol. X, *Manufactures*, part IV, p. 539; 1899–1937, see Solomon Fabricant, p. 490, cited as source for series P 187; 1939–1954, see source for series P 216–217.

P 228. Mechanical refrigerators produced, 1921–1954.

Source: 1921–1937, American Gas Association (gas refrigerators), and Business News Publishing Co., *Air Conditioning and Refrigeration News*, and McGraw-Hill Publishing Co., *Electrical Merchandising* (electric refrigerators); 1939–1954, see source for series P 216–217.

Figures for 1921–1937 measure sales, not production, of household refrigerators.

P 229. Reed organs produced, 1899–1935.

Source: See Solomon Fabricant, p. 595, cited as source for series P 187.

P 230. Pianos produced, 1899–1954.

Source: 1899–1937, see Solomon Fabricant, pp. 597 and 598, cited as source for series P 187; 1939–1954, see source for series P 216–217.

P 231. Phonographs produced, 1899–1929.

Source: See Solomon Fabricant, p. 573, cited as source for series P 187.

P 232. Radios and radio-phonograph combinations produced, 1923–1954.

Source: 1923–1937, see Solomon Fabricant, pp. 573–574, cited as source for series P 187; 1939–1954, see source for series P 216–217.

Figures include home receiving sets, automobile sets, and radio-phonograph combinations.

P 233–249. General note.

Capacity is generally calculated on the basis of full-time operation of an industry (i.e., 365 days a year, 24 hours a day). Capacity as of January 1 is generally used as the basis of computation. Exceptions to these general rules are noted in the text for each series, where applicable.

P 233. Blast furnaces (pig iron), 1898–1957.

Source: 1898–1915, American Iron and Steel Institute, records; 1916–1957, same organization's *Annual Directory* and *Annual Statistical Report*, New York, various issues.

Figures include a 6.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing the equipment. Capacity is based on April 1 for 1898; November 1, 1901 and 1907; June 1, 1904; and the average of January 1 and July 1 for 1941–1944 and 1950.

P 234. Steel ingots and steel for castings, 1887–1957.

Source: See source for series P 233.

Figures include a 9.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing equipment, and for holiday shutdowns. Capacity is based on an average of January 1 and July 1 for 1941–1944.

P 235. Copper refining, 1907–1957.

Source: 1907–1930, Edwin G. Nourse, *America's Capacity to Produce*, The Brookings Institution, Washington, D. C., 1934, p. 557; 1931–1957, American Bureau of Metal Statistics, *Year Book*, New York, various issues.

P 236–237. Lead refining, 1921–1957.

Source: American Bureau of Metal Statistics, *Year Book*, New York, various issues.

Digitized by Google

P 238. Zinc refining, 1921–1957.

Source: See source for series P 236–237.

Figures are not comparable throughout because of changes in components. For 1921–1925, figures represent distillation zinc; 1926–1940, distillation and electrolytic zinc; 1941–1957, slab zinc. As an alternative source for data, see Bureau of Mines, *Minerals Yearbook*, various issues.

P 239. Aluminum ingots, 1889–1957.

Source: 1889–1895, J. D. Edwards, *et al., The Aluminum Industry*, McGraw-Hill Publishing Co., New York, 1930; 1910–1919, Business and Defense Services Administration, *Materials Survey, Aluminum*, 1956; 1927–1938, Surplus Property Board, *Aluminum Plants and Facilities Report*, 1945; 1939–1957, American Bureau of Metal Statistics, *Year Book*, New York, various issues.

The general practice in this industry is to rate potline capacity on full-time operation. As an alternative source for data, see Bureau of Mines, *Minerals Yearbook*, various issues.

P 240. Portland cement, 1910–1957.

Source: 1910–1923, Geological Survey, *Mineral Resources of the United States*, annual volumes; 1924–1931, Bureau of Mines, *Mineral Resources of the United States*, annual volumes; 1932–1957, *Minerals Yearbook*, annual volumes.

A deduction from full-time operation is taken for estimated average number of days required for repair or other unavoidable shutdowns. Favorable labor, fuel, and transportation conditions are assumed.

P 241. Crude petroleum refining, 1918–1957.

Source: Bureau of Mines, *Petroleum Refineries, Including Cracking Plants in the United States, January 1, 1957*, Information Circular No. 7815, December 1957, Monthly Petroleum Statement No. 431 (also shown in *Minerals Yearbook*).

Capacity is defined as the maximum daily average throughput (converted to an annual basis) of the plant in complete operation, with allowance for necessary shutdown time for routine maintenance, repairs, etc. It approximates the maximum daily average crude runs to stills that can be maintained for an extended period. Capacity is based on November 1 for 1924 and May 1 for 1925.

P 242–243. Coke, 1909–1957.

Source: 1909–1920, see source for series P 235; 1921–1957, see source for series P 240.

P 244. Carbon black, 1929–1957.

Source: See source for series P 240.

P 245. Sulfuric acid, 1945–1957.

Source: American Chemical Society, *Chemical and Engineering News*, Washington, D. C., July 10, 1945; 1950–1957, Business and Defense Services Administration, *Chemical and Rubber Industry Report*, various issues.

Capacity is based on 350 days a year.

P 246. Phosphatic fertilizers, 1900–1957.

Source: 1900–1951, Agricultural Research Service, *Statistics on Fertilizers and Liming Materials in the United States*, Statistical Bulletin No. 191, April 1957; 1952–1957, National Plant Food Institute, *Plant Food Review*, vol. 4, Nos. 2 and 3, 1958.

These data are the total of normal superphosphate, concentrated superphosphate, and miscellaneous phosphatic materials. Capacity of normal superphosphate is based on 300 two-shift days a year. Capacity of concentrated superphosphate and other phosphatic materials is based on 350 days a year, continuous operations.

P 247. Synthetic nitrogen, 1924–1957.

Source: 1924–1950, see source for series P 246; 1951–1955, Business and Defense Services Administration, *Summary Information on Anhydrous Ammonia*, Bulletin No. 142, February 1956; 1956–1957, Business and Defense Services Administration, records.

Capacity is based on 350 days a year, continuous operations.

P 248. Rayon and acetate fibers, 1911–1957.

Source: 1911, *New York Times*, Special Chemistry Section, September 2, 1951; 1936–1957, Textile Economics Bureau, *Textile Organon* (prior to 1952, *Rayon Organon*), New York, various issues.

Capacity is as of November for all years except 1940 (July) and 1944 (April). Allowance was made for periodic shutdowns of machines for repair, overhaul, or cleaning on a set time schedule.

P 249. Paper and paperboard, 1900–1957.

Source: American Paper and Pulp Association, *The Statistics of Paper*, New York, December 1957.

Capacity for paper and building paper is based on 310 days a year, 24 hours a day; for paperboard, 313 days.

P 250–306. Value of output of finished commodities and construction materials destined for domestic consumption at current producers' prices, and implicit price indexes for major commodity groups (Shaw), 1869–1939.

Source: William H. Shaw, *Value of Commodity Output Since 1869*, National Bureau of Economic Research, New York, 1947, pp. 30, 66, and 290.

These estimates are derived from Census of Manufactures data, supplemented by less complete data for nonmanufactured finished commodities and construction materials and for intercensal year interpolations. The estimates before 1919 are based necessarily on less adequate information.

The estimates of finished commodities measure the value of commodities that have reached the form in which they are used by ultimate recipients—largely households in the case of consumers' goods, chiefly business and public enterprises in the case of producers' goods. The amount "destined for domestic consumption" is derived as the sum of domestic production, minus exports, plus imports. In most years and for most commodities, the differences between domestic production of finished commodities and finished commodities destined for domestic consumption were modest. Changes in the latter, therefore, can be used as an approximate measure of changes in domestic manufacturing output. For figures on domestic output of finished commodities at producers' prices for 1919–1933, see Kuznets, cited above, pp. 136–138 and 348.

The estimates presented here exclude transportation and distribution costs incurred after the production stage, and hence are not in terms of prices to final users. Nor do they measure domestic consumption for they make no allowance for inventory changes.

Perishable commodities include those usually lasting less than 6 months; semidurable, those usually lasting from 6 months to 3 years; and durable, those usually lasting more than 3 years. For a detailed discussion of sources and procedures, see the source, part II for estimates of the value of output, part III for exports and imports, and part IV for price indexes.

[1] 1954 figure is an average based on reported employment totals for payroll periods nearest the 15th of March, May, August, and November except for seasonal industries in 1954 when a 12-month average was used. For 1947, figure represents the average of 12 monthly figures; for 1939 and earlier years, figures represent nonproduction workers reported for 1 payroll period (usually in October). For treatment of employees of central administrative offices, see text.

[2] For 1849–1933, cost of contract work was not subtracted from value of products in calculating value added by manufacture. For definition of value added, see text.

[3] Revised.

[4] Figures for 1939, but not for earlier years, represent figures which have been revised by retabulation of returns to exclude data for establishments classified as manufacturing in 1939 and prior years, but classified as nonmanufacturing beginning with 1947. Value added by manufacture for 1939, prior to revision and on a basis comparable with 1937 and previous years, was $24.7 billion.

[5] Not revised to exclude data for establishments classified as manufacturing in 1939 and prior years but classified as nonmanufacturing beginning with 1947.

[6] 1939 figures for "Nonproduction employees" revised on basis of estimates rather than by retabulation of 1939 reports. Estimates were made in the following manner: For nonproduction employees, by multiplying the retabulated figure for number of production and related workers by the ratio of all employees to production and related workers computed from unrevised 1939 statistics; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 statistics.

[7] Excludes data for salaried officers of corporations and their salaries and, therefore, not strictly comparable with figures for other years.

[1] Covers factories having annual production of $5,000 or more.
[2] Some minor groups are not adjusted for investment in emergency facilities after "normal" depreciation or intangible assets. Therefore sum of detail does not equal totals.
[3] Covers factories having annual production of $500 or more.
[4] Includes custom and neighborhood shops.
[5] N.e.c. represents not elsewhere classified.

[1] Covers factories having annual production of $5,000 or more.
[2] Some minor groups are not adjusted for investment in emergency facilities after "normal" depreciation or intangible assets. Therefore sum of detail does not equal totals.
[3] Covers factories having annual production of $500 or more.
[4] Includes custom and neighborhood shops.
[5] N.e.c. represents not elsewhere classified.

Series P 187-232. Physical Output of Selected Manufactured Commodities: 1860 to 1957—Con.

Year	Primary and fabricated metals							Construction materials			Transportation equipment				
	Steel ingots and castings produced					Rolled iron and steel produced	Tinplate consumption	Rails produced	Structural iron and steel shapes produced	Common and face brick produced	Locomotives produced	Railroad freight cars produced	Railroad passenger cars produced	Horse-drawn vehicles produced	
	Total	Bessemer	Open hearth	Crucible	Electric and all other									Farm wagons, trucks, and business vehicles	Carriages, buggies, and sulkies

[1] Figures for 1915–1929 are for crop years ending June; all other figures are for calendar years. The 1914 crop-year figure is 114.2 million barrels. The 1929 calendar-year figure is 120.0 million barrels.
[2] Figures are for years ending June 30 and include data for Alaska and Hawaii.
[3] Not available.
[4] Includes small cigars.
[5] Excludes small cigars.
[6] Alcoholic content limited to 3.2 percent by weight from Apr. 7 to Dec. 5, 1933.
[7] Includes 1,588,788 barrels produced prior to Apr. 7 (effective date of the act of Mar. 22, 1933).

[1] From open hearth, Bessemer, crucible, and electric furnaces.
[2] 1944–1957 includes electrolytic refining capacity plus Lake Superior and fire-refined; 1907–1943, electrolytic capacity only.
[3] 1941–1957, slab zinc; 1926–1940, distillation and electrolytic zinc; 1921–1925, distillation zinc.
[4] Available phosphoric oxide (P_2O_5).
[5] Less than 500 tons.

[1] Does not agree with source, which is in error.
[2] Shaw's estimates for 1869–1919; Kuznets' estimates adjusted by Shaw for 1919–1939. See source, p. 104, for explanation.
[3] Agrees with source; however, figures for components do not add to total shown.

Transportation

RAIL TRANSPORTATION (Series Q 1–152)

Q 1–11. Railroad and other domestic intercity freight traffic, by type of transportation, 1939–1957.

Source: 1939–1954, Interstate Commerce Commission, *Intercity Ton-Miles, 1939–1954*, Statement No. 568 (mimeographed), 1956; 1955–1957, ICC, *Annual Report*, various issues.

For description of estimates, see Statement No. 568.

Q 12–14. Indexes of transportation output, 1889–1953.

Source: 1889–1946, Harold Barger, *The Transportation Industries, 1889 to 1946*, National Bureau of Economic Research, New York, 1951; 1947–1953, National Bureau of Economic Research, unpublished estimates by John W. Kendrick.

Sources of figures and methods of computation are described in Barger's book. The components of series Q 13, passenger traffic, are airlines, intercity buslines, waterways, and steam railroads. For series Q 14, freight traffic, the components are motor trucking, pipelines, waterways, and steam railroads.

Q 15–31. Railroad mileage, equipment, and passenger and freight service, 1830–1890.

Source: Interstate Commerce Commission, *Railway Statistics Before 1890*, Statement No. 32151 (mimeographed), 1932.

Before 1890, the principal source of continuous information on railroads is the annual *Poor's Manual of Railroads*. The figures in the *Manual* were revised in successive issues. The Interstate Commerce Commission consulted the issues from 1869 to 1900 and evidently took account of the revisions. Earnings and traffic figures are understatements of actual level; mileage covered is shown in the table below. Similar but not identical figures, with the degree of coverage similarly indicated in terms of mileage, appear in Bureau of the Census, *Report on Transportation Business in the United States at the Eleventh Census*, 1890, part I.

Table I. Miles of Road Operated by Railroads

Year	Roads reporting earnings[1]	Roads reporting earnings and traffic statistics	Year	Roads reporting earnings[1]
1890	158,037	157,976	1879	79,009
1889	153,945	153,689	1878	78,960
1888	145,387	145,841	1877	74,112
1887	137,028	136,986	1876	73,508
1886	125,185	125,146	1875	71,759
1885	123,320	122,110	1874	69,273
1884	115,704	113,172	1873	66,287
1883	110,414	106,988	1872	57,323
1882	104,971	95,752	1871	44,614
1881	92,971	----------		
1880	82,146	----------	1851	8,836

[1] Includes elevated railways.

All figures except those for series Q 15 and Q 17 are based on reports of individual railroads for fiscal years ending in the calendar year indicated. The period of time covered is therefore not the same for all carriers included. Balance sheet and equipment data pertain to the ends of such fiscal years.

Data for 1890 shown in these series do not agree with 1890 data shown for series Q 44–72 because of different sources.

Q 32. Freight service, ton-miles carried, 13 railroads, 1865–1885.

Source: H. V. and H. W. Poor, *Manual of Railroads*, New York City, 1888, p. XXVIII.

The roads represented are 7 eastern roads (Pennsylvania; Pittsburgh, Fort Wayne, and Chicago; New York Central; Lake Shore; Michigan Central; Boston and Albany; New York, Lake Erie and Western) and 6 western roads (Illinois Central; Chicago and Alton; Chicago and Rock Island; Chicago; Burlington and Quincy; Chicago and Northwestern; Chicago, Milwaukee, and St. Paul).

Q 33–42. Railroad property investment, capital, income, and expenses, 1850–1890.

Source: See source for series Q 15–31.

See also text for same series.

Q 43. Miles of railroad built, 1830–1925.

Source: 1830-1879, Tenth Census Reports, vol. IV, *Report on the Agencies of Transportation in the United States*, p. 289; 1893–1925, *Railway Age*, vol. 104, No. 1, Simmons-Boardman Publishing Corp., New York, January 1, 1938, p. 66.

For a more detailed discussion of the problems of estimating miles of railroad built, see E. R. Wicker, "United States Railway Investment in the Pre-Civil War Period," and George R. Taylor, "Comments on E. R. Wicker's Paper," in *Studies in Income and Wealth*, Princeton University Press, vol. 24 (forthcoming).

The Tenth Census report (pp. 289–293, 300–375) contains materials on history of construction which includes figures on mileage built and existent, by groups of States, for individual companies, annually from 1830 to 1880. Somewhat similar data appear in Bureau of the Census, *Report on Transportation Business in the United States at the Eleventh Census: 1890*, part 1, pp. 3–5, 54–107.

According to the Bureau of the Census, information was received from every railroad known to exist in 1880. The letter of instructions from the Superintendent of the Census to the railroads said: "In cases . . . in which the records have been lost, the officers of such companies and roads are requested to obtain . . . this information in the best form possible. The recollection of officers and employees long in the service of a road may be used . . . if more reliable data be not accessible."

The *Railway Age* obtained its figures at annual intervals from individual railroads and from State railroad commissions.

It is not clear just when a mile of road would be reported as built. Construction of some lines extended over several years. Each annual segment may have been reported when finished, or nothing may have been reported until the whole line was completed. The year of physical completion may have differed from the year in which traffic was first carried. In such cases, the mileage may have been assigned to either year.

The Census Bureau figures pertain only to miles in operation in the census year. The figures for any year are, therefore, understatements to the extent that mileage constructed in that year may have been abandoned by June 1, 1880 (the date of the 1880 Census).

Digitized by Google

The change from year to year in miles operated (series Q 15) or miles owned (series Q 16) is sometimes used as a measure of miles constructed. The annual change in miles operated, however, is also affected by acquisitions of trackage rights, as a result of which the same line may be counted in the operation of two or more railroads. Both the change in miles operated and that in miles owned are affected by abandonments during the year (regardless of when constructed).

Q 44–152. General note.

The principal sources of these series are various issues of two annual publications of the Interstate Commerce Commission: For 1954–1957, *Transport Statistics of the United States*, part 1; and for all years prior to 1954, *Statistics of Railways in the United States*.

No attempt has been made to adjust the figures for the effect of changes in methods of accounting and reporting; hence, the data for the various years are often only approximately comparable.

Although railroads regulated by the ICC are still described legally as "steam railways," most train and switching operations are now performed by Diesel locomotives, and some divisions of the railways included are electrified. The Commission has also regulated a small and diminishing number of railways of the interurban electric type which are not included in the figures shown here.

Railway *operating* companies are those whose officers direct the actual transportation service and whose books contain operating as well as financial accounts. *Lessor* companies maintain a separate legal existence, but their properties are operated by the lessees. *Proprietary* companies are also nonoperating companies. Their outstanding capitalization is owned by other railway companies. The term "circular" refers to roads (operating or nonoperating) for which brief circulars showing date of incorporation, mileage, and a few of the facts were filed with the Interstate Commerce Commission. They include intrastate roads and roads under construction. The term "unofficial" is used to indicate roads for which official returns were not received by the ICC—the figures having been taken from the returns by roads in prior years, and items contained in railway and engineering periodicals and newspapers, corrected in accordance with the best information available.

Switching and terminal companies are those operating separately for joint account or for revenue. Services such as those of switching and terminal companies are mostly performed directly by the line-haul carriers as an ordinary part of their business. Line haul denotes train movements between terminals and stations on main and branch lines of the road, exclusive of switching.

Beginning in 1911, the ICC classified operating companies on the basis of operating revenues. Those of Class I had annual revenues above $1,000,000; Class II, above $100,000; Class III, below $100,000. Beginning in 1956, the minimum for Class I was raised to $3,000,000 and the other two classes were consolidated. If the revenues of a company fall below the limit, it is not reclassified until the decline appears to be permanent. The relative importance of Class I railroads has increased since 1911 because of the growth of traffic and the absorption of small roads in larger systems. The ratio of operating revenues of Class I line-haul companies to the total revenues of Classes I, II, and III was 96.48 percent in 1911, 97.45 percent in 1916, 98.07 percent in 1926, 98.76 percent in 1941, and 99.06 percent in 1945.

A collection of definitions of words or phrases frequently used in discussions of railway statistics has been issued by the ICC, entitled *Railway Statistical Terms*, Statement No. 4119, June 1941. For financial terms, see ICC, *Uniform System of Accounts for Steam Railroads*.

Statistics of mileage in existence and stocks of equipment, and balance sheet items, pertain to the end of the year indicated.

Q 44–72. Railroad mileage, equipment, and passenger traffic and revenue, 1890–1957.

Source: All series, except series Q 53–54, see general note for series Q 44–152. Series Q 53–54, American Railway Car Institute, *Railroad Car Facts*, New York, annual issues.

Q 45, mileage constructed. Miles on which operations were begun during the year. Figures exclude relocated road or road constructed to shorten distance without serving new territory.

Q 46, mileage abandoned. Miles on which operation was permanently abandoned during the year, the cost of which was written out of the investment accounts or was scheduled to be written out at the end of the year.

Q 49, track operated, first main track. Equivalent to miles of road operated. Figures exceed those for series Q 47, road owned, in some years because of two or more roads operating on same line under trackage agreements.

Q 60, average tractive effort. Figures represent the force in pounds exerted by locomotives, measured at the rim of the driving wheels.

Q 61–63, passenger-train cars. Includes coaches and parlor, sleeping, dining, club, lounge, observation, postal, baggage, express, and other cars, as well as cars serving a combination of purposes.

Q 64, freight-train cars. Includes cabooses as well as freight-carrying cars.

Q 71, passenger revenue. Excludes revenue from services such as handling of excess baggage or mail; sleeping and parlor or chair car reservations; dining and buffet service on trains; station, train, and boat privileges; parcel rooms; storage of baggage; or other miscellaneous services and facilities connected with the transportation of passengers. Passenger revenue depends upon the established tariffs (the published schedules of rates and fares) and includes extra fares on limited trains, additional railway fares for the exclusive use of space, mileage and scrip coupons honored, or revenue from the transportation of corpses.

Q 72, revenue per passenger mile. Represents figures for series Q 71 divided by those for series Q 67.

Q 73–86. Railroad freight traffic and revenue, 1890–1957.

Source: See general note for series Q 44–152.

Revenue-tons and ton-miles exclude the movement of a railroad company's materials and supplies on its own lines. A carload is a shipment of 10,000 pounds or more of one commodity from one shipper to one consignee.

Tons originated are tons identified as not having had previous line-haul transportation by other rail carriers; such shipments include import traffic and traffic from outlying possessions of the United States received from water carriers at the port of entry, and finished products from transit points. Ton-miles are computed by multiplying the weight of each shipment by the distance it moves and summing the products.

For definitions of Class I, II, and III roads, see general note for series Q 44–152.

Q 75, products of agriculture. Includes not only raw farm products but simple manufactures such as flour, corn meal, cottonseed meal, cake, and linters. On the other hand, such products as vegetable oils, sugar and molasses, canned fruits

Digitized by Google

and vegetables, and manufactured tobacco are included in series Q 79, manufactures and miscellaneous.

Q 77, products of mines. Includes coke as well as coal and other raw minerals.

Q 78, products of forests. Includes not only raw forest products but lumber, shingles, lath; box, crate and cooperage materials; veneer and built-up wood.

Q 84, freight revenue. Includes revenue from the transportation of freight and from transit, stop, diversion, and reconsignment arrangements upon the basis of tariffs. Excludes revenue from such activities as switching of freight-train cars; water transfers of freight, vehicles, and livestock; movement of freight trains at a rate per train-mile or for a lump sum; storage of freight; demurrage; grain elevators; stockyards; or other miscellaneous services and facilities connected with the transportation of freight.

Q 87–88. Railroad passenger-miles per car-mile and per train-mile, 1890–1957.

Source: Interstate Commerce Commission, *Revenue Traffic Statistics*, December issues.

Figures for passenger-miles per car-mile for 1908–1919, and for passenger-miles per train-mile for 1890–1932, were computed by the National Bureau of Economic Research from figures for passenger-miles, car-miles, and train-miles presented in *Statistics of Railways in the United States*.

Q 89. Passenger train-miles per train-hour, 1936–1957.

Source: Interstate Commerce Commission, *Passenger Train Performance*, December issues.

The train-hour figures upon which these figures are based are reckoned from the time a train leaves its original terminal to the time it arrives at its final terminal. Time spent in stopping to take on and discharge traffic and other delays on the road is included.

Q 90–92. Railroad freight revenue ton-miles per loaded car-mile, train-mile, and mile of road, 1890–1957.

Source: See general note for series Q 44–152.

Q 93. Freight train-miles per train-hour, 1920–1957.

Source: Interstate Commerce Commission, *Freight Train Performance*, December issues.

For explanation of train-hour figures, see text for series Q 89.

Q 94. Freight car-miles per car-day, 1921–1957.

Source: See general note for series Q 44–152.

Days of unserviceable cars are included in the divisor.

Q 95–102. Railroad property investment and capital, 1890–1957.

Source: See general note for series Q 44–152.

Q 95, investment, book value. Figures represent recorded value, in the accounts of carriers, of land, fixed improvements such as roadbed and track, rolling stock, maintenance machinery, etc., owned by them. Figures include property held under contract for purchase.

Q 96, depreciation reserve. Figures represent the accumulated accounting allowance for loss in service value not restored by current maintenance. The loss in value is incurred in connection with the consumption or prospective retirement of physical property in the course of service from causes against which carriers are not protected by insurance, which are known to be in current operation, and the effect of which can be forecast with a reasonable approach to accuracy.

Q 100, funded debt unmatured. Funded debt is debt maturing more than one year from date of issue.

Q 101, net capitalization. Figures represent railway capital outstanding, series Q 97, minus stocks and debt of railroad companies held by other railroad companies.

Q 103–105. Railroad capital expenditures for additions and betterments, 1921–1957.

Source: Association of American Railroads, Bureau of Railway Economics, *Railroad Transportation*, annual issues.

Additions comprise: Additional facilities such as equipment (rolling stock), tracks, buildings and other structures; additions to such facilities, such as extensions to tracks, buildings and other structures; additional ties laid in existing tracks; and additional devices applied to facilities such as airbrakes applied to cars not previously thus equipped.

Betterments comprise improvements of existing facilities through the substitution of superior parts for inferior parts retired, such as the substitution of steel-tired wheels for cast wheels under equipment, the application of heavier rail in tracks, the strengthening of bridges by the substitution of heavier members, and the application of superior floors or roofs in buildings.

Q 106–116. Railroad income and expenses, and interest and dividends, 1890–1957.

Source: See general note for series Q 44–152.

Q 106, operating revenue. Includes revenue from freight, passenger, and other transportation and incidental services.

Q 107–109, operating expenses. Includes current depreciation.

Q 110, tax accruals. Taxes imposed by any form of government whether based on an assessed value of the property, on amounts of stocks and bonds, on earnings, income, dividends declared, payroll, number of passengers, quantity of freight, length of road, rolling stock, or other basis. Tax accruals do not include special assessments for street and other improvements, nor special benefit taxes such as water assessments.

Q 111, operating income. Figures represent net revenue from railway operations (series Q 106 minus series Q 107) less tax accruals (series Q 110).

Q 112, net operating income. Figures represent operating income (series Q 111) minus net payable balance of equipment and joint facility rents. The equipment rents deducted at this point are those for equipment leased for less than one year, or interchanged. They are usually on a per day or per mile basis.

Q 113, net income. Figures represent net operating income (series Q 112) plus other income, minus miscellaneous deductions and fixed and contingent charges. Fixed charges are mainly rent for leased roads and equipment (i.e., equipment leased for one year or more), and interest (except contingent interest).

Q 116, interest accrued on funded debt. Figures include interest not paid during year on debt in default of interest; exclude interest on debt owned by issuing company, or on debt incurred for new lines, extensions, additions or betterments, accrued before such property is completed or comes into service.

Q 117–123. Railroad tax accruals, 1921–1957.

Source: See general note for series Q 44–152.

Other taxes (series Q 123) are largely property taxes levied by State or local governments.

Q 124. Miles of railroad operated by receivers or trustees, 1894–1957.

Source: See general note for series Q 44–152.

Digitized by Google

Q 125–127. Railroad highway grade crossings, 1925–1957.

Source: See general note for series Q 44–152.

Specially protected highway grade crossings (series Q 126) include crossings with operated gates, watchmen, or both, during at least part of day, and those with audible signals, visible signals, or both; exclude those with fixed signs only.

Q 128–137. Fuel received, ties and rails laid, and purchases by railroads, 1917–1957.

Source: Series Q 128–134, see general note for series Q 44–152. Series Q 135–137, Association of American Railroads, *Railroad Transportation*, annual issues.

Q 128–130, fuel received. Figures include not only fuel for operation of trains but fuel for station, shop, or other use.

Q 131, new rails laid. Figures include both rails laid in replacement and rails laid in additional tracks, new lines, and extensions.

Q 132–133, cross-ties laid. Figures for 1917–1926 include only ties laid in replacement. In 1927, 78,340,000 ties were laid in replacement only. Treated ties are those which have been subjected to some preservative process, e.g., creosoting, before being placed in the track.

Q 138–140. Pullman Company operations, 1915–1957.

Source: Interstate Commerce Commission, *Statistics of Railways in the United States* and *Transport Statistics in the United States*, part 2, *The Pullman Company* (*Sleeping Car Companies*), various annual issues; except series Q 139, 1915–1921, Office of Business Economics, *Survey of Current Business*, January 1939, p. 18.

Figures for series Q 139 exceed those in series Q 70, parlor and sleeping car passenger-miles, mainly because travel of railroad employees, etc. (for which railroad companies receive no revenue) is not included in series Q 70; but if Pullman accommodations are paid for, the travel is included in series Q 139.

The number of Pullman employees (series Q 140) is the number on the payroll at the end of the year.

Q 141–142. Railroad employees and compensation, 1890–1957.

Source: See general note for series Q 44–152.

An employee is defined as a person in the service of a railroad, subject to its continuing authority to supervise and direct the manner of rendition of his service. Persons such as lawyers engaged to render only specifically defined service for specific cases and not under general or continuing retainer are not classed as employees. For 1890–1914, the number of employees is the number on the payroll at the end of the year. Thereafter, the nature of the figures included for the smaller (Class II and III) roads is not clear in the source. For Class I roads they appear to be averages of 4 quarterly counts, 1915–1920, and of 2 quarterly and 6 months counts, 1921; beginning 1922, they are averages of 12 monthly counts.

Q 143–152. Railroad accidents and fatalities, 1891–1957.

Source: Interstate Commerce Commission, *Accident Bulletin*, annual issues.

> The Accident Reports Act approved May 1910 requires the filing of monthly reports of railway accidents and authorizes the Interstate Commerce Commission to investigate accidents. A reportable accident is one arising from the operation of a railway resulting . . . in the death of a person; or in the disability of an employee for more than 3 days during the 10 days following the accident; or in the disability of others for more than 1 day.

[1] Revenue ton-miles. Includes electric railroads, express, and mail.
[2] Includes Great Lakes.
[3] Domestic revenue service. Includes express, mail, and excess baggage.
[4] Ton-miles revised upward on basis of new data; not applied to previous years.
[5] Part of these year-to-year changes resulted from coverage of waterways previously in use but not covered.

Series Q 12–14. Indexes of Transportation Output: 1889 to 1953

[Weighted indexes, 1939 = 100]

Year	All traffic	Passenger	Freight	Year	All traffic	Passenger	Freight	Year	All traffic	Passenger	Freight

[1] Includes circular and unofficial.
[2] First track. Includes lessors, proprietary, circular and unofficial companies.
[3] For railroads reporting track by class. Excludes circular and unofficial, figures for which cover road, first track only.
[4] Class I line-haul railroads.
[5] Includes switching and terminal companies.
[6] For 1890–1927, number of locomotives; for 1928–1957, number of units, except for steam locomotives. (A unit is the least number of wheel bases together with superstructure capable of independent propulsion, but not necessarily equipped with an independent control.)
[7] For 1915–1922, identified as "other than steam," but all or almost all of the locomotives must be electric.
[8] For 1916–1956, represents steam locomotives and freight cars of Class I railroads excluding switching and terminal companies; for 1957, includes all Class I locomotives including switching and terminal companies.
[9] Diesel included with "Other."
[10] Calendar-year data.

[4] Class I line-haul railroads.
[8] Includes switching and terminal companies.
[8] For 1916–1956, represents steam locomotives and freight cars of Class I railroads excluding switching and terminal companies; for 1957, includes all Class I locomotives including switching and terminal companies.
[11] Excludes caboose cars.
[12] Class I and II railroads.

[1] Includes forwarder traffic beginning 1939.

[2] United States as a system, i.e., ton-miles or revenue of connecting roads is included in the numerator, but only tonnage originated in the denominator.

[3] Includes the following amounts of unassigned carload tonnage (thousands): 1911, 35,199; 1912, 32,266; 1913, 15,617; 1914, 14,671; 1915, 2,268; 1916, 1,867; and 1919, 338.

[4] Class I and II railroads.

Digitized by Google

Series Q 87–94. Railroad Passenger and Freight Operations: 1890 to 1957

[Tons are of 2,000 pounds. Class I, II, and III railroads except as follows: Series Q 87, Class I beginning 1911; series Q 88, Class I beginning 1933; and series Q 89, Q 93, Q 94, Class I for all years]

[1] This average is obtained by dividing the revenue ton-miles by the total loaded car-miles, the latter item including some cars loaded with nonrevenue freight. This method is necessary to preserve comparability with figures for the earlier years, and the figures differ slightly from the average "net tons per loaded car" shown in the regular monthly statements of Freight and Passenger Service Operating Statistics based on revenue and nonrevenue ton-miles and car-miles.

[2] Class I and II railroads.

Series Q 95–105. Railroad Property Investment, Capital, and Capital Expenditures: 1890 to 1957

Includes intercorporate duplications. Figures subject to general exception that prior to 1908, the returns for switching and terminal companies were included where applicable. Capital expenditure represents total money outlay without deductions for property retired]

Year ending—	Property investment and capital (Class I, II, III railroads and their lessors)								Capital expenditures for additions and betterments (Class I railroads)

[1] Includes proprietary.

[2] Increase in investment over a period of years cannot be obtained accurately by subtraction of 1 year's investment from that of another owing to reorganization, sale, or abandonment reclassification, etc.

[3] Includes depreciation on "Miscellaneous physical property," prior to 1920. Amortization of defense projects included subsequent to 1940, and, beginning in 1950, includes amortization applicable to proprietary companies.

[4] Figures subsequent to 1914 include actually outstanding, nominally issued, and nominally outstanding securities in order that they may be comparable with those of previous years in which these items were not segregated. Funded debt unmatured does not include equipment obligations subsequent to 1942, but they are included herein to preserve the comparability of the figures.

[5] For 1921–1924, includes investment of lessor companies; and for 1925–1957, investment of lessor and proprietary companies.

[6] Class I and II railroads and their lessor subsidiaries.

[7] Class I railroads.

[8] Includes $170,000,000, estimated reserve for accrued depreciation to put figure on a comparable basis with those of other years.

[9] Represents 1893 investments less increases each year on account of change in classification in 1893.

Digitized by Google

Series Q 106–116. Railroad Income and Expenses, and Interest and Dividends: 1890 to 1957

[In thousands of dollars. Includes intercorporate duplications. Unless otherwise noted, covers Class I, II, and III, railroads subject to general exception, that prior to 1908 the returns for switching and terminal companies were included where applicable]

Year ending—	Income and expenses									Interest and dividends [1]	
	Operating revenue	Operating expenses			Tax accruals	Operating income	Net operating income	Net income [1]	Ratio of operating expenses to operating revenues (percent)	Dividends declared	Interest accrued on funded debt
		Total	Maintenance of way and structures	Maintenance of equipment

chapter Q

WATER TRANSPORTATION (Series Q 153–245)

Q 153–245. General note.

Basic governmental sources of historical merchant-marine and water-traffic statistics include *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2, for 1789–1823; the various annual issues of *Foreign Commerce and Navigation of the United States*, for 1821–1946, originally issued by the Register of the Treasury and then by the Treasury Department, later by the Department of Commerce and Labor, and finally by the Department of Commerce; the *Annual Report of the Commissioner of Navigation*, 1884–1923, the issuance of which followed a similar succession beginning with the Treasury Department; annual issues of *Merchant Marine Statistics*, 1924–1957, originally prepared by the Department of Commerce as successor to the statistical section of the *Annual Report of the Commissioner of Navigation*, and now issued annually by the Bureau of Customs; and the various annual issues of the *Annual Report of the Office of the Chief of Engineers*, Corps of Engineers. The *Statistical Abstract of the United States*, a secondary source, also contains historical merchant-marine and water-traffic statistics. The *Statistical Abstract* has been issued by the following agencies: 1878–1902, Bureau of Statistics (Treasury Department); 1903–1911, Bureau of Statistics (Department of Commerce and Labor); 1912, Bureau of Foreign and Domestic Commerce (Department of Commerce and Labor); 1913–1937, Bureau of Foreign and Domestic Commerce (Department of Commerce); 1938–1957, Bureau of the Census (Department of Commerce).

Congressional documents also contain historical series on the merchant marine, foreign commerce, and related fields. For 1789–1882, a particularly valuable collection of documents was found in the library of the Department of Commerce, bound together under the title *Decadence of American Shipping and Compulsory Pilotage*. The documents included are as follows: *Foreign Commerce and Decadence of American Shipping*, H. R. Ex. Doc. No. 111, 41st Congress, 2d session; *Causes of the Reduction of American Tonnage and the Decline of Navigation Interest . . .*, H. R. Report No. 28, 41st Congress, 2d session; *Foreign Commerce and the Practical Workings of Maritime Reciprocity*, H. R. Ex. Doc. No. 76, 41st Congress, 3d session; *Causes of the Decadence of Our Merchant Marine; Means for Its Restoration and the Extension of Our Foreign Commerce*, H. R. Report No. 342, 46th Congress, 3d session; *American Shipping*, H. R. Report No. 1827, 47th Congress, 2d session; *American Merchant Marine*, H. R. Report No. 363, 48th Congress, 1st session; *Ship-Building and Ship-Owning Interests*, H. R. Report No. 750, 48th Congress, 1st session; and reports of lesser interest, H. R. Misc. Doc. No. 37 and Report No. 1848, both of the 48th Congress, 1st session.

Since 1921, publications of the Maritime Commission and its predecessor agencies also should be consulted, particularly the reports entitled, *Ocean-Going Merchant Fleets of Principal Maritime Nations, Iron and Steel, Steam and Motor, Vessels of 2,000 Gross Tons and Over*, issued quarterly or semi-annually, 1921–1941, and *Employment of American Flag Steam and Motor Merchant Vessels of 1,000 Gross Tons and Over*, issued quarterly, 1923–1941. Finally, the Bureau of the Census (and its predecessor Census Office) has published the results of five censuses of water tranportation, as follows: 1880, 1889, 1906, 1916, and 1926 (see general note for series Q 153–190, below).

Q 153–190. General note.

Statistics on documented merchant vessels and shipbuilding are from *Merchant Marine Statistics*, various annual issues, supplemented by records of the Bureau of Customs. Many are from the 1936 issue. Some of the estimates from the 1936 report have been modified, however, as explained below in table II. The text statements, and the correction of errors found in the published tables are based on reference to the primary sources, as follows: For 1789–1823, see *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2 (published in 1834); for 1821–1892, see annual issues of *Commerce and Navigation of the United States;* for 1884–1923, see issues of *Annual Report of the Commissioner of Navigation;* for 1924–1945, see annual issues of *Merchant Marine Statistics.*

Of the Maritime Commission reports cited in the general note for series Q 153–245, above, the first, *Ocean-Going Merchant Fleets . . .*, provides data for each leading maritime nation on ocean-going merchant vessels of 2,000 gross tons and over, showing number and tonnage of such fleets classified by age, speed, size, boilers, engines, draft, etc., by major vessel type. The second, *Employment of American Flag Steam and Motor Merchant Vessels . . .*, shows for seagoing merchant vessels of 1,000 gross tons and over the number and tonnage of such vessels employed in U.S. foreign and domestic trade, arranged by major vessel type, ownership (government and private), and area of operation.

Census statistics on water transportation are not presented here. For reports of these censuses, see *Tenth Census Reports*, vol. IV, *Report on Agencies of Transportation*, 1880; *Eleventh Census Reports, Report on Transportation Business*, part 1, "Transportation by Water"; *Transportation by Water, 1906; Water Transportation, 1916;* and *Water Transportation, 1926.*

The first census, for 1880, was limited to steam vessels. The report of this census includes a detailed history of steam navigation in the United States with separate discussion and single-year construction statistics by geographic region, from the beginning to 1880. (See T. C. Purdy, "Report on Steam Navigation in the United States," *Tenth Census Reports*, 1880, vol. IV.) The report of the shipbuilding census, also taken the same year, includes a detailed technical history of shipbuilding in all aspects, with particular reference to sailing craft. Single-year figures are shown for New England shipbuilding, 1674–1714, classified by type of vessel and place where built. (See Henry Hall, "Report on the Ship-Building Industry of the United States," *Tenth Census Reports*, 1880, vol. VIII.)

The Censuses of 1889 and 1906 included all classes of vessels. However, the 1889 Census included fishing vessels for the Pacific Division only and the 1906 Census excluded fishing vessels. The Censuses of 1916 and 1926 provided data for all U.S., documented and undocumented, vessels and craft of 5 tons net register and over, whether propelled by machinery or sails, or unrigged, except that certain specified types of vessels were excluded. (See Bureau of the Census, *Water Transportation, 1926*, p. 5.) While the Census reports of 1850 and 1860 contain some statistics relating to water transportation, these statistics apparently were collected by other agencies.

Digitized by Google

Data shown here are for documented merchant vessels only, exclusive of yachts. The following definitions are those currently applicable:

Documented vessels include all vessels granted registers, enrollments and licenses, or licenses, as "vessels of the United States," and as such have certain benefits and privileges. Vessels of 5 net tons and over owned by citizens of the United States and otherwise complying with the requirements for documentation may be documented to engage in the foreign or coasting trades or the fisheries.

Registers are ordinarily issued to vessels engaged in the foreign trade or the whale fisheries. Historically, this group has included the major portion of the whaling fleet.

Enrollments and licenses are issued to vessels of 20 net tons and over engaged in the coasting trade or fisheries.

Licenses may be issued to vessels of less than 20 net tons engaged in the coasting trade or fisheries.

Undocumented craft are those not registered, enrolled, or licensed. Barges, scows, lighters, and canal boats, without any propelling power of their own, operated exclusively in a harbor, on the canals or other internal waters of a State, or on the rivers or lakes of the United States, not in any case carrying passengers, and vessels under 5 net tons are exempt from the requirements of the laws governing documentation.

Gross tonnage refers to *space* measurement, 100 cubic feet equalling 1 ton; it is not a measure of weight. Gross tonnage is the capacity of the entire space within the frames and the ceiling of the hull, together with those closed-in spaces above deck available for cargo, stores, passengers, or crew, with certain minor exemptions. Before 1865, 95 cubic feet equalled 1 ton, and the admeasurement method differed in other respects.

Changes in maritime law: Admeasurement method. "Admeasurement" refers to the method of calculating gross tonnage of ships or vessels. The first law of the United States on the subject appears to have been enacted September 1, 1789 (1 Stat. 55). The enactment then made was reenacted with certain minor amendments in the Acts of August 4, 1790 (1 Stat. 169), and of March 2, 1799 (1 Stat. 675), and as so enacted was in force until January 1, 1865.

A basic change in admeasurement method was provided in the act of May 6, 1864, effective January 1, 1865 (13 Stat. 70–72, R. S. 4153, 46 U. S. C. 77). The method described in the act of May 6, 1864, appears to have been substantially the same as that in force in 1945.

For the transition period, 1865–1868, the total tonnage figures for the fleet are "mixed." During those years, the total fleet tonnage was obtained by combining the "old admeasurement" tonnage of vessels not yet readmeasured and the "new admeasurement" tonnage of vessels which had been readmeasured or newly built. For a recapitulation of the "old" and "new" *components* of the fleet tonnage (not the same vessels) for each year, 1865–1868, see *Commerce and Navigation, 1870*, p. 798.

No table has been located comparing the tonnage of a substantial number of vessels under "new" and "old" admeasurement; hence, neither the magnitude nor the direction of the change can be stated here. Apparently it varied for different types of vessels. "Brigs, schooners, and sloops measure less under the 'new' admeasurement . . . while ships, barks, steamboats, and vessels having closed-in spaces above their hulls have their tonnage largely increased." Further, the difference between "old" and "new" was not believed to affect a comparison of New England shipbuilding for the years 1855 and 1868. (See *Treasury Annual Report*, 1868, p. 496.)

Another type of change in maritime law affecting the statistics is illustrated by the act of April 18, 1874 (18 Stat. 31), which exempted the greater amount of canalboat and other unrigged tonnage from documentation. (See U.S. Code, title 46, sec. 336.) For 1874–1876, the "balance sheets of tonnage," published annually in the source volumes, record the removal of 879,000 tons of vessels for this reason alone. However, *Merchant Marine Statistics, 1936*, lists 843,000 tons exempted in 1876, whereas the 1876 balance sheet of tonnage specified 601,000 tons exempted. The reason for this discrepancy is not clear. The tonnage exempted annually, 1874–1936, is shown on pp. 54–55 of *Merchant Marine Statistics, 1936*.

At irregular intervals, steps were taken to remove from the tonnage accounts those vessels lost, abandoned, captured, sold to aliens, etc., which had not been officially reported for removal purposes. From the outset, the failure to remove such vessels annually resulted in a cumulative error which inflated the statistics of tonnage. When general clearances of this cumulative error were made, the effect was concentrated in a single year or a small group of years.

For a basic statement on this subject, see *American State Papers*, cited above, vol. 1, p. 494, where Albert Gallatin, Secretary of the Treasury, outlines the problem and discusses the first attempt (1800) to deal with it. Recurrently, in the annual tonnage reports found in the source volumes, the problem is discussed, the announcement is made that the rolls have been finally cleared, and assurance is given that the problem has been solved for the future. However, as late as 1867, in spite of repeated clearances in earlier years, the "First Annual Report of the Director of the Bureau of Statistics" stated, "The tonnage returns were swelled with thousands of ghostly ships—ships that had gone to the bottom years ago." (See *Annual Report of the Secretary of Treasury, 1867*, p. 244.)

In 1869, the Register of the Treasury attributed the entire decline of tonnage reported for 1869 to this factor. (See *Treasury Report, 1869*, p. 300.) In the same year, Francis A. Walker, Deputy Special Commissioner of Revenue in Charge of the Bureau of Statistics, stated that the process of assigning a number to each vessel and the institution of an annual list of vessels, as required by the Act of July 28, 1866, "has succeeded in clearing from the lists of vessels . . . a vast amount of purely fictitious tonnage, which have been carried forward from year to year [although] thousands of vessels which this tonnage originally represented had been meanwhile lost at sea, broken up, or sold abroad." (See *Treasury Report, 1869*, p. 342.)

In the "balance sheets of tonnage" published annually in the source volumes, clearances of cumulative error are generally identified as "not heretofore credited" to distinguish them from listings of removals of the various types routinely reported as having occurred during the given year.

Some of the more important clearances of this cumulative error, and the tons of shipping thereby removed, were: 1800–1901, 197,000; 1811, amount not stated but the effect is evident in series Q 154; 1818, 182,000; 1829–1830, 604,000; 1837, 96,000; 1841–1842, 267,000; and 1855–1858, 945,000.

In later years, the terms "obsolete," "obsolete, not heretofore reported," and "correction of balance" found in annual balance sheets of tonnage, frequently reflect removal of cumulative errors. Examples are (in tons): 1864, 188,000; 1866, 1,063,000; 1867, 260,000; 1868, 128,000; 1869, 338,000; 1870, 58,000; 1871, 103,000; 1881, 157,000.

Other factors which require that early merchant-vessel statistics should be used with some caution are the following: (1) In some instances, systematic differences in identically described statistical series appear in the source volumes (see

Digitized by Google

text for series Q 178–182) which reflect conflicting series of figures, possibly originating from different primary sources of data (see table II below); (2) transcription and typographical errors have crept into historical tables in the source volumes in the process of repeated recopying and retypesetting; (3) statistically significant footnotes which appeared in early reports frequently were dropped in later years; and (4) caution is suggested in referring back to the earlier volumes in the search for explanations of discrepancies or major changes, since the earlier data may reflect the same or similar errors.

In this volume (see table II below), a number of the copying and typesetting errors have been corrected where the exact nature of the discrepancy could be determined beyond reasonable doubt; several broad differences in figures have been pointed out; and a few detailed tabular notes have been added based on information in various annual issues selected largely at random.

Table II. Merchant Marine Tonnage—Changes in Figures From Those Shown in Source

["Source" is *Merchant Marine Statistics, 1936*]

Series No.	Year	In source volume	In this volume
Q 153	1868	[1] 28,118	[1] 28,167

Q 153–168. Documented merchant vessels, by major classes, material of which built, and trade, 1789–1957.

Source: Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, and Bureau of Customs, records. (Series Q 163–164, 1884, Treasury Department, *Annual Report of Commission of Navigation, 1884*, p. 161.)

See also general notes for series Q 153–245 and Q 153–190.

For 1789–1793, tonnage figures are the "duty tonnage," i.e., the tonnage of vessels on which duties were collected during the year. (See *American State Papers*, cited above in general note for series Q 153–190, vol. 1, p. 895.) The "duty tonnage" appears to have been the tonnage on which duties were collected on registered vessels, including "the repeated voyages of the same vessel," plus tonnage of the enrolled and licensed vessels which paid tonnage duties once each year. (See *American State Papers*, cited above, vol. 1, pp. 494, 498, 528.) Beginning in 1794, "district tonnage returns" were used, derived from reports of District Collectors of Customs, which gave the tonnage of vessels in each district based on registers, enrollments, and licenses outstanding, as of December 31.

For 1794–1801, figures are district tonnage returns, with no attempt to correct for the cumulative error caused by failure to remove vessels lost, abandoned, sold to aliens, etc. (See *American State Papers*, vol. 1, pp. 494, 499.) The figures for 1800–1801 ignore the first clearing of tonnage accounts which took place during these years. (See *American State Papers*, vol. 1, pp. 494–499, 527–531.) The correction for the cumulative error for *registered vessels only* would reduce the 1800 total to 819,571 tons and the 1801 total to 903,235 tons. The sharp drop attributable to the clearing of tonnage accounts would thereby be shifted back to 1800 instead of appearing in 1802.

For 1802–1818, the figures in series Q 154 consist of the "corrected registered" tonnage plus the uncorrected enrolled or licensed tonnage (see 1813 tonnage report in *American State Papers*, cited above, vol. 1, p. 1017). The figures for 1811 and 1818 reflect two additional attempts to clear out the cumulative error of registered vessels improperly retained on the registers. (See *American State Papers*, vol. 1, pp. 876, 958, and vol. 2, p. 406.)

The figures shown below in table III are those which were derived by a method authorized by Secretary of the Treasury Gallatin. They were reported to Congress in the annual tonnage reports in *American State Papers* as being the "actual" or "more nearly correct" tonnage.

Table III. "Actual Tonnage" of Documented Vessels: 1800 to 1818

[In thousands of gross tons]

Year	Tons	Year	Tons
1818	1,150	1808	1,173
1817	1,341	1807	1,208
1816	1,264	1806	1,166
1815	1,262	1805	1,085
1814	1,029	1804	983
1813	1,032	1803	917
1812	1,127	1802	865
1811	1,131	1801	850
1810	1,329	1800	768
1809	1,266		

These were obtained by taking the "corrected registered tonnage" and adding to it the "duty tonnage" for enrolled and licensed vessels. Since duties were paid only once each year on enrolled and licensed vessels, and owners were not likely to pay duties on nonexistent vessels, it was reasoned that the lower "duty tonnage" figure more accurately reflected the true total for the enrolled or licensed craft than did the district

Digitized by Google

returns of tonnage based on outstanding marine documents. This correction for enrolled and licensed craft was dropped after 1818, probably because, beginning 1819, the "duty tonnage" for this group exceeded the district tonnage returns for the group.

In *American State Papers*, vol. 1, p. 499, the tonnage described as "actual tonnage" in the comparative table for 1794–1799 is, in fact, the district returns of tonnage without correction of any kind. Elsewhere in the tonnage report for 1800 (pp. 494–499), and in tonnage reports for later years, the term "actual tonnage" normally means the district returns based on outstanding marine documents (registers, enrollments, and licenses) corrected for cumulative error. In table III, the term "actual tonnage" is used in the latter sense; the figures are from annual tonnage reports, 1800–1818, in *American State Papers*, vols. 1 and 2.

Q 163–164, vessels, by material of which built. The source publication also classifies tonnage of each material by type of propulsion (steam, motor, sail, canalboat, and barge).

Q 165–168, vessels, by trade in which engaged. The source publication also presents the number of vessels engaged in each type of trade as well as tonnage. The statutes do not recognize for documenting purposes any fisheries except the cod, mackerel, and whale. Vessels engaged in catching any other fish, such as salmon or menhaden, are documented for the mackerel fishery.

Figures in early reports identified as "registered," or as "registered in foreign trade," commonly include the registered vessels engaged in the whale fishery. Accordingly, figures on "whale fishery" found in early reports should be examined carefully to determine whether they represent the entire whaling fleet or only the "enrolled or licensed" portion. The term "fisheries" as used in early volumes refers to cod, and later, to cod and mackerel fisheries. It rarely includes the whale fishery.

In terms of documentation as "registered," "enrolled," "licensed," series Q 165–168 are composed broadly as follows:

Series Q 165 (foreign trade) represents the total "registered" minus "registered whale fishery." The "registered" whaling tonnage, is, however, included for 1794–1798.

Series Q 166 (coastwise and internal) represents the portion of the enrolled or licensed group engaged in this trade. The rest of the enrolled or licensed group is in series Q 168 (cod and mackerel fisheries).

Series Q 167 (whale fishery) is the "registered whale fishery" portion of the registered fleet plus the "whale fishery" portion of the enrolled or licensed fleet. For 1794–1798, however, the registered whaling tonnage is not included here, but in series Q 165.

Series Q 168 (cod and mackerel fishery) is the cod and mackerel fishery portion of the enrolled or licensed fleet. The rest of the enrolled or licensed group is in series Q 166 (coastwise and internal).

Q 169–174. Documented merchant vessels, by geographic region, 1816–1957.

Source: See source for series Q 153–168.

See also general notes for series Q 153–245 and Q 153–190.

Q 175–177. Documented merchant vessels, by type of service, 1934–1957.

Source: See source for series Q 153–168.

Series Q 177 includes cable, cod, dredging, elevator, ferry, fireboat, fishing, ice breaker, lightering, oil exploitation, oystering, passenger, pile driving, pilot boat, police boat, patrol boat, refrigerator, towing, waterboat, whaling, welding, wrecking, and miscellaneous. The source presents details for each of these in recent years.

See also general notes for series Q 153–245 and Q 153–190.

Q 178–182. Merchant vessels built and documented, by type, 1797–1957.

Source: See source for series Q 153–168.

The source publication also presents statistics separately for steam, motor, and sailing vessels, canalboats, and barges. Statistics for motor vessels begin in 1898.

For 1938–1957, figures are not comparable with those for earlier years and are probably understated. They represent those vessels built during the 12-month period which were still existent and documented as part of the merchant fleet at the end of the period. Hence, they exclude vessels completed during the period which were lost, sold to U.S. Government, sold to aliens, or otherwise removed from merchant vessel documentation before the end of the period.

See also general notes for series Q 153–245 and Q 153–190.

Q 183–187. Merchant vessels built and documented, by region, 1817–1936.

Source: Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, pp. 46–48, and table 2.

See general notes for series Q 153–245 and Q 153–190.

Q 188–190. Merchant vessels built and documented, by region, 1817–1850.

Source: Fold-in table on the history of shipbuilding (1817–1868) at back of the *Annual Report of the Secretary of the Treasury*, 1868.

Source also presents figures separately, for "The United States," "The Lakes," and "Western Rivers." For a discussion of these data see the *Annual Report*. The source table, with a more detailed discussion appears as Plate XXII in H. R., Ex. Doc. No. 111, 41st Congress, 2d Session, where the period covered is extended to 1869, and as Plate X (extended to 1870) in H.R. Ex. Doc. No. 76, 41st Congress, 3d Session. These three series do not add to series Q 179.

See also general notes for series Q 153–245 and Q 153–190.

Q 191. Persons entering the United States by ship, 1933–1957.

Source: Treasury Department, *Annual Report of the Secretary of the Treasury on the State of the Finances*, various issues.

Data include persons entering by documented vessels, excluding ferryboats.

Q 192–203. General note.

Net tonnage capacity, as used here, refers to net or registered tonnage of the vessel, not weight of cargo. The net tonnage is what remains after deducting from the gross tonnage (defined in general note for series Q 153–190) the spaces occupied by the propelling machinery, fuel, crew quarters, master's cabin, and navigation spaces. It represents, substantially, space available for cargo and passengers. It is the usual basis for tonnage taxes and port charges. The net tonnage capacity of a ship recorded as "entered with cargo" may bear little relation to actual weight of cargo. Gross tonnage and net tonnage are both measures of cubic capacity, not of weight, 100 cubic feet equalling 1 ton. These terms should not be confused with the cargo ton of 2,000 pounds. Tonnage figures shown in series Q 193 and Q 199 for U.S. vessels entered and cleared, respectively, in foreign trade are greater than the total tonnage of U.S. vessels documented for the foreign trade because the "entered" and "cleared" series include tonnage for each vessel as often as it "enters" or "clears"

Digitized by Google

each year. The documented tonnage (series Q 154) includes the tonnage of each vessel once for each year.

These figures include the tonnage of all types of watercraft engaged in the foreign trade, whether entering or clearing with cargo or in ballast, which are required to make formal entrance and clearance under U.S. customs regulations. Vessels engaged in trade on the Great Lakes with Canada as well as in trade with Mexico are also included. Vessels touching at a U. S. port in distress or for other temporary causes without discharging cargo, and Army and Navy vessels carrying no commercial cargo, are not required by customs regulations to enter or clear and thus are not included in the figures.

Vessels are reported as entered at the first port in the United States at which entry is made, regardless of whether any cargo is unladen at that port; arrivals at subsequent ports are not counted. Vessels are reported as cleared from the last port in the United States where loading of outward cargo is completed or where the vessel cleared in ballast; departures from prior ports are not counted.

Source: 1857–1879, *Statistical Abstract of the United States, 1881*, p. 136; 1880–1957, see source for series Q 192–194.

Q 204–209. Value of waterborne imports and exports (including reexports) of merchandise, 1790–1946.

Source: 1790–1820, see source for series Q 192–194; 1821–1858, Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, p. 91; 1859–1866, *Statistical Abstract of the United States, 1895*, pp. 399–400; 1867–1912, *Statistical Abstract, 1918*, pp. 318–319; 1913–1923, *Statistical Abstract, 1924*, p. 417; 1924–1935, *Statistical Abstract, 1946*, p. 552 (see general note for series Q 153–245 for the various agencies which have issued the *Statistical Abstract*); 1943–1946, Bureau of the Census, *Foreign Commerce and Navigation of the United States*, annual issues.

The primary source of figures for 1790–1820 is J. R. Soley, "The Maritime Industries of America," *The United States of America* (N. S. Shaler, Editor), vol. II, 1894, pp. 522–527, 534, 536, 538. The report gives the percent of imports and exports in U.S. vessels. Guetter and McKinley (cited above for series Q 192–194) have derived absolute figures by applying these percentages to total imports and exports of merchandise and specie. The primary source of figures for 1821–1935 is *Foreign Commerce and Navigation of the United States*, annual issues. Starting with 1943, import or export statistics by method of transportation showing shipping weight, as well as dollar value, have been compiled by the Bureau of the Census.

Q 210–215. Waterborne imports and exports, by flag of carrier vessel, 1921–1957.

Source: 1921–1945, Bureau of the Census, *Foreign Commerce and Navigation of the United States*, annual issues; 1946–1957, Bureau of the Census, releases and records.

Excludes cargoes (small in the aggregate) carried by ships of less than 100 tons gross capacity prior to 1946. Beginning in 1946 excludes Army and Navy cargo, and includes Alaska, Hawaii, and Puerto Rico. Beginning in July 1950 excludes commodities classified for security reasons as "special category." From July 1953 to December 1955 and beginning July 1956, exports exclude shipments under $500 in value regardless of shipping weight; for January–June 1956, exports exclude shipments under $1,000. Beginning 1954, imports exclude shipments under 2,000 pounds shipping weight.

Q 216–229. Waterborne cargo tonnage, foreign and domestic, 1924–1957.

Source: 1924–1953, Corps of Engineers, *Annual Report of the Chief of Engineers*, part 2; 1954–1957, *Annual Report of the Chief of Engineers, U.S. Army, on Civil Works Activities*, part 1.

In 1954, part 2 of the *Annual Report* was superseded by a separate publication entitled *Waterborne Commerce of the United States* (published in several regional parts). Part 5 of this report, *National Summaries*, presents separate figures for series Q 221–222 for "Canadian" and "overseas" for recent years.

Cargo tonnage refers to the weight of cargo and should not be confused with gross tonnage shown in series Q 153–190 or the net or registered tonnage capacity shown in series Q 192–203, which are measures of cubic capacity, not of weight. See also text for those series.

Q 230–234. Waterborne bulk freight traffic on the Great Lakes, 1900–1956.

Source: Lake Carriers' Association, *Annual Report, 1956*, pp. 62–63.

Includes tonnage moving to or from Canadian or U.S. lake ports, in Canadian or U.S. bulk carriers.

Q 235–237. Commercial ocean traffic on the Panama Canal, 1915–1957.

Source: 1915–1924, Governor of the Panama Canal, *Annual Report, 1948*, p. 10; 1925–1957, Panama Canal Company, *Annual Report*, various issues.

Does not include U.S. Government traffic.

Digitized by Google

Q 238–242. Freight traffic on the Sault Ste. Marie canals, 1855–1900.

Source: Corps of Engineers, *Statistical Report of Lake Commerce Passing Through Canals at Sault Ste. Marie*, 1931.

These series include traffic moving through the American and Canadian canals. Figures for later years may be obtained from various issues of Corps of Engineers, *Annual Report*, part 2, *Commercial Statistics*. They are not shown here because they pertain only to traffic between Lake Superior and the other lakes and series Q 230–234 therefore provide more comprehensive totals of Great Lakes traffic.

Q 243–244. Tonnage moved on New York State canals, 1837–1957.

Source: State of New York, Department of Public Works, *Annual Report of the Superintendent*, annual issues, and records.

Q 245. Federal expenditures for rivers and harbors, 1822–1957.

Source: 1822–1882, *Statement of Appropriations and Expenditures for Public Buildings, Rivers and Harbors, Forts, Arsenals, Armories, and Other Public Works from March 4, 1789 to June 30, 1882*, U. S. Senate Ex. Doc., vol. 7, No. 196, 47th Congress, 1st Session (Treasury Department Doc. No. 873), pp. 521–522; 1883–1919, Federal Works Agency, records (compiled from Treasury Department accounts); 1920–1957, Corps of Engineers, *Annual Report of the Chief of Engineers, U.S. Army*, part 1, vol. 1, annual issues (in 1954, changed to *Annual Report of the Chief of Engineers, U.S. Army, on Civil Works Activities*, part 1).

Figures include expenditures for rivers, harbors, and flood control prior to 1928. In 1928, expenditures for flood control amounted to less than $13,500,000. Figures for 1929–1957 exclude expenditures for flood control. The figures include amounts expended from emergency relief and Public Works Administration funds, 1933–1937, but exclude $5,500,000 for purchase of Cape Cod Canal, 1928, expended by and accounted for by Treasury Department.

[1] For 1920–1937, tonnage for vessels with electric screw included in total (series Q 156 or Q 159) but excluded from series Q 157, Q 158, and Q 160. Maximum such tonnage included in series Q 156 is 201,246 in 1933 and maximum in series Q 159 is 91,470 in 1934.

[2] Includes gasoline engines, not shown separately.

[3] Includes canalboats and barges prior to 1868.

[4] Includes iron, steel, composite, concrete, bronze, and aluminum.

[5] Beginning 1937, excludes mackerel.

[6] Increase due to documentation of 1 large vessel on Atlantic Coast.

[7] Not available.

[8] Less than 500 tons.

[9] Figures for 1789 are for ships paying tonnage duties during the last 5 months of the year. Figures for 1790–1792 are for ships paying duties at some time during the year.

[1] Excludes U. S. Army and Navy cargo, and Great Lakes.

Series Q 216–229. Waterborne Cargo Tonnage, Foreign and Domestic: 1924 to 1957

In thousands of short tons of 2,000 pounds. For definition of cargo tonnage, see text. Net totals are derived by deducting two types of duplications from unadjusted totals: (1) Traffic between seaports and river points, and (2) "Other duplications," comprising principally coastwise and lake traffic passing through canals and connecting channels other than the St. Marys Falls Canal and the Detroit River]

Year	Foreign and domestic commerce		Foreign commerce					Domestic commerce						
	Net total	Unadjusted total	Total	Through seaports		Great Lakes ports		Approximate net total [1]	Unadjusted total	Between ports		Local traffic of seaports and Great Lakes ports [2]	Between seaports and river ports	On rivers, canals, and connecting channels [2]

[1] Figures for 1924–1945 are approximations, excluding duplications in domestic traffic. There are, however, some minor duplications in figures for foreign traffic.

[2] Includes figures for harbor traffic of New York, Philadelphia, and San Francisco; local traffic of other seaports, and local traffic of lake ports.

[2] Excludes St. Marys Falls Canal traffic and additional Detroit River traffic, both of which are already counted in Great Lakes traffic; also excludes duplications relating to rivers and canals themselves.

chapter Q

HIGHWAY TRANSPORTATION (Series Q 246–344)

Q 246–264. General note.

In 1894, the Federal Government created an Office of Road Inquiry to initiate experiments and conduct inquiries concerning the best methods of road building. It was succeeded by the Office of Public Roads, which is now the Bureau of Public Roads (the latter was called the Public Roads Administration during 1939–1949). The Office of Public Roads made surveys of highway mileage, revenues, and expenditures in 1904, 1909, and 1914.

In 1916, Congress passed the first of the many Federal-aid highway acts, under which the Federal Government has contributed to the cost of constructing highways designated as parts of the Federal-aid system. The Bureau of Public Roads administers Federal legislation providing for the improvement, in cooperation with the States, of roads on the Federal-aid primary, secondary, and interstate highway systems. As the principal road-building agency of the Federal Government, it also cooperates with the Forest Service, the National Park Service, and other Federal agencies in the construction of roads in national forests, parks, and other areas.

Q 246–251. Mileage of rural roads and municipal streets, 1904–1957.

Source: 1904–1955, Bureau of Public Roads, *Highway Statistics, Summary to 1955*, 1957; 1956–1957, *Highway Statistics*, annual issues.

Rural roads, as used here, are defined roughly as those roads located outside of incorporated communities or delimited places generally having more than 1,000 inhabitants. Estimates for earlier years for total mileage of rural roads are (in thousands of miles): 1904, 2,151; 1909, 2,200; 1914, 2,446.

Municipal and other mileage figures for 1934 and 1935 represent only mileage on municipal extensions of State systems, which are State administered. Mileage not on State or county systems was initially included in 1936 (67,000 miles). Mileage on local city streets was first included in 1941 (274,000 miles for that year). Municipal extensions are continuations of State system roads through communities with more than 1,000 inhabitants. Although mileage in places having more than 2,500 inhabitants was not originally included in Federal-aid programs, those places have been eligible for such aid in more recent years.

Q 252–254. Existing surfaced mileage, 1904–1957.

Source: See source for series Q 246–251.

High-type surfaced roads include bituminous penetration, sheet asphalt, bituminous concrete, portland cement concrete, vitrified brick, and block pavements of asphalt, wood, and stone. For some years, they also include dual-type surfaces and a small amount of unclassified mileage. Low-type surfaced roads include sand, clay, selected soil, untreated gravel, bituminous surface-treated, mixed bituminous and treated gravel, chert, shale, waterbound macadam.

Q 255–259. Mileage built by State highway departments, 1923–1957.

Source: See source for series Q 246–251.

Mileage built is mileage on which construction work creates a newly located road or is regarded as significantly improving the condition of an existing road. It does not include work designed to maintain or restore the condition of an existing road without material betterment. Mileage resurfaced or rebuilt to higher standards is the bulk of mileage built. Construction of earth roads consists of aligning, grading, and draining. See also text for series Q 252–254.

Q 260–264. Mileage and cost of Federal-aid highway improvements, 1917–1957.

Source: See source for series Q 246–251.

In 1912, the Congress authorized $500,000 for an experimental program of rural post-road construction. However, it was not until the Federal-Aid Road Act of 1916 that the present cooperative Federal-State highway program was established on a continuing basis. In order to accelerate the improvement of the main traveled roads, Congress in 1921 authorized designation of a system of principal interstate and intercounty roads, limited to 7 percent of the total rural mileage then existing. The use of Federal aid was restricted to this system, and to rural mileage only.

Urban highway improvement first came in for its share of the Federal-State program when the Federal-Aid Highway Act of 1944 specifically authorized the use of funds for Federal-aid highways in urban areas. In addition, the Act provided for the designation of a Federal-aid secondary system and a National System of Interstate Highways. The Federal-Aid Highway Act of 1956 provided substantially increased sums for the Federal-aid primary and secondary systems for a 3-year period, and established a long-range plan for financing accelerated completion of the 41,000-mile interstate system.

Federal funds are available for expenditure only on the designated Federal-aid systems and, in general, must be matched by an equal amount of State funds. However, under the Federal-aid Act of 1954 the Federal share for the Interstate System was raised to 60 percent, and under the 1956 Act the proportion was increased to 90 percent. Federal aid may not be expended for maintenance. The cost of most Federal-aid projects is paid initially out of State highway funds, or in some cases by counties or other local governments. The Federal share is paid as reimbursement to the States as work progresses, with final payment made after completion.

Federal authorizations have usually been made on a biennial basis and apportioned among the States for use within a 3-year period. Figures for State funds shown here are based on legal matching ratios determined by applicable Federal-aid acts. In States having public lands in excess of 5 percent of their total area, the Federal share is proportionally increased.

Q 265–279. State highway finances, 1890–1957.

Source: See source for series Q 246–251.

A State highway-user tax is defined as a special tax or fee (except tolls) levied upon motor-vehicle users because of their use of the highways. Highway-user taxes include motor-fuel taxes, motor-vehicle registration and associated fees, and special taxes applicable only to motor carriers; these taxes are separable and apart from property, excise, business, or other taxes paid by the general public.

In many States, specific portions of the revenue from each type of highway-user tax are allocated to particular highway purposes. A number of States, however, place all highway-user revenue in a highway fund, and a few have a general State fund into which go all types of revenue. For the latter group of States, each particular appropriation or expenditure for highway purposes is considered to have been made from

Digitized by Google

motor-fuel taxes, motor-vehicle registration fees and motor-carrier taxes in proportion to the relative amount of revenue received from each of these three sources.

The largest share of receipts from State highway-user taxes is expended on State highways, but a portion is also allocated for local roads and streets, and a small amount used for nonhighway purposes.

Q 280–293. Funds contributed and disbursed for county and other local rural roads, 1921–1956.

Source: 1921–1955, the principal sources used were Bureau of Public Roads, *Highway Statistics, Summary to 1955; The Financing of Highways by Counties and Local Rural Governments, 1931–1941; The Financing of Highways by Counties and Local Rural Governments, 1942–51;* 1956, in great part from *Highway Finance, 1948–1957.* (Additional information obtained from Bureau of Public Roads, annual published local finance tables, 1921–1955, and records on file at the Bureau of Public Roads.)

Q 294–309. Funds contributed and disbursed for streets in incorporated and other urban places, 1921–1956.

Source: 1921–1955 (except for series Q 303, 1924–1939), Bureau of Public Roads, *Highway Statistics, Summary to 1955;* and annual published national summaries of urban finance data, UF series. Series Q 303, 1924–1939, "Municipal Bond Sales," published by *The Bond Buyer;* 1956, in great part from *Highway Finance, 1948–1957.* (Additional information is on file at the Bureau of Public Roads.)

Q 310–313. Motor-vehicle factory sales, 1900–1957.

Source: Automobile Manufacturers Association, *Automobile Facts and Figures,* 38th edition, 1958.

Production of passenger cars was discontinued in February 1942 to economize resources for war purposes, but some vehicles remaining in factory stocks were sold under rationing orders in subsequent war years.

Q 314–317. Motor-vehicle registrations, 1900–1957.

Source: 1900–1952, Bureau of Public Roads, *Highway Statistics, Summary to 1955;* 1953–1957, same agency, records (table MV-200, "Summary of Motor Vehicle Registrations by Years").

Figures are based on reports and records of State motor-vehicle registration departments. They include both privately and publicly owned vehicles.

Motor-vehicle data in the early years of the century are incomplete, largely because few States required their registration, and hence had no records of the number of vehicles using roads and streets. As production of vehicles increased, shortly before the first World War, so did the number of registration laws. By 1921, all States had adopted some form of motor-vehicle registration.

Accompanying the growth in motor-vehicle registrations has been a corresponding diversity in the registration practices among the States. In general, motor vehicles are classified as private passenger cars, passenger carriers for hire, trucks, trailers, motorcycles, and property carriers for hire. Several States, however, still register buses with either trucks or passenger cars. These differences have made it necessary for the Bureau of Public Roads to supplement the data submitted by the States with information obtained from special studies and from other sources.

Q 318–320. Motor-fuel usage, 1919–1957.

Source: 1919–1955, Bureau of Public Roads, *Highway Statistics, Summary to 1955,* p. 2; 1956–1957, same agency, records (table G 221, Analysis of Motor Fuel Consumption).

Fuel consumption figures for which reports from State authorities were not available have been estimated by Bureau of Public Roads. Motor fuel includes all gasoline used for any purpose (private and public), except military, plus any diesel or other fuels used solely for the propulsion of motor vehicles on public highways. Exports from the United States are excluded, and there is no duplication because of interstate shipment. Tractor fuels are not included. Nonhighway consumption includes all use off the highway, such as aviation, agriculture, marine, industrial, etc., and usually falls under the exemption or refund provisions of the motor-fuel tax law.

Q 321–327. Miles of travel by motor vehicles, 1921–1957.

Source: 1921–1935, Federal Works Agency, records, and Public Roads Administration, records (table VM-1 and table entitled "Estimates of Vehicle-Miles Traveled, 1921 to 1947"); 1936–1957, see source for series Q 246–251.

Q 328–329. State and Federal gasoline tax rates, 1930–1956.

Source: See source for series Q 246–251.

State average tax is weighted by net gallons taxed at the various rates in the several States. No data are shown before 1930 because it was the first year in which all States had motor fuel taxes in effect for the whole year.

The precise dates of the changes in the Federal tax are as follows: June 21, 1932, 1 cent; June 17, 1933, 1.5 cents; January 1, 1934, 1 cent; July 1, 1940, 1.5 cents; November 1, 1951, 2 cents; July 1, 1956, 3 cents.

Q 330–341. Public transit mileage, equipment, passengers, and passenger revenue, 1917–1957.

Source: American Transit Association, *Transit Fact Book,* various annual issues; *The Transit Industry in the United States, Basic Data and Trends,* 1943; mimeographed release on number of passengers, dated January 3, 1938.

Figures are estimates based on reports for about 85 percent of the industry, which includes local motorbuses, electric street railways, elevated and subway lines, interurban electric railways, and transit coach lines.

Mileage estimates for trolley coaches (series Q 331) are miles of negative overhead wire. Mileage estimates for motorbuses (series Q 332) are miles of route, round trip. Equipment owned, railway cars (series Q 333) includes surface, subway and elevated cars. The estimates for 1933 and 1934 for equipment owned, motorbuses (series Q 335) are probably understated. Revenue and nonrevenue passenger figures (series Q 336–339) exceed revenue passenger figures (series Q 340) chiefly because of free transfers.

Q 342–344. Oil pipelines operated and oil originated, 1921–1957.

Source: 1921–1953, Interstate Commerce Commission, *Statistics of Railways in the United States,* various annual issues; 1954–1957, *Transport Statistics in the United States,* part 6, *Oil Pipe Lines.*

Figures refer to pipelines operating in interstate commerce and regulated by ICC. Oil originated, crude, series Q 343, includes both gathering and trunk lines.

For a discussion of statistics of oil pipelines, see ICC, *A Review of Statistics of Oil Pipe Lines, 1921–1941,* Statement 4280, mimeographed, 1942. The figure for mileage in 1938, which appears to have been revised, is from this Statement.

Figures for barrels of oil carried are as follows, in millions: 1925, 831; 1926, 836; 1927, 989; 1928, 1,053; 1929, 1,156; 1930, 1,172; 1931, 987. In these figures, a barrel handled by two or more pipelines in succession is counted each time it is handled. In the figures for barrels originated, this duplication is avoided.

[1] Includes extensions of county, town, and township roads but excludes rural mileage not under State or local control.
[2] Includes all surfaced mileage whether under State or local control.
[3] Includes State highway extensions within cities.
[4] Beginning in 1937, includes special construction defined as mileage built by State Highway Departments on county and local roads not under State control; on city streets other than urban extensions of State highway system; on forest, park, and institutional roads; etc.

Series Q 260–264. Mileage and Cost of Federal-Aid Highway Improvements: 1917 to 1957

[1] Includes estimates on Federal-aid primary system throughout, Federal-aid on secondary systems beginning in 1942, and national system of interstate and defense highways beginning in 1951. Estimates as of end of calendar-year.
[2] Comprises new and rebuilt mileage.
[3] Represents actual expenditures of funds on calendar-year basis. Beginning 1925, includes money spent on public works and defense highways. Beginning 1940, includes secondary highways.

[1] Includes road, bridge, and ferry tolls; property taxes; appropriations from general funds; and other State imposts.
[2] Includes funds of Bureau of Public Roads and other agencies paid as reimbursement to the States. Does not include direct Federal expenditures for highways.
[3] Includes refunding issues and toll revenue bonds.
[4] Includes funds transferred from local governments and miscellaneous receipts.
[5] Includes administration, engineering and equipment; State highway police; interest on obligations for State highways; and retirement of obligations for State highways.
[6] Includes expenditures and funds transferred for nonhighway purposes and expense of collecting and administering highway-user revenue.

[1] For 1940–1956, includes contributions from urban places not shown elsewhere. ($1 million in 1956).

[2] The following amounts of Federal work-relief funds (mainly Works Progress Administration) are included for 1933–1942, respectively (in millions of dollars): 25, 150, 91, 339, 221, 389, 352, 295, 189, and 78.

[3] Work performed directly by State agencies on local projects; similar amounts included in disbursements.

[4] Refunding issues excluded after 1937.

[5] Estimated.

[6] Less than $500,000.

chapter Q

AIR TRANSPORTATION (Series Q 345–397)

Q 345–397. General note.

Only scattered data on air transportation are available for years before 1926. Regular collection of national statistics began with the establishment in that year of an Aeronautics Branch in the Department of Commerce. In 1934 a Bureau of Air Commerce was organized in that department. The Civil Aeronautics Act of 1938 created the Civil Aeronautics Authority, an independent regulatory agency, which was reorganized in 1940 into 2 separate entities, the Civil Aeronautics Board and the Civil Aeronautics Administration. The latter's annual *Statistical Handbook of Civil Aviation* is the source for the statistics presented here.

Statistics of domestic scheduled airline operations cover trunk airlines, local service airlines, helicopter carriers, and territorial airlines except those operating in Alaska. Scheduled intrastate airlines are not included anywhere, nor are those operating locally in Alaska. Statistics of international scheduled airline operations include not only operations to and from foreign countries but overseas operations to American possessions. They also include the service of Northwest Airlines and Pan American World Airways between the United States and Alaska. Some companies operate in both the domestic and the international fields, but the statistics are segregated.

Operations of scheduled carriers of cargo only are generally not included.

Q 345–351. Aircraft production and exports, 1913–1957.

Source: Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1958 edition. (A few of the earlier figures are from the 1945 or 1948 edition.)

Q 352–362. Scheduled air transportation, domestic and international, 1926–1957.

Source: See source for series Q 345–351.

Q 363–375. Scheduled airline revenues and expenses, 1938–1957.

Source: See source for series Q 345–351.

Q 376–383. Airports, aircraft, pilots, and miles flown, 1926–1957.

Source: See source for series Q 345–351.

Figures for airports and landing fields (series Q 376–377) include civil, military, and CAA fields but exclude seaplane facilities prior to 1953. Growth of airports after 1940 was stimulated by Federal defense expenditures during the war and by the Federal-aid airport program thereafter.

Estimates of the number of certificated pilots (series Q 379–382) refer to persons certificated by CAA in the various classifications. Some may not have been actively engaged in the classification for which they were certificated. The count of certificated pilots after 1941 is not directly comparable with the previous years as the Civil Aeronautics Regulations were amended to permit pilot certificates currently effective on April 1, 1942, to continue in effect indefinitely. This amendment expired on July 1, 1947. The number of commercial pilots (series Q 381) rises sharply after 1944 because the CAA awarded many veterans commercial certificates on the basis of their military flying experience. The number of private pilots (series Q 382) increased sharply after 1939 because of the Federally subsidized civilian pilot training program which was initiated in 1939. It gave preliminary training to hundreds of thousands of men who went into the military service. Miles flown (series Q 383) include business flying (by corporate executives or employees or by individuals, including farmers, on personal business), commercial flying (contract, charter, crop-dusting, photographic, etc.), instructional flying, pleasure flying, and other flying (testing, experimental, ferrying, Civil Air Patrol, etc.). Separate data on these five categories are given in the source.

Q 384–397. Air transportation accidents, 1927–1957.

Source: See source for series Q 345–351.

An aircraft accident is considered to be any occurrence, while the aircraft is operating as such, which results in fatal or serious injury to persons or appreciable damage to the aircraft. The aircraft is considered to be "operating as such" from the time the engine is started for purposes of flight until the flight is completed; in the case of gliders, while they are under tow or gliding.

Propeller accidents to persons are included. A collision between two or more aircraft is counted as one accident.

Data include military contract operations for 1956 and 1957, but not for earlier years. Scheduled cargo carriers are included for 1949–1957, but not for earlier years.

[1] Identified as "Shipments of complete civilian aircraft" for 1948–1957 in Civil Aeronautics Administration, *Statistical Handbook of Civil Aviation*, 1958 edition.

[2] Value of aircraft, engines, parts, parachutes, etc.

[3] 1913–1918, fiscal years, 1919–1957, calendar years. Data for the second half of 1918 are included with calendar year 1919.

[4] Exclusive of gliders and barrage balloons. 1949–1957, civil aircraft only.

[5] Total value of aircraft, engines, parts, etc. 1913–1921 include values of aircraft and aircraft parts. Prior to 1922, engine values were not reported separately but were probably included with either "other" internal combustion engines or with "parts" of aircraft. Values for parachutes and their parts have been included only since 1932.

[6] Data not available for security reasons.

[7] Not available.

[8] Includes U.S.-financed aircraft manufactured in Canada.

[9] Includes military aircraft for Lend-Lease shipments.

[10] Values are for military aircraft produced in the United States only. These data were computed by the War Production Board in terms of August 1943 unit cost. The values are not meant to measure output at current prices or expenditures. The 1940 figure is only for the second half of that year; the 1945 figure covers only the first 8 months.

[11] No production other than military.

[1] Duplication exists where (a) the same passengers were carried on more than 1 route of an air carrier; and (b) where the same passengers were carried by more than 1 air carrier.
[2] Duplication has been eliminated where the same passengers were carried on more than 1 route of an air carrier, but still exists where the same passengers were carried by more than 1 air carrier.
[3] Based on revised CAB procedures.
[4] Enplaned passengers not strictly comparable to previous years due to change in CAB reporting procedure.
[5] Computed by CAA from reports of duplicated revenue passengers.
[6] Excludes Marine.
[7] Excludes Colonial and Marine.
[8] Includes nonrevenue passenger-miles flown.
[9] Includes nonrevenue passengers.
[10] Excludes Colonial Airlines, Inc., and Hawaiian Airlines, Ltd.
[11] Excludes 224,236 ton-miles flown by U.S. Army.
[12] Excludes Colonial Airlines, Inc.
[13] Not available.
[14] Includes employees of Pan American Airways.
[15] Included with domestic air transportation.

1926	[6]	[6]						18,747

[1] Continental United States, and Territories and possessions.
[2] Includes gliders.
[3] Active and inactive.
[4] Data estimated from trend since no official survey was conducted for this year.
[5] As of Mar. 1, 1954.
[6] Not available.
[7] As of May 1, 1949.
[8] As of Apr. 1, 1948.
[9] Not available. No surveys made during war years, because the Civil Air Regulations were amended and aircraft owners were not required to submit reports.
[10] Airline transport rating became effective May 6, 1932.

[1] Includes scheduled revenue operators only.
[2] Rates computed on basis of total passengers carried and passenger miles flown revenue and nonrevenue. Applies to passenger-carrying service only.
[3] Excludes accident near Daggett, Calif., July 25, 1957; 1 passenger fatality, suicide, bomb explosion.
[4] Includes 1 accident resulting in fatal injury to 4 persons on ground.
[5] Excludes sabotage disaster at Longmont, Colo., on Nov. 1, 1955 in which 5 crew members and 39 passengers were fatally injured.
[6] Includes 1 ground collision between 2 air-carrier aircraft, 1 in scheduled passenger service and 1 in other revenue operations.
[7] No operational statistics for nonscheduled and personal flying are available for 1943, 1944, and 1945.

Communications

TELEPHONE AND TELEGRAPH SYSTEMS (Series R 1–89)

R 1–89. General note.

Among the primary sources of governmental historical statistics relating to the telephone and telegraph industries are the following:

1. *Compendium of the Seventh Census of the United States, 1850; Compendium of the Tenth Census of the United States, 1880; Statistics of Manufactures, 1890,* Census Bulletin No. 196, June 1892.

2. Bureau of the Census quinquennial censuses of the telephone and telegraph industry, 1902-1937: Bulletin No. 17, *Special Reports: Telephones and Telegraphs, 1902; Special Reports: Telephones, 1907;* Bulletin No. 102, *Telegraph Systems: 1907; Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912; Census of Electrical Industries: 1917, Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems; Census of Electrical Industries: Telephones—1917, 1922, and 1927; Census of Electrical Industries: Telegraphs—1917, 1922, and 1927; Census of Electrical Industries: Telephones and Telegraphs, 1932 and 1937.* (Titles with more than a single year represent different volumes for each year.)

3. Interstate Commerce Commission reports of telephone and telegraph carriers, 1914-1933:

a. *Memorandum Concerning Telephone Companies and Telegraph Companies Reporting to the Interstate Commerce Commission for the Years 1916 and 1917* (processed).

b. *Annual Report on Telephone Companies,* 1920-1927, 1928-1932, and 1933 (processed); *Annual Report on Telegraph Companies,* 1926-1927, 1928-1932, and 1933 (processed).

4. *Report on Communication Companies* (Splawn Report), issued as House Report No. 1273, 73d Cong., 2d sess. (1934) in connection with the consideration of the Communications Act of 1934. This report contains detailed data from the carrier reports filed with the Interstate Commerce Commission and also the results of a questionnaire to the telephone, telegraph, and radio industries for 1922-1932.

5. Federal Communications Commission reports of telephone and telegraph companies filed monthly and annually with that agency, 1934-1957. Selected data from these reports have been issued monthly and annually (in processed form) and in the Commission's annual reports to Congress. Beginning in 1939, the data have also been issued in the FCC's annual *Statistics of the Communications Industry in the United States.*

6. Federal Communications Commission, *Investigation of the Telephone Industry in the United States,* House Document No. 340, 76th Cong., 1st sess. (1939). This report includes the results of the Commission's investigation of the American Telephone and Telegraph Company (AT&T). Page 609 of the report refers to a number of staff reports, or exhibits, containing more detailed statistical and other material prepared in connection with the investigation and issued in processed form. These staff exhibits and reports are listed under the title, *Special Investigation Docket No. 1.*

7. Statistics for 1926-1934 obtained by the Federal Communications Commission from telephone and telegraph companies and designed to afford the FCC a basis for determining whether carrier rates were just and reasonable and in enforcement of other statutory responsibilities. (The text of the telephone inquiry appears in "Telephone Division Order No. 9," FCC, *Reports,* vol. 1, p. 49; the text of the telegraph inquiry is in "Telegraph Division Order No. 12," FCC, *Reports,* vol. 1, p. 88. The detailed responses are available to the public at the Commission.)

Other major sources of telephone and telegraph statistics are the annual reports to stockholders by AT&T (Bell), the Western Union Telegraph Company, and statistics of independent (i.e., non-Bell) telephone companies compiled and published by the United States Independent Telephone Association.

A major factor affecting the statistics of the telephone and telegraph carriers has been the prescription of uniform systems of accounts for these companies by the Interstate Commerce Commission and by the Federal Communications Commission after its formation in 1934. The ICC prescribed a uniform system of accounts for telephone companies having annual operating revenues exceeding $50,000, effective January 1, 1913, and for telegraph carriers, effective January 1, 1914. The ICC issued more detailed accounting systems, effective January 1, 1933, for Class A companies, and condensed classifications for Class B companies, effective January 1, 1934. The FCC adopted a revised uniform system of accounts for Class A and Class B telephone companies, effective January 1, 1937. The outstanding change was a requirement that telephone plant be recorded in the accounts at original cost, i.e., cost at time of first dedication to public use. The FCC adopted a revised uniform system of accounts for Class C telephone companies, effective January 1, 1939 (the earlier ICC system had been established, effective January 1, 1915).

The reporting authority of the FCC relates only to those telephone and telegraph carriers engaged in interstate and foreign communication which cross State or national boundary lines over their own facilities or through connection with the facilities of an affiliated carrier having such facilities. Thus, the carriers filing reports with the Commission (with the exception of a small number of companies filing voluntarily) exclude a very large number of small, and a few large, telephone companies.

R 1–42. General note.

The Bell System provides the great bulk of local exchange and interexchange or toll telephone facilities and service in the United States. It includes the parent company of the Bell operating telephone companies, consolidated with "associated holding and operating companies in the United States, not including connected independent or sublicensee companies." The figures as presented are "statements of the Bell Telephone business as a whole, eliminating all duplications and showing the figures and results as 'if operated by a single company.'" The parent company has been American Telephone and Telegraph Company since January 1, 1900; prior to that date it was the American Bell Telephone Company. The number of companies included within the Bell group has varied from time to time. In 1914, approximately 35 companies were included and in 1915–1916 the number increased to 39. Subsequent consolidations reduced the number to 29 in 1920 and to the present level of 23, including Cincinnati and Suburban Bell Telephone Company, and Southern New England Telephone Company in 1948. Since 1936, however, AT&T in its consolidated

Digitized by Google

financial statements has excluded these 2 large noncontrolled companies. For comparability with previous years, however, the figures have been adjusted to include these 2 companies using reports filed by them with the FCC. "Bell companies" and "Bell System" are at times used interchangeably herein. Unless otherwise specified, the reference is to "Bell companies."

Included in the Bell organization presently are the following:

1. AT&T, which is the parent company.

2. 19 regional subsidiaries owned and controlled by AT&T, plus a subsidiary of one of these regional companies. These 20 Bell System principal telephone subsidiaries furnish exchange and intrastate toll service, as well as interstate toll telephone service; they constitute, with the parent, the Bell System of today.

3. Two other major companies, Cincinnati and Suburban Bell Telephone Company and Southern New England Telephone Company, in which AT&T has substantial minority interests. These 2 companies, together with the 20 mentioned above, are referred to as the Associated Companies.

4. Bell Telephone Laboratories, Inc., a scientific research and development organization and Western Electric Company, Inc., which is the Bell manufacturing and supply organization.

In addition, a number of the Bell company affiliates have varying degrees of stock interest in various other telephone companies. The data for series R 1–27 relating to the Bell companies exclude the operations of Bell Telephone Laboratories and of Western Electric, except as their operations affect the operating expenses and miscellaneous income of the Bell companies. Bell Telephone Laboratories operates on a nonprofit basis and the profits of Western Electric on sales to the Bell companies are not eliminated in the consolidated statements.

Independent companies are referred to as non-Bell companies, although AT&T or Bell companies have financial interests in some of them. The independents participate with Bell in providing toll service, and have contractual arrangements with AT&T and the Bell Associated companies.

R 1 and R 3–5. Total telephones, Bell company telephones, and telephones of independent companies, 1876–1956.

Source: FCC, records, and AT&T, records (except for census data). Census data were obtained from the following census reports, and records: *Telephones and Telegraphs*, 1902, table 2, for total telephones in 1880, 1890; table 4, for total telephones in 1902; table 6, for Bell System telephones in 1902; *Telephones*, 1907, table 51, for total telephones in 1907; table 54, for Bell System telephones; *Telephones and Telegraphs . . . , 1912*, table 1, for total telephones and Bell System telephones in 1912; p. 37 for telephones connecting with the Bell System: *Telephones and Telegraphs, 1932*, table A for total telephones in 1917, 1922, 1927, and 1932; table 12, for Bell System telephones in 1922, 1927, and 1932; *Telephones and Telegraphs, 1937*, table 1, for total telephones and Bell System telephones in 1937.

The data for 1876–1934 (except census data) were taken from FCC, records consisting of *Special Investigation Docket No. 1*, "Report on Control of Telephone Communications," vol. III, Exhibit 2096-D, p. 11 (June 15, 1937, processed), and "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit 1360-A, pp. 115 and 150. For 1935-1956, the data were supplied to FCC by AT&T. Substantially the same data are also available in the AT&T annual reports to stockholders.

Telephones include telegraph and teletypewriter stations through 1930 and private line telephones through 1934, but not thereafter.

R 2. Telephones per 1,000 population, 1876–1956.

Source: FCC, records (except for census data). For census data, see source for series R 1 and R 3–5.

Annual figures are based on data supplied to FCC by AT&T.

R 6–9. Average daily calls, 1880–1956.

Source: FCC, records.

Figures are based on data supplied to FCC by AT&T.

Generally, exchange service is telephone service within an exchange area. A local call is defined as a call originating in and completed within the same public exchange area; a toll call is one which originates in one exchange destined to another exchange area, whether located nearby or across the continent. In instances in which there is a high community of interest between exchanges, accompanied by considerable calling on a message toll basis, "extended area service" has been established under which adjacent and nearby exchanges are included in the subscriber's local service area. The growth of this type of service each year has significantly affected the number of calls classified as local, which otherwise would have been classified and charged as toll. Moreover, elimination of toll charges through the establishment of extended area service has tended to stimulate telephone usage within the service area.

Conversations are those calls originating from company and service telephones, excluding private line telephones. Local calls include both completed and uncompleted calls. Bell System toll messages consist of interstate and intrastate completed calls originated or terminated at Bell System Associated Company telephones, and toll messages originated or terminated at connecting (i.e., independent) company telephones, provided their transmission utilized toll line facilities of a Bell operating company. Toll messages handled wholly over facilities of connecting or nonconnecting independent companies are shown under Independent Companies. Toll message figures include ship-to-shore messages, and messages to Mexico, British Columbia, and Cuba. Since a toll ticket is made for each toll call, the count of toll messages can be relatively exact. In very large exchanges, some counts of local calls are automatically accumulated in message registers but in small exchanges the counts are estimates based upon samples.

R 10–13. Telephone toll rates between New York City and selected cities, 1902–1957.

Source: 1902, Bureau of the Census, *Special Reports: Telephones and Telegraphs, 1902*, p. 77; 1911-1957, FCC, records.

Data for 1911-1917 are based on records of AT&T, newspapers, and other published reports. Data for 1919-1937 are based on information in FCC, Telephone Rate and Research Department, "The Classified Toll Rate Structure and Basic Rate Practices for Message Toll Telephone Service," pp. 40-47, (Jan. 15, 1938, processed). Data for 1940-1957 are based on records and tariffs of the FCC. Considerable historical toll rate data also appear in the report of a committee of National Association of Railroad and Utilities Commissioners (NARUC) and FCC representatives, *Message Toll Telephone Rates and Disparities*, pp. 96–131.

The four major classes of toll telephone messages are station full rate, station reduced rate, person full rate, and person reduced rate. Station service is defined as "that service where the person originating the call gives only the telephone number of the station (i.e., telephone), or the branch exchange system desired, or the name and address under which the

Digitized by Google

telephone is listed and does not specify a particular person or branch exchange station to be reached at the called point."

In interstate toll service, person-to-person rates are approximately 40 percent higher than station rates. On station calls, the starting point is computed at the time communication is established between the calling and called stations; on person-to-person calls, the chargeable period begins when the person called is reached. There was generally no rate differentiation between station and person service until January 21, 1919.

A paucity of historical data exists with respect to local exchange rates. Such data can only be laboriously constructed from the records of the Bell System companies and other telephone companies or from the tariffs filed with each State which has regulatory authority over the intrastate telephone rates. One source of data pertaining to exchange rates is the Bureau of the Census report, *Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912*, pp. 49–156, which presents telephone rates of selected cities in 38 States and the District of Columbia. Another source of exchange rate data is provided by the responses of telephone companies to FCC, "Telephone Division Order No. 9," which called for rates in effect in selected size exchanges between 1907 and 1933. These responses are on file at the FCC.

R 14–15. Telephone plant and depreciation reserves, 1880–1956.

Source: 1885–1935, FCC, records consisting of *Special Investigation, Docket No. 1* "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit No. 1360-A (Jan. 16, 1937, processed), pp. 73, 102; vol. II, Exhibit No. 1360-B, Schedule 2 (appendix); "Report on Associated Bell Telephone Companies Financial and Operating Data," Exhibit No. 1364 (Jan. 23, 1937), Schedule A-15; 1936-1956, American Telephone and Telegraph Company, annual reports, and FCC, records. Census data are from the following volumes: *Compendium of the Tenth Census, 1880*, p. 1332; *Telephones and Telegraphs, 1902*, table 6, p. 7; *Telephones and Telegraphs . . . , 1912*, table 29; *Telephones, 1917*, table 33; *Telephones, 1922*, table 34; *Telephones and Telegraphs, 1932*, table 17; *Telephones and Telegraphs, 1937*, table 1 (see general note for series R 1–89 for complete list of census sources).

The FCC's uniform system of accounts, which became effective January 1, 1937, requires establishment of telephone plant accounts on the basis of original cost (cost at time of first dedication to the public use). This applies to all plants ordinarily having a service life of more than one year as well as franchises, patents, rights of way, leaseholds, and other interests in land.

The depreciation policies of the Bell System have undergone various changes from a simple maintenance reserve set up for the purpose of equalizing maintenance charges over a period of years and providing for deferred maintenance expenses, to depreciation rates prescribed by the FCC. Prescription of depreciation rates for Bell companies began in 1949 and initial prescriptions were completed in 1953. For a discussion of Bell System depreciation policies see, *Report of the Federal Communications Commission on the Investigation of the Telephone Industry in the United States*, pp. 325–349.

R 16. Miles of wire, 1880–1956.

Source: 1880-1884, AT&T, unpublished financial report; 1885-1935, FCC, records consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 76, 115; 1936-1956, AT&T, annual reports, and FCC, records. Census data are from the following volumes: *Compendium of the Tenth Census, 1880*, p. 1327; *Telephones and Telegraphs, 1902*, table 2; *Telephones, 1922*, table 21; *Telephones and Telegraphs, 1937*, table 14.

Miles of wire are not an adequate index of the growth in telephone capacity for a variety of reasons: The shift from single open wire lines to complex cable systems including coaxial tubes; use of carrier systems to increase significantly the number of communication channels over a band of frequencies transmitted over an electrical circuit; and use of microwave radio systems not included in the statistics of wire lines.

R 17–19 and R 24–25. Operating revenues, net income, and dividends, 1880–1956.

Source: 1881-1914, FCC, records consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 39, 54, 73, 81, 89, 109 (for operating revenues and division between local and toll revenues, 1900-1914, Schedule B-2 of *Special Investigation Docket No. 1*, Exhibit No. 1364 combined with Long Lines revenues from p. 395 of Exhibit 1360-B); 1915-1956, AT&T, annual reports, and FCC, records. Census data are from the following reports (see general note for series R 1-89 for detailed listing of sources): *Compendium of the Tenth Census, 1880*, p. 1329; *Statistics of Manufactures, 1890*, pp. 1, 5; *Telephones, 1907*, table 36; *Telephones and Telegraphs . . . , 1912*, table 29; *Telephones, 1917*, tables 21, 30, and 31; *Telephones, 1922*, tables 2, 31, 32; *Telephones, 1927*, table 1; *Telephones and Telegraphs, 1932*, table 1; *Telephones and Telegraphs, 1937*, table 1.

Figures for series R 17–19 for 1900–1914 have been adjusted by the FCC by subtracting uncollectible operating revenues so that they are comparable with figures for 1915-1956.

Operating revenues include monthly service charges; amounts charged for connection, restoration and termination of service, and for moves, instrument changes, and similar service requirements; initial nonrecurring charges for plant or equipment, except initial charges based on the cost of specially assembled private branch exchanges; and amounts of service charges for supplemental or auxiliary equipment as extension stations and auxiliary receivers. Operating revenues include the telegraph services of the Bell System, including revenues derived from teletypewriter exchange service (TWX), and private line service; international radiotelephone service; directory advertising and sales; and rent revenues.

Net income is net operating income and other income, including dividend income and interest income, including interest charged to construction; minus miscellaneous deductions from income and fixed charges (as interest deductions). All of the Bell System operations are included; however, as noted below (see text for series R 22), prior to 1933 only the dividends from controlled companies not consolidated were included.

Dividends declared refer to the entire Bell System operations, excluding dividends paid by one System Company to another.

R 20. Operating expenses, 1880–1956.

Source: 1885–1907, FCC, records consisting of *Special Investigation Docket No. 1*, Exhibit 1360-A, pp. 54, 73, 109 (figures for operating expenses derived by subtracting net earnings from revenues); 1908-1935, AT&T, annual reports; 1936-1956, AT&T, annual reports, and FCC, records. For census data, see source for series R 17–19 and R 24–25.

For 1885–1907, FCC's figures include all taxes (including Federal income taxes) and interest expense and miscellaneous income. For 1908–1913, figures also include Federal income

Digitized by Google

taxes. For 1914–1920, figures were adjusted to exclude estimated amounts of Federal income taxes by use of annual reports of the individual Bell Telephone companies to the ICC. For 1921–1935, the Federal income tax adjustment was obtained from AT&T records.

Figures include that portion of the expenses of Bell Telephone Laboratories absorbed by AT&T.

R 21. Federal income taxes, 1914–1956.

Source: 1914–1920, FCC, records (approximations derived from annual reports of individual Bell System companies to the ICC); 1921–1935, AT&T, records; 1936–1956, AT&T, annual reports, and FCC, records.

R 22. Income from Western Electric Company, 1882–1956.

Source: AT&T, annual reports, and FCC, records.

Since 1933, instead of including under this item only the dividends from controlled companies not consolidated, the AT&T has included its proportionate interest in the total earnings or deficits of such companies.

In recent years, AT&T's annual share of the net income of Western Electric has exceeded $50 million. In 1956, it was over $80 million.

The historical growth of the Western Electric Company is described in the FCC *Report . . . on the Investigation of the Telephone Industry . . .*, pp. 56-64. More recent data appear in the "Report on Preliminary Survey and Investigation of Western Electric Company, Inc." prepared by a committee of National Association of Railroad and Utilities Commissioners and FCC representatives (July 15, 1948, processed), and in annual supplements since 1948.

R 23. Interest expenses, 1885–1956.

Source: AT&T, annual reports, and FCC, records. Census data are from the following reports: *Special Reports, Telephones, 1907*, table 57; *Census of Electrical Industries: 1917, Telephones*, table 30; *Census of Electrical Industries: Telephones, 1922*, table 31.

Interest expense includes interest on all classes of debt owing to the public but excludes intercompany interest payments.

R 26–27. Employees and wages, 1880–1956.

Source: 1885–1899 and 1907–1935, (except for series R 27) FCC, records consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 76, 136, 147; 1900–1906, AT&T, records; series R 27, 1913–1935, AT&T, records; 1936–1956, AT&T, annual reports to stockholders, and FCC, records. Census data are from the following reports (see general note for series R 1–89 for detailed description of sources): *Compendium of the Tenth Census, 1880*, p. 1327; *Statistics of Manufactures, 1890*, p. 1; *Telephones and Telegraphs, 1902*, tables 2, 6; *Telephones and Telegraphs . . ., 1912*, tables 3, 29; *Telephones, 1917*, table 1; *Telephones, 1922*, table 1; *Telephones, 1927*, table 1; *Telephones and Telegraphs, 1932*, table 1; *Telephones and Telegraphs, 1937*, table 1.

Employee figures for 1885–1935 exclude Western Electric Company.

Figures for 1939–1956 also appear in the FCC annual issues of *Statistics of the Communications Industry in the United States*. These issues also contain detailed reports of the occupational classifications and wage rates of Bell System employees.

R 28–42. Independent telephone companies—property, revenues, expenses, interest, net income, dividends, employees and wages, 1916–1956.

Source: 1916-1934, FCC, records; 1935-1956, *Annual Statistical Volume of the United States Independent Telephone Association* (USITA), various issues. Census data are from the following reports (see general note for series R 1–89 for detailed description of sources): *Telephones, 1917*, tables 1, 30, 31, 33; *Telephones, 1922*, tables 1, 22, 32; *Census of Electrical Industries: Telephones, 1927*, tables 1, 34; *Telephones and Telegraphs, 1932*, table 1; *Telephones and Telegraphs, 1937*, table 1.

The large discrepancy between the census figures and the ICC and USITA figures is due to the major differences in coverage. The following excerpt from Bureau of the Census, *Telephones, 1922*, refers to census coverage:

> **Unit of enumeration ("system" or "line").**—So far as practicable, a report was secured for each system or line operated under separate ownership. The terms "system" and "line" are sometimes used as synonymous, but in general the former is employed with reference to the aggregations of lines operated by the larger companies, whereas the latter is more commonly used to denote the small farmer or rural lines. A farmer or rural line may be merely an individual line connected with an exchange under different ownership, or may be a party line without an exchange or connected with an exchange owned jointly with other lines or under independent ownership.

Figures for 1916–1933 were based on ICC annual summaries (which did not differentiate between the Bell System and the independent telephone companies) and were derived by subtraction from the ICC figures of those amounts for each company included on a consolidated basis in the data shown for series R 14–27.

Figures for 1935–1956 were obtained by USITA from various sources: Reports of independent telephone companies to the FCC, to State commissions, and to the USITA. For recent years, the publications provide detailed data on companies reporting to the USITA, and limited data in respect to companies not reporting to the USITA. Certain totals for combined reporting and nonreporting independent companies are shown for 1947-1956 in the USITA *1957 Annual Statistical Volume . . .*, p. 1.

A discussion of the relations between the Bell System and the Independents is presented in the FCC *Report . . . on the Investigation of the Telephone Industry . . .*, pp. 123–146; and a Report of Committee of National Association of Railroad and Utilities Commissioners and FCC representatives, *Message Toll Telephone Rates and Disparities*.

R 43–71. General note.

Since the 1850's the Western Union Telegraph Company has been the dominant carrier in the domestic telegraph industry. Established in 1851 as the New York & Mississippi Valley Printing Telegraph Company, this company succeeded by 1866 in acquiring or merging dozens of competing telegraph companies and emerging as the sole telegraph company in the United States. (See Robert Luther Thompson, *Wiring a Continent; the History of the Telegraph Industry in the United States, 1832-1866*, Princeton University Press, 1947.) In succeeding decades, smaller telegraph companies were formed, serving a region or major cities, often with the intent of forcing Western Union to acquire them. Western Union developed close contractual ties with the railways. Telegraph pole lines were constructed along railroad rights-of-way. The lines were used jointly for general telegraph and railroad telegraph communication and signaling; and railroad stations and personnel were used for the pick-up and delivery of telegraph messages.

Western Union's most serious telegraph rival, Postal Telegraph, was acquired by the Mackay interests in the 1880's as

Digitized by Google

the domestic pick-up and delivery agent for Mackay's Commercial Cable Company (later the International Telephone and Telegraph Company). Until the 1920's, Postal Telegraph competed with Western Union for the larger, and more profitable routes. Beginning in the 1920's, Postal Telegraph attempted to provide a nationwide service in full competition with Western Union. Postal Telegraph expanded its own facilities and also made arrangements with the telephone companies, gasoline stations, and others for the pick-up and delivery of telegrams.

The expansion of Postal Telegraph coincided roughly with the emergence of more effective competition from other sources. Predominantly, such competition came from the growth and development of toll telephone service, the expansion of domestic airmail, the introduction of the Bell System's teletypewriter exchange service (TWX), and the provision of domestic radiotelegraph service by the international radiotelegraph carriers, RCA Communications and the Mackay Companies. (In 1942 as a war measure, domestic radiotelegraph service was discontinued and was not subsequently resumed.) Postal Telegraph's share of domestic telegraph revenues was less than 25 percent. In 1943, Postal Telegraph merged with Western Union. (See FCC, *Reports*, vol. 10, pp. 148–198, September 27, 1943, for Commission approval of the specific terms of the merger.)

R 43–52. Western Union Telegraph Company—summary of facilities, traffic, and finances, 1866–1915.

Source: Series R 43–46 (except 1913), The Western Union Telegraph Company, annual reports; 1913, Moody's Investor Service, *Moody's Public Utilities Reports*, 1919, New York. Series R 47–52 (except R 49, 1914-1915), ICC, Bureau of Valuation, *Accounting Reports, The Western Union Telegraph Company* (December 31, 1915 and June 30, 1919); series R 49, 1914 and 1915, FCC, records. Census data are from the following reports: 1880, *Compendium of the Tenth Census, 1880*, pp. 1310-1325; *Special Reports: Telephones and Telegraphs, 1902*, tables 39, 41; *Telegraph Systems: 1907*, tables 1–8; *Telephones and Telegraphs . . ., 1912*, tables 2, 3.

The data for series R 49, 1914 and 1915 are based on ICC Bureau of Valuation report cited above, Exhibit V, sheets 2 and 3.

According to the *Compendium of the Seventh Census*, 1854, p. 189, there were 89 telegraph lines having 23,261 miles of wire in 1853. In 1854, the miles of wire were estimated at over 30,000.

The 1880 Census data include many companies in addition to Western Union, and the later census data include Postal Telegraph as well as reports from some 15 to 20 small companies. Included in the Postal Telegraph data were the telephone operations of that company. The 1902 Census data include the several domestic ocean-cable systems, while the 1880, 1907, and 1912 Census figures exclude ocean-cable systems other than the Western Union Cable Division.

Other statistics appear in 60th Cong., 2d sess., *Investigation of Western Union and Postal Telegraph-Cable Companies*, U.S. Senate Document No. 725 (1909); State of New York, *Proceedings of Joint Committee Investigation of Telephone and Telegraph Companies* (1910); and *Submarine and Land Telegraph Systems of the World*, an excerpt from the Treasury Department, *Monthly Summary of Commerce and Finance*, January 1899.

R 53–67. Domestic telegraph industry—messages, property, revenues, expenses, net income, dividends, employees, and wages, 1916–1957.

Source: 1916-1928, ICC and FCC, records (annual reports of Western Union Telegraph Company and Postal Telegraph-Cable Company to the ICC); 1929-1955, FCC, *Statistics of the Communications Industry in the United States*, 1955, pp. 110-115; 1956–1957, FCC, records (data are from the annual report of Western Union Telegraph Company to the FCC). Census data are from the following reports (see general note for series R 1–89 for detailed identification of sources): *Census of Electrical Industries: 1917, Telegraphs . . .*, tables 1, 2, 4, 5; *Telegraphs, 1922*, tables 2, 3, 5, 6; *Telegraphs, 1927*, tables 2, 3, 5, 6; *Telegraphs, 1932*, tables 2, 3, 4; *Telephones and Telegraphs, 1937*, tables 2, 3, 4.

For 1916–1928, the Western Union reported landline (domestic) and cable operations on a merged basis; therefore, supplementary material was obtained from Western Union relating to the landline operations. Necessarily, these involve estimates and allocations, the precise bases of which were not specified. For 1929-1955, figures were obtained from annual reports of the telegraph carriers to the ICC and to the FCC, supplemented by correspondence and reference to the reports of the telegraph companies.

Each census report, 1917–1937, included Western Union Cable Division with Western Union telegraph plant. The census reports of 1917, 1922, and 1927 similarly, in reporting Western Union operating revenues, operating expenses, net income, and dividends declared include Western Union Cables. Apparently, in each census report, number of employees and wages and salaries were for Western Union landline system only.

The census data refer to approximately 15 to 20 minor domestic telegraph companies, in addition to Western Union and Postal Telegraph. In 1943, Western Union acquired Postal Telegraph, and the telegraph company data, beginning in 1944, relate to the single merged carrier.

R 53, messages handled. Prior to 1935, the annual count of revenue messages handled was based on a count of messages during the month of January and was partly estimated. For 1935-1950, most of the Western Union message data were based on an actual count for 2 days in each month at some 400 of the largest offices which together accounted for about 80 percent of total message revenues. The Postal Telegraph data continued to be based on counts and estimates for the month of January projected to annual totals. For 1950-1956, Western Union used a scientifically constructed random message sample, the results of which provide generally reliable monthly and annual message data by service classes and rate zones.

Data include telegraph traffic with Canada and Mexico. Such traffic forms only a small portion of the message data.

R 54, private-line telegraph service revenues of telegraph companies. For 1916–1935, data were furnished to FCC by Western Union and added to annual report figures for Postal Telegraph; for 1936-1943, figures are from annual reports of Western Union and Postal Telegraph.

Private line, or leased circuit, revenues are derived from the lease of wires, cables, channels, circuits and similar wire-telegraph facilities to banks, airlines, governmental agencies, and other large organizations for the exclusive use of these customers. The charge for such service is based on contractual rent agreements providing for definite periodic terms without regard to the extent of the service obtained by the users of such facilities.

R 55, Private-line telegraph service revenues of telephone companies. Data for 1916–1938 apply to the Bell System telephone companies only. Data for 1916–1926 and 1935–1938 were obtained from records of the Bell System. Data for

Digitized by Google

1927-1934 were obtained from the Bell System response to the FCC, "Telegraph Division Order No. 12," and appear in "Some Aspects of Competition Affecting the Land Wire Telegraph Industry" (1937), an unpublished FCC staff study. For 1939-1956, data include all telephone companies reporting on an annual basis to the FCC (roughly varying between 90 and 125).

R 56–57, telegraph plant. Effective January 1, 1914, the ICC prescribed a Uniform System of Accounts for telegraph and cable companies and required the carriers to keep their accounts in conformity with this system. All charges made to plant and equipment or other property accounts with respect to any property acquired on or after January 1, 1914 were to be the actual money costs of the property. The ICC did not attempt to prescribe the depreciation rates of the carriers.

In 1940, the FCC adopted a revised uniform system of accounts for wire telegraph and ocean cable carriers, to go into effect January 1, 1942. The effective date was later postponed to January 1, 1943. The new system was designed to supplant the previous system in use since 1914. The FCC prescribed depreciation rates for the telegraph carrier, effective January 1, 1948. After the merger of Western Union and Postal Telegraph, the Commission required that the merged carrier reclassify its plant as of January 1, 1943.

Telegraph plant book costs for 1946–1956 were affected by two conflicting factors: Accelerated retirement of old plant, and addition of new plant as part of the general modernization program of the Western Union Telegraph Company begun in 1946. As part of its modernization program the Western Union Telegraph Company leased substantial plant, in the form of voice channels, from the Bell System.

Census figures on book cost of plant include Western Union cables in all years.

R 58, miles of wire. Wire figures are not a satisfactory measure of the capacity of the domestic telegraph industry for various reasons, including the shift from less efficient open wire to more efficient cable; the introduction of multiplex terminal equipment, which has permitted a significant subdivision of each telegraph channel and the simultaneous transmission of messages on each such subdivision; the leasing from the Bell System telephone companies of voice-frequency channels and the subdivision of these channels into a substantially greater number of telegraph channels; operation by Western Union of its microwave radio system for the transmission of messages; and use of modernized routing and switching systems.

R 59–65, finances, employees, and wages and salaries. Operating revenues are derived, in the bulk, from various transmission and nontransmission telegraph services. However, a small proportion has been derived from incidental services, such as errand service, time service, and code registration. The operations of the former Postal Telegraph toll telephone system were included until February 1, 1952, when Western Union disposed of this service. Also included in operating revenues are revenues derived by the domestic telegraph carriers in handling the domestic haul of insular, mobile, and foreign cable and radiotelegraph communications. Such domestic haul is between the "gateway" cities and the interior of the nation.

To obtain data on total operating expenses, the domestic telegraph carriers (Western Union and Postal Telegraph) were required to subdivide their expense accounts as between domestic and international operations in respect to compensation, overhead, materials and supplies, and other charges. Such allocations are subject to some arbitrariness.

Census data for 1917, 1922, and 1927 with respect to operating revenues, expenses, and net income differ from the other data as a result of the inclusion of Western Union cable operations and the inclusion of minor companies, in addition to Western Union and Postal Telegraph.

No adjustments were made in the annual reported income statements. Thus, the net loss shown for 1945 resulted from a substantial retroactive wage award made by the War Labor Board. This was shown in the 1945 statement of the Western Union Telegraph Company as an extraordinary charge (less recoverable income taxes).

Income taxes are total Western Union income taxes minus those assigned by the company itself to its cable operations. The amounts assigned to Western Union cables were obtained by the FCC from Western Union on an informal basis. Income taxes for 1924 and prior years are not available separately and are included in total operating expenses.

Dividends declared include the entire operations of Western Union, domestic and international. No basis exists for allocating these dividends.

Number of employees were reported as of different periods: 1929–1934, at the end of June; 1935–1945, at the end of December; and 1946-1956, at the end of October. However, wages and salaries are uniformly reported for the calendar year ending December 31.

R 66–67, Bell Teletypewriter Exchange (TWX) Service. For 1931–1934, data are from responses to FCC, "Telegraph Division Order No. 12"; for 1935–1938, from the FCC *Annual Report.*

Teletypewriter exchange service (TWX) was initiated November 21, 1931. The revenues from this service, as well as the private line telegraph revenues of telephone companies, are not included in total operating revenues, which is limited to the revenues of domestic telegraph carriers.

R 68–71. Domestic telegraph message rates and TWX rates between New York City and selected cities, 1850–1956.

Source: FCC, records.

The 1850 rates are cited in William Holmes, *History of Telegraph Rates, 1860 to 1913* (an unpublished study obtained by the FCC from the Western Union Telegraph Company), p. 2. The same source states (p. 8) that the New York-Chicago rate from 1866 to October 1, 1869 was $1.85, although James D. Reid, *The Telegraph in America* (1886), p. 746, states that the Chicago rate was $2.05 between 1866 and 1869, and U.S. Senate, 60th Cong., 2d sess., *Investigation of Western Union and Postal Telegraph Cable Companies*, Document No. 725 (1909), p. 24, claims that in 1866 this rate was $2.20. Holmes, p. 8, is the source for the 1866 and 1869 New York-Philadelphia rates. Reid, p. 746, quotes the New York-San Francisco rates for 1866 and 1869. The *Investigation of Western Union . . .*, p. 24, is also the source for the New York-Denver rate as of 1866. The 1870 rates are mentioned in 51st Cong., 1st sess., *Hearings before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities*, p. 131. In addition, Holmes, p. 9, states that in 1870 the maximum rate from States north of Washington, D.C., to San Francisco was reduced from $7.45 in currency (or $6.75 if paid in gold) to $5.00 in currency (or $4.00 in gold). The 1873 rates are shown in *Investigation of Western Union . . .*, p. 24. Holmes, p. 10, states that the $2.50 San Francisco rate became effective February 1, 1873, and a reason given was that $2.50 was the denomination of a coin in common use on the Pacific Coast. The same source, p. 12, describes the New York-Chicago rate in 1875 as having been 25 cents and in 1877 as being successively increased to 40 cents, 50 cents, and 60 cents. Holmes also states, p. 11, that the New York-Denver rate became $2.00 in March 1876 and that the San Francisco rate was reduced to $2.00 in August 1876. However, Reid

Digitized by Google

mentions, p. 747, March 1877 as the date $2.00 was fixed as the maximum rate between New York City and points east of the Rocky Mountains. The 1883 rates are also from *Investigation of Western Union . . .*, p. 24. Holmes, p. 17, states that the $1.00 San Francisco rate became effective in March 1884 as part of a general reduction which established $1.00 as the maximum rate for a 10-word full rate telegram between any two points in the Western Union system. Holmes also reports, p. 17, that in June 1884 the rate between New York and Chicago charged by Western Union was 50 cents, by Postal Telegraph, 25 cents, and by the Baltimore and Ohio Telegraph Company, 40 cents. The 1888 rates are based on State of New York, *Report of the Joint Committee of the Senate and Assembly of the State of New York Appointed to Investigate Telephone and Telegraph Companies* (transmitted to the Legislature March 21, 1910), p. 687, and the annual report of Western Union to stockholders for 1888, p. 5. The 1890 rates are from *Hearings Before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities*, p. 68. The rates in effect as of 1908 are from *Investigation of Western Union . . .*, p. 24, although there is evidence from other sources that some of these rates were put into effect in 1907. The 1919 rates were the result of a 20 percent increase in domestic telegraph rates as set forth in the 1919 Western Union annual report to stockholders, p. 8.

The 1931 TWX rates are from testimony on behalf of AT&T by Mr. Carroll O. Bickelhaupt in the hearings pursuant to FCC, "Telegraph Division Order No. 12."

All rates beginning with the 1946 increase are derived from official tariffs filed with the FCC.

The census report, *Special Reports: Telephones and Telegraphs, 1902*, states (p. 14) that the first telegraph rate was applicable in 1845 between Baltimore and Washington and was one cent for each group of four characters. The rates shown here are mainly those of the Western Union Telegraph Company. During some of the early years, lower rates were sometimes published by competing companies. The frequent changes in the New York-Chicago rate illustrate particularly the effects of competition. New companies appeared offering lower rates on this basic route and Western Union was forced to meet the competition until such time as it succeeded in acquiring the competing company. Moreover, it is not certain that the published rates were adhered to uniformly, particularly in the early years of telegraph development and in periods of depression. Under the stress of competition, rebates were sometimes allowed.

The rate for the full-rate telegram is the keystone of the telegraph rate structure. Rates for most other public message telegraph services (day letters, night letters, etc.) are a percentage of the rates for the full-time telegram. Between 1908 and 1946, there was no change in the level of the full-rate telegram, except for the increase effected in 1919. However, while maintaining the rate level on its full-rate telegrams, Western Union introduced various new classifications (including the fixed text social message and serials) which in effect provided discounts to the message customer.

TWX is provided only by the Bell Telephone System. As contrasted with message telegraph service, which is a 1-way communication service, TWX provides 2-way, instantaneous communication service between TWX subscribers. The maximum number of words which can be transmitted in the 3-minute rate period depends on the speed of the transmitting operator (provided by the subscriber) and the maximum rated speed of the TWX equipment. In addition to the charges for specific use (measured in time units and distance) of the facilities, TWX subscribers since July 1, 1953, have been billed a monthly service charge of $10.

R 72–85. General note.

The first successful cable linking North America with Europe was laid in 1866. Radio was not a significant factor in overseas telegraphy until 1920 when the newly formed Radio Corporation of America (RCA) entered the field as successor to Marconi Company of America. The record of hearings held in 1929 before the Committee on Interstate Commerce, United States Senate, 71st Cong., 1st sess., on S. 6, a "Bill to Provide for the Regulation of the Transmission of Intelligence by Wire or Wireless," contains (pp. 960-972) a list of submarine cables of the world, and the year in which each was laid. Since most of the first cables are still in use, it is possible from this source to develop a fairly complete history of ocean-telegraph cables. Similarly, information on the beginnings of international radiotelegraphy appears in the *Report of the Federal Trade Commission on the Radio Industry* (1924).

The first overseas radiotelephone service was opened in 1927 between New York and London by AT&T. The only overseas telephone service available during 1921-1926 was to and from Cuba by means of cable.

The census data are derived from the special quinquennial census reports of the telephone and telegraph industries (see general note for series R 1-89). With respect to international telegraph, these reports suffer from two major shortcomings. First, the Bureau of the Census was unable to obtain from the Western Union Telegraph Company a division between its land-line system and its cable operations with respect to plant and financial operations. Prior to the 1932 Census, Western Union provided separate data for its cable operations only in the categories of messages and cable mileage. In the Censuses of 1932 and 1937, Western Union also supplied operating revenue information for its cable system. The absence of Western Union's Cable Division from the census data on the ocean-cable companies largely accounts for the significant differences between the census data and the annual series with respect to telegraph plant book cost and depreciation reserves, operating revenues, operating expenses, and net income.

A second shortcoming of the census data is the lack of adequate coverage of the radiotelegraph industry. The financial information included in the 1922 and 1937 Census compilations is seriously distorted because of the failure to exclude various activities of the Radio Corporation of America not related to its telegraph communications business. In the 1932 Census, no information on radiotelegraph appeared, while in the 1937 Census the published statistics relate only to messages and operating revenue. Consequently, the only census data shown with respect to radiotelegraph are the message statistics, and $9,515,000 in operating revenues included within the 1937 cable-radiotelegraph total.

R 72–74, R 76–78, R 80–85. Telegraph messages, plant, nautical miles of ocean-telegraph cable, operating revenues and expenses, Federal income taxes, net income, employees, and wages, 1907–1957.

Source: 1916-1928, FCC, records; 1929–1956, *Statistics of the Communications Industry in the United States*, 1955 and 1956 issues, table 19; 1957, *Statistics of Communications, Common Carriers*, 1957. Census data are from the following reports (see general note for series R 1-89 for detailed description of sources): *Telegraph Systems: 1907*, pp. 10, 19; *Telephones and Telegraphs . . ., 1912*, pp. 165, 167; *Telegraphs, 1927*, pp. 19, 25; *Telephones and Telegraphs, 1937*, pp. 49, 52.

Annual data prior to 1929 were derived in part from annual reports of the carriers filed with the ICC. In large part, these data were obtained through field examinations by the staff of the FCC and from data supplied by the carriers upon specific request.

Digitized by Google

Cable and radiotelegraph messages (series R 72–74) include communications sent from, received in, and transiting the United States and its territories and possessions. In addition, radiotelegraph messages include ship-shore messages, and domestic telegraph messages handled over radiotelegraph circuits prior to the closure of such circuits on June 30, 1942.

Plant and financial statistics (series R 76–77) are on basis of the currently effective systems of accounts. The radiotelegraph accounts became effective January 1, 1940, and the ocean-cable uniform system accounts January 1, 1943 (replacing an earlier cable accounts system promulgated by the ICC, effective January 1, 1914).

The miles of ocean cable (series R 78) as published have been adjusted in view of the fact that some of the cables were reported and tabulated in statute miles rather than nautical miles.

Federal income taxes prior to 1929 are included in operating expenses (series R 81) in amounts which are not ascertainable. The substantial decline in net income in 1912 compared with 1907 may have been accounted for in large measure by the introduction of depreciation charges which were absent from the 1907 accounts.

Included in employees and compensation (series R 84-85) are the foreign employees of the carriers. The reporting dates for number of employees have varied: For 1929-1934, as of the end of June; for 1935-1945, as of the end of December; for 1946-1956, as of the end of October.

R 75. Overseas telephone calls, 1921–1956.

Source: 73d Cong., 2d sess., *Report on Communication Companies*, House Report No. 1273, pt. III, No. 2, p. 1459 (1935); and AT&T, records.

Figures include calls to and from ships on the high seas. Telephone service with Cuba is by means of submarine cable, with Canada and Mexico by means of wire lines, and with Alaska by means of wire lines and radio. Additional data on radiotelephone service are contained in the *Statistics of the Communications Industry in the United States*. See also *Census of Electrical Industries: Telephones and Telegraphs, 1937*, table 9.

R 79. Overseas countries served by direct radiotelegraph circuits, 1912–1956.

Source: FCC, records (supplemented and confirmed in *Report of the Federal Trade Commission on the Radio Industry* and *Report on Communication Companies*, House Report No. 1273, pt. III, No. 1, pp. 990, 998; pt. III, No. 4, pp. 3934, 3948, and 4188).

R 86–89. International cable and radiotelegraph rates between New York City and selected cities, 1866–1956.

Source: 1866-1928, scattered sources as indicated below; 1929-1956, FCC, records.

New York to London. The first successful transatlantic cable was laid in 1866. James D. Reid, *The Telegraph in America* (1886), p. 748, indicates that the first telegraph rate on the cable (presumably New York to London) was $100 for 10 words. Three months later, the same source states, the rate was reduced to $50 and subsequently to $25. By 1868, the rate for 10 words had declined to $15.75, and in 1885 it stood at 40 cents per word. A staff document of American Cable & Radio, Inc., prepared in connection with FCC Docket No. 8777 (1948) indicates that the Western Union Telegraph Company had a 50 cents per word rate in 1884, and that on December 24 of that year the Commercial Cable Company entered the field with a rate of 40 cents per word. The same source indicates that the cable companies other than Commercial Cable reduced their rates to 12 cents per word on May 6, 1886, and Commercial Cable in turn lowered its per word rate from 40 cents to 25 cents. On September 16, 1887, Commercial Cable further reduced its rate to the 12 cent level. Then on September 1, 1888, all the cable companies raised their rate between New York and London to 25 cents per word.

Exhibit No. 190, introduced by RCA Communications, Inc., in the same hearing (Docket No. 8777) shows the same rates, but with somewhat different effective dates; while William Holmes, *History of Telegraph Rates, 1860 to 1913*, p. 23, cites rates which differ in part from those shown here.

In 1916, it became possible to send messages from New York to London through Canada via Marconi Wireless for 17 cents per full rate word. According to the FTC *Report on the Radio Industry*, p. 36, RCA, on March 1, 1920, began transmitting radiotelegraph messages to Great Britain. The rate initially was 17 cents per word, with an increase to 18 cents on January 1, 1921, and to 20 cents on April 15, 1923. At this point the international cable companies reduced their rate to 20 cents to meet the radio competition. Since then, the rates for cable and radio have been identical.

The rate reductions effective May 1, 1945, provided for a uniform 20 cents per word basic rate from the United States "gateway" cities to a large part of the world (see FCC, *Eleventh Annual Report for Fiscal Year Ended June 30, 1945*, p. 45). Effective May 1, 1946, all international cable and radiotelephone rates were established on a country-to-country basis at 20 cents and 30 cents per word, respectively.

The reductions in rates, effective July 1, 1950, are the result of "unification" of the full rate and the code rate on all cable and radiotelegraph service. The rates were unified at 75 percent of the existing rate per full-rate word. This had the effect of lowering the charge for full-rate messages but increasing the charge for code messages which form a substantial portion of international telegraph traffic.

New York to Cairo. Telegraphic communication between New York and Cairo began, probably, in 1870 or shortly thereafter. A Commercial Cable Company tariff book, dated January 1903, indicates a rate of 61 cents per word as of that time. A July 1905 tariff book of the Western Union Telegraph Company shows a New York-Cairo rate of 56 cents per word; 25 cents was the rate for the New York-London haul and 31 cents for the rate beyond London. No record has been found of rates in effect between 1905 and 1925. Data since 1925 are from the FCC based on filed tariffs and correspondence with companies.

New York to Tokyo. No specific record has been found dating the beginning of telegraphic communication with Tokyo. In the hearings before the Senate Committee on Foreign Relations, 54th Cong., 1st sess., Senate Document No. 194 (1896), conflicting testimony was presented with respect to the early rates. The Commercial Cable Company tariff book of January 1903 stated that the rate at that time was $1.76 per word. Shortly thereafter Commercial Pacific Cable Company opened its trans-Pacific cable and the rate fell to $1.53 per word. This rate included 12 cents per word for the domestic landline haul from New York to San Francisco, and $1.41 for the San Francisco-Tokyo leg. *Report on Communication Companies*, 73d Cong., 2d sess., House Report No. 1273, pt. III, No. 4, p. 3926, is the source of the New York-Tokyo rates between 1903 and 1929. FCC is the source of rates since 1929. For data on radiotelegraph rates lower than cable rates prior to 1925, see FTC, *Report on the Radio Industry*, p. 35, and testimony before the House Committee on the Merchant Marine and Fisheries, pursuant to H.R. 7357, 68th Cong., 1st sess., p. 170.

New York to Buenos Aires. The 1880 rate is stated in the *1956 Annual Report of the American Cable and Radio Corporation to Stockholders*, p. 16. Rates between 1882 and 1927 are derived from testimony before the Senate Committee on Interstate and Foreign Commerce, 71st Cong., 2d sess., on S. 6 (1929-1930) beginning p. 2201, and *A Half Century of Cable Service to the Three Americas* (1928) published by All America Cables, Inc. When radio service was opened in 1924 the rate was fixed at the same level as the existing cable rate. FCC is the source for rates since 1929.

New York international radiotelephone rates to selected cities. The first overseas radiotelephone service was opened on January 7, 1927, between New York and London. Service to Buenos Aires began April 3, 1930, and to Tokyo December 8, 1934. The circuit to Cairo, opened August 8, 1932, operated via London until January 7, 1946, when a direct circuit to Cairo was placed in operation. As in telegraph, the Tokyo radiotelephone rate included a landline haul charge until 1946 for the New York–San Francisco haul. Initially $9.00, the landline charge was reduced to $6.75 on July 1, 1937, and to $4.50 on August 1, 1940. All radiotelephone rates presented are for 3 minute weekday daytime calls. In addition, there are lower night and Sunday rates on some routes.

[1] Includes miscellaneous revenues not shown elsewhere.
[2] Excludes Federal income taxes.
[3] Beginning 1915, includes miscellaneous sources of income, less miscellaneous deductions.
[4] Excludes intercompany payments.
[5] Represents net loss.

RADIO AND TELEVISION (Series R 90–138)

R 90–138. General note.

Federal regulation of radio communication has been continuous since 1912 when the Department of Commerce was given authority to license radio equipment and radio operators, and broadcast stations, which began operation in 1921. On February 23, 1927, Congress established the Federal Radio Commission with broad authority for the regulation of radio. In 1934, the powers of the Federal Radio Commission were transferred to the Federal Communications Commission.

Principal governmental sources of statistics in respect to broadcast and nonbroadcast radio services include the following:

1. Census reports: *Census of Business, 1935: Radio Broadcasting.* Fifteenth Census Reports, *Population*, vol. VI, *Families*, 1930. Sixteenth Census Reports, *Housing*, vol. II, part 1, 1940. *U.S. Census of Housing: 1950*, vol. I, part 1.
2. *Annual Report of the Secretary of Commerce*, 1913–1926.
3. *Annual Report of the Federal Radio Commission*, 1927–1933.
4. *Annual Report of the Federal Communications Commission*, 1938–1956.
5. Federal Radio Commission, *Commercial Radio Advertising*, 1931.
6. House Report No. 1273, 73d Cong., 2d sess., *Report on Communication Companies*, 1934.
7. Federal Communications Commission reports: *Report on Chain Broadcasting*, 1941; *The Public Service Responsibilities of Broadcast Stations*, 1946; "An Economic Study of Standard Broadcasting," October 1947 (processed); House Report No. 1297, 85th Cong., 2d sess., *Network Broadcasting*, 1958.

Since 1937, the FCC has obtained annual financial reports from networks and broadcast stations. Statistical tabulations of the data so reported have been made available by the FCC in its annual reports; in its annual *Statistics of the Communications Industry in the United States*, 1939-1949; and in annual processed reports. Unlike the telephone and telegraph industries, radio broadcasting is not classified as a common carrier and is not subject to rate or earnings regulation. The FCC, therefore, does not prescribe a uniform system of accounts for the radio industry. However, the Commission's Annual Report Form No. 324, and the accompanying instructions, ensures general uniformity in the reported data. The individual financial reports of networks and stations filed with the FCC are not available for public inspection. However, some individual network and station data have been published from time to time, as for example, in a Committee Print, 84th Cong., 2d sess. (Senator John W. Bricker), *The Network Monopoly: Report Prepared for Use of the Committee on Interstate and Foreign Commerce*, 1956; *Monopoly Problems in Regulated Industries; Hearings before the Antitrust Subcommittee of the Committee on the Judiciary*, 84th Cong., 2d sess., 4 vols., part 2, 1956.

R 90–94. General note.

Statistics of broadcast stations are commonly presented in terms of "authorized" and of "licensed" stations. A broadcast station is authorized when it receives a construction permit from the FCC (or predecessor licensing agencies). Normally, a station is expected to complete construction and begin regular operation within 8 months thereafter. However, not all authorized stations complete this process and become operating stations. This has occurred mainly in the newer broadcast services, frequency modulation (FM) and television (TV).

Similarly, statistics of "licensed" stations can be misleading. A station permittee who has completed construction in accordance with the specifications of the construction permit or a modification thereof, usually receives a regular license, prior to start of regular on-the-air program service. However, for a variety of reasons, the FCC has permitted stations to undertake regular broadcast service under a Special Temporary Authorization. Many stations have operated under such authority for a number of years. Here, again, this statement applies particularly to FM and TV stations.

Figures for these series are for the most part presented in terms of operating stations. Stations are recorded in FCC records as operating when they have received permission to conduct program tests. In some instances, considerable time may elapse before such stations are in regular, daily operation. Adjustments for this factor have been made by the FCC on the basis of trade sources, and such adjustments are incorporated here. In sum, the data on operating stations are not precise, but are believed to be reasonably accurate.

R 90. Standard broadcast (AM) stations, operating, 1921–1956.

Source: 1921, FCC, records; 1922-1926, *Annual Report of the Secretary of Commerce*, various issues; 1927-1933, *Seventh Annual Report of the Federal Radio Commission for Fiscal Year 1933*, p. 18; 1934-1956, FCC, records.

Prior to 1948, data pertain to licensed stations which, in the AM service, generally approximated operating stations.

Figures are not available annually on the number of noncommercial AM stations because there is no separate noncommercial service. Usually, such stations are supported by educational or public bodies. In the early growth of radio prior to 1927, educational institutions were prominent in radio (see S. E. Frost, *Education's Own Stations; the History of Broadcast Licenses Issued to Educational Institutions*, University of Chicago Press, 1937). Since 1945, the number of noncommercial AM stations has remained fairly constant at about 35. In addition, a small number of educational institutions operate commercial stations.

The decline in the number of AM stations between 1927 and 1929 followed the transfer of the licensing function from the Secretary of Commerce to the Federal Radio Commission. The latter body tightened the licensing requirements, resulting in the withdrawal or deletion of a number of operating stations.

R 91–92. Frequency modulation (FM) stations operating, 1941–1956.

Source: FCC, records.

FM was authorized as a regular service in 1940, effective January 1, 1941, and the first commercial station was licensed in 1941. Noncommercial FM is a separate service with a specific spectrum allocation. The stations are licensed to nonprofit educational organizations.

R 93–94. Television (TV) stations operating, 1941–1956.

Source: FCC, records.

Television was authorized on a regular commercial basis, effective July 1, 1941, and 2 stations in New York began operating as of that date. Figures include very high frequency (VHF) stations, first authorized in 1941, and ultra high

Digitized by Google

frequency stations (UHF), first authorized in 1952. Some stations (almost entirely UHF stations) began operation and subsequently ceased operation, but retained their FCC authorization. Such stations are not included in the years of nonoperation.

R 95–96. Sets produced, 1922–1956.

Source: Electronic Industries Association, *Electronics Industry Fact Book*, 1957, pp. 4, 5.

Figures are based on reports of members of the Electronic Industries Association (formerly Radio-Electronic-Television Manufacturers Association) adjusted for estimated production of nonmembers. Radio set figures include home sets for all years; auto sets, 1930-1956; portable sets, 1939-1956; and clock sets, 1951-1956. Auto sets have constituted over 30 percent of total radio set production for 1949-1956. The figures also include sets produced for export. As of July 1, 1957, it was estimated by Electronic Industries Association that there were 135 million radio sets in working order in the United States, including 90 million sets in homes, 35 million in automobiles, and 10 million in public places.

R 97. Families with radio sets, 1922–1956.

Source: Annual figures, National Broadcasting Company (NBC), records. Census data, as follows: 1930, Fifteenth Census Reports, *Population*, vol. VI, *Families*, table 39; 1940, Sixteenth Census Reports, *Housing*, vol. II, part 1, table 10; 1950, *U.S. Census of Housing: 1950*, vol. I, part 1, table 13.

NBC accredits data on radio ownership prior to 1950 to the National Association of Broadcasters (NAB), which is the national trade association of broadcasters, and to Broadcast Measurement Bureau, a private survey group, which conducted a detailed nationwide survey of radio listening. A survey conducted by the Columbia Broadcasting System (CBS), the results of which were published as "Lost and Found," purported to show 2,450,000 families with radios not enumerated in the 1930 Census of Population. Accordingly, the NAB adjusted the 1930 Census figure to 14,499,000. Similarly, 964,026 occupied dwelling units did not report concerning radio ownership in the 1940 Census of Population. The NAB estimated that 786,043 of these should be added to the 1940 Census figure of 28,048,219 occupied units with radio.

The figures include radio sets which may not be in working order. Sets temporarily out of order or being repaired at the time of enumeration were included in the census data. As of January 1, 1956, a joint network Radio Advertising Association estimate showed that there were 1,800,000 households with radio sets not in working order.

The figures exclude radio sets in places of business, institutions, and hotels.

R 98. Families with television sets, 1946–1956.

Source: National Broadcasting Company, records. Census data for 1950 from *U.S. Census of Housing: 1950*, vol. I, part 1, table 13.

An indication of the accuracy of the estimates is provided by several surveys of TV ownership in the Nation's households conducted by the Bureau of the Census for the Advertising Research Foundation. These studies have yielded the following estimates:

	June 1955	*March 1956*	*August 1956*
Total sets in TV homes	33,269,000	37,277,000	39,568,000
TV homes	32,106,000	35,495,000	37,410,000
Second sets in TV homes	1,163,000	1,782,000	2,158,000
TV homes as percent of total homes	67.2	72.8	76.1

All figures exclude sets in places of business, institutions, and hotels, but include households with television sets which may not be in current working order.

R 99–102 and R 110–113. Radio and television advertising expenditures, 1935–1957.

Source: 1935-1939, *Printers' Ink Advertisers' Guide to Marketing for 1956*, 1955, p. 68; 1940-1956, same publication, *1959*, 1958, pp. 154–155; 1957, *Printers' Ink*, Feb. 6, 1959, p. 9.

Historical-time series on advertising expenditures were first developed by L. D. H. Weld of the McCann-Erickson Advertising Agency, New York, in 1938. After Dr. Weld's death in 1946, McCann-Erickson continued to prepare the estimates.

Total advertising expenditures in radio and television are total time sales of networks and stations including commissions of advertising agencies and station representatives, as reported by the FCC, multiplied by the estimated "adjustment" factors. For a description of the method used in developing the annual adjustment factors, see the source. Total advertising expenditures are larger than total broadcast revenues as reported by the FCC in two respects: The inclusion of commissions paid to advertising agencies and station representatives; and the inclusion of sums paid by advertisers for talent, program, and production to organizations which do not operate networks or broadcast stations (included in the "adjustment" figures).

The elements in the FCC radio figures merit noting. First, the financial results of approximately 12 "key" stations owned by the networks in the major centers of New York, Chicago, and Los Angeles have been included with network time sales because of difficulties in allocations between national and station operations in these cities. This has had the effect of overstating network time sales and understating national spot and local time sales to some extent. In addition, the FCC data on time sales exclude stations with annual revenues of $25,000 or less. These stations have not been required to detail their time sales. Neither of these elements is present in the FCC series on television time sales.

The networks included in radio are the four national networks—American Broadcasting Company (ABC), Columbia Broadcasting System (CBS), National Broadcasting Company (NBC), and the Mutual Broadcasting System (MBS). The three large regional networks included for most years are the Don Lee Network, the Yankee Network, and the Texas State Network. The networks included in television are ABC, CBS, NBC (each of which operates a network in both radio and television) and until September 1955, the DuMont Network. At that time DuMont withdrew from the network field.

For a detailed discussion of the network system, see the FCC and other reports listed in the general note for series R 90-138; and 84th Cong., 2d sess., Robert F. Jones, *Investigation of Television Networks and the UHF-VHF Problems; Progress Report Prepared for the Committee on Interstate and Foreign Commerce*, 1955.

R 100 and **R 111**, network expenditures. Figures are total expenditures of network advertisers in radio or television for time (i.e., access to the individual stations broadcasting the program); for the program, including talent and production; and for the production of the commercial announcements. Such sums include commissions to advertising agencies but exclude discounts and allowances received by the advertiser. The figures are before disbursements by the networks to their affiliated and owned stations, and exclude the nonnetwork time sales of the stations owned by the networks.

The Publisher's Information Bureau (PIB) provides a monthly series on the billings of each nationwide television network, and through 1956 of each nationwide radio network. The PIB billings differ from either total advertiser expenditures or total broadcast revenues. They are limited to expenditures for time; and they are gross figures before trade or cash discounts or payment of commissions. The PIB figures are published

Digitized by Google

by trade magazines such as *Broadcasting-Telecasting* and *Television Digest*.

R 101 and R 112, national spot expenditures. This type of advertising is commonly confused with commercial, or "spot," announcements. The term "spot" in this context refers to the purchase of time by national advertisers on individual stations "spotted" or selected in various communities. Predominantly, the advertiser expenditures are for commercial announcements adjacent to network or other programs carried by the individual stations. In addition, national spot advertisers sponsor programs or purchase "participations" in station-supplied programs. Thus, national spot advertiser expenditures include total time sales (after discounts but including commissions to advertising agencies and station representatives) multiplied by the estimated adjustment factor for program and production.

R 102 and R 113, local advertising expenditures. These include total time sales (after trade discounts but including commissions to advertising agencies) multiplied by the estimated adjustment factor for program and production. Local advertiser expenditures are made both in connection with the broadcast of commercial announcements and the supply of a program service. The main distinction between national spot and local advertising is, as follows: National spot advertisers are connected with firms or companies which produce or distribute goods or services on a national or regional basis, and which usually place their advertising message on a number of selected stations. Local advertisers are usually local retailers and other organizations whose goods or services are primarily for local distribution. As such, a local advertiser will place his advertising message only on the stations in his community or marketing area. However, in practice, the "national" and "local" categories are not completely differentiated.

R 103–109 and R 114–119. Networks and stations reporting broadcast revenues, expenses, income, gross investment, and employees, 1935–1957.

Source: 1935, *Census of Business, 1935, Radio Broadcasting*, pp. 15, 25; 1937–1957, Federal Communications Commission, *Annual Report*, various issues.

The basic sources of figures shown in the Annual Report are *Statistics of the Communications Industry in the United States*, annual issues, and processed releases of the FCC. Both sources are used prior to 1949; however, only the latter is used subsequently.

FCC began the regular annual collection of financial and operating data from networks and stations in 1937. The respondents each year usually include over 90 percent of commercial stations in operation, accounting for well over 95 percent of total industry revenues, expenses, and income. Statistics based on these reports, particularly prior to 1952, have included considerable detail. These statistics have been made available to the public in the *Annual Report* of the FCC, 1938–1956; *Statistics of the Communications Industry in the United States*, 1939-1949; and in processed releases.

R 103, R 104, and R 114, reporting networks and stations. Prior to 1949 the radio data are limited to commercial standard broadcasting (AM) stations and networks operating in the continental United States and its Territories and possessions, including Puerto Rico. Since 1949, the radio data also include reports of joint AM-FM stations, and reports of FM-only stations. The television data include stations operating in the continental United States and its Territories and possessions.

R 105 and R 115, broadcasting revenues. Figures include the amounts received by networks and stations from the sale of time (net of all trade and cash discounts and commissions to advertising agencies and station representatives) and from other broadcast activities as follows: Gross amount received for services of talent under contract to and in the pay of networks or stations; net commissions, fees, and profits for services in obtaining, or for placing with others, talent not under contract to and in the pay of respondent; amounts received for furnishing manuscripts, transcriptions, productions, or other program materials or services; and amounts received for incidental broadcast activities such as charges for studio facilities and special charges in connection with remote broadcasts, fees or other charges for conducting studio tours, and fees or profits received for the right to operate concessions.

R 106 and R 116, broadcasting expenses. The broad expense categories reported include technical, program, selling, and general and administrative expenses. Among the expenses required to be included are the following: Salaries and wages; talent expenses; film and transcription expense; commissions to staff salesmen; insurance; depreciation and amortization of broadcast investments; rents paid for use of broadcast property; taxes (other than Federal taxes on income); and losses on notes, accounts, and other amounts receivable.

R 107 and R 117, broadcasting income. Figures represent net operating revenues (before Federal income tax), excluding income derived by the networks and stations from sources and operations other than broadcasting.

R 108 and R 118, gross investment. Figures represent investment in tangible broadcast property, before depreciation. The FCC report form requires that the costs be reported on an original-cost basis, and not on the basis of cost readjustments resulting from the sales or transfers of stations. Tangible broadcast property includes land and buildings, if owned, and transmitter and studio property; it excludes financial assets and good will. It is, therefore, not a measure of total investment in broadcasting.

R 109 and R 119, employees. Figures include all employees, staff and nonstaff, full and part time, not excluding general officers and other managerial officials, but excluding "uncompensated" employees. Figures for 1935 are employees reported as of 15th of each month, summed and divided by 12; 1938, week beginning Dec. 11; 1939–1943, middle week in October; 1944–1946, as of Dec. 31; 1946–1948, middle week in October; 1955–1956, as of Dec. 31.

R 120–126. Safety and special radio stations authorized, by class, 1913–1957.

Source: 1913–1926, *Annual Report of the Secretary of Commerce*, various issues; 1927–1934, Federal Radio Commission, *Annual Report*, various issues; 1935–1957, FCC, *Annual Report*, various issues.

Prior to 1948, the only data available to measure the use of radio in various nonbroadcast safety and special radio services were the number of authorized stations. The term "station," however, has not had a uniform significance among these services or within the same service over time. Primarily, the term reflects licensing procedures. A station is a single authorization issued by the FCC (or its predecessor licensing agencies) authorizing the use of one or more transmitters on assigned frequencies. A station may include one of the following: A single fixed transmitter, or a single mobile transmitter; a single frequency; a system including a land station and one or more mobile units; two or more fixed stations; a number of low-power mobile units in one authorization and a single higher-power mobile transmitter in another. Within most of the services, station authorizations have been changed from one to another form in an effort to simplify licensing procedures. As a result, year-to-year changes in the number of stations must be interpreted with caution, particularly if a decrease is shown.

Digitized by Google

In addition to the safety and special services, radio is assuming an ever larger role in the operations of the telephone and telegraph industries. By June 30, 1956, telephone companies operated 819 land mobile radio systems for 2-way communications.

R 127-138. Authorized land stations and mobile transmitters in the safety and special radio services, 1948-1956.

Source: See source for series R 120-126.

The distinctive characteristics of a land station are that it is located at a fixed site, has a fixed antenna and a panel control, and is used for communication in the mobile services (aviation, land transportation, etc.). In land transportation radio services, a land station is often referred to as a base station. Thus, in the taxicab radio service, the base station is used to send and receive communications to and from the associated mobile transmitter-receivers located in the taxicabs. In the marine radio services, coastal stations are examples of land stations, and in the aviation radio services, aeronautical stations are the land stations.

Fixed stations are similar to land stations but are employed in the nonmobile radio services to communicate, or transmit messages, to other land points.

Mobile transmitters, as the name implies, are installed in moving vehicles. They have relatively simple antenna and switching equipment, and are used for transmitting and/or receiving information. Such transmitters usually tie in with a land station, the latter serving as a central control point for communicating with the various mobile units.

One major shortcoming of the transmitter data, however, is that they measure authorized rather than operating transmitters. This divergence is not too great in the case of the land or fixed transmitters. It is estimated that over 90 percent of the authorized transmitters are in operation. However, an entirely different situation prevails with respect to mobile transmitters. As a rough approximation, only 50 percent of the authorized mobile transmitters were estimated as in operation in 1953. Licensees, in applying for authorizations, have wide latitude in estimating the number of mobile units they expect to have in operation within the license period.

POSTAL SERVICE, NEWSPAPERS, AND BOOKS (Series R 139–186)

R 139. Post offices, 1789–1957.

Source: Post Office Department, *Annual Report of the Postmaster General, 1958*, pp. 144-149.

The source also presents a classification of the number of post offices into first, second, third, and fourth class for 1946–1956.

R 140–141. Revenues and expenditures, 1789–1957.

Source: See source for series R 139.

For 1789–1953, revenues and expenses are stated on a cash basis and therefore include payments and receipts in one year applicable to the expenses and revenues of prior years. For 1954–1957, revenues and expenses are stated on an accrual basis, with expenses reported in the year which gave rise to the earnings, whether collected or accrued.

Comparability of figures from year-to-year are affected by various factors. For example, the Post Office discontinued payment of subsidies to airlines in 1954; the Department also began receiving reimbursement for penalty and franked mail in 1954, costs which the Post Office had previously absorbed.

Expenses include expenditures for plant and equipment of a capital nature and for inventories and supplies, but no provision for depreciation is made. Expenses also include certain public service costs paid by the Post Office Department, but which the Department considered to be unrelated to the determination of the proper operating costs of the Postal Service. These include in recent years unreimbursed services for other Government agencies; specific rate subsidies for mailings of second- and third-class mail by certain nonprofit organizations, free-in-county second-class mail, classroom publications, and mail for the blind; excess rates paid to foreign air carriers; and custodial services for other Government departments and agencies. These costs were estimated to have been approximately $43.2 million for 1956.

Expenses of the Post Office Department do not include costs applicable to postal operations which are paid by other Government departments and agencies for retirement pay accrual, workmen's compensation and unemployment compensation for postal employees, and certain custodial and maintenance expenses. These expenses amounted to $157.2 million in 1956.

R 142–143. Ordinary postage stamps and stamped envelopes and wrappers issued, 1848–1957.

Source: See source for series R 139.

R 144. Postal cards issued, 1873–1957.

Source: See source for series R 139.

The Government postal card was authorized in 1872. The post card, or private mailing card, was introduced in 1898. The rate for this service has been practically identical with that of the postal cards. Business reply cards and letters as a postal service was initiated in 1928. The rate for this service since October 1, 1928, has been 1 cent each plus regular postage collected on delivery.

R 145. Pieces of matter of all kinds handled by the Post Office, 1886–1957.

Source: See source for series R 139.

With the establishment of the Cost Ascertainment System in 1926, data on the volume of mail have been obtained from sample counts conducted quarterly for one week at representative post offices ranging in number from 255 to over 500. These sample data were then projected to include all originating mail at all post offices in the United States. The methods of estimating the number of pieces of matter handled prior to 1926 could not be ascertained. See also general note for series R 146-160.

R 146–160. General note.

The bulk of postal revenues and postal expenses cannot be allocated directly to the various classes of mail handled or to special services performed.

Postal revenues (except for about 10 percent which can be directly allocated or computed) are derived from postage acquired in the form of stamps and stamped paper and from payments under permits, which may be used by the purchaser generally on any class of mail. The result is a large common pool of revenues from numerous sources. Similarly, the several classes of mail and the special services are to a considerable extent handled by the same employees using the same buildings, equipment, operating facilities, house services, and supplies.

A regular, continuing Cost Ascertainment System was begun in 1926, pursuant to a Congressional Act of February 28, 1925 (39 U.S.C. 826). Selected post offices, grouped according to receipts, furnish basic data as to revenues and expenditures and the related weights and volumes of the several classes and subclasses of mail matter and special services. The data so obtained are used to develop ratios for segregating the audited revenues and the operating costs of each homogeneous group of offices in order to apportion the postal revenues and expenditures to the several classes of mail matter and to the special services.

Since 1926, various changes have been made in the number of offices used in the sample and the detailed revenue and expense apportionments and allocations. These are described in the annual *Cost Ascertainment Report* of the Post Office Department and in the *Report on Cost Ascertainment System of the Post Office Department*, December 29, 1944.

The statistics of expenses as published annually are subject to later readjustments as a result of increases in the charges of railroad or air or of other transportation services, or increases in the salaries of Post Office Department employees, if such increases are made retroactive to an earlier fiscal year.

R 146–148. First-class mail, 1926–1957.

Source: 1926–1946, Post Office Department, *Budget Digest*, 1949, chapter IV, tables 5-11; 1947-1957, Post Office Department, *Cost Ascertainment Report*, 1956 and 1958 issues, tables 250-252.

Figures include letters and packages (including local delivery letters), Government postal cards, and private mailing cards. For 1926–1929, domestic airmail could not be segregated and is included with first-class mail. Mail fees are included for 1950–1957. Box rent revenues, previously reported as unassignable are allocated to classes of mail, 1951–1955, and classified with special services for 1956–1957. For 1951–1956, the expense of free mail from members of the Armed Forces is included in first-class mail expenditures.

Digitized by Google

R 149–151. Second-class mail, 1926–1957.

Source: See source for series R 146-148.

This category includes newspapers, magazines, and pamphlets under the special low-rate "second-class privilege," the purposes of which are set forth in the Act of 1879. Revenues include postage payments (stamps or money order permit) and since 1932 payment of fees for use of the second-class privilege; transient second-class matter (mailings of second-class publications by other than the publisher or news agents); publishers' second-class matter forwarded or returned, 1950-1957; domestic mail fees, 1951–1957; and box rent revenue allocation, 1951–1955.

Expenses include cost of free-in-county service (delivery of newspapers free in the county of publication at offices not having city or village carrier service); publishers' second-class matter forwarded or returned, 1950–1957; and for 1953–1957, also includes the expense of sending notices to publishers regarding undelivered mail.

R 152–154. Third-class mail, 1926–1957.

Source: See source for series R 146–148.

Third-class mail embraces all matter not exceeding 8 ounces in weight and not qualifying as first or second class. A significant proportion of the matter mailed under third class is advertising material. In 1928, a special "bulk rate" was made applicable to separately addressed identical pieces of third-class matter mailed at one time in quantities of at least 20 pounds or 200 pieces. Revenues include postage revenues and permits; domestic mail fees, 1951–1957; and box rent revenue allocation, 1951–1955.

Prior to 1953, the revenues and expenses applicable to controlled circulation publications (publications consisting primarily of advertising and distributed free or mainly free) were included with third-class and fourth-class services. For 1953–1957, controlled circulation publications are shown separately.

R 155–157. Fourth-class mail, 1926–1957.

Source: See source for series R 146–148.

This class includes mailable matter exceeding 8 ounces in weight, not qualifying as first or second class. The major development in this class of mail was the establishment of the parcel post system effective January 1, 1913. Books, library books, catalogs, and matter for the blind included in fourth class carry special rates. Revenues include domestic mail fees for 1951–1957; box rent revenue allocations, 1951–1955; and special handling fees.

R 158–160. Domestic airmail, 1930–1957.

Source: See source for series R 146-148.

Since September 1948, domestic airmail includes a parcel post service and since January 1949 airmail postal and post card service. Paid airmail to and from the Armed Forces overseas and the outlying possessions of the United States, formerly in international airmail, is included with domestic airmail, 1947-1957. For 1951-1956, airmail expenses include the cost of free mail from members of the Armed Forces.

Airmail expenditures include subsequent payments, as of June 30, 1950, to airlines for retroactive rate increases where effective. The decline in airmail expenses between 1953 and 1954 resulted from the transfer of subsidy payments to airlines from the Post Office Department to the Civil Aeronautics Board effective October 1, 1953. The *Cost Ascertainment Report* for 1953 and prior years shows division of service costs and subsidy payments.

For 1954-1957, the Post Office Department experimented with the transporting of all mail by air between a number of major cities. Such mail, carrying first-class postage, is counted within first-class service.

R 161. Post Office employees, 1926–1957.

Source: 1926-1946, Post Office Department, *Budget Digest*, 1949, chapter II, table 1; 1947-1957, *Annual Report of the Postmaster General, 1957*, p. 107.

Includes regular or full-time employees and substitute, hourly rate, and part-time employees. Part-time employees are a substantial part of the Post Office labor force.

Prior to October 1933, the operating force for public buildings housing post offices and other Government agencies was on the rolls of the Treasury Department. On that date, the personnel were transferred to the Post Office Department. This increased the regular labor force of the Post Office Department by 8,000 employees.

R 162–163. Postal rates for first-class mail, letters and postal cards, 1792–1957.

Source: Post Office Department, *United States Domestic Postage Rates, 1789-1956*, table I.

The postage rates in effect in 1789 were those fixed by the Continental Congress in the Ordinance of 1782. These rates were continued until 1792. It was not until 1863 that mail was divided into "classes." In the early days of the postal service the recipient rather than the sender ordinarily paid the postage. In 1847 postage stamps were introduced, and in 1885 compulsory prepayment for all domestic letter mail was established.

The rates shown are for regular service. During the earlier years of the westward expansion, special local rates were often improvised. Thus, the first letter rate on the "pony express," which operated between Missouri and California from 1860 to 1861, was $5 for a half ounce, reduced in May 1861 to $2 for a half ounce, and in July 1861 to $1 for a half ounce because of a Government subsidy.

A considerable part of the domestic mail service between 1792 and 1863 was carried by ship, and was subject to ship-letter rates. These rates are detailed in the source, table II, p. 24. In 1863, a ship and steamboat rate, double the regular rate, was made applicable to domestic mail conveyed by ships not regularly employed in carrying mail. This classification is omitted after 1879 because of its diminishing importance but the double rate is still in effect although little or no matter is mailed under these rates.

In 1863, first-class mail was defined to include letters and matter wholly or partly in writing, except book manuscripts and corrected proof sheets. In 1872, first-class mail was described as including letters and all correspondence, wholly or partly in writing, except book manuscripts and corrected proof sheets passing between authors and publishers. In 1879, it was redefined to include letters, postal cards, and all matter wholly or partly in writing, except such writing as is authorized to be placed on mail of other classes. See Jane Kennedy, "Development of Postal Rates: 1845-1955," *Land Economics*, May 1957 issue, pp. 93-112, for additional materials on postal rates, particularly rates for second-, third-, and fourth-class mail.

R 164. Postal rates for domestic airmail, 1918–1957.

Source: See source for series R 162-163, table III, p. 25.

Until 1948, domestic airmail rates applied not only to letters but also to other mailable matter, including sealed parcels up to specified maxima (prescribed according to weight or according to length and girth). Effective September 1, 1948, an Air Parcel Post Service was established. Matter carried by air weighing 8 ounces or less was classified as "airmail" and over 8 ounces "air parcel post."

R 165–168. New books, new editions, and pamphlets published, 1880–1957.

Source: R. R. Bowker Co., New York, N.Y., *Publishers' Weekly* (usually the third or fourth weekly issue in January).

Figures represent the number of titles published, not the number of books which were printed. The data are compiled from information and actual books submitted to R. R. Bowker Company by the various book publishing firms. The source also contains the number of books by subject matter and the number of publications for some foreign nations.

R 169–172. Number and circulation of daily and Sunday newspapers, 1920–1957.

Source: Editor and Publisher, New York, N.Y., *International Year Book Number*, various issues.

The term "daily" refers to papers that are published either morning or evening. About 90 percent of the circulation figures are credited by the Audit Bureau of Circulations. The remaining 10 percent is based on publishers' statements to the Post Office Department. The compilation is checked annually with a questionnaire to every daily newspaper in the country. Source also presents data for individual States.

R 173–186. Number and circulation of newspapers and periodicals, 1850–1954.

Source: 1850-1899, Twelfth Census Reports, *Manufactures*, vol. IX, part III; 1904-1909, Thirteenth Census Reports, *Manufactures*, vol. X; 1914-1927, *Census of Manufactures* for each census year; 1929-1947, *Census of Manufactures: 1947, Product Supplement*, pp. 67 and 68; 1954, *U.S. Census of Manufactures: 1954*, vol. II, part I, p. 27A-16.

For data prior to 1850, which is not comparable to the data since that time, see Tenth Census Reports, S. N. D. North, *History and Present Conditions of the Newspaper and Periodical Press of the United States*, p. 47; and W. S. Rossiter, *A Century of Population Growth in the United States*, Government Printing Office, 1909, p. 32.

[1] Excludes branches and stations.
[2] Accounting basis changed from cash to accrual basis in 1954.
[3] First issued under act of Mar. 3, 1847, and placed on sale at New York, July 1, 1847.
[4] Stamped envelopes first issued June 1853, under act of Aug. 31, 1852.
[5] First issued May 1, 1873, under Act of June 8, 1872.
[6] For 1918 and 1919, includes $44,500,000 and $71,392,000, respectively, war-tax revenue accruing from increased postage.
[7] Special-request envelopes first issued in this year.
[8] Newspaper wrappers first issued under act of Feb. 27, 1861; they were not made after Oct. 9, 1934.
[9] For 3 months only.

[1] For 1926–1929, domestic airmail included with first-class mail.
[2] For 1951–1955, box rent revenue, previously classified as unassignable, allocated to classes of mail; thereafter, classified as "Special services."
[3] Beginning 1947, includes airmail to and from Armed Forces overseas, previously included with foreign mail. Beginning 1954, excludes reimbursement for airmail transportation.
[4] Not available.

Series R 162–163. Postal Rates for First-Class Mail, Letters and Postal Cards: 1792 to 1957

[First-class mail as a mail category not officially established until 1863. Ship and steamboat letters, 1792-1863, carried special rates]

Year of rate change	Letters, nonlocal	Postal cards (cents)	Year of rate change	Single letters [5]		Year of rate change	Single letters [5]

				over 400	25		351–450	22
							over 450	25

[1] The 1940 rate change provided that the 3¢ letter rate was not to apply to first-class matter for local delivery or for delivery within a county with a population of over 1 million if county entirely within a corporate city.
[2] Government postal cards first authorized in 1872.
[3] A uniform rate regardless of distance, a free city delivery service, and a letter unit of ½ ounce instead of the former "single letter" were inaugurated.
[4] Rate between any point in the U.S. east of the Rocky Mountains and any State or Territory on the Pacific. For other rates, see those for 1855.
[5] A communication of 1 sheet. Proportionately higher rates charged for letters of 2, 3, and 4 or more sheets (packet).
[6] Various acts between 1847 and 1850 established special rates for the western and southwestern U.S.
[7] In 1825, rates for single letters, 151 to 400 miles, increased to 18¾ cents.
[8] Between 1794 and 1863, extra fees were charged for city delivery service. The proceeds went to the letter carrier.

Series R 164. Postal Rates for Domestic Airmail: 1918 to 1957

Effective date	Rate	Effective date	Rate	Effective date	Rate
1949, Jan. 1, to 1957	6¢ per oz., 4¢ each for airmail postal and post cards [1]	1926, Feb. 15	Contract air routes: Under 1,000 miles, 10¢ per oz.; 1,000–1,500 miles, 15¢ per oz.; Over 1,500 miles, 20¢ per oz. — plus 5¢ per oz. for each air-mail zone Government routes: Daytime zone rate, 8¢ per oz. New York to Chicago (overnight), 10¢ per oz.	1925, July 1	10¢ per oz. for Government-operated overnight service New York to Chicago; 8¢ per oz. daytime zone rate
1948, Sept. 1	[2]			1924, July 1	8¢ per oz., per zone [3]
1946, Oct. 1	5¢ per oz.			1919, July 18	2¢ per oz. [4]
1944, Mar. 26	8¢ per oz.			1918, Dec. 15	6¢ per oz.
1934, July 1	6¢ per oz.			1918, July 15	16¢ per oz. and 6¢ each additional oz., of which 10¢ was for special delivery
1932, July 6	8¢ first oz.; 13¢ each additional oz.				
1928, Aug. 1	5¢ first oz.; 10¢ each additional oz.			1918, May 15	24¢ per oz., of which 10¢ was for special delivery
1927, Feb. 1	10¢ per ½ oz., regardless of distance (both contract and Government-operated air routes)				

[1] Airmail postal and post card service started Jan. 1, 1949.
[2] Prior to 1948, weight and size limits for airmail were the same as for first-class mail; beginning Sept. 1, 1948, matter carried by air weighing 8 ozs. or less was classified as "airmail," and over 8 ozs. as "air-parcel post."
[3] Zones were (1) New York-Chicago, (2) Chicago-Cheyenne, (3) Cheyenne-San Francisco.
[4] Not strictly an "airmail rate." Between July 18, 1919, and July 1, 1924, there was no airmail rate and no offer of airmail service. Some mail, however, was carried by planes at the regular first-class rate of 2¢ per oz.

[1] From 1880 to 1918, pamphlets were counted but were not separately identified. The number of pamphlets that are included with new books and new editions for 1918 to 1920 are shown in parentheses. After 1928, pamphlets were not counted.
[2] Agrees with source; however, figures for components do not add to total shown.

Series R 173–186. Newspapers and Periodicals—Number and Circulation: 1850 to 1954

[Data for 1947 and 1954 are for establishments having 1 or more regularly paid employees for whom a social security account was maintained at the Bureau of Old-Age and Survivors Insurance. Data for 1921–1939 are for establishments reporting annual receipts of $5,000 or more. For prior years the corresponding limit was $500. Circulation figures are the totals of average circulation per issue]

Power

S 1–93. General note.

Energy to meet the expanding power needs of our economy has been secured from various animate and inanimate sources. Among those of historical significance, whose use is generally within the control of mankind, are human and animal power, waterpower, windpower, wood and other vegetable matter used as fuel, coal, oil, and natural gas. Currently, efforts are being made to develop and control solar energy, atomic energy, internal heat of the earth, and, through chemical processing, certain additional natural resources such as shale and sea water. For those interested in developing a comprehensive understanding of power problems the following books are suggested: Eugene Ayers and Charles A. Scarlott, *Energy Sources—The Wealth of the World*, McGraw-Hill Publishing Company, Inc., 1952; Fred Cottrell, *Energy and Society*, McGraw-Hill Publishing Company, Inc., 1955; J. F. Dewhurst and Associates, *America's Needs and Resources, A New Survey*, The Twentieth Century Fund, 1955; P. C. Putnam, *Energy in the Future*, D. Van Nostrand Company, Inc., 1953.

Preparation of historical tables showing energy from various sources and total energy input on a per capita or other basis is complicated. The amounts shown will differ greatly depending on the basis and point of measurement used. End-use data, for example, will show far larger increases in total per capita over the last 100 years than will data presenting physical measures such as tons, gallons, cubic feet, or B.t.u.'s because of increased efficiency in conversion and utilization. During the 50-year period 1907–1957 reduction of the total energy required or lost in coal mining, in moving the coal from mine to point of utilization, in converting to electric energy, in delivering the electric energy to consumers, and in converting electric energy to end uses have increased by well over 10 times the energy needs supplied by a ton of coal as a natural resource.

Data on energy available from mineral fuels, waterpower for electric energy, and fuel wood are shown in series M 71–87. For total waterpower, net imports from waterpower sources in Canada and the energy equivalent of waterpower not converted to electric energy (direct drive from water wheels) must also be considered. Statistics available for power sources not included here are presented in the volumes by Ayers and Scarlott, Dewhurst, and Putnam, cited above. Government agencies such as the Bureau of Mines, Bureau of the Census, Rural Electrification Administration, Bureau of Labor Statistics, Federal Power Commission, Federal Reserve Board, Interstate Commerce Commission; the various trade associations such as the Edison Electric Institute, American Gas Association, Bituminous Coal Institute, American Petroleum Institute; and various technical journals, particularly in their statistical issues, compile or summarize and publish data on the development and use of energy for power and related purposes.

S 1–14. Total horsepower of all prime movers, 1849–1955.

Source: 1849–1952, J. F. Dewhurst and Associates, *America's Needs and Resources, A New Survey*, The Twentieth Century Fund, 1955, p. 1117; 1955, estimates prepared by John A. Waring for *Transactions of Canadian Sectional Meeting, World Power Conference, 1958* (in press).

Data for series S 4 (work animals), S 10 (sailing vessels), and S 12 (windmills), as shown on p. 1117 of *America's Needs and Resources*, are based on data presented in appendix 25-3 of that volume. All other data for 1849–1919 are from C. R. Daugherty, A. H. Horton, and R. W. Davenport, *Power Capacity and Production in the United States*, Water Supply Paper No. 579, Geological Survey, 1928. The original data from Daugherty, *et al.* were for 1849 and subsequent 10-year intervals through 1919. Estimates for 1850 and subsequent 10-year intervals through 1940 are based on straight-line interpolation of original data.

All data for 1929, 1939, 1950, and 1952 shown in Dewhurst were prepared by John A. Waring. According to Waring, estimates for 1952 as shown in Dewhurst are too low for mines and farms, and too high for railroad locomotives.

A technical and statistical bibliography of early data pertaining to the development of horsepower equipment in the United States appears on pp. 43 and 44 of Daugherty, *et al.* This source also contains a section on the sources and accuracy of the data. The following appraisal of the data appears on p. 21: "In general the accuracy of the statistics presented . . . increases with each successive decade. The data for the early years are almost wholly estimated, but it is believed that the estimates are supported by bases accurate enough to lend a degree of authenticity to them."

In addition to the classifications shown in series S 1–14, the installed mechanical horsepower in a number of special industries were also calculated for 1955 by Waring, as follows: Waterworks pumping stations, 1,700,000; communications standby reserve generators, 308,930; gas utility stations, 1,775,800; motorboats and yachts, 25,450,000; outboard-powered boats, 33,680,000; petroleum pipeline pumping stations, 3,603,750; natural gas pipeline pumping stations, 3,881,200; isolated nonindustrial power plants, 5,170,000; underground gas storage pools, 301,000; construction and contractors' building equipment, 53,403,750. These total 129,274,430 horsepower, which, when added to the 1955 total shown in series S 1, result in an aggregate total of 7,272,997,430 horsepower.

S 15–93. General note.

Some data on the production and use of electric energy are available since the beginning of commercial production in 1882. Data for 1882–1920, however, are difficult to evaluate because of changing bases of measurement and variations in coverage of the various censuses or other surveys made during the period. The Bureau of the Census published the results of censuses of the electric light and power industries made at 5-year intervals for 1902–1937, and the reports of the Census of Manufactures and of Mineral Industries contain important data on industrial use and production of electric energy. The Geological Survey, the *Electrical World* (McGraw-Hill Publishing Company, Inc., New York), and the National Electric Light Association also published considerable data applicable to the industry during this early period.

The chief gaps in the data for these years are in the production of electric energy by industrial establishments for their own use, and in the measurement of the sales by electric railroads and railways for public distribution. Early

Digitized by Google

data on capacity must be converted from horsepower (hp.) to kilowatts (kw.) to be comparable; and capacity data in kilovolt-amperes (kv.-a.) were often tabulated as kw. without adjustment for power factor. Data on generation were also often reported without allowance for the kilowatt-hours (kw.-hr.) used in production and, in many instances, where the prime mover was used both for direct drive and for electric generation, the kw.-hr. equivalent of power used directly was reported as generation. End uses were reported by appliances, as number of lamps, arc lights, or motors, rather than as kw.-hr. These variations in units of measurements, in classification, and in coverage often resulted in differences in estimated totals of as much as 20 to 25 percent. In presenting historical data on electric energy since 1902, efforts have been made to resolve such differences and place the data on a comparable basis.

Referring to various historical sources it will be noted that data published in later years will frequently show material revisions to reflect changes in classification and coverage. In the utility series prior to 1945, for example, when a large generating plant was purchased from an industrial concern, the utility series would be adjusted to include the capacity and generation of this plant in prior years. Where such revisions have been made, the revised data are shown.

Since 1920, comprehensive statistics on capacity and generation of electric utilities for public use have been compiled and published by the Geological Survey for 1920–1936, and by the Federal Power Commission since 1936. Data on capacity and generation by nonutility establishments since 1939 have been compiled and published by the Federal Power Commission. The Commission also published financial, operating, sales, and rate statistics for the electric utility industry. Data on customers, revenues, sales, and related matters since 1926 are published by the Edison Electric Institute and the McGraw-Hill Publishing Co., Inc., *Electrical World.*

During the 20 years prior to 1957 there was a marked growth in the application of power from various fuels through electric energy produced not only in central stations but by generators in mobile equipment of many types. Among these are power plants in ships, railroad locomotives, trailers, barges, trucks, tractors, buses, and in machines used in mining and heavy construction which produce electric energy for driving and operating the mobile unit and for other services related thereto, or to supplement central stations for temporary periods. Also of interest are the electric generators for auxiliary purposes operated directly or indirectly by the prime movers in automobiles, airplanes, and other mobile engines or by independent power units in refrigerator cars and trailers and many other installations to furnish electric energy directly or to maintain the electric charge in batteries for use as required. The importance of these small generators is indicated by the fact that the 65 million motor vehicles registered in the United States in 1956 alone have a total generator capacity in excess of that of all the Federally owned electric utilities. Except where large units in the general classification of mobile plants are connected to utility systems for power for extended periods neither capacity nor generation are included in the data indicating production and use of electric energy in the United States. In some cases, however, industries will report the horsepower of such equipment as driving generators, but, in general, do not indicate power output in kw.-hr.

S 15–18. Net production of electric energy, by central stations, by type of prime mover, 1902–1957.

Source: Summation of series S 19–26.

S 19–22. Net production of electric energy, by electric utilities, by type of prime mover, 1902–1957.

Source: 1902–1917, Bureau of the Census, *Census of Electrical Industries: Central Electric Light and Power Stations;* 1920–1957, Federal Power Commission, *Production of Electric Energy and Capacity of Generating Plants,* monthly and annual reports.

Census data for 1902–1917 have been adjusted in some instances for classification and coverage by L. D. Jennings of the Federal Power Commission. The figures for electric energy produced by waterpower for 1912 and 1917, for example, differ from those published in *Central Electric Light and Power Stations: 1917,* table 26, because they have been adjusted to exclude electricity produced by steam and internal combustion engines at plants which also produced energy by waterpower, and energy produced in plants subsequently included in series S 23–26.

For 1920–1957, data are based on monthly reports by electric utilities to the Federal Power Commission. Coverage is substantially 100 percent. Included are plants of the privately owned electric utilities, the cooperatively owned systems, and the publicly owned electric utilities. The latter group is composed of the following classes: Municipal electric utilities, Federal projects, public utility power districts, and State power projects.

S 23–26. Net production of electric energy, by industrial establishments, by type of prime mover, 1902–1957.

Source: 1902–1941, Federal Power Commission, records; 1942–1957, *Production of Electric Energy and Capacity of Generating Plants,* monthly and annual reports.

Data include the generation of electric energy by manufacturing and extracting industries and by electric railroads and railways, but exclude electric energy generated by the following sources: Nonutility central station plants of less than 100 kw. capacity; plants operated by hotels, apartment houses, office buildings, or other commercial, transport, or service establishments; plants in military installations; new industrial plants which are not added promptly as reporting establishments; and, in some instances, generation of newly installed utility plants during test periods. The total central station generation excluded is estimated as about 1½ percent of the annual total shown for both utility and industrial plants. This percentage has declined in recent years with the development of mobile type generators.

Data for steam and internal combustion prime movers are processed separately and are combined when annual reports are completed. For 1938–1942, data on capacity by type of prime mover, and on total generation, are available from data reported to the Commission. As most plants had only one type of prime mover, the area to be estimated was limited, and detailed data for subsequent years were available as a basis for preparing such distribution. For 1902–1940, data for a portion of these plants are available from FPC S-20, *Electric Power Statistics, 1920–1940,* and from the data presented in the reports of the Census of Electrical Industries issued for each 5 years, 1902–1937. Data on capacity of prime movers driving generators also appear in various reports of the Census of Manufactures and the Census of Mineral Industries, particularly those for 1929 and 1939; from papers published by the Geological Survey; from technical and trade publications; and from special studies made by various governmental agencies and others. For 1938–1950, there was considerable effort on the part of a number of Federal agencies (Department of Commerce, Department of the Interior, Department of Defense, War Production Board, Executive Offices of the President, Federal Power Commission, Atomic

Digitized by Google

Energy Commission, and others) to develop historical data relating to power by utilizing data on capacity and use to estimate generation for segments where reported data on generation were incomplete or not available. These studies resulted in the development of the data shown.

In interpreting the data, it should be noted that the coverage may have varied during the period. For 1955, for example, approximately 250,000 kw. capacity with related generation for plants operated by transport industries (pipelines and nonelectrified railroads), and by certain miscellaneous establishments, were dropped because the plants were small, generally under 1,000 kw. capacity each, and the coverage for these industries was becoming increasingly incomplete. The cost of securing full coverage and processing these data was considered unreasonable for the relative amount of energy involved. At the same time, however, approximately an equivalent capacity and generation were added by the inclusion of plants in manufacturing industries previously excluded for security and other reasons. For 1956, however, additional information indicated that certain of the larger plants excluded with the pipeline group would now be classified in the extracting industry and they were again included. Further, in the usual methods for compiling such statistics there are delays in adding new plants while plants retired are excluded promptly. Changes in coverage of these types normally will not affect materially the relative annual amounts for nonutility central station electric generation excluded from this classification.

S 27–35. Net production of electric energy, by central stations, by class of ownership, 1902–1957.

Source: Series S 27–34, see source for series S 19–22; series S 35, see source for series S 23–26.

The FPC reports cited above show data for "noncentral stations" within the publicly owned group for 1920–1951. This category, which includes plants supplying electric power primarily for such functions as public street lighting, water pumping, and sewage disposal, have been included in municipal or other named classifications for 1952–1957. A similar adjustment using records available was made for 1920–1951.

Data for cooperatively owned utilities (series S 30) are shown in the source combined with power districts and State projects. The separate data for series S 30 were obtained from the detailed records of the Federal Power Commission. These amounts are slightly below those reported by the Rural Electrification Administration, *Annual Statistical Report—Rural Electrification Borrowers*, because a few plants financed by the REA are included in other classifications or are not, for various reasons, included in the Federal Power Commission totals.

S 36–43. Consumption of fuels by electric utilities, 1920–1957.

Source: Federal Power Commission, *Consumption of Fuel for Production of Electric Energy*, monthly and annual reports.

For series S 42–43, data for years prior to 1940 are from the records of the Federal Power Commission or may be computed from the data shown for fuel used and electric energy generated. For 1920–1938, the distribution of energy generated for plants using two or more kinds of fuel was estimated.

The data are based on individual generating plant reports submitted monthly by all electric utilities to the Federal Power Commission. Both the privately owned and publicly owned operations are included. The coal figures include anthracite, bituminous, and lignite coal—processed separately for the detailed report—and small amounts of coke; those for oil include crude oil, fuel oil, distillate pitch, sludge, and small quantities of other liquid fuels. The consumption of gas includes both natural gas and byproduct manufactured gas. In general, the minor fuels are reported in units equivalent to those for the major class of fuel with which they are combined. The quantities of each fuel include the consumption of generating plants operating on a standby or other intermittent basis.

Data on fuels used in industrial electric generating plants are not solicited as many establishments do not keep such records separate from fuels used for other purposes.

Kilowatt-hour production represents the summation of net station output after deduction for energy used in the operation of auxiliary equipment and facilities within the generating plants. Where two or more kinds of fuel are used at a particular plant during the same month, allocation of the kilowatt-hour production to each fuel is reported. Where such allocations are not made by the reporting utility, they are estimated on the basis of the latest available annual average B.t.u. content of each fuel used at that plant and the average B.t.u. per kw.-hr. generated reported for each kind of fuel.

S 44–48. Number of electric utility generating plants, and production per kilowatt of installed generating capacity, 1902–1957.

Source: See source for series S 19–22.

Figures for series S 48 are based on beginning- and end-of-year average installed generating capacity, except for 1902–1920 when capacity of the end of the year was used.

In counting the number of generating plants, each prime mover type in combination plants was included separately. Generating capacity is based on the nameplate rating of generators.

S 49–52. Installed generating capacity in central stations, by type of prime mover, 1902–1957.

S 71–73. Percentage of dwelling units with electric service, 1907–1956.

Source: For census years, Bureau of the Census, Census of Housing (decennial) and Census of Agriculture (quinquennial); for intercensal years, various annual issues of the following: National Electric Light Association, *Statistical Supplement to the Electric Light and Power Industry in the United States*, New York; McGraw-Hill Publishing Company, Inc., *Electrical World*, New York; and Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York.

Some adjustments for comparability and coverage have been made in the source data by L. D. Jennings of the Federal Power Commission.

In the annual *Statistical Bulletin* of the Edison Electric Institute and in the statistical reports of their predecessor organization, the National Electric Light Association (cited above), data on the electrification of farms (series S 72) are presented. The information shown in these publications includes Bureau of the Census data and data compiled by the Rural Electrification Administration as well as material collected by the Institute or the Association. In the annual statistical numbers of the *Electrical World* (cited above), data are presented showing the percent of the population living in wired homes (series S 71). These percentages are generally based on the relation between the number of residential electric customers and population in census years. Percentages presented by the different sources indicated may vary from one to the other for intercensal years, depending on the statistical procedures used to determine the number of farms and dwelling units and related concepts applied. Among the items causing variations in the percentages of farms electrified, for example, are the inclusion or exclusion of farms without permanent dwelling units, farms with their own electric power plants, farms without service where distribution lines are within ¼ mile of the dwelling unit, or interpolation for the number of farms in intervening years between the various Censuses of Agriculture. The percentages shown are those considered reasonable and comparable to those for census years.

S 74–76, and S 78. Average price of electricity by class of service, 1907–1956.

Source: 1907–1924, based on a study by W. G. Vincent, Pacific Gas and Electric Company, *Edison Electric Institute Bulletin*, June 1936, p. 224 (adjusted by L. D. Jennings for comparability with the Federal Power Commission series); 1925–1956, Federal Power Commission, annual report, *Typical Electric Bills: Cities of 50,000 Population and More* (except that average prices for 1925-1934 have been adjusted from as of October 1, as originally published, to as of January 1 for comparability with the series subsequent to 1934).

Data shown in source for series S 78 are labelled "Industrial" which, in general, includes customers in the "Large light and power" classification as used by the Edison Electric Institute for series S 79.

The average bills for specified consumption are based on typical bills for residential and industrial service in cities with 50,000 or more inhabitants. These cities include about one-third of the total U.S. population. Since populations in adjacent areas are frequently served under the rate schedules effective in these cities, the bills reported indicate rate levels applicable to more than 70 percent of the total population.

Specifications for the computation of typical net monthly bills are prepared by the Federal Power Commission. Special rates for refrigeration, cooking, or water heating, where generally applicable, are used in computing the bill. Sales taxes computed separately and added to the bill computed under the rate schedules are not included in the bills reported.

Average bills are determined by multiplying the bill as of January 1 for each city by its population and dividing the sum of these products by the sum of the populations. Where two or more utilities serve a community with different bills, the population for each bill is determined by the proportion of customers served by class of service. Except for possible disproportionate shifts in population to higher or lower rate areas, changes in these averages indicate changes in rate levels.

S 77, S 79, and S 80. Average price of electricity for all users, by class of user, 1902–1956.

Source: 1902–1925, Bureau of the Census, *Census of Electrical Industries*, 1917 and 1922 reports; 1926-1956, Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York, 1954 issue, table 37, and 1956 issue, table 41.

These averages indicate the average revenue from electric service and will vary with average use and rate levels.

S 81. Electric energy, total use, 1902–1956.

Source: Summation of series S 82–93.

Total amount is equal to (*a*) utility sales of electric energy by class of service, plus (*b*) industrial generation minus sales to utilities, plus (*c*) use by utilities except in connection with the operation of generating plants, plus (*d*) energy furnished others without charge, plus (*e*) reported losses and unaccounted for, plus (*f*) estimated production for nonutility central stations not included in industrial generation (series S 23) minus sales to utilities as shown by utility reports on purchased energy. This total by years was compared with total net generation of utility and industrial plants (series S 15), plus net imports (series S 93), plus estimates of energy produced by central stations not included in series S 15. Differences of significance were analyzed, sources checked, explanations of the differences considered and adjustments made as necessary to account for all production or use. For 1939–1956, an appreciable portion of the energy estimated for plants not included in series S 15 and related series are variously reported to the Federal Power Commission or available from related material. For prior years, the amount estimated is based on relationships in benchmark years for which census or comparable type data on capacity, production, or use were available.

S 82–83. Electric energy, residential and commercial use, 1912–1956.

Source: 1912–1925, based on McGraw-Hill Publishing Company, Inc., *Electrical World*, annual statistical numbers, New York, and Bureau of the Census, *Census of Electrical Industries*, 1902–1927, reports at 5-year intervals; 1926–1944, Edison Electric Institute, *Electric Light and Power Industry in the United States*, New York; 1945–1956, Federal Power Commission, *Sales of Electric Energy by Class of Service*, monthly reports.

For 1912–1945, some combinations and adjustments were necessary for comparability with data for later years. These adjustments were made by L. D. Jennings of the Federal Power Commission.

Series S 82 includes residential use on farms and in rural areas but does not include (*a*) residential service charged in the rent of dwelling units, (*b*) service where energy is submetered by large apartment houses or operators of housing projects, (*c*) residential service secured in connection with commercial or other enterprises purchasing energy usually under commercial service classifications, or (*d*) irrigation sometimes included in the sales classification "Rural (district rural rates)." The Federal Power Commission data include

Digitized by Google

some residential service rendered by industrial and certain classes of publicly owned plants excluded from the Edison Electric Institute series.

Series S 83 includes purchases under commercial rate schedules for residential services by operators of apartment houses or housing projects where electric service is included in the rent of the facilities, and submetered service to small industrial establishments. Generally excluded are sales to very large commercial enterprises included in series S 91.

S 84. Electric energy, total industrial use, 1912–1956.

Source: Summation of series S 85 and S 90.

S 85. Use of electric energy for manufacturing industries, 1912–1956.

Source: 1912–1938, based on data in units of horsepower or kilowatt-hours presented in Bureau of the Census reports of the Census of Manufactures; 1939–1956, based on reports of the Census of Manufactures and Federal Power Commission report, *Industrial Electric Power, 1939-1946.*

Estimates or reported data were checked with information on industrial or large light and power sales of electric energy plus data available or developed for industrial generation with allowances for data applicable to series S 90, and, to a limited extent, series S 91. Adjustments that appeared reasonable in view of all information available, including that for later years, were made by L. D. Jennings of the Federal Power Commission for changes or variations in classification and coverage.

S 86. Use of electric energy for manufacture of nuclear fuels and related products, 1943–1956.

Source: 1943, Atomic Energy Commission, records; 1944–1956, Federal Power Commission, records.

Data for 1955–1956 were reported by suppliers of major installations of Atomic Energy Commission and by the Commission itself.

S 87. Use of electric energy for paper and chemical industries, 1912–1956.

Source: See source for series S 85.

The figures combine data for two major industry groups—paper and chemicals; they exclude major nuclear energy projects where included in the chemical industry group.

S 88. Use of electric energy for primary metals, 1912–1956.

Source: See source for series S 85.

Figures include ferrous and nonferrous metals.

S 89. Use of electric energy for other manufacturing industries, 1912–1956.

Source: See source for series S 85.

S 90. Use of electric energy for extracting industries, 1912–1956.

Source: 1912–1939, based on Bureau of the Census, *Census of Mineral Industries*, reports for 1919, 1929, and 1939; 1940–1946, Federal Power Commission, *Industrial Electric Power, 1939–1946;* 1947–1956, Federal Power Commission, records.

Data for 1947–1956 are based on generation reported by industrial plants in this classification. Data from trade associations and from technical publications on total output and on electric energy per unit computed for intercensal years for representative establishments were used to check data estimated for these years by other methods.

S 91. Use of electric energy for miscellaneous light and power, 1912–1956.

Source: See source for series S 82–83.

Depending on rate schedules applicable, figures include uses variously classified as other, industrial or large light and power (but not included in manufacturing or mineral industries), street and highway lighting, other sales to public authorities where service is not rendered under commercial or industrial rate schedules or purchased for resale by publicly owned systems, railroads and railways, interdepartmental or company use or furnished without charge by electric power systems, rural or other sales for irrigation, and generation in central stations and used by enterprises of various kinds not included in the use classifications shown separately. The figures include energy for certain classes of residential and commercial uses (series S 82–83), as noted for those series, and may also include some manufacturing and extracting plants for which data were not included in these series (S 85–90) for reasons indicated in text for series S 81.

S 92. Electric energy losses and use unaccounted for, 1912–1956.

Source: 1912–1936, Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York, monthly and annual issues, and *Electric Light and Power Industry in the United States* (annual); McGraw-Hill Publishing Company, Inc., *Electrical World* (annual), New York, and Bureau of the Census, *Census of Electrical Industries*, 1912–1932, reports at 5-year intervals; 1937–1956, Federal Power Commission, records.

Relation to total energy used varies from year to year with changes in the proportion of energy metered on the low or on the high side of transformers at the point of delivery or at the generating plant, as well as for changes in technological efficiency in the transmission and distribution of electric energy and its relation to the quantities handled.

S 93. Electric energy, net imports, 1912–1956.

Source: Federal Power Commission, records.

Data for 1940–1956 are based on annual survey for staff use. For prior years, data are based on FPC S-15, *Movement of Electric Energy Across State Lines and International Boundaries, 1940*, and on historical records and files to include exports and imports for industrial as well as utility purposes. Monthly and annual *Electric Power Statistics* published by the Dominion Bureau of Statistics, Ottawa, Canada, were also considered. Coverage in reports for the earlier years varied as did the treatment of energy delivered or received on long-term exchange agreements.

Distribution and Services

T 1–386. General note.

The data presented here, except for series T 346–351 (advertising), are based on distribution or service *establishments* rather than distribution or service *functions*, and therefore exclude the many distribution activities undertaken by other types of establishments, especially by manufacturers. The data for services are limited to types offered by retail-store-type establishments.

T 1–11. National income originating in distribution and selected service industries, 1869–1957.

Source: 1869–1929, Harold Barger, "Income Originating in Trade, 1869–1929," *Studies in Income and Wealth*, vol. 24 (forthcoming), Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton; 1929–1945, Office of Business Economics, *National Income: 1954 Edition, A Supplement to the Survey of Current Business*, pp. 176–177; 1946–1957, *U. S. Income and Output*, 1958, pp. 130–131.

Series T 5 combines the series shown in the source for "commercial and trade schools and employment agencies" with the series for "other business services."

T 12–22. Persons engaged in distribution and selected service industries, 1869–1957.

Source: 1869–1919, see source for series T 1–11; 1929–1945, see source for series T 1–11, pp. 202–203; 1946–1957, see source for series T 1–11, p. 214.

These figures show the man-years of full-time employment by persons working for wages or salaries and by active proprietors of unincorporated businesses devoting the major portion of their time to the business. Full-time equivalent employment measures man-years of full-time employment and its equivalent work performed by part-time workers. Full-time employment is defined simply in terms of the number of hours which is customary at a particular time and place. For a full explanation of the concept, see Office of Business Economics, *Survey of Current Business*, June 1945, pp. 7–18.

Unpaid family workers are excluded due to unresolved difficulties in their definition and measurement.

Series T 16 combines the series shown in the source for "commercial and trade schools and employment agencies" with the series for "other business services."

T 23–48. Retail store sales, by kind of business, 1929–1957.

Source: 1929–1953, Office of Business Economics, records (except series T 23, T 32, T 40, and T 43 for 1951–1956, Office of Business Economics, *Survey of Current Business*, June 1957, p. 28; and series T 44–45 for 1929–1956, Bureau of the Census, *Statistical Abstract of the United States, 1953*, p. 851; *1954*, p. 862; and *1957*, p. 838); 1954–1956, *Statistical Abstract, 1957*, p. 838 (except series T 23, T 32, T 40, and T 43 as noted above); 1957, Office of Business Economics, records.

Sales of multiunit stores, which are shown separately in series T 49–71, are also included in series T 23–48.

The definitions of retail stores and of kinds of business are in accordance with the 1948 Census of Business except as noted below. The classification of durable goods stores and nondurable goods stores is based on the durability of the commodities accounting for a major portion of the sales of each kind-of-business group. Census of retail trade data were used as benchmarks for 1929–1951. Estimates for intercensal years in this period were developed from sales tax collection data, special Internal Revenue Service compilations, business population trends, the Federal Reserve Board index of department store sales, and data from the Bureau of Public Roads and the American Petroleum Institute. Methods of compilation are described in Office of Business Economics, *Business Statistics, 1957, A Supplement to the Survey of Current Business*, p. 218.

Beginning in 1951, the figures are based on a new method of estimating retail sales and are not comparable to those shown for prior years. The new series for 1951–1957 is based on a sample consisting of about 30,000 organizations operating about 100,000 stores. The new series (as revised in 1957) also excludes milk dealers engaged in processing on the premises. Such establishments are treated as manufacturing plants in the 1954 Census. The sampling procedure for the new series is described in *Business Statistics, 1957*, cited above. Current monthly data are reported in the *Survey of Current Business*.

T 49–71. Retail sales of multiunit stores, by kind of business, 1929–1957.

Source: 1929–1953 and 1956–1957, Office of Business Economics, records; 1951 and 1954–1956, Bureau of the Census, *Statistical Abstract of the United States, 1957*, p. 849.

These series consist of 3 segments. The old series (designated as "Retail Sales of Chain Stores and Mail-Order Houses") represents sales of firms with 4 or more stores, and covers 1929–1951. Data from the Census of Business for 1929, 1933, 1935, 1939, and 1948 were used as benchmarks. The intercensal estimates were based on sample groups of organizations with 4 or more stores.

The new series, which covers 1951–1956, is based on a sample of firms which operated 11 or more units in 1948. The figures are not linked to the census of business. The new series, modified, covers 1956 and 1957, and is based on a new sample of firms which operated 11 or more units in 1954 and using 1954 classifications and definitions. As no adjustments are made for entries and exits from the "11 or more" category between censuses, the reported data cannot be subtracted from total retail sales to obtain sales by organizations operating 10 or fewer stores. Current monthly data for most of these series are reported in the *Survey of Current Business*.

T 72–182. Retail establishments, sales, and persons engaged, by kind of business, 1929–1954.

Source: 1929, 1939 (figures comparable with later years), 1948 (figures comparable with earlier years), *U. S. Census of Business: 1948*, Vol. I, *Retail Trade*, pp. 1.04–1.05; 1933; *Census of American Business: 1933*, Vol. I, *Retail Distribution;* 1935, 1939 (figures comparable with earlier years), *Census of Business: 1939*, Vol. I, *Retail Trade*, p. 57; 1948 (figures comparable with later years), 1954, *U. S. Census of Business: 1954*, Vol. I, *Retail Trade*, pp. 1-5 to 1-8. Series T 84–86, T 93–95, T 177–179, 1929, *Fifteenth Census of the United States: 1930*, Vol. I, *Distribution*.

Certain of these series have been combined for some years, and adjusted for others, by Professors Charles S. Goodman and Reavis Cox of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to provide as comparable historical series as possible. Figures for 1933, in particular, have been adjusted for comparability. The reports of the census of business provide considerably more detail as to kinds of business.

Stores are classified according to their principal kind of business. Where a number of lines are carried, changes in relative importance may serve to shift a particular establishment from one category to another between censuses. The user of these figures is cautioned that sales figures shown are for kinds of establishments, not kinds of products.

Sales and excise taxes are included in sales figures for 1954 and excluded for 1948 and 1939. For earlier censuses, instructions called for the inclusion of sales taxes but these instructions were ignored in many instances.

Figures for persons engaged represent the total of the reported number of active proprietors and employees for the payroll period nearest November 15 for 1939 and later years, and of active proprietors plus the average number of employees for the year for 1939 and earlier years. Unpaid family workers are excluded from the definition of persons engaged. Such workers do represent an important additional labor force in some lines of retail trade. For retail trade as a whole, the 1948 Census enumerated 930,546 such workers, or 107 per thousand persons engaged (as defined above). For 1939, there were 923,878 unpaid family workers, or 144 per thousand persons engaged, of which 467,393 were full time and 456,485 were part time. Unpaid family workers were of greatest significance in grocery stores, without fresh meat, in which there were some 503 such workers per thousand persons engaged (as defined above) in 1948. Data for 1948 and 1939 are reported in the *Census of Business* for those years.

Establishments without paid employment and with less than $2,500 sales were excluded in 1954. The 1948 figures exclude stores which operated the entire year but had sales less than $500. The corresponding cutoff point for 1939 was $100.

There have been many changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones are noted here; others are described in the various census volumes. The 1954 Census was conducted by a mail canvass of firms included in the active records of the Internal Revenue Service as subject to the payment of FICA taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50-percent sample of 1954 tax returns. The 1948 and earlier censuses were conducted by field enumerations. The differences in enumeration affect particularly the coverage of establishments without easily recognized places of business (e.g., nonstore retailers) and those leaving business prior to the end of the year. The 1954 data are thus more complete in these areas. The 1933 and 1935 Censuses were not taken under mandatory reporting requirements and may be subject to some underenumeration.

Dairies which processed milk and cream were included as retailers in 1948 and earlier years if the major portion of their sales was by route delivery to the homes of consumers. They were excluded in 1954.

Nonstore retailers are treated as a separate kind of business for 1954. For earlier years, such retailers (to the extent enumerated) were classified in the appropriate product kind of business. For 1954, each leased department is treated as a separate establishment; for 1948 and earlier years, such departments were consolidated with the establishments in which they were located.

Two sets of estimates are shown for 1948. The data for 1948 (comparable with later years) represent retabulations of 1948 data to make them comparable with 1954 as to treatment of dairies, nonstore retailers, and cutoff points for tabulation. Similarly, two sets of estimates are shown for the number of persons engaged in retail establishments in 1939. The data for 1939 (comparable with later years) represent the sum of active proprietors and paid employees for the payroll period nearest November 15 and are comparable with 1948 and 1954 data. The figures for 1939 (comparable with earlier years) represent the number of active proprietors and the average number of employees for the year, and are comparable with data for 1935 and earlier years.

T 183–187. Chains and chain stores, 1872–1928.

Source: Federal Trade Commission, *Chain Stores: Growth and Development of Chain Stores* (72d Congress, 1st session, Senate Document No. 100), p. 80.

Figures include chains of two or more stores reporting to the Federal Trade Commission or known to that agency. Grocery and meat chains have been combined with grocery chains. Ready-to-wear chains include men's ready-to-wear chains, women's ready-to-wear chains, and men's and women's ready-to-wear chains but not chains specializing in furnishings, accessories, millinery, and the like, nor dry goods chains whether carrying apparel or not. Data for each of the 26 lines of business shown in the total column are found in the source. The source publication also contains estimates of the number of chain outlets in different years but such data embody substantial estimating difficulties.

T 188–207. Retail trade margins, by kind of store, 1869–1947.

Source: Harold Barger, *Distribution's Place in the American Economy Since 1869*, National Bureau of Economic Research, Princeton University Press, 1955, pp. 57, 60, and 81.

The retail margin estimates are shown as a percent of retail value, and include both net profit and expenses of doing business. With regard to the reliability of the data, the source volume notes that "because of the extremely heterogeneous nature of the source material, it is not possible to offer any measures of dispersion within categories for the data." The source concludes, however, that we may "have some confidence that at least the larger differences reported . . . have a real existence."

T 208–210. Sales of wholesale establishments, 1939–1957.

Source: Office of Business Economics, records.

These series appear currently in the *Survey of Current Business*. The estimates exclude sales of corporate manufacturers, sales branches and offices, and the marketing stations of petroleum refiners which are included in the manufacturing series of the Office of Business Economics. Sales of agents and brokers are included here on the basis of actual receipts of the agents and brokers rather than on the total value of goods sold. Data for 1948–1957 are based on definitions and classifications in the 1954 Census of Business; for 1939–1947, on 1948 Census of Business definitions and classifications.

T 211–302. Wholesale establishments, sales, operating expenses, and persons engaged, by kind of business, 1929–1954.

Series T 213–214, 1929, *Census of Business: 1939*, Vol. II, *Wholesale Trade*. Series T 217, T 221, T 233, T 237, T 241, T 245, T 249, T 253, T 257, T 261, T 265, T 269, T 273, T 277, T 281, T 293, and T 297, 1929, *Fifteenth Census of the United States: 1930*, Vol. II, *Distribution*.

Data shown are for wholesale establishments, other than chain store warehouses. Adjustments have been made in the published data for certain years by Professors Charles S. Goodman and Reavis Cox of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to attain maximum comparability.

Persons engaged represents paid employment for the workweek ended nearest November 15 plus active proprietors of unincorporated firms.

There have been numerous changes over the years in the definitions of kinds of business, scope of the census (especially as regards size minima for enumeration), enumeration methods, and completeness of data. The statistics shown have been adjusted where possible to maintain maximum comparability over time. Significant changes are noted below. For treatment of lesser differences, see source publications.

The 1954 Census was conducted by mail canvass. Report forms were mailed to all firms included in the active records of the Internal Revenue Service as subject to the payment of FICA taxes and which were classified in appropriate kinds of business or were unclassified at the time the forms were mailed. The 1948 and earlier censuses were conducted by field canvasses. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration.

Data for 1954 are for establishments with paid employees. The original 1948 tabulations include all establishments with sales of $5,000 or more irrespective of employment. For 1939, the corresponding cutoff point was $500. The figures for 1948 (comparable with later years) have been revised to reflect 1954 coverage and to incorporate certain changes in classification.

T 303–309. Wholesale trade margins of independent wholesalers, 1869–1947.

Source: See source for series T 188–207, p. 84.

See text for series T 188–207 for definition of "margin" and statement regarding reliability of the data.

T 310–345. Selected service establishments and receipts, 1914–1954.

Source: Series T 320–323, 1914–1935, *Biennial Census of Manufactures*, 1925, 1933, and 1935; series T 342–343, 1929–1935, *Census of Business: 1935, Hotels*. Except as noted above, 1933, *Census of American Business: 1933*, Vol. I, *Service Establishments;* 1935, *Census of Business: 1935*, Vol. I, *Service Establishments;* 1939 (figures comparable with earlier years), *Census of Business: 1939*, Vol. III, *Service Establishments;* 1939 (figures comparable with later years), 1948 (figures comparable with earlier years), *U.S. Census of Business: 1948*, Vol. VI, *Service Trade;* 1948 (figures comparable with later years), 1954, *U.S. Census of Business: 1954*, Vol. V, *Selected Services*.

Certain series have been combined for some years in order to provide as comparable historical series as possible. For some of the series, as noted below, data for some years were collected in other census programs. The series presented here cover that very limited segment of the services sector which bears greatest similarity to retail trade, specifically, personal, business, and automotive services, and hotels.

There have been numerous changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones are noted here; others can be noted by reference to the various census volumes. The 1954 Census was conducted by a mail canvass of firms included in the active records of the Internal Revenue Service as subject to the payment of FICA taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50-percent sample of 1954 tax returns. The 1948 and earlier censuses were conducted by field enumerations. The differences in enumeration methods affect particularly the coverage of establishments without easily recognizable places of business and those leaving business prior to the end of the year. The 1954 data are thus more complete in those areas. The 1933 and 1935 Censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration. There are important gaps in enumerators' reports for 1933 so that substantial underenumeration, particularly of the smaller establishments, exists for 1933. Underenumerations have more effect on the number of establishments than on receipts.

Establishments without paid employment and with less than $1,000 receipts were excluded in 1954 tabulations. The data for 1948 (comparable with later years) show 1948 figures adjusted to this cutoff point. The data for 1948 (comparable with earlier years) exclude establishments which operated the entire year but had receipts less than $500. For 1939 and earlier years establishments having receipts of $100 or more are included (except as noted). Where two estimates are shown for 1939, the figures for 1939 (comparable with later years) represent a revision to conform to 1948 kind-of-business definitions.

Receipts for 1954 include sales and excise taxes. These items are excluded for 1948 and 1939.

Establishments are classified according to their principal kinds of business. Changes in relative importance may thus serve to shift particular establishments among service categories or between service and retailing classifications from one census to another. Many service establishments derive some receipts from sales of merchandise; conversely, many establishments primarily engaged in the sale of goods, and hence included in retail trade, obtain some income from services. Receipts reported in each case represent *total receipts of establishments comprising the classification*, not receipts for the particular service indicated.

T 310–311, total personal services. Data for 1933 and 1935 represent groupings that correspond most closely to the 1939 scope. Power laundries and drycleaning plants with receipts under $5,000 have been excluded for 1933.

T 318–325, laundries and laundry service; cleaning and dyeing plants; and pressing, alteration, etc. Total laundries (series T 318–319) include self-service laundries for 1948 and subsequent years. Power laundries for 1919–1935 include only establishments with receipts of $5,000 or more. Cleaning and dyeing plants (series T 322–323) include plants primarily engaged in drycleaning and dyeing of apparel and household fabrics. Collecting and distributing units are included only if owned and operated by the plant. Establishments known as "cleaners" which do no drycleaning but have their cleaning done for them by cleaning and dyeing plants are included in series T 324–325. Rug cleaning plants are included as cleaning and dyeing plants for 1933 and later years; such establishments are treated as laundries for 1931 and earlier years.

T 326–327, photographic studios. Since the 1954 data were obtained by mail canvass, they are believed to be substantially

Digitized by Google

more complete than data for earlier years for this industry in which nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 330–331, automobile repair shops. Data for 1935 include specialized shops as enumerated in the census of service establishments, and general repair garages as enumerated in the *1935 Census of Business, Retail Distribution*, table 1A. Data for 1933 cover only general repair garages, as enumerated in the *1933 Census of American Business, Retail Distribution*, table 1A, and the following types of specialized shops as reported in *1933 Census of American Business, Service Industries:* Paint shops, radiator shops, top and body repair shops, tire repair shops, and brake repair shops.

T 338–341, miscellaneous repair services. Separate data are available for some or all of the indicated years for several of the repair services in this group including shops engaged in armature rewinding, bicycle repair, blacksmithing, harness and leather goods repair, musical instrument repair, saw and tool repair, typewriter repair, upholstering and furniture repair, watch, clock, and jewelry repair, etc. Since the 1954 data were obtained by mail canvass, they are believed to be substantially more complete than data for earlier years in these industries in which nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 342–343, year-round hotels. Data for 1954 are for establishments with payrolls only.

T 346–351. Volume of advertising, 1867–1957.

Source: 1867–1939, Printers' Ink Publications, New York, N. Y., *Printers' Ink Advertisers' Annual*, 1955 edition; 1940–1956, *Printers' Ink Advertisers' Guide to Marketing for 1958*, pp. 54–55; 1957, *Printers' Ink Advertisers' Guide to Marketing for 1959*, pp. 154–155.

The data are prepared by McCann-Erickson, Inc., from information furnished by the American Newspaper Publishers Association, A. C. Nielson Company, Publishers' Information Bureau, Farm Publication Reports, Inc., the Direct Mail Advertising Association, A. R. Venezian, Outdoor Advertising, Inc., and the Federal Communications Commission.

The data include the cost of preparation, and the cost of talent in the case of radio and television as well as the charges for space and time. Total advertising figures (series T 346) include, in addition to the figures for the media shown, advertising in regional farm publications and business papers, outdoor advertising, and miscellaneous advertising expenditures.

T 352–355. Farm-to-retail price spreads of farm food products, 1913–1957.

Source: 1935–39 market basket: 1913–1950, Department of Agriculture, *Agricultural Statistics, 1952*, p. 669; 1951–1952, Agricultural Marketing Service, *The Marketing and Transportation Situation*, April 1953, p. 6. 1952 market basket: 1947–1956, Agricultural Marketing Service, *Farm-Retail Spreads for Food Products*, Misc. Pub. No. 741, 1957, p. 98; 1957, *The Marketing and Transportation Situation*, January 1958, p. 47.

The data are prepared by the Agricultural Marketing Service. The 1952 market basket contains quantities of food equal to the average annual purchases per wage-earner and clerical-worker family in 1952. The 1935–39 market basket contains quantities equivalent to the 1935–39 annual average purchases per family of 3 average consumers. Quantities do not change from year to year.

Retail costs are calculated from prices collected by the Bureau of Labor Statistics. Farm value represents payments to farmers, exclusive of government subsidies, for unprocessed products equivalent to the foods in the market basket. The marketing margin is the difference between farm value and retail cost. It comprises payments to agencies that assemble and process the food raw materials and perform other functions to get food products to consumers at the times and places desired.

T 356–358. Retail cost, farm value, and marketing bill, for all farm food products purchased by domestic civilian consumers, 1913–1956.

Source: Agricultural Marketing Service, *Farm-Retail Spreads for Food Products*, Misc. Pub. No. 741, 1957, p. 49.

Unlike the market basket (series T 352–355) which measures a fixed quantity of food products, these series represent aggregates of all food products which originate on domestic farms and are bought by domestic civilian consumers. These estimates reflect not only price changes, but also changes in the total volume of products marketed, some variations in marketing services, and some of the effects of changes in the form in which goods are purchased by consumers, for instance the shift from flour to bread or the purchase of potato chips or frozen french fries instead of unprocessed potatoes.

In developing retail costs, different methods were used depending on the availability of data. Most commonly, such costs were estimated by dividing adjusted cash farm receipts by the farmers' share percentages for individual commodities as calculated for the market basket series. Thus they do not fully reflect changes in processing and other marketing services.

Food purchased in the form of meals is valued at what the food would have cost in retail stores, thus excluding services provided by such food preparers. For a similar series in which food purchased in eating establishments is valued at prices paid by consumers, see Department of Agriculture, *Agricultural Economics Research*, "The Farmer's Share: Three Measurements," April 1956, pp. 43–50.

The farm value represents only that part of farmers' cash receipts allocated to civilian domestic food use after making allowance for export and military use, interfarm transfers, the value of nonfood byproducts, and changes in stocks. These series do not include imported foods or nonfarm foods such as coffee, tea, and fish.

T 359–360. Index of department store sales and stocks, 1919–1957.

Source: 1919–1946, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, December 1951, pp. 1490-1491; 1947–1956, *Federal Reserve Bulletin*, December 1957, p. 1340; 1957, *Federal Reserve Bulletin*, April 1958, p. 486.

The index for sales is based on the average per trading day. The stocks index is the annual average of monthly data of end-of-month stocks. Procedures used and the nature of periodic revisions are described in the December 1951 and December 1957 *Bulletins*. Current data appear monthly in the *Federal Reserve Bulletin*.

T 361–365. Hotel operations, 1920–1957.

Source: Horwath and Horwath, New York, *Hotel Operations in 1957*, pp. 23 and 26–27.

Data are computed by Horwath and Horwath from about 400 hotels and are reported monthly in *The Horwath Hotel Accountant*. Data for 1926 and earlier years are based on relatively few hotels but do include two of the largest chains existing at that time. Sales and rate indexes based on 1951=100 are also available, as are average room rates, in dollars, for the period since 1940.

T 366–386. Book value of inventories at end of year, 1929–1957.

Source: Series T 366–374, 1938–1952, Office of Business Economics, *Business Statistics, 1957*, pp. 49–50; 1953–1955, same agency, records; 1956, same agency, *Survey of Current Business*, February 1958, p. S-10; 1957, *Survey of Current Business*, May 1958, p. S-10. Series T 375–377, 1938–1947, Office of Business Economics, *Business Statistics, 1957*, p. 14; 1948–1950, same agency, records; 1951–1956, *Survey of Current Business*, August 1957, p. 32; 1957, *Survey of Current Business*, May 1958, p. S-3. Series T 378–386, 1929–1956 (except series T 380–382 and T 384–386 for 1953–1956), *Business Statistics, 1957*, pp. 17-20; series T 380–382 and T 384–386, 1953–1956, *Survey of Current Business*, September 1957, p. 20; 1957, *Survey of Current Business*, May 1958, p. S-4.

In these series, trade inventories are valued at the cost of merchandise on hand while manufacturers' inventories are valued at cost or market price, whichever is lower. About 15 percent of manufacturers' inventories are valued on a last-in-first-out basis; this basis is much less prevalent in trade, although it is used extensively by department stores. Changes in book values reflect changes in unit costs as well as changes in physical quantities. Data for these series are published currently in the *Survey of Current Business*.

T 366–374, retail store inventories. Data for 1950–1957 represent the new series which are based on samples and are comparable in concept and coverage to the new series on retail sales. Data for 1938–1950 represent the old series which was linked to the 1954 Census of Business.

T 375–377, wholesale trade inventories. The scope includes all classes of wholesalers as defined by the 1954 Census of Business except that corporate manufacturers' sales branches and offices, and marketing stations of petroleum refiners have been excluded since they are included in the series on manufacturers' inventories. Data for 1947 and earlier are based on the definitions and classifications of the 1948 Census of Business instead of the 1954 Census. Inventories are valued at the cost of merchandise on hand; changes thus reflect changes in unit prices as well as changes in physical quantities.

T 378–386, manufacturers' inventories, by stage of fabrication. Seasonally adjusted series are not available prior to 1939. Data for 1929–1938 are without adjustment for seasonal variation. Unadjusted series are available since 1938 in the sources indicated.

1929	19,587	2,101.1	16.0	----------	18,467	14,517.2	[21] 3.2	----------	34,143	4,452.1	[17]	----------

[1] Totals include subclasses not shown separately.
[2] Fresh fruits and vegetable wholesalers and poultry and dairy products distributors. Milk bottling plants are included in the 1948 (unrevised) and earlier data.
[3] Based on 1954 scope of census for wholesale trade.
[4] Comparable with later years.
[5] Comparable with earlier years.
[6] Excludes commission bulk tank stations.
[7] Total of active proprietors plus the average number of employees (full time and part time) for the year.
[8] Includes dressed furs.
[9] Includes 42 distilled spirits wholesalers with sales of $12,785,473 and operating expenses of 24.7 percent.
[10] Includes musical instruments and sheet music wholesalers.
[11] Air conditioning and ventilating equipment distributors are included beginning 1948. Such distributors were classified in the plumbing and heating category in earlier years but were of negligible importance.
[12] Data for 1954 not strictly comparable with earlier years because of differences in treatment of sales to contractors and possible effects of differences in enumeration methods in the ready-mix concrete trade.
[13] Excludes wholesalers of shoe finding and cut stock. In 1929, 555 such establishments had sales of $55,810,553. Persons engaged in optical goods segment partially estimated.
[14] It is likely that there is a moderate amount of underenumeration in these series for 1954 as the mail canvass resulted in the activities of some branches and offices being reported as those of the manufacturing plant or as an auxiliary establishment.
[15] For 1954, 142 sales branches (with stocks) of steel works and rolling mill companies are included in metal distributors rather than as manufacturers' sales branches. These establishments had sales of $172,379,000.
[16] Partly estimated.
[17] Includes manufacturers' sales offices (without stocks).
[18] Combined with manufacturers' sales branches (with stocks).
[19] Not available.
[20] Data for assemblers for 1954 exclude fish and seafood assemblers which are included in the grocery, confectionery, meat group. In 1948 (adjusted) there were 544 such establishments with sales of $116,566,000, and operating expenses of 23.5 percent.
[21] Operating expenses.
[22] Includes district and general sales offices.

Series T 303–309. Wholesale Trade Margins of Independent Wholesalers: 1869 to 1947

Foreign Trade and Other International Transactions

FOREIGN TRADE (Series U 1-167)

U 1–167. General note.

Statistics on foreign trade of the United States are among the most useful, revealing, and, in spite of their deficiencies, reliable series relating to the growth of the American economy. This situation is especially true for the first 100 years of the Republic. The United States was more heavily dependent upon foreign markets and sources at that time than it has been in the 20th century. For a fuller discussion of the usefulness of such data, see G. G. Huebner's review of foreign trade of the United States in Emory Johnson, *History of Domestic and Foreign Commerce of the United States*, Carnegie Institution, Washington, D.C., 1915. This study has an excellent bibliography of material on foreign trade available at that time.

Since the first appearance of the *Statistical Abstract of the United States* in 1878, official time series on foreign trade have been presented in that publication and it is, therefore, cited here as a primary source for certain of the foreign trade data shown.

Foreign trade data are subject to a variety of special statistical problems relating to compilation, publication, coverage, valuation, and classification as to composition and direction. The record of gold movements, in particular, has been found to be subject to considerable error owing to its peculiar qualities which make it both a useful form of money and a likely candidate for smuggling (see R. G. D. Allen and J. Edward Ely, *International Trade Statistics*, John Wiley and Sons, New York, 1953; and Oskar Morgernstern, *Validity of International Gold Movement Statistics*, Special Paper in International Economics No. 2, International Finance Section, Princeton University Press, November 1955).

The first Congress of the United States provided for the compilation of statistics on foreign trade, and the Treasury Department, through its customhouses, began keeping a record of foreign trade beginning August 1, 1789. According to the Chief of the Bureau of Statistics, Treasury Department, Government records of the total values of our imports for 1790 to 1820 are fairly complete but do not show, except for a few years, the articles imported. They show, however, domestic exports by articles, but do not distinguish the values of merchandise from coin and bullion imported and exported, nor the value of the commerce with each country (see *Statistical Tables Exhibiting the Commerce of the United States With European Countries From 1790-1890*, Washington, D.C., 1893, p. vii).

Compared with currently compiled statistics, these earliest records left a great deal to be desired. J. Edward Ely, writing on the historical development of foreign trade statistics, observes that:

> The United States may be said to have had an adequate set of import and export statistics only since about 1821. Prior to that time no information was compiled on the amount of imports of articles which were free of duty upon importation into the United States. No value figures were compiled on imports subject to specific rates of duty and the dollar value for imports subject to ad valorem rates of duty, although apparently accurate, was compiled only as a total with no information on how much of each commodity was imported. Existing figures on the total dollar value of imports during the years 1795 to 1801 were apparently estimated at the time by the Secretary of the Treasury, and the figures for 1790-1794 and from 1802-1820 were apparently estimated many years later. (Allen and Ely, cited above, p. 269.)

Douglass North observes that the 1789-1820 figures were "officially overhauled and published in the Report of the Secretary of the Treasury on Finances for 1835" (see North's "United States Balance of Payments, 1790-1860," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, forthcoming). In employing the early records, North found a number of deficiencies, and users of figures for 1790-1820 should note his revised figures and consider the criticisms in the appendix to his paper. The adequacy of the early records, of course, depends upon the use made of them. Some of the earliest records were not published officially and scholars have had to depend for information on the unofficial work of Tench Coxe, Samuel Blodget, Jr., Timothy Pitkin, and Adam Seybert (see Faith Williams, "The Origin and Development of Modern Trade Statistics," *Journal of the American Statistical Association*, vol. 17, 1920–21, footnote, p. 740). Such data as were published annually for 1790-1820 were brought together later in U.S. Congress, *American State Papers*, Class 4, "Commerce and Navigation," two volumes, Gales and Seaton, Washington, D.C., 1832 (vol. I) and 1834 (vol. II).

In 1820, Congress passed a law to provide for obtaining accurate statements of the foreign commerce of the United States and, at the same time, established the Division of Commerce and Navigation in the office of the Register of the Treasury. It required collectors of customs to compile and transmit annual reports to that office showing the detailed trade with foreign countries and the navigation employed therein. Beginning with 1821, these reports were consolidated and published annually in the *Commerce and Navigation of the United States*.

Foreign trade statistics published by the Federal Government after 1820 are regarded as superior to those for the earlier period but still subject to some deficiencies, notably with respect to valuation of imports. They also suffered in respect to coverage of overland exports (see North, cited above, app. II, and Allen and Ely, cited above, pp. 270-271).

The Civil War introduced two special difficulties. For the last three quarters of fiscal year ending June 30, 1861, certain ports of the Southern States failed to make reports, and it was necessary for the Treasury Department to introduce estimates of the exports of cotton by the Southern States during the war based on records of the main recipient countries in Europe (see Treasury Department *Statistics of the Foreign and Domestic Commerce of the United States*, Washington, D.C., 1864, p. 39).

The second difficulty was introduced in 1862 when the United States abandoned the specie backing for its money. The dollar fluctuated against foreign currencies and gold with each reverse or success of the northern forces. While imports and reexports continued to be valued in specie (dollars of a fixed parity to gold), since these goods were initially expressed in foreign currencies, domestic exports were recorded

Digitized by Google

in "mixed values"—partly gold dollars and partly dollars of a fluctuating value—from 1862 until the resumption of specie payment in 1879. These deficiencies were recognized at the time both officially by the Director of the Bureau of Statistics (established in the Treasury Department in 1866) and by private observers (see, for example, Louis Blodgett's criticism and evaluation of United States foreign trade statistics in the early 1860's in *The Commercial and Financial Strength of the United States as Shown in the Balances of Foreign Trade and the Increased Production of Staple Articles*, King and Baird, Philadelphia, 1864). Treasury statisticians sought to adjust mixed currency values to specie values of total imports and exports and some other broad aggregates. The adjustments, however, were not carried through completely to country and commodity detail, and only a limited number of domestic export series are available for 1862-1879 in terms of "specie values" while the domestic export figures for countries and individual commodities are only available in mixed currency values.

When Congress established the Bureau of Statistics in 1866, it also specified that the kinds, quantities, and values of all articles exported and imported should be distinctly set forth in the statistical accounts, by countries of destination or of shipment, and that the exports of articles produced or manufactured in the United States should be shown separately from the reexports of foreign articles imported into the United States. Prior to 1866, only annual statistics of the foreign commerce of the United States were published; since then, monthly statistics have also been published.

The first report of the Director of the Bureau of Statistics in 1867 contains several pointed criticisms of the previous statistics, and the subsequent annual reports of the *Foreign Commerce and Navigation* emphasized the shortcomings of the figures presented, especially the difficulty which became important in the post-Civil War period of reporting on trade with Canada in the absence of any mandatory reporting requirement on the railroads (see, for example, the *Annual Report of the Chief of the Bureau of Statistics on the Commerce and Navigation of the United States for the Fiscal Year Ended June 30, 1877*, 1878, pp. xii-xiii, table showing " . . . the imports into Ontario, Quebec, and Manitoba, from the United States in excess of the domestic exports from the United States to Canada, as returned to the Bureau of Statistics by United States collectors of customs during the fiscal year ended June 30, 1877."). An act of March 3, 1893, provided for obtaining information on exports by rail and apparently eliminated this deficiency in the subsequent figures, but prior to that time trade totals and figures on trade with Canada suffer lack of coverage in varying degrees. Because of the deficiences in the earlier official United States trade statistics, an effort has been made to include here the account of trade with the United States as published by two of its leading partners throughout most of its history, Canada and the United Kingdom (see series U 152–155 and U 156–167).

For additional comments on foreign trade data for 1861-1900, see Matthew Simon, "Statistical Estimates of the Balance of International Payments and the International Capital Movements of the United States, 1861-1900," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research (forthcoming).

In 1923, the function of compiling foreign trade statistics was transferred to the Department of Commerce; however, the release and publication of the annual figures had been done by that Department since 1903. In 1941, the function was transferred, within the Department of Commerce, from the Bureau of Foreign and Domestic Commerce to the Bureau of the Census.

A problem affecting comparability of value statistics arose between January 31, 1934, and March 10, 1953, when the foreign exchange value of the dollar was permitted to depreciate as a result of the restriction placed on gold shipments to foreign countries. For this period, unless otherwise noted, values stated are in United States dollars without reference to changes in the gold content of the dollar.

World War II and the special foreign aid programs following it introduced new complications into the handling of United States foreign trade statistics. Lend-lease during the war, surplus property disposal immediately after the war, War Department shipments to relieve disease and unrest, economic and military aid, and security shipments have all complicated the presentation as will be noted below.

Import data compiled by the Department of Commerce are from import entries (various Customs forms) which importers are required to file with Collectors of Customs for each shipment arriving. Import values are, in general, based on market or selling price and are f.o.b. the exporting country. Values do not include import duties. The country of origin is defined as the country in which the merchandise was grown, mined, or manufactured. If the importer cannot obtain the information as to the country of origin, it is credited (for statistical purposes) to the country of shipment.

Imports are classified either as general imports or imports for consumption. General imports represent total arrivals of imported goods (except for intransit shipments), that is, merchandise released from Customs custody immediately upon arrival plus merchandise entered into a bonded storage warehouse, bonded manufacturing warehouse, and bonded refining warehouse immediately upon arrival. Imports for consumption comprise merchandise entered into the U.S. consumption channels, that is, merchandise released from Customs custody immediately upon arrival, merchandise entered into a bonded manufacturing warehouse (other than smelting or refining warehouse), merchandise withdrawn from a bonded storage warehouse for release into domestic consumption channels, and imported ores and crude metals which have been processed in a bonded smelting warehouse and then withdrawn for consumption or for reexport.

Effective January 1954, imports valued at $250 or less, reported on formal consumption and informal entries (about 1 percent of total import value), are estimated from a 5-percent sample. The estimated import values are excluded from detailed commodity statistics but are included in the over-all totals and are distributed in the appropriate country, district, and economic class totals, and in the totals for groupings of commodity classifications (i.e., commodity group or subgroup). Some indication of the undercounting in the detailed commodity statistics for imports is presented in the appendixes to the annual issues of Bureau of the Census, Report FT 110, *United States Imports of Merchandise for Consumption*, beginning with the issue for 1954. Explanations of the sampling procedures are given in Report FT 110 for 1956 and in the same Bureau's *Quarterly Summary of Foreign Commerce of the United States*, January-December 1956.

Export data are from Shippers' Export Declarations which exporters are required to file with Collectors of Customs for each shipment leaving the United States. Export data include shipments made after World War II under the Department of the Army Civilian Supply Program only for 1948 and subsequent years. In addition, export data include United States exports under the Lend-Lease, United Nations Relief

Digitized by Google

and Rehabilitation Administration, Economic Cooperation Administration, Mutual Defense Assistance, and other mutual security programs. Shipments to U.S. Armed Forces for their own use are not included in export statistics for any period.

Export value figures are based on the selling price (or on the cost, if not sold) of the commodity shipped and include inland freight, insurance, and other charges to the place of export. Transportation and other costs beyond the United States port of exportation are excluded. The country of destination is defined as the country of ultimate destination or country where the merchandise is to be consumed, further processed, or manufactured. In the event the exporter does not have definite information as to the country of ultimate destination for a shipment, it is credited (for statistical purposes) to the country to which it is consigned.

Certain export commodity classifications were grouped for security reasons into special categories beginning with May 1949, with periodic amendments to include additional commodities. With the adoption of new security regulations, effective July 1950, the publication of the country of destination and customs district detail for the special category commodities and groups was discontinued. Data for special category commodities are included, however, in all total export statistics (series U 1, U 10, U 11, U 21, U 22, U 61, and U 116); in the category of finished manufactures (series U 31, U 32, and U 66); and in the commodity categories of series U 73-93 (except automobiles and parts, series U 86, from which machinery and vehicles manufactured to military specifications have been excluded beginning in July 1949).

Shipments individually valued at less than $100 are not classified by commodity, but are reported in a single separate category. Effective with the statistics for July 1953 and continuing through December 1955, data for export shipments individually valued from $100 to $499 (about 4 to 6 percent of the total export value) were estimated on the basis of a 10-percent sample. From January through June 1956, the 10-percent sample was applied to shipments individually valued from $100 to $999 but, subsequently, the level was reduced to the previous level of $499. Details concerning sampling error and procedures are given in the Bureau of the Census, *Quarterly Summary of Foreign Commerce of the United States*, January-December 1956, and Report FT 410, *United States Exports of Domestic and Foreign Merchandise*, 1956.

The geographic area covered by these statistics, except as noted, is the United States Customs area, which includes Alaska, Hawaii, and Puerto Rico, and for 1935–1939, the Virgin Islands.

U 1–3. Total gold, silver, and merchandise exports and imports, 1821–1957.

Source: 1821-1880, except as noted, Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*, 1912, pp. 43-44 (1821, series U 1 and U 3, revised estimates prepared by the Bureau of the Census); 1881-1903, Department of Commerce, *Statistical Abstract of the United States*, 1924, pp. 420-421; 1904-1941, *Statistical Abstract*, 1948, p. 903; 1942-1949 (except series U 1 for 1948 and 1949), *Statistical Abstract*, 1951, p. 828; series U 1, 1948 and 1949, *Statistical Abstract*, 1953, p. 899; 1950-1957, *Statistical Abstract*, 1958, p. 880.

U 4–9. Gold and silver exports and imports, 1821-1957.

Source: 1821-1864, Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*, 1912, p. 43; 1865-1880, Treasury Department, *Statistical Abstract*, 1887, pp. 41, 42; 1881-1941, see source for series U 1–3 above; 1942-1957, Bureau of the Census, *Summary of Foreign Commerce of the United States*, various annual issues.

The data shown here for 1821-1864 for series U 6 and U 9 are not shown in the source but have been derived as the residual of the exports and imports data as shown in the source. Prior to 1895, figures for gold and silver relate to coin and bullion only; subsequently, they include ore also. Domestic exports of gold and silver cannot be separately stated prior to 1864, but it is probable that the greater portion of the exports was gold. In the series shown here, the data on exports of gold prior to 1864 include domestic exports of silver. The exports of silver for years prior to 1864, therefore, consist of only foreign exports or reexports.

U 10–14. Merchandise, exports and imports, 1790-1957.

Source: 1790, Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*, 1912, p. 43; 1791-1880, except as noted, Treasury Department, Bureau of Statistics, *Monthly Summary of Imports and Exports of the United States for the Fiscal Year, 1896*, pp. 622-623 (1821, series U 10, U 12, and U 14, revised estimates prepared by the Bureau of the Census); 1881-1903, Department of Commerce, *Statistical Abstract of the United States*, 1924, pp. 420-421; 1904-1941, *Statistical Abstract*, 1948, pp. 902-903; 1942-1957, see source for series U 4-9.

Merchandise export statistics include data on all shipments of commodities and merchandise leaving the United States Customs area except: (*1*) Gold and silver and evidences of debt; (*2*) intransit merchandise; (*3*) bunker fuel, stores, supplies, and equipment for vessels and planes; (*4*) temporary exports; (*5*) merchandise having small value or no commercial value; (*6*) shipments of military and naval supplies and equipment to the U.S. Armed Forces; and (*7*) shipments to U.S. Government agencies or establishments.

Exports of United States merchandise (series U 11) consist of commodities grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States.

Reexports (series U 12) comprise withdrawals from customs-bonded storage warehouses for exportation and exports of foreign merchandise (principally duty-free articles) which have previously been formally entered through customs. Exports of foreign merchandise consist of commodities of foreign origin which have entered the United States as imports and which, at the time of exportation, are in the same condition as when imported.

Merchandise import statistics include data on all commodities and merchandise reaching the United States except: (*1*) Merchandise not entering the U.S. Customs area, such as articles excluded from the United States by law, bunker fuel, and ships' stores; (*2*) intransit merchandise; (*3*) certain domestic merchandise returned from foreign countries; (*4*) gold, silver, and evidences of debt; (*5*) merchandise having small value or no commercial value; and (*6*) commodities entered under special provisions, such as articles consigned to diplomatic officers. General imports (series U 13) consist of entries for immediate consumption and entries into warehouses, and therefore comprise the total arrivals of merchandise, whether they enter consumption channels immediately or are entered into warehouses under customs custody to be subsequently withdrawn for consumption or withdrawn for exportation.

U 15–20. Value of merchandise imports and duties, 1821-1957.

Source: 1821-1880, Bureau of Foreign and Domestic Commerce, *Foreign Commerce and Navigation of the United States*,

Digitized by Google

1912, p. 50; 1881-1915, *Foreign Commerce and Navigation of the United States*, 1924, p. lxvii; 1916-1941, Bureau of the Census, *Statistical Abstract of the United States*, 1948, p. 939; 1942-1949, *Statistical Abstract*, 1951, p. 854; 1950-1957, *Statistical Abstract*, 1958, p. 900.

Imports are "imports for consumption" consisting of entries for immediate consumption and withdrawals from warehouses for consumption. The term "entry for consumption" is the technical name of the import entry made at the customhouse, and implies that the goods have been delivered into the custody of the importer and that the duties have been paid on the dutiable portion. Some of them may be exported afterwards.

For 1821–1866, the figures for import values (series U 15–17) represent net general imports (total imports less reexports), the amount of duty collected (calculated) being the annual amounts collected on merchandise only. For 1867-1957, the figures of import values represent imports entered for consumption.

U 18, duties calculated. The series described here as "duties calculated" is the series identified in annual volumes of *Foreign Commerce and Navigation . . .*, through the 1925 issue, as "duties collected"; subsequent issues describe it as "duties calculated." In spite of its description, it was a computed figure at least back to 1876. The evidence indicates that the earlier years, at least in part, were on a "duties collected" basis. This series should not be confused with the modern series called "duties collected" (not shown here) which represents the total amount of duties actually collected (on individual shipments) as reported to the Treasury Department by Collectors of Customs, subject in certain cases to subsequent refund as well as drawback. In contrast, "duties calculated" is a statistical measure derived by applying the appropriate rates to totals for all imports of the given commodity received at all ports of entry; it does not reflect drawbacks or refunds and is subject to some time lag in reporting.

U 19–20, ratio of duties to total. The calculated ratio of duties to total is simply the relationship of series U 18 to series U 15 and series U 17, respectively, expressed in percentage form. Series U 19-20 are similar to, but not identical with, the series described as "ratios of duties to total" shown in annual issues of *Foreign Commerce and Navigation . . .*, 1925 to 1946, and as "*average ad valorem rates*" in earlier issues. These series have been computed as shown here because of conflicts in source volumes with respect to early years.

U 21–44. Indexes of quantity and unit value of exports and imports, 1879–1957.

Source: 1879-1921, unpublished estimates prepared by Robert E. Lipsey, National Bureau of Economic Research; 1921-1957, following editions of the Department of Commerce, *Statistical Abstract of the United States:*

Period	Edition	Page
1921–1929	1934	404
1930–1937	1941	582
1938–1940	1948	911
1941–1946	1950	846
1947–1949	1955	905
1950–1952	1957	900
1953–1957	1959	893

For 1879-1921, indexes were compiled by Robert E. Lipsey of the National Bureau of Economic Research using a method and materials similar to those employed by the Bureau of Foreign Commerce. However, the NBER series are Fisher "ideal" index numbers, constructed in four segments, 1913-1921, 1899-1913, 1889–1899, and 1879–1889, and then linked at the overlapping years. The last year of each segment was used as the base for weighting during that period. To secure the unit value index, the NBER used values, quantities, and indicated unit values for general imports and domestic exports of individual commodities from official reports supplemented by domestic and foreign price data and by customs data from foreign countries. These and other types of index numbers, quarterly as well as annual, in more commodity detail and with notes on sources and methods of computation will appear in a forthcoming NBER publication by Robert E. Lipsey. The figures presented here are preliminary and subject to revision in the final publication.

The basic source of the data for 1920-1957 is the Bureau of Foreign Commerce. The indexes for this period have been calculated using Fisher's "ideal formula," using both the weights of the given year and those of the preceding (or base) year. Commodities not directly entering the calculations, including special category exports, were taken into account in the weighting within the several economic classes of merchandise on the basis of certain assumptions regarding similarity of their price movements to price changes of selected commodities specifically covered.

U 45–50. Foreign trade related to various measures of production, 1869-1957.

Source: Series U 45–46, 1869-1939, computed as the ratios respectively of series U 10 and U 13 to gross national product (using series F 1 for all years except 1909-1918; for these years, the estimates of gross national product are from U.S. Senate, 79th Congress, 1st session, "Report to the Committee on Banking and Currency," *Basic Facts on Employment and Production*, Senate Committee Print No. 4); 1940–1957, Bureau of Foreign Commerce, *Exports in Relation to United States Production*, 1957, p. 2. Series U 47–48, 1919–1927, 1931, and 1935, Bureau of Foreign Commerce, *World Trade Information Service Statistical Reports*, part 3, No. 58-22; 1929, 1933, and 1937-1957, see source for series U 45–46, 1940–1957. Series U 49, 1910–1950, Foreign Agricultural Service, *United States Farm Products in Foreign Trade*, Statistical Bulletin No. 112, p. 10; 1951-1956, *The Problem of Maintaining High Level Agricultural Exports*, November 1957, p. 13; 1957, Department of Agriculture, records. Series U 50, Don D. Humphrey, *American Imports*, 20th Century Fund, New York, 1955, pp. 527-528.

For additional data on the relation of foreign trade to the domestic economy, see the following reports in World Trade Information Service: "Exports in Relation to U.S. Production," part 3, Nos. 55-27, 56-31, 57-36, and 58-22; "Contribution of Imports to United States Raw Material Supplies," part 3, Nos. 55-20, 55-40, 57-1, 57-46, and 58-30; "Contribution of Imports to U.S. Food Supplies," part 3, No. 58-38; and "Role of Foreign Trade in the U.S. Economy," part 3, No. 57-38.

U 51–60. Value of merchandise exports and imports, by groups of customs districts, 1860–1954.

Source: 1860-1880, Department of Commerce, *Statistical Abstract of the United States*, 1923, pp. 824-825; 1881-1903, *Statistical Abstract*, 1924, p. 441; 1904-1944, *Statistical Abstract*, 1947, p. 921; 1945-1954, Bureau of the Census, records.

The customs district in which merchandise is entered or withdrawn for consumption is the district shown in the "imports for consumption" statistics. The customs district shown in the "general imports" statistics is the district through which merchandise enters the United States either as an entry for immediate consumption or as an entry into a customs-bonded warehouse. Except for shipments by mail the customs district through which a shipment clears when it leaves the country is the district to which the export is credited statistically. Exports are not credited on the basis of the

Digitized by Google

district in which the shipments originate. Exports and imports by mail are credited to the customs district at which the export or import entry is filed. For definition of terms, see text for series U 10–14 and U 15–20. Export figures for 1865 and 1870-1878 represent mixed gold and currency values and hence do not agree with the specie values given for total exports elsewhere.

U 61–72. Value of merchandise exports and imports, by economic classes, 1820–1957.

Source: The following editions of the Department of Commerce, *Statistical Abstract of the United States:*

Period	Edition	Page
1820–1881	1907	698–701
1882–1903	1926	448–449
1904–1939	1947	896–897
1940–1945	1950	845
1946–1949	1955	904
1950–1957	1958	888

For definition of terms, see text for series U 10–14 and U 15–20.

The economic classes shown here are broad categories based on groupings of more than 2,000 individual commodities listed in *Schedule B: Statistical Classification of Domestic and Foreign Commerce Exported From the United States and Regulations Governing Statistical Returns of Exports of Commodities*, "Part II, Numerical Classification and Articles Included (January 1, 1945, edition)," issued and kept current by the Bureau of the Census. Following are some of the important and typical commodities included in each of the economic classes:

Class	Exports	Imports
Crude materials	Crude petroleum	Crude rubber
	Coal	Raw silk
	Raw cotton	Hides and skins
Crude foodstuffs	Grains	Coffee
	Fruits	Tea
	Vegetables	Fruits
Manufactured foodstuffs	Meat	Sugar
	Lard	Meat
	Prepared fruits	Wheat flour
Semimanufactures	Iron and steel plates	Wood pulp
	Lumber	Copper in bars, etc.
	Refined copper	Tin in bars, etc.
Finished manufactures	Aircraft	Wool manufactures
	Cigarettes	Newsprint
	Radios and television sets	Automobiles and parts

In a report on *Exports of Manufactures from the United States and Their Distribution by Articles and Countries, 1800-1906* (1907), the Department of Commerce and Labor presented trade figures by economic classes annually back to 1850 and for selected years back to 1820. This study provided a different grouping of commodities than the Bureau of Statistics of the Treasury Department had previously employed for exports. In "Exports of Domestic Manufactures and Their Distribution" (*Monthly Summary of Commerce and Finance of the United States*, April 1903, p. 3239 ff.) the Treasury tabulated domestic exports for 1800–1850 by decade years and for 1851–1902 annually according to economic sector ("sources of production") as follows (p. 3249): Agriculture, manufactures, mining, forest, fisheries, and miscellaneous. But it tabulated imports "according to degree of manufacture and uses" for 1821, 1830, 1840, 1850, and 1851–1902 as follows (p. 3279–3280): Food and live animals, crude articles for domestic industries, articles manufactured wholly or partially for use as material in the mechanic arts, articles manufactured ready for consumption, and articles of voluntary use, luxuries, etc. This report noted that values for exports were in fluctuating currency for 1862-1879 and for those years gave specie values both for total exports and for exports of manufactures (p. 3315).

Trade in agricultural and forest products have been of special concern to the Department of Agriculture. Bulletin No. 51 of the Bureau of Statistics of the Department of Agriculture (1909) provides the "only compilation . . . ever to be completed (to that time)" of the "Foreign Trade of the United States in Forest Products, 1851-1908." Bulletins No. 74 and 75 in the same series, published in 1910, reviewed the "Imports of Farm Products into the United States, 1851-1908" and "Exports of Farm Products from the United States, 1851-1908," respectively.

U 73–115. General note.

The totals of the selected imports and exports (series U 73 and U 94) are shown to provide a means of judging the extent to which the selected items account for the total trade of this country. They include only the values of the items shown for each year and are, therefore, a total with a variable composition. Additional information on the composition of the foreign trade of the United States may be found in M. B. Hammond, *The Cotton Industry*, American Economic Association Series 2, No. 1, New York, 1897, and in reports by the Bureau of Statistics, Treasury Department, on the grain, provision, cotton, coal, iron and steel, and lumber trades of the United States which appeared in the *Monthly Summary of Commerce and Finance* (hereafter abbreviated as *MSCF*) for 1899-1900, 1900-1901, and 1902-3.

Source: See source for series U 80-93.

U 116–151. General note.

Imports are shown according to country of origin and exports according to ultimate destination. When the final destination is not known the shipment is credited statistically to the country to which it is consigned. Accurate information on country of origin is difficult to obtain. Consequently, the directional breakdown of foreign trade is at best approximate.

Trade with Canada and the United Kingdom, particularly, is difficult to measure. Considerable United States merchandise normally moves to foreign destination via Canada and some moves across Canada to destinations in the United States, notably from ports in Michigan to ports in New York. At times such movements have been counted as trade with Canada. Also considerable Canadian trade with other countries moves through the United States. A good deal of United States merchandise has been consigned to the United Kingdom and reexported to other markets by the United Kingdom, as can be observed by the difference between general imports and retained imports in the United Kingdom's record of trade with the United States.

Special studies of United States-Canadian trade have been made from time to time. In this connection, see the headnote to the table, p. 295 of *Commerce Yearbook*, vol. II, for 1931; and see *MSCF*, June and July 1898, pp. 2084–2089, where it is also noted (p. 2075) that "exports to Canada are incomplete prior to April 1, 1893, the date on which the law requiring exporters to clear their goods exported by railways went into effect." For an effort at adjusting the United States trade record for this deficiency and the similar lack of coverage in the report of trade with Mexico, see table II of Matthew Simon's "Statistical Estimates of the Balance of International Payments and the International Capital Movements of the U.S., 1861–1900" to be published by the National Bureau of Economic Research in *Studies in Income and Wealth*, vol. 24. For a discussion of shortcomings in the United States record of trade with the United Kingdom in the early years of the Civil War, see the Treasury's report in 1864 to Congress, *Statistics of the Foreign and Domestic Commerce of the United States*, p. 37 ff.

For certain periods, like the Civil War and the greenback era, partners' records of trade with the United States are more reliable than the United States record and in some ways more revealing of certain aspects of the trade. Accordingly, the records of two of the most important partners, Canada and the United Kingdom are shown in series U 152–161.

For 1862–1879, exports of domestic merchandise are mixed gold and currency values. Imports and reexports, however, are specie values. The extent of the adjustment can be observed by comparing figures from series U 116 with those in series U 10.

Prior to 1873, trade figures for Canada are actually trade figures for all of British North America, a somewhat larger area than the Dominion of Canada. Asia includes the Philippines in all years and Turkey in Europe for 1926-1951. Oceania includes Hawaii prior to 1901. Europe includes the Soviet Republic in Asia since 1923 and Iceland in all years (Iceland was included with northern North America in *Historical Statistics of the United States, 1789-1945*).

The source for these series for 1821-1881 is the Treasury Department, Bureau of Statistics, *Monthly Summary of Commerce and Finance*, hereafter abbreviated as *MSCF*.

U 116–133. Value of exports (including reexports) of U.S. merchandise, by country of destination, 1790-1957.

U 152–155. Trade with the United States as reported by Canada, 1850–1957.

Source: 1850–1867, Dominion of Canada, Department of Trade and Commerce, *Special Report of Trade Between Canada and the U.S. for the Use of the International Commission, Quebec, August 1898*, Dawson, Ottawa, 1898, pp. 258-259; 1868-1900, Dominion Bureau of Statistics, *Trade of Canada*, vol. I, 1956, p. 19; 1901–1918, series U 152 and U 155, *Review of Foreign Trade*, part II, p. 49; series U 153 and U 154, unpublished records of the Dominion Bureau of Statistics; 1919-1956, *Trade of Canada*, vol. I, 1956, pp. 24-25; 1957, *Review of Foreign Trade*, part II, pp. 50-51.

The Dominion Bureau of Statistics takes, as the value of goods exported, the actual amount received by the exporter in Canadian dollars, excluding such charges as freight, insurance, and handling. In effect, therefore, export values are taken f.o.b. point of shipment for export. The value of goods imported is the value as determined for customs duty purposes. In most cases, this corresponds to the value shown on the invoice accompanying the goods, converted to Canadian dollars at authorized exchange rates (usually the commercial rate

Digitized by Google

prevailing on the date at which the goods were actually dispatched to Canada), and excluding such charges as freight, insurance, handling, and taxes. In effect, therefore, import values are taken f.o.b. point of shipment in the country of export.

1924–1957, the following Department of Commerce publications: *Commerce Yearbook* (for years as noted); 1924–1926, vol. II, 1928 edition, p. 644; 1927-1929, vol. II, 1931 edition, p. 295; *Foreign Commerce Yearbook* (for years as noted); 1930-1932, 1933 edition, p. 145; 1931-1934, 1935 edition, p. 149; 1934-1936, 1937 edition, p. 168; 1937-1938 and 1946, 1948 edition, p. 209; 1947, 1950 edition, p. 508; 1948-1951, 1951 edition, p. 517; for 1952-1957, *World Trade Information Services*, part 3, Nos. 54-3, 56-37, and 58-16.

The basic source for all years is the official trade record of the United Kingdom and the sources quoted here for the data prior to 1923 are British publications. The figures from the British publications were converted at the following rates of exchange (dollars per pound sterling): 1923, $4.575; 1924, $4.417; 1925, $4.829; 1926, $4.858; and 1927-1933, $4.44. British imports are valued c.i.f. (cost, insurance, and freight); exports are valued f.o.b.

The sources used give wheat imports variously in quarters, hundredweight (cwt.), or bushels, and these have been converted to pounds at 8 bushels per quarter, 60 pounds per bushel, and 112 pounds per cwt. Cotton is given variously in pounds, centals (hundreds of pounds), or hundredweight (of 112 pounds).

Trade of the whole of Ireland is included with trade of Britain prior to April 1, 1923. Thereafter, trade of the Irish Free State is excluded.

The British system of reporting direction was changed in 1908 in accordance with recommendations of the departmental Committee on Trade Records [Cd 4345 (Command Paper by Parliament)] from country of shipment to country of consignment. Returns on both systems are reported in the *Annual Statement* (cited above) and its *Supplement* for 1904-1913. Figures given here were drawn from the *Annual Statement* for 1904 and 1909 (vol. II) giving the old basis through 1904 and the new beginning 1905. "The difference (between the two bases) arises mainly in the case of imports from and exports to countries which do not possess a seaboard. . . ." Imports from the United States were affected somewhat by the adoption of the new system; exports to the United States of British produce, not at all. Imports of grain, especially, were affected; on the new basis of consignment United Kingdom grain imports from the United States were smaller than on the old country-of-shipment basis, indicating that more grain was consigned from Canada and shipped from United States ports than was consigned from the United States and shipped from Canadian ports (both movements are normal). See *Annual Statement* for 1910 *Supplement*, p. 317 ff.

The Department of Commerce and Labor in *MSCF*, April 1904, makes the following observation about the United Kingdom's trade record prior to the change in counting direction:

> In the trade accounts of the United Kingdom imports are generally credited to the country whence they were shipped direct to the United Kingdom. Although efforts are made to trace the more important imports back to the actual countries of first shipment, yet in the absence of "certificates of origin" of imported goods this is not always possible. . . . The same practice is followed in the case of exports, which are charged to the country in which the port of first discharge is situated.
>
> Similar inaccuracies appear in the United States trade account. As a rule the exports from the United States to countries having no direct steamship connections with American ports appear understated in the United States accounts, whereas the exports to countries containing the respective ports of discharge whence the goods are forwarded, either by land or water, to the ultimate country of destination as a rule are overstated. Thus the exports from the United States to Austria-Hungary, Russia, and Switzerland are understated, while those to United Kingdom and Germany appear overstated in the United States accounts. Generally a more correct idea of the trade relations between two countries can be obtained from a study of their respective import figures than their export figures. (p. 3727)

Prior to the issuance of the *Commerce Yearbooks* and their successor serials, various agencies of the U.S. Government from time to time published the official British record of trade with the United States converted into U.S. dollar equivalents. An early publication giving the dollar value of total United Kingdom imports and exports with the United States was the State Department's "Report on the Commercial Relations of the United States with all Foreign Nations" (S. Doc. 107, 34th Cong., 1st sess.). On p. 40 of vol. I of this work is a table giving a "View of trade between Great Britain and the part of the North American Colonies now included in the United States from 1697-1774 and between Great Britain and the United States from 1775-1820" compiled from British authorities. The sources of these figures are not more definitely specified, the problem of conversion is not discussed, nor is the basic record assessed critically, although much dissatisfaction developed late in the 18th century with the valuation of British trade statistics. From 1698, both imports and exports were valued according to official unit values which were altered from time to time but some of which remained fixed for over a century. The system of valuing exports of domestic products was changed to employ "real or declared" values beginning in 1805, and beginning in 1854 the system of valuing imports and exports of foreign and colonial merchandise was changed to give "computed real values" based on market quotations in the United Kingdom. An indication of the extent of the revision introduced by the change to market values can be obtained from the *Annual Statement* for 1854 (pp. iii-iv). Using market prices added 22¾ percent to the "official values" of all United Kingdom imports in 1854, 26 percent to imports from foreign countries, and 13⅓ percent to imports from British possessions. Curiously, the value of reexports was reduced by 38 percent. The new unit values were lower on raw cotton, coffee, and tea, but higher on cereals. In 1871, the "declared" value basis was introduced for imports and reexports. In spite of deficiencies, figures on trade in official values may serve as weighted indexes of quantities traded between the United States and United Kingdom,

Digitized by Google

weights being the official unit values; and the State Department series may serve a useful purpose. The user would be well advised, however, to track down the original official returns in order to interpret the figures properly.

Another U.S. Government publication giving the dollar value of British trade with the United States is the 1864 report to Congress by the Treasury Department, *Statistics of the Foreign and Domestic Commerce of the United States*, which gives (p. 33 ff.) the values for United Kingdom trade with the United States from the official United Kingdom record, converted to U.S. dollar equivalents, for 1856-1862. A still later report is Department of State, Foreign Commerce Bureau, "Abstract of the Foreign Commerce of Europe, Australasia, Asia, and Africa 1873-1885," *Consular Report*, No. 85, vol. 24, 1887. It gives (p. 90 ff.) dollar values for the totals traded with the United States by the United Kingdom. However, this series appears to have required revision, for a subsequent compilation of the same nature in *Consular Report*, No. 91, vol. 25, 1888, p. 740, gives figures for the decade 1877–1886 showing an upward revision in both imports and exports for the years common to both tabulations. The 1888 tabulation is repeated, in part, in *Consular Report*, No. 141, vol. 39, 1892, p. 211, carrying similar figures for 1881-1890. The last year of this set of figures appears to have been revised. Somewhat different figures for 1890 are given by the Department of Commerce and Labor in *MSCF*, April 1904, p. 3848 ff., carrying the dollar values for United Kingdom trade with the United States 1890–1902. The series was extended to 1906 in Department of Commerce and Labor, Bureau of Statistics, *Statistical Abstract of Foreign Countries, parts I-III; Statistics of Foreign Commerce*, 1909, p. 120 ff.

From 1906 until the Department of Commerce began the serial publication of the dollar value of British trade with the United States in the *Commerce Yearbook* of 1926 and subsequent years, the publication of this series was spotty and irregular. The Bureau of Foreign and Domestic Commerce issued two compilations on the "Commercial Relations of the United States with Foreign Countries" for 1911 and 1912 giving the dollar value of total trade of the United Kingdom with the United States in 1910, 1911, and 1912. Figures for 1913 are given in the *Commerce Yearbook* for 1926 and subsequent years; and the Bureau of Foreign and Domestic Commerce, *Supplements to Commerce Reports* Nos. 19a, March 28, 1916, and 22b, April 12, 1920, give dollar values of United Kingdom trade with the United States in 1914 and 1917–1919. The last, however, are converted at par and there is some question as to whether this conversion is the best. The problem of conversion is discussed at some length in the *Supplement* for 1921, No. 1, p. 74. See also *Supplements* for 1922, No. 7, pp. 63 and 68, and 1923, No. 1, p. 21 ff.

Thus, for most of the last hundred years one agency or another of the U.S. Government has published dollar equivalent values for the official United Kingdom trade totals with the United States. However, until the publication of the *Commerce Yearbooks* the statistics were not always presented with descriptive notes giving exact sources and describing the method of conversion. Because of the frequency of revisions, one suspects, especially of consular reports, that the sources used for the most recent year given, and perhaps for other years, were preliminary figures which may or may not have been revised. Consequently, these series should be used with some caution. For additional information, see Albert Imlah, *Economic Elements in the Pax Britannica: Study in British Foreign Trade and Trade Policy in the 19th Century*, Harvard University Press, 1959.

[1] Prior to 1864, domestic exports of silver included with gold.
[2] Figures include gold and silver prior to 1821.
[3] Figures which include estimates of civilian supplies shipped to occupied areas through U. S. Armed Forces and other relief agencies are as follows (in millions of dollars): 1944, 14,414; 1945, 10,580; 1946, 10,184; 1947, 15,338.
[4] Less than $500,000.
[5] Figures for 6-month period of July 1, 1915—Dec. 31, 1915, are as follows (in millions of dollars): Series U 1, 1,905; series U 2, 1,239; series U 3, +667; series U 4, 24; series U 5, 807; series U 6, −288; series U 7, 29; series U 8, 19; series U 9, +10; series U 10, 1,853; series U 11, 1,820; series U 12, 33; series U 13, 913; and series U 14, +940.
[6] Period beginning Oct. 1, 1842, and ending June 30, 1843.
[7] Data shown under silver are for gold and silver.

[1] Figures for 6-month period July 1, 1915—Dec. 31, 1915, are as follows (in millions of dollars): Series U 15, 935; series U 16, 631; series U 17, 303; series U 18, 96; series U 19, 10.26 percent; and series U 20, 31.61 percent.

[2] Agrees with source; however, figures for components do not add to total shown.

[3] During the period from May 1, 1900, to July 25, 1901, merchandise brought from Puerto Rico was dutiable at 15 percent of regular rates. The duties collected thereon were as follows: May 1, 1900, to June 30, 1900, $134,593.88; July 1, 1900, to July 25, 1901, $448,198.91.

[4] Period beginning Oct. 1, 1842, and ending June 30, 1843.

[1] For security reasons, data for certain commodities and data on Department of Defense controlled cargo are excluded from export figures for individual customs districts, effective July 1950. Data on these shipments are included in total export statistics.

[2] Not available.

[3] Includes Omaha beginning April 1, 1945.

[4] Figures for 6-month period July 1, 1915–Dec. 31, 1915, are as follows (in millions of dollars): Series U 51, 1,304; U 52, 688; U 53, 224; U 54, 44; U 55, 10; U 56, 13; U 57, 97; U 58, 105; U 59, 218; and U 60, 105.

[1] Prior to 1865, quantity in hogsheads. Includes some leaf tobacco which has been partly processed.
[2] Includes semimanufactures.
[3] Includes margarine of vegetable origin since 1948. Excludes inedible fish oils. Excludes lard compounds since 1921; now classified as vegetable cooking fats.
[4] Includes fruit and nut preparations since 1946.
[5] 1855–1881, "Meats and meat products"; 1882–1904, "Meats."
[6] "Cars, carriages, automobiles, etc.," prior to 1902. Excludes machinery and vehicles manufactured to military specifications beginning July 1949.
[7] Includes box, crate, and package shooks (except fruit and vegetables) beginning 1949; classified as "Sawmill products" in prior years. Prior to 1881, "Sawmill products" combined with "Other wood manufactures."
[8] "Coal and coke" prior to 1946.
[9] Includes a small amount of nonferrous metal articles.
[10] Not available.
[11] No record of cotton exports for southern ports.
[12] Less than one-half the unit indicated.
[13] For 9 months.

[1] Includes semimanufactures.
[2] "Copper including ore and manufactures" since 1946.
[3] Includes fur hats beginning 1921; formerly classified as miscellaneous textile products.
[4] Includes "Sawmill products," "Wood pulp," and "Paper and manufactures."
[5] Not available.
[6] Value in millions of dollars for "Imports for consumption" as follows: Series U 101, 19; series U 102, 16; series U 106, 51; series U 107, 31; series U 108, 15; series U 109, 45; series U 112, 37; series U 113, 37; series U 114, 144; series U 25, 26.
[7] Less than $500,000.
[8] For 9 months.

[1] Prior to 1873, data are for trade with British North American Provinces which is a somewhat larger area than the Dominion of Canada. In the year ending June 30, 1873, the U. S. traded with British North American Provinces the following amounts: $34.6 million of exports and $37.6 million of imports. Beginning 1952, includes Newfoundland and Labrador.

[2] Prior to January 1952, East and West Germany; thereafter, only West Germany.

[3] Figures in italics include gold and silver.

[4] Beginning 1954, excludes Ryukyu Islands. No records available prior to 1855.

[5] Includes amounts not shown by continents for security reasons.

[6] Less than $500,000.

[7] Includes Puerto Rico.

[8] For 9 months.

[1] Prior to 1873, data are for trade with British North American Provinces which is a somewhat larger area than the Dominion of Canada. In the year ending June 30, 1873, the U.S. traded with British North American Provinces the following amounts: $34.6 million of exports and $37.6 million of imports. Beginning 1952, includes Newfoundland and Labrador.

[2] Prior to January 1952, East and West Germany; thereafter, only West Germany.

[3] Figures in italics include gold and silver.

[4] Beginning 1954, excludes Ryukyu Islands. No records available prior to 1855.

[5] Agrees with source; however, figures for components do not add to total shown.

[6] Less than $500,000.

[7] For 9 months.

chapter U

BALANCE OF INTERNATIONAL PAYMENTS AND INVESTMENT POSITION (Series U 168–213)

U 168–213. General note.

This section presents statistics on the balance of international payments and the international investment position of the United States. A separate table shows the value of United States direct investments in foreign countries by area and industry groups. The balance of international payments shows the economic transactions between residents of the United States and those of all other areas of the world during a stated time period. The international investment position indicates the value of United States investments abroad and of foreign investments in the United States at specified points of time. The change in the international investment position of the United States results partly from the movement of foreign and United States capital, as presented in the balance of international payments, and partly from other factors, such as changes in the valuation of assets or liabilities, including changes in the market value of securities, defaults, expropriations, writeoffs, and reinvested earnings of subsidiaries operating abroad and of foreign subsidiaries operating in the United States. Direct investments include all foreign enterprises whose voting stock is owned to the extent of at least 25 percent by United States organizations or individuals, or in the management of which Americans have an important voice. In addition, they include unincorporated foreign branches or other direct foreign operations of United States interests, including mining claims, oil concessions, and other property held for business purposes such as real estate.

In all the series of this section, international organizations, such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the United Nations, though located within the United States, are considered extra-territorial. Consequently, transactions between the United States and these organizations are considered international transactions of the United States, while transactions between them and foreign countries do not enter the balance of payments of the United States. United States holdings of their obligations and United States liabilities to them are part of the United States investment position.

U 168–192. Balance of international payments, 1790–1957.

Source: 1790–1918 (except series U 191, 1874–1900), Office of Business Economics, records; series U 191, 1874–1900, Treasury Department, *Annual Report, Director of the Mint*, 1921, p. 130; 1919–1955, Office of Business Economics, *Balance of Payments Statistical Supplement*, 1958, pp. 10–13; 1956–1957, *Survey of Current Business*, June 1959, p. 20.

Basically the figures for 1790–1918 are from publications by private authors; therefore, they are unofficial figures. However, the figures, as shown by these authors, have been rearranged and adjusted, and in some cases supplemented, for this volume by the Office of Business Economics. The reclassified figures fit into the concepts and framework currently used in the official balance of payments statements prepared by OBE.

The original figures are from the following private publications: 1790–1860, Douglass C. North, "The United States Balance of Payments, 1790–1860," *Studies in Income and Wealth*, Princeton University Press, vol. 24 (forthcoming); 1861–1900, Matthew Simon, "The United States Balance of Payments, 1861–1900," *Studies in Income and Wealth*, Princeton University Press, vol. 24 (forthcoming); and 1901–1918 (with the exception of exports and imports of merchandise trade and silver), Paul D. Dickens, "The Transitional Period of American International Financing, 1897–1914," (unpublished doctoral dissertation, George Washington University, 1933) and C. J. Bullock, John H. Williams, and Rufus S. Tucker, "The Balance of Trade of the United States," *Review of Economic Statistics*, July 1919. Data on merchandise trade and silver for 1901–1918 were taken from Department of Commerce, *Monthly Summary of Foreign Commerce*, various issues.

The estimates for 1901–1918 were revised primarily to make them consistent with, and to link them to, data prepared for subsequent years. The revised estimates were published by Raymond W. Goldsmith, in *Study of Savings in the United States*, Princeton University Press, 1956, vol. 1, pp. 1078, 1080, 1081, 1084, and 1086.

The Department of Commerce began its series in 1922, later extending the data backward to cover 1919–1921. Data for annual and quarterly United States international transactions, total and with individual regions of the rest of the world, are available currently in the March, June, September, and December issues of the *Survey of Current Business*.

The balance of payments statement reflects all the exchanges of goods, services, gold, and capital claims between residents of the United States and residents of all other areas of the world. For 1919–1939, residents of the United States comprise residents of continental United States, Alaska, Hawaii, and Puerto Rico. Since 1940, residents of the Virgin Islands, the Panama Canal Zone, and American Samoa are also included. As noted above, international organizations are not regarded as residents of the United States.

Transactions entering into the balance of payments are divided into four categories—goods and services, unilateral transfers, capital movements, and changes in the monetary gold stock. The balance of payments statement is built on a double entry system, whereby, in principle, every transaction is recorded both as a debit and a credit. Debits represent increases in assets or decreases in liabilities, and credits represent decreases in assets or increases in liabilities. Thus, an export of merchandise in return for a check drawn on a foreign account in a bank in this country results in a credit for the export (a reduction in an asset) and a debit for the reduction in foreign-held bank deposits (a reduction in a liability). Unilateral transfers to foreign countries (payments) are debits (as are expense items in accounting), and unilateral transfers from foreign countries (receipts) are credits (as are income items in accounting). While all transactions have a debit and credit phase which are necessarily equal, both sides are not estimated simultaneously nor from the same sources; hence, the possibility of error. The resulting discrepancy, referred to as "errors and omissions," series U 192, is given a plus or minus sign, depending upon which is necessary to make the accounts balance.

The procedure generally followed by North and Simon in their studies was to estimate receipts and payments on account of merchandise trade, transportation, travel, interest, dividends, and remittances. The authors then assumed that the balance indicated net flows of United States and foreign

Digitized by Google

capital. For 1790–1900, series U 185–190 represents this balance which, of course, includes any errors and omissions in the estimates.

Data on exports and imports of merchandise used in the study by North are reported to include gold and silver prior to 1821 (see *Statistical Abstract of the United States*, 1957, p. 890). A separate estimate, however, was made by North for net movements of gold, because he concluded on the basis of his research that specie movements were in fact not included in the merchandise trade figures prior to 1821. (See "The United States Balance of Payments, 1790–1860," pp. 24–25.) This estimate is included in series U 169 and U 176. Although the annual amounts are small, varying from net exports of $1 million to $2.5 million to net imports of $1 million to $4 million, the residual item, or net movement of capital, may be in error by the same amount.

North indicates that the reliability of the data on exports prior to 1820 is doubtful and that data on imports are incomplete. The paucity of information also made the estimates for other transactions for this period considerably less satisfactory than for subsequent years. Consequently, North suggests that 5-year averages may be more reliable than the annual data. Such averages are included in his study.

For the classification and contents of series U 168–192, 1900–1918, see Raymond W. Goldsmith, cited above. Three transactions have been entered which did not appear in this study. See text below for series U 184 and U 185.

For methods of estimating current data, see *Balance of Payments of the United States, 1949–1951, a supplement to the Survey of Current Business*, Office of Business Economics. Continued changes and improvements in the methods of collecting data have been made and the figures have become progressively more reliable over time.

U 169 and U 176, merchandise. The estimates for ship sales for 1790-1900 are included in exports, series U 169. For 1790–1819, the net export or import of specie is included in series U 169 or U 176, respectively. The gross movements of specie were not available. For 1820–1860, exports of specie are included in series U 169 and imports in series U 176. Exports and imports of gold for 1861–1873, of nonmonetary gold for 1874-1900, and of silver for 1861–1900 are included in series U 169 and U 176, respectively.

The data for 1901–1918 include merchandise trade proper, silver and nonmonetary gold. The basic data on merchandise trade for 1919–1957 are the official trade statistics published until 1946 in *Foreign Commerce and Navigation* and since then in the foreign trade compilations of the Bureau of the Census. For 1919–1957, adjustments in both exports and imports have been made to correct for known overvaluation or undervaluation, to exclude noncommercial items, to include an estimate for unrecorded trade, and to adjust for certain differences in territorial coverage, e.g., to exclude the trade with the Panama Canal Zone, beginning with 1940. For World War II and early postwar years, data on Government purchases were substituted for certain import data. For Government-financed transfers of merchandise, the figures based on fiscal records were used instead of the figures appearing in the recorded export statistics. For the years after World War I and World War II, sales and other transfers of surplus property located abroad were added to recorded export statistics. Series U 169 also includes the transfers with or without compensation to allied countries of military equipment, including that purchased abroad under the Mutual Defense Assistance Program. A small amount of services connected with these transfers is also included. Series U 169 and U 176 include nonmonetary movements of gold. For the treatment of gold, see series U 191 below.

U 170 and U 177, transportation. For 1790–1819, series U 170 represents gross earnings on freight carried in United States ships. Some adjustment was made to eliminate earnings from carrying United States imports.

For 1820–1860, series U 170 includes earnings by United States ships from carrying United States exports and from carrying freight between foreign ports. It also includes American port charges paid by foreign ships. Transportation payments, series U 177, consist of freight payments to foreign ships for carrying United States imports, and expenditures of American ships in foreign ports. Port expenditures and receipts are estimated as a percentage of freight earnings by American and foreign ships, respectively. (Fare payments to American ships by immigrants are included in the estimate for immigrant funds. See discussion of series U 183, private unilateral transactions. For fare payments of tourists, see discussion of travel, series U 171 and U 178.) For 1861–1900, series U 170 includes ocean freight earnings from carrying United States exports and from carrying freight between foreign ports, and port expenditures in the United States of the foreign merchant marine and of passenger steamships. The estimates for the years 1871–1900 also include earnings from carrying overland freight. Payments for transportation, series U 177, includes ocean freight payments on United States imports, and expenditures in foreign ports by the United States merchant marine. Passenger fares are included in the travel account (series U 171 and U 178). The data for 1900–1918 include receipts and payments on account of ocean freight, and port charges. For 1916–1918, payments for charter hire were added.

For 1919–1957, the transportation category includes international freight, fares and shipboard expenses of travelers, revenues and expenditures resulting from the charter of vessels and the rental of freight cars, and the expenses of United States transportation companies abroad and foreign transportation companies in the United States. The data cover air and surface transportation.

U 171 and U 178, travel. For 1790–1819, no estimate was made for international travel expenditures. For 1820-1860, series U 171 includes tourist expenditures in the United States and their fare payments to American ships; series U 178 represents American tourist expenditures abroad. North assumed that American tourists going abroad and, for the most part, foreigners coming to the United States traveled on American ships during this period. The method employed in the source study for estimating tourism precludes the transfer of fare payments to the transportation account. For 1861–1900, series U 171 includes outlays of foreign travelers in the United States. It was assumed that alien travelers came to the United States on foreign lines, and therefore, no estimate was made for receipt of fares. Series U 178 includes payments abroad by American tourists for maintenance and for ocean fares. Simon assumed that the bulk of the travel during 1861–1900 was on foreign ships. The outlays for procurement of sundry items and luxury consumption goods were not included in his estimate for expenditures abroad by American tourists.

The data for 1900–1918 include fares paid to United States ships by foreign tourists and to foreign ships by United States tourists.

For 1919–1957, all expenditures made in the United States by foreign residents, except those of diplomats and other official personnel stationed here, are included in the travel receipts. Expenditures made in foreign countries by United States travelers for food, lodging, amusements, gifts, and other personal purchases constitute travel payments. Expenditures

Digitized by Google

for transportation within or between foreign countries when purchased abroad are in general included as travel expenditures. However, passenger fares for overseas transportation to the ultimate destination (even if the ticket permits stopovers enroute) when paid to foreign carriers by United States residents, and when paid to United States carriers by foreign residents, are included in the transportation account.

U 172, U 173, and U 180, income on investments. For 1790–1900, series U 180 represents net payments of income on investments by the United States. The income was computed by applying an assumed yield rate to the net indebtedness of the United States.

For 1900–1918, separate estimates were made for receipts and payments. Series U 172 for 1915–1918 includes income on private and Government war loans. See Goldsmith, cited above, p. 1078.

For 1919–1957, income includes all interest, dividends, and branch profits effectively paid or credited during the period, after payment of all taxes in the country in which the payer of income resides.

Private income, series U 172, for 1919–1957 includes interest, dividends, and branch profits from direct investments, and interest and dividends received from holdings of foreign bonds by residents in the United States, from stocks issued by foreign corporations which are not United States direct investments, from loans by banks and other financial or commercial organizations, from miscellaneous assets such as commercial real estate, insurance policies, commercial claims of various kinds, trusts and estates, and mortgages. Reinvested earnings, or the parent company's equity in the undistributed earnings on common stock of foreign subsidiary companies, are not included except for 1919–1929. Reinvested earnings are, however, regularly tabulated and used for computing changes in the international investment position of the United States.

Government income, series U 173, for 1919–1957 includes interest received by the U.S. Government on long- and short-term loans and other investments.

Income payments, series U 180, for 1919–1957 include payments of interest, dividends, and branch profits by foreign direct investment companies in the United States, interest and dividend payments to foreign holders of other American bonds and stocks (including U.S. Government securities), and payments of income on various miscellaneous assets such as estates and trusts.

U 174 and U 181, other transactions. Marine insurance and brokers' commissions constitute series U 181 for 1790–1819. No estimate was made for these transactions between 1820 and 1860. For 1861–1900, series U 174 consists of receipts on marine insurance; series U 181 comprises payments for marine insurance and net payments for broker's commissions.

For 1900–1918, no estimates were made.

For 1919–1957, the coverage of miscellaneous service items has expanded and now includes receipts and payments from insurance transactions, communications, management services, motion picture and other royalties; receipts from fees of American engineering, construction and consulting firms from foreign contracts, from foreign governments in the United States, and expenditures of U.S. Government agencies abroad, except expenditures by the Department of Defense. The latter is included in series U 179, while receipts from abroad by the military agencies are included in series U 169.

U 179, military expenditures. This item includes direct outlays by the military agencies in dollars and in foreign currencies, as well as expenditures in the foreign economies by troops, civilian personnel of the military agencies, and post exchanges. It does not include expenditures of deutsche marks received from the Federal Republic of Germany or of yen received from Japan for the support of Allied and United States Forces stationed in the respective countries. Offshore procurement under military assistance programs and the purchase of goods and services to be transferred to other foreign countries under aid programs are included in the expenditures by military agencies.

U 183–184, unilateral transfers, net. No estimate was made prior to 1820 for series U 183. For 1820–1860, series U 183 represents the excess of funds brought into the United States by immigrants and their fare payments to American shipping companies over the amounts remitted to abroad after their arrival in this country. For 1861–1916, series U 183 consists of the immigrant remittances and funds carried by immigrants into the country (+) and out (−). The estimate for immigrant remittances includes remittances through banks and an estimate for outlays by U.S. residents for prepayment of passage for friends and relatives planning to emigrate to the United States. For 1917 and subsequent years, remittances in cash and kind by religious, educational, and charitable institutions are also included. For series U 184, the entries of $0.6 million for 1794–1796 represent annual payments to the Barbary pirates. The payment of $11.2 million in 1803 was to France for the purchase of Louisiana Territory. The United States acquired sovereignty over this territory in 1803 and issued bonds for the amount of the purchase. These bonds carried an interest rate of 6 percent per year and were redeemed between 1812–1823. The interest during this period amounted to $8.2 million, $5.6 million of which was paid in the first 10 years. (See E. M. Douglas, *Boundaries, Areas, Geographic Centers and Altitudes of the United States and the Several States*, Washington, D.C., 1930.) Presumably the interest is included in the estimate for income payments, series U 180. The entries of $5.5 million for 1836–1838 represent receipts by the U.S. Government from France on behalf of American citizens in satisfaction of claims for indemnities arising from the Napoleonic wars. (See J. T. Adams, ed., *Dictionary of American History*, Scribner's, New York, 1940, Vol. II, p. 348.) Interest of $0.5 million ($0.3, $0.1, and $0.1 million for 1836–1838, respectively) is included. In 1848, at the end of the Mexican War, the United States and Mexico signed the treaty of Guadelupe-Hidalgo which gave to the United States the present States of Arizona, New Mexico, California, Nevada, Utah, and Colorado west of the Rockies. The payment by the United States of $15 million for this territory, plus interest of $1.4 million, is represented by the entries for 1849–1852. These entries were referred to in the study, "United States Balance of Payments, 1790–1860," as indemnity payments and entered in the capital account. The entries for 1854-1856, aggregating $10 million, represent the Gadsden purchase. Russia, in March 1867, agreed to sell Alaska to the United States for $7.2 million in gold. The United States took possession in fiscal year 1868, but payment was not made until fiscal year 1869. During the Civil War, Great Britain had sold to the Confederate States ships which were used as privateers to sink the Union ships. An international tribunal in 1873 held Great Britain liable to the extent of $15.5 million. Payment was made to the United States in 1873, as indemnity on behalf of its citizens. The treaty of peace with Spain in 1898, as a result of which the Philippines, Guam, and Puerto Rico were ceded to the United States, stipulated a payment to Spain of $20 million.

The figures for series U 184 include two transactions which are not included in Goldsmith's *Study of Saving . . .*, mentioned earlier for the 1900-1918 period. In 1904, the U.S.

Digitized by Google

Government paid $10 million to the Republic of Panama for lease of the Panama Canal, and in 1917, the United States bought the Virgin Islands from Denmark for $25 million. These transactions appear in series U 184.

For 1919–1957, series U 184 consists of Government transfers of goods, services, or cash, in both dollars and foreign currencies, for which payment by the foreign country has not been made, is not expected, or has not been specified, less reverse lend-lease, counterpart funds on certain foreign-aid programs, and other receipts. Series U 184 also includes Government payments of pensions, receipts or payments for idemnities, intangible rights, or other considerations.

U 185–190, United States capital, net, and foreign capital, net. For 1790–1900, the data for series U 185 and U 190 represent the net flow of United States and foreign capital, and were estimated as residuals, to balance the other items in the balance of payments. Consequently, they reflect errors and omissions in the estimates of the other items. For some of these years, particularly 1861–1900, the data shown here differ from those in the source studies because of adjustments in some of the other series. For 1900–1918, see Goldsmith, cited above, pp. 1080–1081.

In 1904, the figure for series U 185 includes the payment by the U.S. Government of $40 million for the original Panama Canal Company. This transaction was not included in Goldsmith's *Study of Saving*.

For 1919–1957, the data for series U 185–188 represent changes in assets or in investments of the United States abroad. The long-term transactions represent shifts in capital claims of indefinite maturity or of a stated original maturity of more than one year from the date of issuance. Short-term transactions represent changes in claims on foreigners with a maturity of one year or less. For 1919–1957, series U 185 (long-term) includes disbursements of foreign loans, net of repayments, by all U.S. Government agencies, whether made in dollars or in foreign currencies. Also included are movements of capital related to the operation by the U.S. Government of productive facilities abroad, and United States capital contributions to international organizations such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the International Finance Corporation. Loan operations between these organizations and foreign countries are not included since such organizations are regarded as foreign entities in the United States balance of payments. Loans made by private banks and guaranteed by the Export-Import Bank are included in series U 187. Real property purchased by the Government for administrative purposes is included in series U 181, other transactions, while all expenditures of religious, educational, and charitable institutions are included in series U 183, unilateral transfers, even if they involve the purchase of fixed assets. For 1919–1957, series U 185 (short-term) includes changes in the U.S. Government short-term claims arising from holdings of foreign currencies (received as a counterpart to foreign grants or through sales of agricultural and other surplus products), deposits abroad, and various advances.

For 1919–1957, the shifts in capital claims in series U 186 and U 187 refer not only to securities (stocks, bonds, mortgages, etc.) but also to real property (farms, branch factories, and real estate). Series U 186 consists of net purchases of stocks in, and of changes in net claims by United States parent companies against foreign incorporated companies in the management of which United States companies have an important voice, and net changes in the equity in foreign branches of United States companies. Series U 187, other private long-term capital movements, consists of United States purchases of newly issued foreign securities, amortizations of foreign bonds, net transactions in outstanding foreign securities, and net changes in long-term claims reported by United States banks (including loans made by private banks and guaranteed by the Export-Import Bank) and other commercial enterprises.

Series U 188 includes changes in bank deposits, brokerage and commercial balances, and uncollected bills.

For 1919–1957, the data for series U 189–190 represent changes in liabilities of the United States to residents of foreign countries, or changes in assets held in the United States by residents of foreign countries. Series U 189 represents shifts in foreign claims on the United States with an original maturity of more than one year, including changes in the investments of foreign corporations in their branches and subsidiaries in the United States, and transactions by foreigners in the United States public debt obligations. Series U 190 represents shifts in the liabilities of the U.S. Government and of private individuals and institutions with an original maturity of one year or less. Foreign short-term claims on the U.S. Government include deposits with the Treasury and other Government agencies and changes in foreign holdings of U.S. Government short-term obligations. Foreign short-term claims on private Americans include foreign deposits in United States banks, changes in holdings of privately issued short-term securities, and other commercial liabilities. The data also include an estimate of movements of United States currency and coins.

U 191, gold. For 1874–1957, the gold entry is the net change in the monetary gold stock, including Stabilization Fund holdings. Thus, the gold stock is considered a special kind of international asset, all increases in which are debited and decreases credited in the balance of payments statement. Gold may enter the balance of payments account either in nonmonetary or in monetary form. If domestic consumption exceeds production, the excess is treated as an import or debit (−) in the merchandise account. It may be considered to be that part of the imported gold used as merchandise and not added to the monetary gold stock, or the part sold to the public from the monetary gold stock. Net domestic consumption of gold, which reduces the monetary gold stock of the United States, is treated as being comparable in its balance-of-payments effect to a merchandise import paid for by a net export of monetary gold to foreign countries. The sum of the merchandise entry and the monetary gold entry, it should be noted, still equals net international gold transactions.

U 192, errors and omissions. As indicated in the text for series U 168–192, this is the residual item which has been given the sign (+ or −) necessary to make the statement balance. It compensates for missing data, possible errors in the estimates, as well as for seasonal and other leads and lags in the reporting of the debit and credit phases of transactions which are compensating over a period of time.

U 193–206. International investment position of the United States, 1843–1957.

Source: 1843–1914, Cleona Lewis, *America's Stake in International Investments*, The Brookings Institution, Washington, D.C., 1938; 1919–1945, Office of Business Economics, various publications; 1946–1955, *Balance of Payments Statistical Supplement*, Washington, D.C.; 1956–1957, *Survey of Current Business*, September 1958.

The estimates for 1919–1945 are based on the following publications: (1) *The United States in the World Economy*, Economic Series No. 23, Washington, D.C., 1943, p. 123; (2) *The Balance of International Payments of the United States in 1931*,

Digitized by Google

Trade Information Bulletin No. 803, Washington, D.C., 1932, pp. 44, 48, and 62; (3) *Foreign Investments in the United States*, Washington, D.C., 1937, p. 5; (4) Cleona Lewis, *America's Stake in International Investments* (see source for 1843–1914); (5) *International Transactions of the United States During the War 1940-45* (as revised), Economic Series No. 65, 1948, p. 110.

In *America's Stake in International Investments*, direct investments are based on book value wherever possible; portfolio investments are calculated at par value for bonds and preferred stocks, and at market value for common stocks. Similar practices were followed in the estimates of the Department of Commerce for 1930, 1931, and 1935; miscellaneous portfolio investments for the same years were calculated at market values wherever possible. For 1940, 1945, and 1946–1957, the values of bonds and preferred stocks as well as of common stocks were calculated at market prices.

The estimates for these series prior to 1919 were prepared by compilers who used different valuation methods and whose data varied in completeness. While the estimates are therefore not homogeneous, they do present rough indications of the magnitudes involved.

U 207. International investment position of the United States (net liabilities), 1789–1900.

Source: 1789–1860, Douglass C. North, "The United States Balance of Payments, 1789–1860," cited in text for series U 168–192; and 1861–1900, Matthew Simon, "The United States Balance of Payments, 1861–1900," also cited in text for series U 168–192.

In the source studies, a net liability of $60 million was estimated for 1789. For the following years, the changes were computed by adding the annual net international flow of capital which is the balancing item, series 185–190, for exports and imports of goods, services, and unilateral transactions. For certain years, adjustments were made for defaults. Differences between the accumulating "net indebtedness" in the source studies and the data in series U 207 are due to adjustments incorporated in series U 168–192 as explained in the text for those series.

U 208–213. Value of direct investment in foreign countries, by area and industry groups, 1929–1957.

Source: See source for series U 193–206.

See also general note, U 168–213, and text for series U 186.

						1820	1	1	.....	−1				

[1] Series U 169 and U 184 include transfer of military supplies and services under grants. For 1946–1957, these transfers amounted in millions of dollars to: $69 in 1946, $43 in 1947, $300 in 1948, $210 in 1949, $526 in 1950, $1,470 in 1951, $2,603 in 1952, $4,254 in 1953, $3,161 in 1954, $2,325 in 1955. $2,579 in 1956, $2,435 in 1957. Series U 169 also includes receipts from military cash and credit transactions, the major portion of which is merchandise.
[2] Includes reinvested earnings of subsidiaries for 1919–1929.
[3] Includes, for 1919–1939, certain adjustments to merchandise transactions.
[4] Net for 1790–1900.
[5] Comparable with later years.
[6] Comparable with earlier years.
[7] Military expenditures in Mexico.
[8] Included with series U 18.–19 prior to 1900.
[9] 1933 includes a net outflow of $40 million and 1934 a net inflow of $30 million of funds through arbitrage operation in securities which cannot be divided between domestic and foreign securities.
[10] Includes transactions in securities in 1923–1925 which cannot be separated between domestic and foreign securities.
[11] Included in figures for series U 185–190.

Series U 193–206. International Investment Position of the United States: 1843 to 1957

chapter V

Business Enterprise

BUSINESS POPULATION (Series V 1–64)

V 1–64. General note.

Statistics on the total number and the size distribution of business firms must be used with caution. No governmental process records all firms, and an entirely satisfactory definition of a firm seems impossible. The boundary between self-employment and conduct of a business firm is hazy at best. In addition, there are problems of inactive or partly (e.g., seasonally) inactive firms, joint ventures, partial interests, ownership of multiple firms by individuals and families, etc. Moreover, the characteristic which causes an enterprise to be counted as, for example, a corporation, an employer subject to social security, or an operator of an establishment requiring a sanitary or safety license, varies with the laws creating these categories and with the degree of thoroughness of administration of these laws.

These difficulties are compounded when an attempt is made to group firms into industrial categories, because industry boundaries must be arbitrary, and the assignment of a firm on one side of the boundary or another may be based on a 50-percent rule or on some convention lacking analytic justification. Or the activity may not fit well into any recognized category.

The statistical importance of these problems is great because of the unusual size distribution of the business population (see series V 20–29), which contains a large number of very small firms, and a minute proportion of larger firms accounting for a substantial or even predominant fraction of total activity. Many small firms are on the boundary line between recognition and nonrecognition (enumeration or nonenumeration), so that a slight difference in method or source, particularly one of which the statistician is unaware, may generate considerable but spurious change or absence of change in the total number of firms. If, however, the object of estimation is not number of firms but total activity, the radically unequal size distribution becomes a great advantage because it permits more efficient sample design at lower cost.

The number and percentage of business firms, therefore, must be used with a realization that the meaning of a business firm is not always certain and that the figures are subject to considerable error. The most meaningful statistics of the business population are those which are based on some consistent criterion or definition over a period of years. The business population studies of the Office of Business Economics may be said to have inaugurated the publication of such satisfactory statistics.

The statistics of business concentration in series V 57–64 do not share the defect of statistics of business population, since they require estimates only of total activity and the identification of some small number of the largest firms. However, the record of one particular year's activity is in effect a single observation out of the infinite number which might be generated by the structural condition which is the object of measurement. Strikes, accidents, and cyclical fluctuations, with highly unequal impact upon various branches of industry, cause a divergence of the actual year's activity from the theoretically true or representative (average) year. Furthermore, if the incidence of mergers (series V 30) is substantial, a given year may be the peak or trough of a short-run change in concentration. Moreover, concentration measures may be strongly affected by the arbitrary nature of industry subdivisions and changes in industry classification from census to census.

V 1–3. Concerns in business, failure rate, and average liability per failure, 1857–1957.

Source: 1857–1950, Dun & Bradstreet, Inc., *Dun & Bradstreet Reference Book and Failure Statistics* (a printed mail folder distributed by Dun & Bradstreet); 1951–1957, *Dun & Bradstreet Reference Book*, various issues.

Total concerns are the number of business enterprises listed in the *Reference Book*. The figures are for continental United States and represent listings in the books published nearest to July 1 of each year. The listings include types of business which are seekers of commercial credit in the accepted sense of the term; namely, manufacturers, wholesalers, retailers, contractors, and certain types of commercial service. Specific types of business not covered are finance, insurance, and real estate companies; railroads; terminals; amusements; and many types of small service and construction enterprises. Neither professions nor farmers are included.

Failure rate is obtained by dividing total failures by total number of enterprises. Failures are defined as concerns involved in court procedures or voluntary actions, probably ending in loss to creditors. These include, but are not limited to, discontinuances following assignment or attachment of goods, bankruptcy petitions, foreclosure, etc.; voluntary withdrawals with known loss to creditors; enterprises involved in court action such as receivership; businesses making voluntary arrangements with creditors out of court; and since June 1934 (enactment of the Bankruptcy Act), reorganization which may or may not lead to discontinuance.

Average liability per failure is obtained by dividing total liabilities by total concerns. Liabilities represent primarily current indebtedness, including accounts and notes payable on secured or unsecured obligations held by banks, officers, affiliates, suppliers, or government at all levels. For 1933–1957, certain types of enterprises characterized by heavy deferred obligations were eliminated from the data, thus conferring a slight downward bias in average liability figures as compared with earlier years.

V 4–12. Annual average number of firms in operation, by major industry group, 1929–1957.

Source: 1929–1950, Office of Business Economics, *Survey of Current Business*, January 1954, p. 12; 1951–1957, *Survey of Current Business*, May 1959, p. 18.

These estimates are based primarily on data from the Bureau of Old-Age and Survivors Insurance, and are revised from time to time by the Office of Business Economics. The last substantial revision was made in January 1954 and revealed errors in the earlier estimates for absolute number and rate of growth; these errors were due partly to the cumulative effect of imperfect estimates for discontinued businesses. OBE defines a firm as a business organization under one management, with either an

Digitized by Google

established place of business or at least one paid employee. Concerns owned or controlled by the same interests are not combined. Agriculture and professional services are excluded. A firm conducting more than one kind of business is classified by industry according to the major activity of the firm as a whole. Revisions of the Standard Industrial Classification (see Bureau of the Budget, *Standard Industrial Classification Manual*, 1957) have, therefore, affected the industrial distribution of firms.

V 13–19. Annual average number of new, discontinued, and transferred businesses, by major industry group, 1940–1957.

Source: See source for series V 4–12.

Discontinued businesses include closures of all kinds without reference to the reason for going out of business. New businesses include only firms which have been newly established. A firm which is maintained as a business entity but which undergoes a change of ownership is counted as a transferred business, not as a discontinuance. Partnerships in which a member is added or dropped, corporations that are reorganized or reincorporated, and businesses sold or otherwise acquired by new owners or changed in legal form of organization (such as partnership to corporation) are considered transfers. Note should be taken of the large differences between the figures for failures in series V 2 and those for discontinued businesses in series V 13.

V 20–29. Number of firms in operation and paid employment, by size of firm, 1945–1951.

Source: Office of Business Economics, *Survey of Current Business*, May 1954, p. 18.

See general note for series V 1–64, as well as text for series V 4–12.

V 30–31. Recorded mergers in manufacturing and mining, 1895–1957.

Source: 1895–1920, Ralph L. Nelson, *Merger Movements in American Industry*, chap. III, app. B, Princeton University Press (forthcoming); 1919–1957, Federal Trade Commission, *Report on Corporate Mergers and Acquisitions*, 1955, pp. 17–36, and releases.

Methods of estimation of the Nelson figures are explained in chapters II and III of his book; the basic source of the figures is chiefly the *Commercial and Financial Chronicle*.

Figures for 1919–1957 include mergers reported by Moody's Investors Service and Standard and Poor's Corporation. For 1919–1939, the estimates were first made by Willard L. Thorp in various publications, and then continued by the Federal Trade Commission. For complete sources and related data, see the Federal Trade report cited above.

The annual totals of reported mergers are only a small fraction of all "transferred businesses," as shown in series V 13–19. Series V 30–31 are essentially a count of all mergers and acquisitions involving corporations with widely held or publicly traded securities outstanding. There are two offsetting biases of uncertain amount: Mergers may be announced but not actually accomplished; small acquisitions, particularly, may be accomplished without announcement.

The data for 1895–1920 and 1919–1957 use different sources, each of which changes in degree of coverage over time, and are not comparable. The estimates for 1919–1957 include a more complete recording of smaller mergers, so that average capitalization or assets per merger would on this account tend to decrease, and total assets to increase. As distinguished from the number of mergers per year, the relative rates of change are generally, though not precisely, comparable and the assets involved would not differ greatly in the aggregate in any one year, since the larger mergers are presumably counted in both sets of estimates.

V 32–44. Number of corporations, by major industry group, 1916–1956.

Source: 1916–1933, Bureau of Internal Revenue, *Statistics of Income*, various annual issues; 1934–1956, Internal Revenue Service, *Statistics of Income*, part II, *Corporation Income Tax Returns*, various annual issues.

After 1925, trade is divided into wholesale trade, retail trade, and trade not allocable. The latter figure appears at the end of the listing and varies widely owing to changes in inclusion. The joint figure of wholesale and retail trade for 1916 is not comparable with figures for subsequent years because the "merchandising companies" group was not as inclusive as the "wholesale trade" and "retail trade" groups. This is reflected in the very large figure for all other active corporations. The same is true of "finance, insurance, and real estate" for 1916, then labelled "banks and insurance companies."

V 45–56. Percent of total corporate net income reported by small and large corporations (with net income only), 1918–1939.

Source: Office of Business Economics, *Survey of Current Business*, March 1944, p. 11.

The data are based on a special tabulation of corporate income tax records by the then Bureau of Internal Revenue. See general note for series V 1–64.

V 57–64. Concentration in manufacturing, by industry group, 1901, 1947, and 1954.

Source: Series V 57, G. Warren Nutter, *The Extent of Enterprise Monopoly in the United States*, copyrighted 1951 by The University of Chicago, Press, 1951, tables 10 and 39. Series V 58, M. A. Adelman, "The Measurement of Industrial Concentration," *Review of Economics and Statistics*, vol. 33, November 1951, table 14 (based on *Hearings Before the Subcommittee on Study of Monopoly Power*, House of Representatives, 81st Congress, 1st session, Serial No. 14, part 2-B, pp. 1436–1456). Series V 59–60 are tabulations prepared by the Bureau of the Census from data reported in the *Census of Manufactures*. Series V 61–64, Irving Rottenberg, "New Statistics on Companies and on Concentration in Manufacturing From the 1954 Census," *Proceedings of the American Statistical Association*, 1957, table 5.

The basic source of most of the data in all columns is the *Census of Manufactures*. The concentration ratio is defined as the percent of total industry sales (or, occasionally, value added) made by the four largest sellers.

The entries for series V 57–58 represent the value added by manufacture in 4-digit (Standard Industrial Classification) industries with concentration ratios of 50 or higher, as a percentage of value added by all 4-digit industries included in each 2-digit industry group (e.g., "food and kindred products" is a 2-digit group containing "meat-packing plants" and 2 other 4-digit meat industries, "creamery butter" and 5 other 4-digit dairy industries, etc.).

The figures for series V 59–64 are average concentration ratios for each 2-digit industry group, i.e., the concentration ratio of each 4-digit industry is weighted in proportion to its employment or value added, as indicated, as a proportion of total employment or total value added by the whole 2-digit group.

Series V 59–60 include all industries for the given year—452 in 1947, and 434 in 1954. Because of changes in 4-digit industry definitions, concentration ratios are not fully comparable. Series V 61–64 are based on 375 comparable industries accounting for 85 percent of all value added by manufacture in 1947, and for 82 percent in 1954.

The first total line is a set of weighted averages based on value-added weights derived from the basic data for the

Digitized by Google

respective years shown. Figures on the second total line (for series V 61–64) are averages of the concentration ratios shown for the 20 industry groups.

Where the change in concentration, 1947-1954, as shown in series V 59–60, is substantially different from that shown in series V 61–64, the difference is due to industry redefinition and to inclusion or exclusion of industries from the Census of Manufactures. A striking example is in group 39, "miscellaneous manufactures" from which major group 19, "ordnance and accessories," has been omitted for national security reasons.

[1] First 9 months.
[2] Not available.
[3] An estimate of assets involved in mergers in manufacturing and mining (plus wholesale and retail trade and miscellaneous) during the 42 months, 1951 through June 1954, inclusive, is $5.14 billion. See American Management Association, *Financial Management Series: No. 114*, 1957, p. 89.
[4] It is estimated that not over $5 billion was involved in all manufacturing and mining mergers during 1940–1947. See J. Keith Butters, John Lintner, and William L. Carey, *Effects of Taxation: Corporate Mergers*, Harvard Graduate School of Business Administration, Boston, 1951, chap. 10.
[5] Comparable with later years.
[6] Comparable with earlier years.

chapter V

CORPORATE ASSETS, LIABILITIES, AND INCOME (Series V 65–237)

V 65–237. General note.

Aggregate balance sheet and income data for all U.S. corporations combined and for corporations classified by major industry have been published annually since 1926 by the Internal Revenue Service (and its predecessor, Bureau of Internal Revenue) in *Statistics of Income*, part 2. Data classified by asset-size class are also available since 1931. Series V 65–127 are based on the materials assembled in *Statistics of Income*. Other sources provide balance sheet and income data for public utilities, railroads, and commercial banks over considerably longer periods. Data for public utility corporations are presented, in condensed form, in series V 128–142. Data for railroads are presented in Chapter Q, Transportation, and for commercial banks in Chapter X, Banking and Finance.

Most of the series shown here include aggregates based on the values reported by corporations in their accounting statements. These book values are seldom, if ever, equal to current market values, nor do they correspond to theoretical values computed by economic analysts (e.g., values arrived at on the basis of the expected revenue streams). When the general price level remains stable, individual differences between the book value and the market value (or between the book value and the theoretical economic value) may largely cancel out in the process of aggregation. In times of a persistent inflation, however, book values show a general tendency to fall below current market valuations, while in times of persistent deflation the reverse is generally true. Some specific valuation problems, arising in connection with different types of business assets, are briefly discussed below.

Physical assets. Physical assets owned by business firms include inventories (of both finished goods and goods in process) and fixed assets (land, plant, and equipment).

Inventories are usually shown on the balance sheet at "cost or market, whichever is lower." Consequently, in periods of rising prices, book values tend to be below current market values. In periods of falling prices, however, conservative accounting practices require an adjustment in the book value so as to bring it down to the level of the current market value.

Until recently, book charges for inventories used up in production have been based almost universally on the "fifo" (first in, first out) method of valuation. But in recent years a substantial number of firms have switched to the "lifo" (last in, first out) method. These two valuation methods yield different results with respect to reported costs and profits and also with respect to the book value of the year-end inventory. Under "lifo" procedure, the most recent prices are used for the computation of costs. Consequently, reported profits (and, therefore, income tax liability) are reduced in periods of rising prices, but are increased in periods of falling prices, as compared with the amount that would be reported under "fifo."

On the other hand, the year-end inventories are valued at less recent prices on a "lifo" than on a "fifo" basis. Consequently, in periods of price instability the use of "lifo" tends to widen the gap between the book value and the current market value of the year-end inventories.

Except in special cases, a comparison of year-end inventory values does not provide an adequate indication of changes in the physical volume of inventories. When "lifo" is used, a change in the book value of inventory will correctly indicate the change in the physical volume valued at current prices, as long as the volume is increasing. If the physical volume is decreasing, however, a valuation adjustment is required in order to arrive at the current value of the physical decrement. When "fifo" is used, a valuation adjustment must be made whether the physical volume is increasing or decreasing.

Since the aggregate inventory values represent a combination of "fifo" and "lifo" inventories (the former being the predominant component), an inventory valuation adjustment is clearly required before any inferences regarding changes in the physical stock are to be drawn from these figures.

Fixed assets include durable capital goods, which are generally entered at cost and are written off gradually over a period of years by means of annual depreciation charges. A detailed balance sheet usually includes (*a*) the gross amount before depreciation, (*b*) the depreciation reserve accumulated to date, and (*c*) the net amount after depreciation, which is equal to (*a*) minus (*b*).

If the prices of capital goods remained constant, the gross amount of plant and equipment would equal their replacement cost (the cost of replacing the existing items, which vary in age from almost new to being close to the time of retirement, with brand new items of the same type). During periods of continual price increases, however, the gross amount falls considerably short of the replacement cost; while during periods of continual price declines, the opposite is true.

The net amount of plant and equipment would approach the current market value only if the annual depreciation allowances corresponded to the actual loss of value through wear and tear as well as obsolescence (and, furthermore, if the prices of new capital goods remained constant). This, however, hardly ever happens in actual practice. Most corporations have been using the "straight line" method of depreciation, under which durable equipment has been written off by equal amounts every year during its entire lifetime, irrespective of the actual degree of wear and tear or obsolescence. During and after World War II accelerated writeoffs were allowed in industries working for defense, whereby plant and equipment could be written off over an arbitrary 5-year period. This procedure, coupled with the fact that prices generally rose at a relatively fast rate during the war and the postwar period, has served to further widen the gap between the net book values and the actual market values of fixed assets.

Neither the gross nor the net amount of plant and equipment may be taken to reflect accurately changes in the physical stock of durable capital goods. If prices remained constant, changes in the gross amount would indicate changes in quantity, though not in quality, of capital goods. For example, if a firm owned 100 units of machinery and added 10 new units next year, the gross amount would show a 10-percent rise (assuming no retirements during the year); but the gross amount could not show the decline in quality of the original 100 units through the process of aging. The net amount does reflect the aging of durable equipment but, as stated above, the prevailing depreciation methods do not—and are not intended to—align the book values with changes in the actual market value over time.

Financial assets. Financial assets of corporations represent their claims on other business units, individuals, and government. Current (short-term) financial assets include cash, bank deposit accounts, notes receivable and marketable securities (mostly U.S. Government but frequently including marketable corporate stock as well). Noncurrent (long-term) financial assets consist of bonds, other long-term debt instruments, and nonmarketable securities which are largely permanent holdings of corporate stock. The problem of market valuation does not, of course, arise in connection with cash and bank deposits. If receivables are salable, their market value does not ordinarily deviate from the book amount by more than a moderate discount. But in the case of securities, especially common stocks, the current market value may differ widely from the original cost to the owner. Bonds tend to rise in price when the current interest rate declines relative to the coupon rate. Stocks tend to rise when the expected rate of profit and/or dividends earned by the issuer increases. Conservative accounting practice requires that securities be valued at "cost or market, whichever is lower." Thus, while the book values are not expected to exceed the market values for any considerable length of time the reverse relationship may continue indefinitely.

While the market value of stocks tends to rise with—though not necessarily in proportion to—the general level of prices, the market value of bonds is not directly affected by this factor. In fact, in times of inflation or deflation, the fixed amount debt instruments become especially variable in terms of real purchasing power represented by them.

A special problem arises in connection with financial assets when aggregate balance sheets are compiled. In a closed economic system all financial claims and liabilities would cancel out. A consolidated balance sheet for the entire system would show only physical property on the asset side and net claims to this property by individuals on the liability side.

Since the corporate sector of our economy is not a closed system, a consolidated balance sheet for all corporations combined would not eliminate all financial assets and liabilities, although it would eliminate a substantial part representing intercompany claims.

The aggregate balance sheets presented in this section are essentially unconsolidated data. Some large corporations submitted consolidated balance sheets comprising the parent company and its subsidiaries. (Consolidated returns were permitted prior to 1934 and then again after 1942. See text for series V 65–127.) But, in the main, the total amounts were obtained by mere aggregation rather than consolidation of individual companies' statements.

As a result, the total amounts of both receivables and payables include a certain (undetermined) amount owed by corporations to other corporations. The total amount of investments includes a certain (undetermined) amount of corporate securities owned by corporations. When claims of the creditor corporations on the debtor corporations are included in total assets of the sector as a whole, the total is inflated by the double-counting involved.

Liabilities. The valuation problems encountered in connection with corporate liabilities are generally similar to those discussed above in connection with financial assets. When the price level rises, the amount of debt shrinks in terms of real purchasing power. When the market value of assets increases, the dollar amount of debt remains unchanged, but its magnitude in relation to net worth (valued at market prices) declines. When unconsolidated data are aggregated, the total amount of debt is inflated because no adjustment is made for intercompany liabilities.

The item designated as "other liabilities" (series V 80) includes accrued income tax and other accrued liabilities. Tax accruals were a relatively minor item during the 1920's and 1930's, but assumed major proportions during and after World War II, when the income tax rates were sharply raised and the excess profits tax was imposed (during 1940–1945 and again during 1950–1953). Tax accruals rose substantially also in the years of World War I, but a sharp decline occurred after the war. These movements are reflected in the sample data for large manufacturing corporations, extending over the 1914–1943 period (see text for series V 217–237).

The amount of accrued taxes has not been reported as a separate balance sheet item in *Statistics of Income*. Until recently, the year-end amount of tax accruals usually was fairly close to the current year's total tax liability (series V 94, V 111, and V 126), but the acceleration program enacted in 1954 placed large corporate taxpayers on a partially pay-as-you-go basis, which tended to reduce their tax reserves.

The rise in the income tax accruals on the liability side of corporate balance sheets was accompanied by an increase in government security holding on the asset side. Thus, in a completely consolidated statement for the corporate sector, the debt owed by corporations to the government would be largely offset by the debt owed by the government to corporations, and the net balance of such claims would be relatively small.

Net worth. Net worth (or equity) is the stockholders' share in the total assets of a corporation. It is not measured by the capital stock account alone, but is equal to the sum of capital stock, capital reserves, paid-in surplus, and earned surplus; or, alternatively, it represents the difference between total assets on the one hand and the sum of all short-term and long-term liabilities on the other. Since the dollar amount of liabilities is fixed at any one time, a revaluation of assets results in a corresponding change in net worth.

In a newly established firm, net worth is equal to the amount of capital paid in by its first stockholders. This amount may be registered in the capital stock account alone, or partly (usually up to the par value per share) in the capital stock account and partly in the paid-in surplus (or capital surplus) account. A going concern, on the other hand, can increase its net worth from two sources—by selling additional shares of stock and by retaining profits. The latter method (known as internal financing) has generally been a very important source of funds for American corporations.

Net profit retained in a given year is reflected in the year-end balance sheet as an increase in the earned surplus account. However, the amount of earned surplus shown on the balance sheet may not generally be taken to represent the sum of all profit retentions over the company's entire lifetime. Many companies declare stock dividends from time to time, and this involves transfers from the earned surplus to the capital stock account. Other companies make occasional transfers from earned surplus to various reserve or special fund accounts. In some cases, earned surplus and paid-in surplus are combined into one account, which makes it impossible to separate paid-in equity from retained funds. Thus, generally speaking, while the balance sheet data for any one year indicate the total amount of net worth, they contain no accurate information as to what portion of net worth has been built up by stock sales and what portion has been accumulated through profit retentions.

Sales, income, and dividends. The sales, income, and dividend figures also represent unconsolidated aggregates, with no adjustment for intercompany transactions. Goods and services sold by corporations to other corporations are included in the total amount of sales two or more times. For example, the value of steel sold by steel producers to automobile manufacturers is included in the sales of the steel industry and also in the sales of the automobile industry (as part of the total value of the

Digitized by Google

automobiles sold). In other words, total reported sales of all industries would exceed by a large margin the net value of corporate production (the sum of all net values added by individual companies) in any given period.

The net income and dividend totals also contain some duplication, since no adjustment has been made for intercompany dividends. When dividends are paid by one company to another, this is obviously a transfer payment which does not increase the actual total income of the corporate sector as a whole. Yet, since such payments are included in net income of the receiving companies without being deducted from net income of the paying companies, the aggregate amount of net income of all corporations is correspondingly inflated.

Problems of asset valuation and income computation have been extensively discussed in the accounting and economic literature. Useful basic discussions may be found in the following books: J. C. Bonbright, *The Valuation of Property*, McGraw-Hill, New York, 1937; N. S. Buchanan, *The Economics of Corporate Enterprise*, Henry Holt & Co., New York, 1940; B. Graham and D. L. Dodd, *Security Analysis*, McGraw-Hill, New York, 1951; J. P. Powelson, *Economic Accounting*, McGraw-Hill, New York, 1955.

The problems encountered in compiling the national income data from the balance sheets submitted by business firms are discussed in Office of Business Economics, *National Income: A Supplement to the Survey of Current Business*, 1954, and *U.S. Income and Output*, 1958.

V 65–127. General note.

Aggregate balance sheet data for all corporations submitting such data with their income tax returns have been published in *Statistics of Income* since 1926. Aggregate income data for all corporations submitting income tax returns have been available since 1916, but income data for corporations submitting balance sheets have been compiled only since 1931.

Companies which did not submit balance sheet data for 1926–1955 represented only a small fraction of the total corporate population in terms of total income and assets. Thus, companies not submitting balance sheets accounted for only 3 percent of the total compiled receipts in 1931 and 1 percent in 1953. The data presented here may, therefore, be taken as a fairly close approximation of the entire corporate population.

For 1926–1950, annual tabulations have been derived from all corporation returns filed. For 1951–1955, the aggregate data for small corporations were estimated on the basis of 10- and 20-percent samples, in order to reduce the cost and delay involved in tabulating all returns. In 1951, sampling procedures were confined to corporations with total assets under $250,000. The sample amounted to 10 percent of this population. In 1952, the companies with total assets under $250,000 were represented by a 10-percent sample. Furthermore, the companies with total assets between $250,000 and $500,000 were represented by a 20-percent sample. All returns with total assets of $500,000 and over together with all consolidated returns, life and mutual insurance companies, personal holding companies, and taxable returns with total income (total gross receipts less cost of sales or operations) of $200,000 and over, regardless of size of total assets, were tabulated.

For 1953–1955, the sampling rates no longer depended on total assets. A 10-percent sample was selected from the companies which had total gross receipts below $100,000. A 20-percent sample was selected from the companies with total gross receipts between $100,000 and $500,00. All companies with total gross receipts of $500,000 and over were tabulated.

Although small companies account for a very large share of the total corporate universe in terms of the number of returns, they represent a relatively small share of the total in terms of assets and receipts. Thus, in 1952 the total assets of small companies accounted for only 7 percent of the aggregate figure for all corporations combined.

The data in each volume of *Statistics of Income* are from returns for the calendar year indicated, for fiscal years ending within the period July of the calendar year through June of the succeeding year, and for partial years with the greater number of months of the accounting period falling within the calendar year. The information is compiled from the returns as filed, prior to revisions that may be made as a result of audit by the Internal Revenue Service. Also, the data do not reflect loss carrybacks, renegotiation of war contracts, or recomputation of amortization of emergency facilities.

The returns included in each report are those filed for comparable periods of time. There are factors, however, which interfere with the precise comparability of the data over a period of years. While their influence has not been so strong as to obscure major historical trends, they must, of course, be borne in mind, especially when close comparisons are attempted. Some of the more important interfering factors are indicated below.

In general, the items for 1926–1933 are not precisely comparable with those for 1934–1941, because of the discontinuance, under the Revenue Act of 1934, of the privilege of filing consolidated income tax returns (except by railroad corporations and their related holding and leasing companies and, for 1940 and 1941, Pan-American trade corporations), and the consequent appearance, in the separate returns filed by corporations formerly included in an affiliated group, of items which, owing to "intercompany eliminations," did not appear on the consolidated return.

The discontinuance of consolidated returns also resulted in changes in industrial classification. A corporation is classified industrially according to the business reported on the return. When diversified activities are reported, the classification is determined by the industry which accounts for the largest percentage of receipts. Therefore, industrial groups may contain data for activities other than those on which the classification is based. Prior to 1934, a consolidated return was classified on the predominant activity of the group of affiliated concerns, whereas, for 1934 and subsequent years, the separate return filed by each concern which was formerly a part of an affiliated group is classified on its predominant industry. Beginning 1942, the consolidated return privilege was again extended, in general, to all corporations.

On the basis of the data contained in the 1934 issue of *Statistics of Income*, two sets of figures are given for 1934 in series V 98–112. In 1934 (comparable with later years), corporations which submitted consolidated returns in 1933 are classified according to the business reported on the deconsolidated returns for 1934. In 1934 (comparable with earlier years, insofar as industrial classification is concerned), corporations which submitted consolidated returns in 1933 are classified according to the business reported on consolidated returns in 1933. The latter data for 1934, however, are still not fully consistent with those for 1933 because they include items which are eliminated in consolidated returns but are present in deconsolidated statements.

There have been other changes in the content of various items, which have affected historical comparability. For example, notes payable with maturity of one year or more were included with bonds and mortgages for 1929–1936, but not for succeeding years. Surplus reserves were included with "surplus and undivided profits" for 1926–1937, whereas they have been shown as a separate item since 1938.

The changes in the Standard Industrial Classification from time to time do not substantially affect the comparability of these data. The figures have been revised historically to

Digitized by Google

reflect these changes which are indicated in the annual volumes of *Statistics of Income*.

V 65–97. Corporate assets, liabilities, receipts, deductions, net profits, and dividends, for all industries combined, 1926–1955.

Source: Internal Revenue Service (and predecessor Bureau of Internal Revenue), *Statistics of Income*, part 2, *Corporation Income Tax Returns*, various annual issues.

V 65, number of returns. Excludes returns with fragmentary balance sheets and, except for 1926, returns of inactive corporations.

V 67, cash. Includes bank deposits.

V 70, investments, government obligations. Consists of obligations of all governmental units within the United States and its outlying areas. Where investments are not segregated as between "government" and "other," the entire amount is included in "other investments."

V 72, capital assets. Includes depreciable tangible assets such as buildings, fixed mechanical equipment, manufacturing and transportation facilities, furniture and fixtures; depletable tangible assets—natural resources; land; and, for 1939–1955, intangible assets such as patents, franchises, formulas, copyrights, leaseholds, goodwill, and trademarks. Prior to 1939, intangible assets were included in "other assets."

V 73, other assets. Consists of assets not elsewhere reported on tax return, such as sinking funds, other funds; deferred charges; organization expenses; prepaid and suspense items; interest, discount, coupons, and dividends receivable; and guarantee deposits. "Other assets" of life insurance companies include market value of real estate, bonds, and stocks in excess of book value; interest, rents, and premiums due; and agents' balances.

V 80, other liabilities. Consists of liabilities not elsewhere reported on tax return, such as deferred and suspense items; accrued expenses; dividends payable; funds held in trust; borrowed securities; outstanding coupons and certificates; and overdrafts. "Other liabilities" of life insurance companies include the net value of outstanding policies and annuities, and borrowed money. "Other liabilities" of banks include deposits (time, savings, demand, etc.) and bank notes in circulation.

V 83, surplus reserves. This item is included with surplus and undivided profits for 1926–1937.

V 84, surplus and undivided profits. Consists of paid-in or capital surplus and earned surplus and undivided profits.

V 85, deficit. Consists of negative amounts of earned surplus and undivided profits.

V 87, gross sales and receipts from operations. Gross sales consist of amounts received for goods, less returns and allowances, in transactions where inventories are an income-determining factor. Cost of goods sold is shown as a deduction. Gross receipts from operations consist of amounts received from transactions in which inventories are not an income-determining factor. Cost of operations is shown as a deduction. Gross receipts from operations and cost of operations are not available prior to 1932. The figure shown for 1931 represents gross profit from operations.

V 96, dividends paid in cash and assets other than own stock. Excludes liquidating dividends.

V 98–112. Selected corporate assets, liabilities, and income items, by industrial division, 1926–1955.

Source: See source for series V 65–97.

V 113–127. Selected corporate assets, liabilities, and income items, by size of total assets, 1931–1955.

Source: See source for series V 65–97.

V 128–142. Assets, liabilities, and selected income items for privately owned Class A and B electric companies, 1937–1956.

Source: All series except V 131–133, Federal Power Commission, *Statistics of Electrical Utilities in the United States*, various annual issues; series V 131–133, Federal Power Commission, records.

These data cover reports of all companies having annual electric revenues in excess of $250,000. In recent years, these concerns have represented approximately 98 percent of the total privately owned electric utility industry.

V 128, total assets or liabilities. For total assets, series V 128 is the sum of series V 129, V 130, V 133, and V 134. For total liabilities, series V 128 is the sum of series V 135–139.

V 129, current assets. Includes cash, special deposits, working funds, temporary cash investments, receivables (less reserve for uncollectible accounts), materials and supplies, prepayments, other current and accrued assets.

V 130, investments. Includes investments in associated companies (less reserve), other investments (less reserve), physical property other than utility plant (less reserve), sinking funds, miscellaneous special funds.

V 131–133, plant and equipment in service. Prior to 1932, firms in the electric utility industry included in their electric utility plant and equipment accounts an increasing amount of "phantom assets" which were created by "writing up" assets above their original cost. Changes in economic conditions and government regulation forced a "write-down" of these "assets" at intervals over subsequent years. Until such "write-downs" were made, however, the figures as published in the annual reports of the Federal Power Commission included decreasing amounts of "phantom assets." However, the figures shown here for series V 128–133 represent revised estimates of the Federal Power Commission and exclude "phantom assets."

V 134, other assets. Includes the "phantom assets" deducted from electric plant and equipment (see text for series V 131–133); electric plant not in service such as plant under construction, leased to others, or held for future use; net utility plant and equipment other than electric; deferred debits; capital stock discount and expenses; and reacquired securities. Although there was some decline in deferred debits, capital stock discount and expense, and reacquired securities, the major portion of the decline in this series between 1937 and 1945 is attributable to the writeoff of "phantom assets." The distribution of these assets for significant years was as follows (in millions):

Item	*1937*	*1948*	*1956*
Total other assets	$4,833.9	$3,657.3	$5,207.1
"Phantom assets"	2,100.0	.....	.....
Electric plant not in service	450.0	1,472.1	1,945.0
Net utility plant other than electric	1,683.6	1,876.6	2,959.4
Other asset items	600.3	308.6	302.7

If the "phantom assets" were to be completely excluded from the asset side, a corresponding adjustment would have to be made in the companies' net worth. This has not been done, because it has been deemed advisable to present the capital and surplus figures as reported by the electric companies.

V 135, current liabilities. Includes notes and accounts payable, dividends declared, customers' deposits, accrued taxes and interest, miscellaneous current and accrued liabilities.

V 136, long-term debt. Includes bonds, receivers' certificates, advances from associated companies, miscellaneous long-term debt. Bonds held in treasury were deducted from the total amount of long-term debt outstanding.

V 137, other liabilities. Includes deferred credits, insurance, and other reserves.

Digitized by Google

V 138, capital stock. Includes common and preferred stock, stock liability for conversion, premiums and assessments on capital stock, capital stock subscribed, installments received on capital stock. Treasury stock was deducted from the total amount of stock outstanding.

V 139, net surplus. Includes capital and earned surplus.

V 140, total revenue. Includes operating revenues and other income, gross of operating expenses, and all other deductions.

V 141, net income. Equals total revenue less all operating and nonoperating income deductions (including depreciation, interest, and taxes).

V 142, dividends. Includes dividends on preferred and common shares. Excludes stock dividends.

V 143-157. Assets, liabilities, and selected income items for central electric light and power stations, commercial, 1902–1937.

Source: 1902–1912, Bureau of the Census, *Electrical Industries*, special reports and bulletins for 1902, 1907, and 1912; 1917–1937, *Census of Electrical Industries*, reports for 1917, 1922, 1927, 1932, and 1937.

See also text for series V 128–142.

Central electric stations are defined as plants owned or operated by individuals, companies, corporations, or municipalities, and furnishing current for public or commercial uses.

Although central electric stations, as defined by Bureau of the Census, do not represent a group completely identical with Class A and B electric companies, as defined by the Federal Power Commission, the coverage is nearly the same in terms of assets, liabilities, and revenues, as the figures for 1937 show. Consequently, the data in series V 128–142 and V 143–157 may be taken to indicate, with a high degree of approximation, financial trends in the electric utility industry over the entire 1902–1956 period.

Unfortunately, complete balance sheet data for series V 143–157 are available only for 1927, 1932, and 1937. The data for 1912, 1917, and 1922 do not include reserve for depreciation. Consequently, total assets for these years include the gross rather than net value of plant and equipment. The only balance sheet item available for 1902 and 1907 is the gross amount of plant and equipment. The gross revenue, net income, and dividend figures, however, are available for the entire 1902–1937 period.

The accounting nomenclature in series V 143–157 and also in series V 158–202 is similar to that described above for series V 128–142. However, financial statements were much less detailed in the early years and accounting procedures did not remain fully consistent over the entire 1902–1937 period.

V 158–172. Assets, liabilities, and selected income items for street and electric railways, 1902–1937.

Source: See source for series V 143–157.

See also text for series V 128–142.

These data relate to all electric railways in the United States irrespective of their length or location and all street railways irrespective of their motive power.

Data for 1902–1922 include companies which operated street and electric railways and were also engaged in other activities, while the data for 1922–1937 include only companies which were exclusively engaged in the operation of street and electric railways. The double set of figures given for 1922 should enable users to make an adjustment required for comparing the figures for 1927–1937 with those for 1902–1917. For 1917–1937, the amount of total assets includes net value of plant and equipment. For 1902–1912, on the other hand, gross value of plant and equipment had to be included because of the lack of data on depreciation.

V 173–202. Assets, liabilities, and selected income items of telephone and telegraph companies, 1902–1937.

Source: See source for series V 143–157.

See also text for series V 128–142.

The data available for the telephone and telegraph companies for 1902–1937 are even more incomplete than those for the electric utilities. After 1922, the only data collected by the Bureau of the Census were value of plant and equipment, gross income, and dividends paid. During the entire 1902–1937 period, reserves for depreciation were included with other reserves on the liability side and could not, therefore, be used to obtain net value of plant and equipment. Treasury stocks and bonds were reported as a single item (Treasury securities) and could not, therefore, be subtracted from long-term debt and capital stock respectively, as was done for the other electrical industries.

Despite these serious deficiencies, however, the data throw some light on the rapid development of the telephone and telegraph industries in the early decades of the 20th century and should, therefore, be useful to those interested in financial trends of these two industries.

V 203–216. Net value of plant and equipment in regulated industries, 1870–1951.

Source: Melville J. Ulmer, *Capital in Transportation, Communications and Public Utilities*, National Bureau of Economic Research, Princeton University Press, 1959.

All values in these series are net of depreciation and relate to reproducible fixed assets: Road, plant and equipment. Investment in land and land rights has not been included. The coverage is confined to privately owned enterprises.

In general, the series have been obtained by cumulative addition (or subtraction) of the annual figures on net capital formation to a base value in some selected year. The series in 1929 dollars reflect changes in net physical stock of reproducible fixed assets. The series in current dollars indicate changes in the replacement value of such assets, less depreciation.

More specifically, the derivation of the series in 1929 dollars involved the following steps:

a. Finding a base-year figure. For steam railroads, the base-year value was derived from an ICC estimate for January 1, 1937. For electric light and power companies, the value of plant and equipment was assumed to be zero as of January 1, 1881. For telephones, the value for 1880 was derived from estimates of gross capital expenditures in 1878 and 1879. For street and electric railways, the value for 1870 was obtained from the reports submitted to State Railroad Commissions. For local bus lines, it was assumed that net value for 1910 was less than $100,000.

b. Converting the base-year figure into 1929 dollars.

c. Deriving the series on net capital expenditures in 1929 prices. This series was obtained by deducting the estimated annual amounts of "true" depreciation from the figures on gross capital expenditures for the corresponding years.

d. Applying the series on net capital expenditures to the base-year value.

The series in current dollars for each class of utilities was obtained by multiplying the values in 1929 dollars by the construction cost index applicable to that class.

V 217–237. Assets, liabilities, and selected income items for two samples of large manufacturing corporations, 1914–1943.

Source: National Bureau of Economic Research, records.

These series represent financial data for two samples of large corporations (companies with total assets over $10 million each). The data for 1914–1922 are based on a sample of 81

Digitized by Google

corporations, and the data for 1922–1943 are based on a sample of 84 corporations. These sample materials make it possible to examine financial developments in manufacturing during World War I and the early part of the interwar period, for which time no aggregate data are available.

For both samples, companies were selected from among the largest and most important concerns in 11 major manufacturing industries. A few of the very large corporations (e.g., Ford Motor Company) had to be omitted because of lack of published financial statements, but the number of such omissions was small. Consequently, both samples, though small in terms of the number of firms included, represent substantial portions of the entire manufacturing universe in terms of total assets and total volume of operations. For example, in 1933 the sample represented 29 percent of the total assets of all manufacturing corporations and as much as 45 percent of the total assets of all large manufacturing corporations (with total assets over $10 million). (See A. R. Koch, *The Financing of Large Corporations*, National Bureau of Economic Research, New York, 1948, p. 13.)

In the sample for 1914–1922, data were not available for 8 companies in 1914, 3 companies in 1915, 1 company in 1916, and 1 company in 1917. In the sample for 1922–1948, 3 companies had to be omitted in 1922, 1 in 1923, 1 in 1924, and 1 in 1925. Since the excluded firms were among the smallest in the samples, however, their omission had a relatively minor effect on the composite balance sheets and income statements.

The amounts of total assets, income, and dividends for the sample for 1922–1943 are considerably greater than those for the sample for earlier years. This is due to the fact that in a number of cases larger companies were substituted in the sample for 1922–1943 for smaller concerns included in the sample for 1914–1922. These differences should be borne in mind when trends over the entire period are examined.

For a more detailed description of these samples, see the unpublished manuscript, *Corporate Financial Data for Studies in Business Finance*, May 1945, available at the National Bureau of Economic Research.

The accounting terms used in these series are defined as follows:

Total assets: Sum of all asset items less depreciation and revaluation reserves.

Cash: Cash on hand and bank deposits.

Marketable securities: Government securities; call and time loans.

Receivables: Notes and accounts receivable less bad debt reserve.

Inventory: Raw materials; goods and work in process; finished goods; supplies—less reserves for inventory.

Investments and advances: Investment in, or advances, to subsidiaries or affiliates; other stocks and bonds.

Fixed assets (net): Land; plant; machinery; equipment; nonoperating property—less reserves for depreciation, depletion, and obsolescence.

Other assets: Prepaid expenses; deferred charges; intangibles; due from officers, directors, and stockholders; cash set aside for specific purposes or not available for immediate use.

Notes payable: All notes or bills to banks, trade, and others.

Accounts payable: Accounts payable to trade.

Other current liabilities: Accruals and current reserves.

Long-term debt: All funded debt or mortgages, whether current or not, less sinking fund when listed on asset side; purchase obligations.

Other liabilities: Minority interest; deferred liabilities; amounts appropriated from surplus for specific purposes; due to officers, employees, and affiliates.

Preferred stock: Preferred and debenture stock less treasury preferred stock when listed on asset side.

Common stock: Common stock (A and B) or capital stock less common treasury stock when listed on asset side.

Capital reserves: Special appropriations from income or surplus for contingencies.

Surplus: Capital and earned surplus less profit and undivided surplus when carried on asset side.

Net income: Net amount after all expenses, interest, and taxes.

Dividends: Cash dividends on preferred and common shares. Stock dividends are not included.

95	Compiled net profit after taxes	4,778	2,451	[7] *1,056*	[7] *3,792*	[7] *880*					
	Dividends paid:										
96	Cash and assets other than own stock	5,896	4,788	3,091	3,854	6,092					
97	Corporation's own stock	135	212	90	142	162					

[1] Prior to 1954, based on original maturity date; beginning 1954, based on date of balance sheet.
[2] Net amount beginning in 1954. For 1937–1953, this is the sum of all positive amounts reported; for 1926–1936, the sum of positive net surplus and undivided profits.
[3] For 1937–1953, this is the sum of all deficits reported; for 1926–1936, sum of net deficits.
[4] "Other investments" were included in "Other assets" for all corporations, 1926–1928, and for life insurance companies, 1929.
[5] For 1931, gross profit was reported in lieu of gross receipts and cost of operations.
[6] Not available separately for returns with balance sheets.
[7] Loss.

[1] Includes net value of plant and equipment when a reserve for depreciation is shown; includes gross value when no reserve for depreciation is shown.
[2] Comparable with later years.
[3] Comparable with earlier years.
[4] Intercompany holdings of independent companies not deducted.
[5] Not available.

Productivity and Technological Development

PRODUCTIVITY INDEXES (Series W 1–51)

W 1–51. General note.

Work in the field of productivity has been carried on by many individuals and organizations, especially the Bureau of Labor Statistics (BLS), the WPA National Research Project, and the National Bureau of Economic Research (NBER). Currently, extensive work is being done by BLS, which measures productivity for the economy and for selected major sectors and industries.

Productivity, which is a ratio of output to input, can have different meanings. For example, it may be computed as a ratio of output to capital, or to labor, or to a combination of the two. The latter measures, which have been developed by John W. Kendrick for NBER, are covered in series W 5–8. Their construction and meaning are described briefly in his *Productivity Trends: Capital and Labor*, Occasional Paper No. 53, NBER, 1956, and more fully in the forthcoming NBER volume, *Productivity Trends in the United States*. The indexes in series W 1–4 and W 9–51 were computed by dividing a product index by an index of man-hours or of employment.

Historically, the measure of productivity which is most commonly used has been output per unit of labor input—frequently called "labor productivity." Such a measure reflects not only labor's effort but also other factors, including state of technology, capital per worker, availability of materials, the efficiency of management, and rate of operations.

The output part of a labor productivity ratio may also be defined in several ways. The simplest one conceptually is what is called physical output, where the components are physical units such as pounds, bushels, number, etc. To arrive at total measures for an industry or an industry group, the units are weighted by man-hours or the closest equivalent (such as labor cost or value added). This type of measure is a weighted arithmetic average of the productivity change of its components. The BLS industry estimates are of this type.

Estimates for broad aggregates, such as manufacturing or the total private economy, are constructed in terms of another concept called net output or value added per man-hour. Purchased "intermediate" products consumed in the production process are excluded. This type of measure in relation to man-hours reflects not only the average of the individual productivity changes, but also reflects shifts in the relative importance of low- or high-productivity industries as well as savings in materials inputs.

The specific year chosen for the weight base may affect the trend of the productivity series. For example, net output valued in 1939 prices would undoubtedly show a different trend than net output valued in 1956 prices. In general, a current year-weighted productivity index gives a lower trend than a base year-weighted index, since items which increase most in volume of output tend to be those with price declines or lower price increases.

Productivity series suffer from statistical limitations which are common to most production estimates. They also have additional limitations arising out of the noncomparability of output and man-hour series. For example, quality change cannot be adequately accounted for in measuring changes in output, price indexes often do not cover a sufficiently broad industrial area, and man-hour weights for constructing physical output series are frequently not available. At the industry level, especially, the rigidities of the Bureau of the Budget Standard Industrial Classification system may result in man-hours and output being classified in different industries.

W 1–11. Indexes of national productivity, 1889–1957.

Source: Series W 1–8, John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press (forthcoming); series W 9–11, Bureau of Labor Statistics, *Trends in Output Per Man-Hour in the Private Economy, 1909–1958*, Bulletin No. 1249, Dec. 1959, table 1.

These indexes are measures of aggregate productivity for the total private economy and the major segments thereof. The NBER series (W 1–8) show the change in real gross product per unit of factor input after adjustments to exclude general government and real net factor income from abroad. The BLS series (W 9–11) exclude only general government and retain real net factor income from abroad. Since the latter amount as a percent of total product is extremely small, the difference between the two series in this regard is relatively small. For both series, the numerator is derived from the Department of Commerce gross national product series (with some adjustments), carried back from 1929 in the case of the NBER series, chiefly by the national product estimates of Simon Kuznets, supplemented by estimates of government purchases by John W. Kendrick.

Although the numerator of the indexes is adjusted gross national product, the indexes are actually measures of the net productivity of the economy. This arises as the result of "netting" out all intermediate purchases of goods and services, thus eliminating duplication and measuring only the "end product" of the system. Indexes of net productivity may therefore move differently from gross productivity indexes according to changes in the efficiency of materials utilization which are not reflected in gross output indexes of productivity.

The indexes are "real" in the sense that price fluctuations have been eliminated by various means. In the NBER series, the net goods and services produced were combined in six segments or "comparison periods" by a Marshall-Edgeworth formula using as weights the average prices in the terminal years of each period. The final production index is thus a chain index with shifting weights between links, but fixed weights within links. Over the long period, therefore, the productivity index reflects the overall shifts in the industry composition of the aggregates. The comparison base is 1929.

The BLS index is derived from constant dollar aggregates of gross national product published by the Department of Commerce. These aggregates represent the deflation of current dollar values by weighted price indexes, wherever possible. The resultant indexes of net output approximate production

Digitized by Google

indexes with 1954 representing the price base and 1947–49 the comparison base.

W 1–3, real gross private domestic product per man-hour. This series shows changes in over-all productive efficiency in terms of man-hours as the physical unit of labor input. In general, the estimates of man-hours were obtained by multiplying employment by average hours worked per year in the various industrial groupings. The industry hours were combined to the desired level of aggregation without explicit weights. The exception to the general rule for derivation of total hours occurred in the farm sector where the Agricultural Marketing Service estimates of *Farm Labor Requirements* in terms of "average adult man-hour equivalents" were used. The AMS estimates were adjusted upwards by 10 percent in all years to attain a level comparable to that of the other sectors. For an explanation of the man-hour equivalent concept, see text for series W 48–51.

For the private nonfarm sector, employment data are based upon establishment reports or represent extrapolations of establishment-type estimates. The estimates since 1929 are by the Office of Business Economics. Prior to 1929, they are extrapolations of various benchmark estimates and are largely those used in previous NBER studies of output and employment.

W 4, product per unit of labor input. This series measures net output per weighted man-hour. Man-hours for industry groups or segments were combined by average hourly earnings, using the Marshall-Edgeworth cross-weighting formula. The comparison periods conforming to those in the output index were used. Aside from making possible a comparative study of the movements of output per weighted and per unweighted man-hour, the construction of this index makes possible the combination of the capital and labor inputs and the derivation of indexes of net output per unit of total factor input.

W 5, product per unit of capital input. This series expresses the change in total productivity in terms of real capital assets. The capital input of the private domestic economy was defined to include land and replaceable assets, such as residential and nonresidential structures, equipment, and inventories. The estimates are based primarily on those by Raymond Goldsmith in *A Study of Saving in the United States*, vol. 3, Princeton University Press, 1956. Index numbers of real capital stocks for separate industry groups were combined by use of the Marshall-Edgeworth formula, using unit capital compensation as weights. The system parallels that used in the index of labor input.

W 6–8, product per unit of total factor input. These series are conceptually more inclusive measures than those shown in series W 1–5 since they relate the quantity of net output to the real quantity of total factor input required to produce it. The index of total factor input is the weighted average of the index of labor input and the index of capital input previously described. The weights are units of factor compensation and the combination was made by applying the Marshall-Edgeworth formula.

W 9–11, real gross private product. Aside from the previously discussed differences between the weighting systems used in the two output series, the BLS index also employs different concepts of man-hours in both sectors. Here, the concept is total hours paid for rather than hours worked. They include the time paid for in the form of paid holidays, sick leave, and vacation pay.

The hours of farmworkers are from the Bureau of the Census, *Current Population Survey*, and are derived as the product of average hours times the total number of workers, as distinct from the man-hour requirements estimates used in series W 1–8. Hours of the nonfarm component are from the Bureau of Labor Statistics, *Employment and Earnings*. The index of man-hours is from a simple aggregation of the man-hours worked in the separate sectors.

W 12. Index of output per man-hour for total mining, 1890–1957.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press (forthcoming).

An earlier index appearing in Harold Barger and Sam H. Schurr, *The Mining Industries, 1899–1939: A Study of Output, Employment, and Productivity*, NBER, New York, 1944, provided the basis for this series. The earlier index has been extended back by Kendrick to cover years omitted by Barger and Schurr and to include the later period, 1939–1957. Since Kendrick's study of the mining industry was part of a study of national productivity, the need for consistency between the several sectors caused some modification of the Barger and Schurr index.

The mining industry covers all extraction of minerals including stone quarrying and the pumping of crude petroleum. The output index is a price-weighted aggregate of the Marshall-Edgeworth type and is of "modified chain" construction. Separate indexes were computed for each of several comparison periods using the mean of the commodity prices for the terminal years of each period. The indexes of the comparison periods were then linked to obtain an index covering the entire period.

The general weighting scheme of the original study was followed in the Kendrick revisions, except that he applied national income per unit of output as the weighting factor for combining the broad industry groups into the sector aggregate. These broad groups are metal mining, nonmetallic mining and quarrying, oil and gas wells, bituminous coal, and anthracite. For years prior to 1919, the 1919–1929 weights were used.

Basic sources of quantity and value data for the original production index were *Mineral Resources of the United States*, published annually for 1882–1931; and *Minerals Yearbook*, published annually since 1932–33. These volumes were prepared and issued by the Geological Survey from 1882 to 1923 and by the Bureau of Mines since 1924.

Labor input data for 1902 are from the Bureau of the Census, whereas later data are from accident statistics collected by the Bureau of Mines. The data are man-days used in actual mine operation; in most cases, the average number of employees times the number of days the mine operated during the year. BLS reports on employment and average hours have been used since 1939. The estimates of man-hours are the products of man-days times the "nominal" hours worked per day. Nominal hours are implicitly defined as the number of hours customarily worked on one shift in a regular workday by all persons "engaged in production."

W 13. Index of output per man-hour in all mining, 1880–1950.

Source: Bureau of Labor Statistics computations (1880–1935, based on WPA National Research Project, *Production, Employment, and Productivity in the Mineral Extractive Industries, 1880–1938*; 1935–1950, based on BLS, *Productivity Trends in Selected Industries, Indexes Through 1950*, Bulletin No. 1046).

For 1935–1945, the index for mining represents 6 individual mining industries, for 5 of which the BLS published separate series—bituminous coal, anthracite, iron, copper, and lead and zinc. The production index from which the combined index is derived is an average of the 5 separately published series plus a series for crude petroleum and natural gas weighted with current man-hours; the man-hours index is based on totals for

Digitized by Google

the 6 industries. The productivity index for the years before 1935 is based on the WPA National Research Project study.

The individual mining series (W 14–21) are published annually in a BLS release, *Indexes of Output Per Man-Hour in Selected Industries*. The production data for these series are from the Bureau of Mines. Employment and average weekly hours series are those of BLS for 1939–1957. For 1935–1939, BLS series were used for the coal industry and Bureau of Mines data for metal mining. The employment definition adopted (average number of wage earners employed during the 12 months of each year, including months of no activity) is the concept used by the Bureau of the Census.

W 14–21. Indexes of output per man-hour in selected mining industries, 1935–1957.

Source: For selected years, Bureau of Labor Statistics, *Indexes of Output Per Man-Hour for Selected Industries: 1919–1958*, April 1959; all other years, BLS computations (based on BLS, *Trends in Output Per Man-Hour, 1935–1955, Selected Nonmanufacturing Industries*, Report No. 105, June 1956).

Production data on which the indexes are based come from the Bureau of Mines, *Minerals Yearbook*, and the Bureau of the Census, censuses of mineral industries. The man-hours components of the indexes are derived from the regularly published BLS series on employment and average weekly hours adjusted by data obtained from the censuses of mineral industries. Exceptions to this are the indexes of man-hours for copper mining and iron mining for 1935–1939, which were derived from accident analysis statistics of the Bureau of Mines; and the lead and zinc mining man-hours for 1935–1939, which were derived from special WPA National Research Project tabulations of Bureau of Mines data for 1935–1939. The man-hours cover only production and related workers, and exclude salaried officers, superintendents, other supervisory employees, and professional and technical employees. They include all hours worked or paid for.

W 22–23. Index of manufacturing, net output per man-hour, (1947–49=100), 1947–1957.

Source: Bureau of Labor Statistics, *Trends in Output Per Man-Hour in the Private Economy, 1909–1958*, Bulletin No. 1249, Dec. 1959.

The indexes of net output per man-hour in manufacturing measure changes in the real value added per production worker man-hour and per man-hour of all employees. The numerator of this index is real total output less the real costs of material, containers, fuel, and supplies. The residual value added is the same as adjusted value added in the 1954 Census of Manufactures, corrected for price changes.

Shipments, inventories, and materials consumed are deflated separately for each industry. Deflated shipments are adjusted by net changes in deflated inventories to estimate total production; deflated materials are deducted to arrive at net output. The index of net output is then divided by an index of total man-hours of production workers to obtain the index of net output per man-hour.

Data in current prices, by industry and commodity, are available from the census of manufactures and from the *Annual Survey of Manufactures* for intercensal years. For deflating output, the commodity indexes of BLS Wholesale Price Index are reweighted according to the commodity output of industries in the 1947 Census of Manufactures. Beginning and ending inventories are deflated separately by the price index at the beginning and ending of the year and the net change is computed in real terms.

Material cost deflators were derived by weighting the WPI commodity indexes according to the material consumption patterns of the separate industries as reflected in the 1947 BLS Interindustry Relations study.

Production worker man-hours represent the product of employment times the average weekly hours of production workers, as published by BLS, raised to annual levels. The hours of other workers are estimated by BLS.

W 24. Index of output per man-hour for all manufacturing industries, 1909–1953.

Source: 1909, 1914, and 1919–1939, Bureau of Labor Statistics computations (based on BLS, *Handbook of Labor Statistics*, 1947 edition); 1939, 1947, and 1949–1953, Bureau of Labor Statistics, *Trends in Output Per Man-Hour and Man-Hours Per Unit of Output-Manufacturing, 1939-53*, Report No. 100, 1955.

The production index used to derive the index of output per man-hour in manufacturing for 1909, 1914, and for the odd-numbered years 1919–1939, is from Solomon Fabricant, *Employment in Manufacturing, 1899–1939*, NBER, New York, 1942. The production index for even-numbered years to 1939 was computed by use of the Federal Reserve Index for Manufactures. The man-hours index was derived from an employment index based on Bureau of the Census and BLS data and BLS series for average weekly hours for 1909, 1919, and 1923–1939, supplemented with estimates of the WPA National Research Project for 1920–1922. For 1939, 1947, and 1949–1953, the production index was computed by BLS.

For the period before 1936, indexes of productivity are shown in *Production, Employment, and Productivity in 59 Manufacturing Industries, 1919–1936*, a 3-volume report prepared by WPA National Research Project on Reemployment Opportunities and Recent Changes in National Techniques. BLS made some revisions in these indexes and extended most of them to 1940. These measures, together with indexes of payrolls and unit labor cost, appear in the BLS report, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1910–1940*, and were later revised. The revised output-per-man-hour series was published in the 1947 *Handbook of Labor Statistics*.

The production pattern changed radically when the United States began its World War II program. Statistics were inadequate for measuring overall changes in manufacturing efficiency during the period of transition from peace to war. Consequently, there is a gap in the measurements between 1939 and 1947.

The index of output per man-hour in manufacturing attempts to compare the labor time required in the current year to manufacture the current year's output of goods with the time required in the base year to produce the same quantity and mixture of goods. That is, it measures the change in output per man-hour, assuming that the proportion of goods produced by each industry and within each industry in each year under consideration were also produced in the base year. It is the ratio of a production index (consisting of an aggregate of quantities produced weighted by the labor time required to produce a single unit) to a man-hours index (based upon the time of production workers). The concept of physical output holds constant the relative importance of industries. Indexes developed under this concept reflect primarily the average change in productivity of plants and industries in manufacturing.

W 25–37. Indexes of output per man-hour for selected manufacturing industries, 1919–1957.

Source: For selected years, Bureau of Labor Statistics, *Indexes of Output Per Man-Hour for Selected Industries:*

Digitized by Google

1919–1958, April 1959; all other years, BLS computations (1919–1936, based on WPA National Research Project, *Production, Employment, and Productivity in 59 Manufacturing Industries*, May 1939; 1936–1939, based on BLS, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919–1940*, 1942; 1939–1950, based on BLS, *Productivity Trends in Selected Industries, Indexes Through 1950*, Bulletin No. 1046).

In 1939, the National Research Project on Reemployment Opportunities and Recent Changes in Industrial Techniques, a unit of the Works Progress Administration, published its indexes of production, employment, and productivity, based on data obtained from the Bureau of the Census, BLS, and other official and private agencies. BLS made some revisions in these series, and extended most of them through 1945. These extended and revised indexes were published, together with indexes of unit labor cost, in a series of BLS publications, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919–1940*, and several supplements to this report.

W 38. Indexes of output per man-year in the blast furnace industry, 1850–1925.

Source: Bureau of Labor Statistics, *Monthly Labor Review*, June 1928.

This series was constructed from data of the Bureau of the Census and the American Iron and Steel Association, and is one of the few well-defined industries for which definite figures for both production and employment were available over a long period of years.

W 39–43. Indexes of output per worker in transportation, 1869–1953.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press (forthcoming).

These series represent revisions and extensions of data by Harold Barger, *The Transportation Industries, 1889–1946: A Study of Output, Employment and Productivity*, NBER, New York, 1951. In addition to extending Barger's index, Kendrick also created an index for the trucking industry which was not separately presented in the earlier study.

W 39, output per worker in all transportation industries. This index measures the change in the movement of persons and property for hire per worker employed and includes the industry groupings of the national income accounts which follow closely the Bureau of the Budget, *Standard Industrial Classification Manual.*

The production index used as the numerator is based upon revenue passenger-miles and unweighted ton-miles wherever possible. Where these items were not available, less refined units were substituted, as indicated for individual industries below. Output figures were not available for industries which, in 1929, amounted to some 20 percent of the total. For these industries, output was derived from employment on the assumption that the productivity of the uncovered portion was the same as in the covered portion. The aggregate production index of the industry was derived by weighting together the group indexes using changing national income weights and applying a Marshall-Edgeworth formula. Sources of underlying data are indicated in the notes to the separate industries discussed below. These industries account for a significant part of total transportation output.

The employment index is based upon the Office of Business Economics employment series since 1929. For 1870–1930, the series was extrapolated by estimates of the distribution of gainfully employed workers in census years, adjusted to exclude the unemployed, and are largely from Daniel Carson, "Changes in the Industrial Composition of Manpower Since the Civil War," *Studies in Income and Wealth*, vol. 11, NBER, 1949.

Although only output per worker is presented here, the Kendrick series afford measures of output per man-hour for total transportation and for most individual industries.

W 40, output per worker in steam railroads. The output of this industry includes the freight and passenger activities of Class I, II, and III line-haul roads, switching and terminal companies, the Pullman Company, and the Railway Express Agency and its predecessors.

The production index is a weighted average of simple ton-miles and revenue passenger-miles with different weights for the different classes of passenger service. The data are largely from the annual report of the Interstate Commerce Commission, *Statistics of Railways in the United States.* The combination of freight and passenger traffic was made by a Marshall-Edgeworth formula with average unit revenues in terminal years for the following periods: 1911–1922, 1922–1929, 1929–1939, and 1939–1947. Kendrick's extension to later years retained the 1939–1947 weights. The Barger index started with 1890. The index for 1889 is an extrapolation based on an index prepared by Melville J. Ulmer, *Trends and Cycles in Capital Formation by United States Railroads*, Occasional Paper 43, NBER. Since 1890, the index was multiplied by a "coverage" index to include evenly the output of segments for which quantities were not available, such as switching and terminal and express companies. Before 1890, the implicit assumption is that covered and uncovered components move together.

For 1929–1953, estimates of employment are from the Office of Business Economics. For earlier years, data were available from the Interstate Commerce Commission but the coverage was irregular. Adjustments were made for these deficiencies by Kendrick, and the extrapolation for 1889 was based on Daniel Carson (cited above).

W 41, output per worker for pipelines. This index covers companies primarily engaged in the pipeline transportation of crude petroleum and refined petroleum products. Transmission of natural gas is not included. It includes trunkline mileage in interstate as well as intrastate transmission. Gathering lines are excluded.

The physical unit of output is billions of ton-miles, available since 1936 from the ICC annual report, *Statistics of Oil Pipe-Line Companies.* For 1929, ton-miles were estimated from ICC data on oil received into the system, assuming that the 1936 ratio of barrels originated to barrels received was the same for earlier years. The figure for 1919 is an extrapolation of estimates of trunkline mileage by Walter Splawn, *Oil and Gas Journal*, Petroleum Publishing Co., Tulsa, and an extrapolation of the trend in the ratio of ton-miles transported to total line mileage, 1921–1952. Estimates for this industry for earlier years are not shown separately.

The employment index since 1929 is based upon data in *Statistics of Oil Pipe-Line Companies* and it covers primarily interstate companies. It is not exactly comparable to output since employment on gathering lines is also included. The ICC estimates were raised by 7 percent to correspond with the Office of Business Economics estimate of total employment for the sector. The employment estimate for 1919 is based on the report by Daniel Carson (cited above).

W 42, output per worker in waterways. The productivity estimates of waterways measure the output per person employed on U.S. flag vessels in coastwise, intercoastal, Great Lakes (domestic), inland, noncontiguous, and international water transportation. The exception is that Great Lakes passenger traffic is not included. The original index by Barger

Digitized by Google

excluded coastwise and inland passenger traffic. Kendrick added these and made output and employment estimates for census years between 1899 and 1920, extrapolated intervening years by related series, and made extensions for the later years.

Separate indexes were prepared for freight and passenger traffic for the different types of service and weighted together by the relatives derived as 1939 unit revenues times 1929 units. The freight index is from weighted ton-miles derived from separate tonnage and average haul estimates. Data are from various reports of the Army Engineers, Maritime Commission, and Bureau of the Census. The net tons carried by U.S. flag vessels as shown in Census reports of water transportation were used to interpolate figures for 1906 and 1916. A weighted average of two tonnage series was used to interpolate figures for intercensal years. These were net tonnage capacity of U.S. flag vessels in foreign trade entered and cleared at all ports, adjusted where necessary to a calendar-year basis, and the gross tonnage of merchant vessels engaged in coastwise and internal trade of the United States. The index was extrapolated back to 1869 and 1879 by the 1889–1926 ratio to the index of combined vessel tonnage.

For 1928–1940, Barger's passenger index was based on Maritime Commission estimates of arrivals and departures, by type of service. Prior to 1928, it was based on arrivals and departures in U.S. ports of persons in foreign travel, adjusted by changes in the ratio of U.S. flag vessels to all entrances and clearances. (See August Maffry, *Overseas Travel and Travel Expenditures*, Bureau of Foreign and Domestic Commerce, Economic Series 4, 1939.) Kendrick used the Census transportation series for 1880, 1889, 1906, 1916, and 1926, interpolated by a series on gross tonnage of vessels engaged in coastwise and internal trade and linked with Army Engineers' data for 1926–1946 to derive passenger-miles for coastwise and inland waterways traffic, and thus to broaden the coverage of the original index.

For 1929–1953, the OBE estimates of full- and part-time employment in water transportation formed the basis of the employment index. Prior to 1929, employment estimates of the censuses of water transportation were used after several adjustments for coverage and comparability between censuses. Annual interpolations were made on the basis of gross tonnage estimates of documented merchant vessels. The OBE estimates for the later period were extrapolated back to 1926 and linked with the census-based series. The earlier estimates have most relevance for combination in the total index.

W 43, output per worker in airlines. The productivity estimates for this industry relate to scheduled airlines and unscheduled carriers and companies primarily engaged in operating fixed facilities or providing services to airlines.

The indexes are based on data collected by the Civil Aeronautics Administration (CAA) and predecessor agencies. For 1935–1953, the index of domestic traffic is based on a weighted aggregate of revenue passenger-miles and express (freight and mail) ton-miles. In earlier years, the index is based on total passenger-miles (or total passengers, 1928–1929). The U.S. flag international component represents passenger traffic throughout—revenue passenger-miles for 1937–1953, all passenger-miles for 1930–1937, and all passengers for 1928–1930. The sources of the data are CAA, *The Statistical Handbook of Civil Aviation, 1948* and *Statistical Handbook of Civil Aeronautics, 1954*.

For 1939 and earlier years, the weights are 1939 unit revenues; beginning 1940, average 1939 and 1947 unit revenues were used.

The employment index represents year-end averages of data compiled by CAA through 1941. For 1942 and subsequent years, OBE estimates based upon Social Security Administration data were used.

W 44. Index of output per man-hour in railroad transportation, 1916–1957.

Source: 1919, 1929, 1939, and 1947–1957, Bureau of Labor Statistics, *Indexes of Output Per Man-Hour for Selected Industries: 1919–1958*, April 1959; all other years, BLS computations (1916–1935, based on Witt Bowden, "Productivity, Hours, and Compensation of Railroad Labor, 1933–1936," *Monthly Labor Review*, July 1937; 1935–1947, based on BLS, *Trends in Output Per Man-Hour, 1935–1955, Selected Nonmanufacturing Industries*, Report No. 105, June 1956).

The index of output per man-hour for railroad transportation refers to Class I line-haul railroads. For 1935–1957, the production measure represents aggregate passenger-miles and freight ton-miles, each category being weighted by average unit revenues in the period 1947–1949. The man-hours index represents straight time worked and overtime paid for all hourly basis employees and also includes constructive allowance hours of train and engine employees. Constructive allowance time includes vacations, standby time, held-over time, court time, etc. All basic data are published by the Interstate Commerce Commission.

The indexes for the earlier period, 1916–1934, are based on a somewhat different index prepared by BLS. The components of the production index are combined with 1926 weights; and for the period from 1916 through July 1921, the man-hours represent time worked rather than paid for.

W 45. Output per man-hour for the electric light and power industry, 1935–1948.

Source: Bureau of Labor Statistics computations (based on BLS, *Productivity Trends in Selected Industries, Indexes Through 1950*, Bulletin No. 1046).

The index for the electric light and power industry refers to privately owned utilities generating and distributing electricity, and shows the trend of kilowatt-hours of electrical energy per man-hour. The production index is an aggregate of kilowatt-hours sold to ultimate consumers, and is derived from data of the quinquennial Census of Electrical Industries (suspended since 1937) and the Federal Power Commission. The employment index is based on the hours of all wage and salary employees, except executives and employees of appliance sales departments.

This series was discontinued after 1948 because of a growing lack of comparability between the production and the man-hour series.

W 46–47. Indexes of output per person and per man-hour in distribution, 1869–1953.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press (forthcoming).

These indexes represent revisions and extensions of an earlier index prepared by Harold Barger, *Distribution's Place in the American Economy Since 1869*, Princeton University Press, 1955. The original estimates by Barger represented real margin earned per man-hour on those goods reaching the public through retail stores only. The source of total commodity output was William H. Shaw, *Value of Commodity Output Since 1869*, NBER, New York, 1947. Distribution factors for amounts going through retail were from Simon Kuznets, *Commodity Flow and Capital Formation*, NBER, New York, 1938. The quantities sold through retail stores were weighted by average 1869 and 1929 distributive margins to derive the

488910 O - 60 - 39

Digitized by Google

production aggregate. The index is thus a "net" concept, although it is more inclusive than the usual net productivity index since packaging and other supply materials customarily considered a part of margin are not eliminated.

The revisions in the numerator by Kendrick consisted of converting the weighting system in Shaw's commodity output from the original 1913 price base to a Marshall-Edgeworth formula with the average prices of key years as weights. For periods subsequent to 1929, Kendrick shifted to deflated values of final purchases of consumer goods and producer durable equipment by type and weighted by the corresponding distributive markups for 1929–1939 and 1939–1948, based on Department of Commerce estimates. Kendrick also added the margin on real outlays for construction materials to the series. The coverage of the new index was thus increased.

Since 1929, the Department of Commerce estimates of employment were used by Kendrick with interpolations between census years on the basis of BLS indexes. Extrapolation of the OBE series back to 1900 was based upon an employment series from an unpublished manuscript by Stanley Lebergott, *Estimates of Labor Force, Employment and Unemployment, 1900–1950*. Prior to 1900, the estimates used by Barger were retained. These were based upon the report by Daniel Carson (cited above).

W 48–51. General note.

Two types of gross productivity indexes for agriculture are currently available, both evolving directly from a WPA National Research Project series, *Output Per Worker in Agriculture*, May 1941. These indexes use a measure of gross output as distinct from the measure of net output which appears in series W 2.

W 48–50. Indexes of gross farm output per man-hour, 1910–1957.

Source: Department of Agriculture, *Changes in Farm Production and Efficiency*, Statistical Bulletin No. 233, August 1958.

The Agricultural Research Service (ARS) series are a continuation of the measures developed by Reuben Hecht and Glen Barton in their study, Department of Agriculture, *Gains in Productivity of Farm Labor*, Technical Bulletin No. 1020, December 1950. The indexes are also available for the United States, by major crops and by 9 geographic divisions.

The index includes only the man-hours utilized in the production of crops and livestock and products; does not include agricultural services, forestry, and fishing, which are included in the Bureau of the Budget Standard Industrial Classification definition of agriculture. The index measures only the volume of farm production for eventual human use; it excludes farm-produced power and other producer goods such as horses and mules and their feed, and certain hay, pasture, and cover crop seeds.

The production index which forms the numerator of the productivity index is of the fixed-base aggregative type with price weights. Weights for the period prior to 1939 are average 1935–1939 prices, whereas those for the period since 1939 are average 1947–1949 prices. The two subindexes were linked in 1940 by overlapping calculations in that year. Separate estimates are prepared for crops and livestock. The combination of the aggregates for crops and livestock is on a net basis—that is, the food consumed by livestock, while a part of the crop output index, is eliminated in deriving the sector index.

The labor input denominator of the index is not actual hours but "man-equivalent" hours, i.e., the total hours that would be required to produce the output by average adult males. The annual estimates are derived from benchmarks based upon farm management studies from numerous sources. The interpolations between, or extrapolations beyond, benchmark years are based upon changes in the number of crop acres and livestock units, modified to take into consideration changes in technology, yield, etc.

Although the index is shown here only for total farming and its major sectors (crops and livestock), additional detail is available annually for 12 smaller industry groups—meat animals, milk cows, poultry, feed grains, hay and forage, food grains, vegetables, fruits and nuts, sugar crops, cotton, tobacco, and oil crops—and in total by 9 geographic divisions.

W 51. Index of gross farm output per worker, 1909–1950.

Source: Bureau of Labor Statistics, *Productivity Trends in Agriculture*, March 1952.

The 1909–1935 estimates are derived by linking the original WPA series with the later index developed by BLS. Figures are available for the United States and 11 farming areas.

The production index of the BLS series is labor weighted. For most crops in the production aggregates, the unit man-hour requirements used as weights are for 1939, while the estimates for livestock products are for more recent years. The index is based on data of the Bureau of Agricultural Economics for the output of 73 farm products during the years 1935–1950. For the earlier period, 1909–1935, the series was derived from indexes prepared by the WPA National Research Project covering about 60 products.

The index includes "total farm production whatever its ultimate disposition." Horses and mules and their feed are thus included. Aside from this, the commodity coverage is the same as the ARS measure (see text for series W 48–50).

The labor input measure used in the index is total farm employment from *Farm Labor*, a monthly release by the Agricultural Marketing Service of the Department of Agriculture. Annual data appear in the January issue. Farm employment includes both hired and unpaid family workers above 10 years of age, as well as full- and part-time workers. Unpaid family workers are counted if they work 15 or more hours during the survey week. Farm operators and hired workers are counted if they work 1 or more hours during the period. Another measure of employment, different in coverage, is available from the Bureau of the Census for the period since 1939, and was used in series W 2.

chapter W

COPYRIGHTS, PATENTS, AND TRADEMARKS (Series W 52–78)

W 52–65. Copyright registrations, by type, 1870–1957.

Source: Series W 52–62, W 64–65, The Library of Congress, *Annual Report of the Librarian of Congress* and *Annual Report of the Register of Copyrights*, various issues. Series W 63, 1874–1896, Patent Office, *Annual Report of the Commissioner of Patents;* 1897–1940, records; 1941–1957, *Annual Report of the Register of Copyrights*, various issues.

Additional detail for some series is shown in the source volumes.

Figures are on a calendar-year basis for 1870–1896, and on a fiscal-year basis for subsequent years. Prior to 1870, copyright claims were entered at Federal District Courts. For additional information on this period, see Martin A. Roberts, *Records in the Copyright Office Deposited by the United States District Courts Covering the Period 1790-1870*, Washington, D. C., 1939.

The term "copyright" may be defined as the right to be protected from copying. It has come to mean that body of exclusive rights granted by Federal statute to authors for the protection of their writings. It includes the exclusive right to print, reprint, publish, copy, and vend the copyrighted work; to make other versions of the work; and, with certain limitations, to make recordings of the work and to perform the work in public. The Copyright Office does not examine material for originality; it is primarily an office of record, and registers claims if the provisions of the law and the regulations have been complied with. A certificate is issued to the applicant upon completion of each registration.

The first law, that of 1790, applied only to maps, charts, and books; subsequent amendments provided for prints (1802); musical compositions (1831); dramatic compositions with the right of public performance thereof (1856); photographs (1865); paintings, drawings, sculpture, and models or designs for works of the fine arts (1870); performance rights in music (1897); motion pictures and photoplays (1912); and performance rights in nondramatic literary works (1952). The original term of copyright was 14 years, with the privilege of renewal for 14 years. In 1831, the first term was increased to 28 years, and in 1909, the renewal term was also increased to 28 years. Before 1891, only citizens or residents of the United States could obtain copyrights. The Act of 1891 extended the privilege to citizens of countries with which the United States had reciprocal copyright agreements (in 1958, 38 countries). Claims in works bv citizens of States adhering to international copyright conventions to which the United States is a party (Mexico City, 1902; Buenos Aires, 1910; and Universal Copyright Convention, 1952) may also be registered, as well as works first published in States adhering to the Universal Copyright Convention.

Detailed information on the various classes of works may be found in "Regulations of the Copyright Office," *Code of Federal Regulations*, Title 37, chap. II, 1956, or by writing to the Register of Copyrights, Library of Congress, Washington 25, D.C.

Copyright fees have always been nominal; they are now $4.00 except those for commercial prints and labels, which are $6.00, and renewals, which are $2.00.

W 52, total registrations. For 1870–1940, the figures shown in this series are equal to those given in the source plus those shown for series W 63, commercial prints and labels.

W 53–57, books, pamphlets, and periodicals. Serial publications issued at regular intervals of less than a year are considered periodicals; otherwise, they are considered books.

W 58, dramatic or dramatico-musical compositions. For 1909 and earlier years, this series pertains only to dramatic compositions.

W 63, commercial prints and labels. Registration of commercial prints and labels in the Patent Office was first authorized by the Act of June 18, 1874. Jurisdiction was transferred to the Register of Copyrights by Public Law 244, 53 Stat. 1142, effective June 30, 1940. In 1891, the registration of labels was questioned as the result of a Supreme Court decision, with a resulting temporary drop in registrations until 1896.

W 66–75. General note.

A patent is a grant by the Government to the inventor, his heirs or assigns, of the right to exclude others from making, using, or selling the invention patented. Patents can be obtained for any new and useful machine, manufacture, composition of matter or process, or any new and useful improvement thereof, subject to the requirements and conditions of the law, United States Code, Title 35, Patents. An invention is "useful" if it has lawful purpose and is operative. Since 1946, inventions useful solely in the utilization of fissionable material or atomic energy for military purposes have been unpatentable. If the subject matter patented can be used without infringement of the prior rights of others or violation of any applicable statute, the patent, in effect, gives its owner the exclusive right to make, use, or sell the subject of the patent. The subject matter covered by a patent must be sufficiently new as to be not obvious to one skilled in the art to which it relates.

Patents on inventions have been issued by the Federal Government since April 10, 1790. Both the fees charged and the term of patents have been changed occasionally by law. Except in the case of fees charged foreigners for a short period (see text for series W 76), these changes have generally been slight. Hence, the effect of the changes on patenting rates has tended to be small or negligible. A fee of $30, the same as now, was charged on application in 1793. However, whereas no charge was made in 1793 when a patent was granted, modern-day applicants pay an additional $30 at that time. Other smaller fees incidental to the processing of applications may also be charged by the Patent Office.

For 1790–1861, the term of a patent was 14 years. In addition, from 1836 until the patents granted in 1861 expired, patents were renewable for an additional 7 years upon application by the patentee and approval of a special board or the Commissioner. About 5 percent of the patents issued during the latter part of this period were renewed in this manner. Since 1861, the term of patents on inventions has been fixed at 17 years with renewals possible only by special act of Congress. The number of such renewals has been negligible.

From February 21, 1793, to July 4, 1836, patents were granted on demand of the applicant, upon compliance with the

Digitized by Google

formal requirements, without examination as to novelty and other requirements. Consequently, statistics of patents on inventions issued during this period are more comparable to subsequent statistics of applications for patents on inventions (series W 66) than to subsequent statistics of patents on invention. Different sources for patent statistics during this period show minor discrepancies.

Since July 4, 1836, the Patent Office has examined applications for novelty and for compliance with the requirements of the statute and not all applications which are filed become patents. See Department of Commerce, *The Story of the United States Patent Office, 1790–1956*, 1956, for a brief account of the development of the patent laws. See also, same agency, *General Information Concerning Patents*, 1957 (revised periodically), for an outline of the patent law.

Other kinds of patents issued are design patents, botanical plant patents, and reissued patents. Reissued patents are patents which are issued to replace another patent to correct some error, and hence have no significance in most uses of patent statistics. They are not shown in this compilation, although reissue applications are included in series W 66 for some years for which they could not be separated. Reissued patents were numbered separately from 1838 and the number of the first such patent issued in 1958 is 24,413.

Statistics on various phases of patents on invention are available in various sources. Analyses of aggregate patent statistics appear in S. C. Gilfillan, *The Sociology of Invention*, Chicago, 1935; Barkev S. Sanders, "The Course of Invention," *Journal of the Patent Office Society*, October 1936; Joseph Rossman and Barkev Sanders, "The Patent Utilization Study," *The Patent, Trademark, and Copyright Journal*, June 1957; Alfred B. Stafford, *Trends of Invention in Material Culture*, Ph.D. thesis, University of Chicago, 1950; Alfred B. Stafford, "Is the Rate of Invention Declining?" *American Journal of Sociology*, May 1952; Jacob Schmookler, *Technical Change and Patent Statistics*, a paper presented at the Social Science Research Council Conference on the Quantitative Description of Technological Change, Princeton University Press, 1951 (mimeographed); Jacob Schmookler, *Invention and Economic Development*, Ph.D. thesis, University of Pennsylvania, 1951: and Jacob Schmookler, "The Level of Inventive Activity," *Review of Economics and Statistics*, May 1954.

Statistics of patents issued by industry or by field of technology appear in Simon Kuznets, *Secular Movements in Production and Prices*, Boston, 1930; R. K. Merton, "Fluctuations in the Rate of Industrial Invention," *Quarterly Journal of Economics*, May 1935; *Trends of Invention in Material Culture*, cited above; and *Technical Change and Patent Statistics*, cited above. Statistics of patents issued by State and country of residence appear irregularly in the Patent Office. *Annual Report of the Commissioner of Patents*, and in the Bureau of the Census, *Statistical Abstract of the United States*. For an analysis of patents issued by States, see Jacob Schmookler, "Inventors Past and Present," *Review of Economics and Statistics*, August 1957.

W 66–68. Patent applications filed on inventions, designs, and botanical plants, 1836–1957.

Source: 1836–1839, Department of Commerce, *The Story of the United States Patent Office, 1790–1956;* 1840–1925, Patent Office, *Annual Report of the Commissioner of Patents;* 1926–1957, Patent Office, records.

Series W 66 involves a slight element of double counting prior to 1940. Before a change in the law on August 5, 1939, made it impossible, an applicant could permit his initial application to lapse and then file a new application covering the same invention. Possibly 2 to 4 percent of the applications filed before 1940 were of this character. For years prior to 1880, series W 66 includes design applications and for years prior to 1877, it also includes reissue applications.

W 69. Total patents issued on inventions, 1790–1957.

Source: 1790–1925, Patent Office, *Annual Report of the Commissioner of Patents;* 1926–1957, records.

Patents for inventions are numbered serially, the number of the first patent issued in 1958 being 2,818,567. This numbering system began with the first patent issued after the Patent Act of July 4, 1836. Most sources of patent statistics give, as the annual number of patents issued, the numbers derived by subtracting the serial numbers of the first patent in each year. However, some serial numbers were not used and are blank; that is, there may not be any patent corresponding to a particular number. This may arise when an application scheduled to be patented, with the patent number assigned, is withdrawn for some reason at a time when it is too late to assign that number to some other case. The blank numbers averaged 26 per year for 1939-1955. In the present series the number of blank numbers has been deducted in each year for which it could be ascertained. Therefore, the statistics of patents on inventions issued since 1836 may run a fraction of a percent below those appearing in some issues of the *Annual Report of the Commissioner of Patents* and in *Historical Statistics of the United States, 1789–1945*.

Patents granted in a given year cannot be compared with applications filed in the same year since there is a variable lag between the time of applying and the time of issuing a patent. During the last 10 years this lag varied between 3 years and 3 years and 8 months as the average time for issuing patents. Some variations in the number of patents issued in a given year may be due to administrative problems such as the loss or addition of examining personnel.

W 70–73. Patents on inventions issued to individuals, to U.S. and foreign corporations, and to the U.S. Government, 1901–1957.

Source: 1901–1935, Patent Office, records; 1936–1955, P. J. Federico, *Distribution of Patents Issued to Corporations, 1939–1955*, Washington, D.C., 1957, Study No. 3, table 6 (a report prepared for the Senate Subcommittee on Patents, Trademarks, and Copyrights); 1956–1957, Patent Office, records.

Statistics on patents issued to U.S. and foreign corporations are actual counts for 1931–1937 and 1955; for the other years they are estimates based on samples. Statistics of patents issued to the U.S. Government are based on actual count. This figure does not include patents issued to the Alien Property Custodian during and after World War II. Patents assigned after grant are not included. The patents issued to individuals are obtained by subtraction from the total.

W 74. Patents issued on designs, 1842–1957.

Source: Patent Office, *Annual Report of the Commissioner of Patents.*

Designs became patentable in 1842 and relate to the appearance, not to the structure or use, of articles of manufacture. The term for design patents was initially set at 7 years. Since 1861, the term has been 3½, 7, or 14 years, at the discretion of the applicant. Fees payable vary with the term. Design patents are numbered separately. The number of the first design patent issued in 1958 is 181,829.

W 75. Patents issued on botanical plants, 1931–1957.

Source: Patent Office, records.

Botanical plants became subject to patents for the first time in 1930. Patentable plants are those which are asexually

Digitized by Google

reproduced—distinct and new varieties of plants other than tuber-propagated plants. The term and fees for plant patents are the same as for patents on inventions. Plant patents are numbered separately from the other patents. The number of the first plant patent issued in 1958 is 1,672.

W 76. Patents issued to residents of foreign countries, 1836–1957.

Source: Patent Office, *Annual Report of the Commissioner of Patents*, and records.

The volume of patents issued to citizens of foreign countries was influenced in the early years of the patent system by discriminatory legislation. For 1800–1836, only aliens who had resided in the United States for 2 years and who had declared their intention of becoming citizens could apply for U.S. patents. For 1836–1861, aliens paid higher fees than citizens on a theory of reciprocity. Discrimination based on nationality was eliminated in 1861.

This series is based on residence and not on citizenship. It includes patents on inventions, designs, and botanical plants. Separate statistics on components are not available except for a few recent years. For 7 recent years (1951–1957), design patents constituted 1.85 percent of patents issued to foreign residents, and plant patents were 0.23 percent. Looked at in another manner, foreign residents received 12.59 percent of invention patents, 3.28 percent of design patents, and 12.52 percent of the plant patents.

W 77–78. Trademarks registered and renewed, 1870–1957.

Source: Patent Office, *Annual Report of the Commissioner of Patents*, and records.

A trademark is a symbol—a picture, word, or phrase—applied by a manufacturer or merchant to distinguish his goods from those of others. Trademark rights are acquired by adoption of a mark and use of it on the goods in trade. The Federal law provides for the registration in the Patent Office of such marks which are used in interstate and foreign commerce. Applications for registration are examined and registration may be refused if the mark is of a character-prohibited registration (national emblems, deceptive marks, purely descriptive marks, etc.) or if it conflicts with a prior registered mark. Federal registration does not create ownership, but only gives additional advantages to the owner. See Department of Commerce, *General Information Concerning Trademarks*, 1958 (revised periodically), for an outline of the requirements for registering a trademark.

The first Federal trademark law, that of 1870, was based on the patent and copyright clause of the Constitution instead of the interstate and foreign commerce clause, and was held unconstitutional in 1879. The Trademark Act of 1881 was limited to marks used in foreign commerce. The Act of 1905 included marks used in interstate commerce as well. An Act of 1920 permitted registration of a secondary class of marks not previously registrable. A completely new Act, which came into effect in 1947, provided for a Principal Register on which marks of the type registrable under the Acts of 1881 and 1905 could be registered, and a Supplemental Register on which marks of the type registrable under the Act of 1920 could be registered. Registrations are for a term of 20 years, with renewal possible for successive 20-year terms, except for those trademarks registered on the Supplemental Register which generally are not renewable. Registrations under the Act of 1881 were for an initial term of 30 years but were made renewable for an additional term of 20 years.

RESEARCH AND DEVELOPMENT (Series W 79–121)

W 79–121. General note.

Historical statistics on research and development expenditures and employment by various groups in the major sectors of the economy are of comparatively recent origin. Public interest in representing the input of research and development activity in terms of some widely used measure, such as funds expended or personnel employed, has been largely incidental to concern with major national issues. During the depression years of the 1930's this interest stemmed from the role that research played in the recovery of the economy. Groups such as the National Research Project of the Work Projects Administration (formerly the Works Progress Administration) and the National Resources Planning Board engaged in studies of the interrelationships among trends in research and development, technological change, unemployment, education, and other major economic and social factors. Their interest in measuring research and development was generally subsidiary to a larger preoccupation with such broad national issues as economic recovery, reemployment, and national planning. The research and development estimates which they published were intended to serve primarily as illustrative background materials.

The period of World War II and its aftermath dramatized the critical place of research and development in the Nation's military security program. Groups concerned with measuring research and development during this period included the Committee on Science and Public Welfare (Bowman Committee), the President's Scientific Research Board, and the Research and Development Board of the Department of Defense. Like the earlier groups, these organizations supplemented fragmentary data already on hand with special inquiries and analyses in order to develop background estimates on research and development trends.

More recent years have seen the recognition of scientific research and development both as a permanent component of a successful defense policy and as an essential element in peacetime economic growth and cultural achievement.

The National Science Foundation, a Federal agency established in 1950, undertook as one of its functions the development of such factual data and related analyses on research and development. As a first step, the Foundation initiated an annual survey of Federal funds for research and development, starting with data on funds for scientific research and development at nonprofit institutions for fiscal 1951 and 1952 and moving thereafter to annual surveys of the funds comprising the "Federal Research and Development Budget."

In 1954, the National Science Foundation undertook the first effort to measure the volume of research and development activity across the board, in terms of funds and personnel, through surveys of all major types of organizations in the several sectors of the economy which were known to be performing or financing this activity. Out of this effort grew a continuing Foundation program of surveys designed to facilitate preparation of annual estimates on funds and personnel employed in research and development by the major sectors of the economy.

Because the early inquiries concerning trends in research and development were sporadic and because many aspects of this subject are complex and abstract, there was no determined effort to develop a set of generally accepted concepts, definitions, and terms useful for statistical surveys. In particular, a clear distinction was slow to develop between expenditures for the financing or support of research and development and expenditures for the conduct or performance of research and development. Some exploration of concepts and definitions was undertaken by such groups as the National Resources Committee in 1938–1940 and the Subcommittee on War Mobilization of the Senate Committee on Military Affairs (Kilgore Committee) in 1945, but when the National Science Foundation undertook its first surveys, there was no general agreement on such fundamental matters as the definition of research and development; the distinction between the conduct of research and development and such related activities as academic instruction or industrial production; the distinction between basic and applied research and development; and the major characteristics distinguishing various types of research organizations. A broad review of the entire problem of defining research and development was therefore made a part of the Foundation's survey program.

National estimates for 1953–54—1957–58. National estimates of funds spent on the performance of research and development in the natural sciences by the four major sectors of the economy have thus far been made by the National Science Foundation for 1953–54 through 1957–58, with projected

Table I. Financing and Performance of Research and Development in the Natural Sciences, by Sectors: 1956–57

[In millions of dollars. Preliminary data. For accounting years coinciding with calendar 1956 or ending before mid-1957]

Source of research and development funds, by sector	Research and development performers				Total	
	Federal Government agencies	Industry	Colleges and universities	Other nonprofit institutions	Amount	Percent
Federal Government agencies	1,280	[1] 3,230	[1] 380	[1] 70	[2] 4,960	59
Industry	----	3,210	20	30	3,260	38
Colleges and universities [3]	----	----	170	----	170	2
Other nonprofit institutions [4]	----	----	30	40	70	1
Total	1,280	[1] 6,440	[1] 600	[1] 140	8,460	100
Percent	15	76	7	2	----	100

[1] Includes funds from the Federal Government for the conduct of research and development at research centers administered by organizations in this sector under contract with Federal agencies.

[2] For an explanation of the difference between the total for Federal agencies as sources of funds as shown in this table and the total obligations for conduct of research and development by Federal agencies for fiscal year 1957 in series W 95, see the concluding paragraph in the text on series W 95–106.

[3] Includes all State and local funds, received by public institutions of higher education, which were used for research and development.

[4] Includes State and local funds, received by such nonprofit institutions as museums, zoological gardens, and academies of science, which were used for research and development.

estimates for 1958–59 and 1959–60. National estimates of funds received from various sources for the performance of research and development have been made for 1953–54, 1956–57, and 1957–58. These series appear in tables 1 and 2, respectively, of the National Science Foundation publication, "Funds for Research and Development in the United States, 1953–59," *Reviews of Data on Research and Development*, No. 16, 1959.

An analysis of intersectoral flows or transfers of funds for research and development for 1956–57 appears in table I, above. This table is based on information obtained in the National Science Foundation surveys of funds for research and development in 1956–57 and appears as table 4 in *Reviews of Data on Research and Development*, No. 16.

The estimates in table I must still be regarded as preliminary since some of the underlying data are subject to change. This fact, as well as the limitations described below, indicates that table I should be considered a general approximation rather than an exact statement of the extent to which the different sectors are participating in the financing and performance of research and development.

Research and development performed by industrial firms with funds from Federal production and procurement contracts has been represented in this tabulation insofar as industry reported the expenditure of such funds for research and development. (Federal reporting of funds flowing to "profit organizations" for research and development did not include a full accounting of expenditures for research and development made under production and procurement contracts for the year represented in the table.) Detailed information on the scope and limitations of the various surveys appears in the National Science Foundation publications listed below. Generally speaking, the National Science Foundation surveys seek full enumeration of the various segments. The outstanding exceptions are industrial firms and the smaller endowed philanthropic foundations, for which sampling procedures are employed.

The data in table I are derived basically from survey responses by *performers* of research and development as to how much they spent on this activity and where their funds originated. The estimates represent final through-transfers from source organizations financing research and development to performing organizations which ultimately used the funds. Every effort was made to net out intermediate transfers. Because of the many problems of survey response, including the fact that the accounting systems of most respondents did not easily lend themselves to reporting on funds for research and development, estimates were necessary where there were gaps or conflicts in the reported data.

The wide diversity in the understanding of "research and development" has led to the use of somewhat different definitions of this term in the National Science Foundation surveys. The central idea in all the definitions regards research (both basic and applied) as a "systematic and intensive study directed toward a fuller knowledge of the subject studied" and development as "the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems, methods, or processes." For surveys covering the years 1953–54 through 1956–57, there was a significant conceptual difference between the surveys of the Federal agencies and those of the private industrial firms with respect to the point at which development was completed and production initiated. The Federal survey specifically excluded design and production engineering from development, whereas the industry survey included design and development of prototypes and processes. A somewhat wider range of activities was therefore implied by the data for industry than by the data for Federal agencies. Beginning with the Federal survey for fiscal year 1958, the Federal definition of development was revised and expanded to make it more comparable with that for the industry sector. In the case of colleges and universities and other nonprofit institutions, which employed the same definition as the Federal agencies, this difference was not significant, since these organizations supported and conducted little or no development.

The conduct of research and development refers only to current operating costs and excludes the acquisition of major capital items. Both direct and indirect costs are included and are defined in their usual sense, but it should be borne in mind that indirect cost is an item subject to wide differences in interpretation, not only from sector to sector, but also among respondents within a sector.

These estimates refer in general only to the natural sciences, defined as consisting of the physical sciences, that is, astronomy, chemistry, earth sciences, engineering, mathematics, and physics; and the life sciences, subdivided among the biological, medical, and agricultural. However, due to the difficulty of identifying them separately, some funds for research in social psychology and the social sciences are also included.

In the data for 1956–57, the government sector is represented only by agencies of the Federal Government, since data are not available on a national basis for State and local governments. However, on the basis of a special study of scientific activities in six States (see reference below), it is estimated that, aside from the State funds for research and development at the State universities and agricultural experiment stations, the total dollar amount of State funds for this purpose is not large. All State and local institutions of higher education, including agricultural experiment stations, are covered in the National Science Foundation surveys and are included with other institutions of higher education in the colleges and universities sector. The colleges and universities sector is treated as the source of those portions of university general funds which the educational institutions themselves allocated to research and development, including such general funds as were appropriated to educational institutions by State and local governments. Also attributed to the colleges and universities as a source are State and local government funds earmarked for research and development at educational institutions.

The National Science Foundation surveys include data on research and development by Federal contract research centers. These are laboratories or similar research undertakings supported wholly or predominantly by the Federal Government but operated under contract by an industrial, university, or independent organization. Data relating to the performance of research and development at these centers are included within the appropriate sector in the estimates for 1956–57.

Several groups of organizations comprise the industry sector as represented in table I. Private industrial firms account for about 95 percent of the total funds for performance of research and development in this sector. (Data for firms appear below in series W 107–121.) The remaining groups are Federal contract research centers operated by industrial concerns, independent commercial laboratories and engineering service firms trade associations, and certain other cooperative research organizations.

The colleges and universities sector consists of institutions of higher education with substantial research programs and of the Federal research centers operated under contract by educational institutions. Included in institutions of higher education are their affiliated research organizations, agricultural research

Digitized by Google

centers, graduate and professional schools, and affiliated hospitals.

Other nonprofit institutions include privately endowed philanthropic foundations, nonprofit research institutes, voluntary health agencies, academies of science, professional societies, museums, zoological gardens, and arboretums, as well as several Federal research centers operated by independent organizations.

The data on transfers of funds were based on estimates from many institutions having somewhat different understandings of costs and expenditures. The estimates for Federal agencies, moreover, were based on obligations rather than expenditures, since information on transfers to the other sectors was available only for obligations.

Because of the diversity of accounting procedures the estimates for 1956–57 are based on a number of different time periods. For example, the entire Federal agency survey and the university estimates are based on the Federal fiscal year, July 1, 1956–June 30, 1957. In the industry sector the majority of private firms reported for fiscal years which either coincided with or began shortly after the opening of the calendar year 1953.

For detailed information on research and development funds and personnel at various types of organizations for 1953 and later years, see the following publications prepared for the National Science Foundation: Bureau of Labor Statistics, *Science and Engineering in American Industry, Final Report on a 1953–54 Survey*, 1956; Bureau of Labor Statistics, *Science and Engineering in American Industry, Report on a 1956 Survey*, 1960; Battelle Memorial Institute, *Research by Cooperative Organizations, A Survey of Scientific Research by Trade Associations, Professional and Technical Societies, and Other Cooperative Groups, 1953*, Washington, D.C., 1956; Maxwell Research Center, Syracuse University, *Research and Development by Nonprofit Research Institutes and Commercial Laboratories, 1953*, Washington, D.C., 1956; F. Emerson Andrews, *Scientific Research Expenditures by the Larger Private Foundations*, Washington, D.C., 1956.

Also see the following publications prepared by the National Science Foundation: *Federal Funds for Science*, Nos. VI and VII, 1957 and 1958; *Reviews of Data on Research and Development*, Nos. 1–3, 5–10, 12, and 14–16, 1957–1959; *Research Expenditures of Foundations and Other Nonprofit Institutions, 1953–54*, 1958; *Funds for Scientific Activities in the Federal Government, Fiscal Years 1953 and 1954*, 1958; *Scientific Research in Colleges and Universities—Expenditures and Manpower, 1953–54*, 1959; *Scientific Activities in Six State Governments, Summary Report on a Survey, Fiscal Year 1954*, 1958; and *Performance and Financing of Research and Development in American Industry, 1957*, 1960.

Early major efforts to estimate the volume of research and development. The methodology, scope, and limitations of the various series are often summarized in the publications cited below, and any use of these estimates in descriptive or analytical work should be preceded by a careful review of their limitations.

George Perazich and Philip M. Field, *Industrial Research and Changing Technology*, Work Projects Administration, National Research Project, Philadelphia, 1940, pp. 5–17 and 52–79. This report presents data on research personnel in industrial laboratories for 1920, 1921, 1927, 1931, 1933, and 1938. The data are based on the six directory listings of industrial research laboratories in the United States published by the National Research Council between 1920 and 1938.

National Resources Committee (later, National Resources Planning Board), *Research, A National Resource*, vol. 1, *Relation of the Federal Government to Research*, Report of the National Resources Planning Board Science Committee, 1938. Section 3, pp. 61–112, of this report presents estimates of Federal expenditures for research in 1937 and 1938. Table D, p. 91, summarizes from other sources a number of earlier estimates of Federal expenditures going back as far as 1901. Section 6, pp. 167–193, contains a discussion of research in American universities and colleges. It also provides a general estimate of the dollar volume of expenditures for research and development for 1935–1936.

National Resources Planning Board, *Research, A National Resource*, vol. II, *Industrial Research*, a report of the National Research Council to the National Resources Planning Board, 1941. Section IV, pp. 173–187 of this report, presents estimates of research personnel in industrial laboratories for 1940; and section II, part 7, pp. 120–123, shows research personnel and expenditures in 31 firms for 1937.

U.S. Senate, Committee on Military Affairs, Subcommittee on War Mobilization (Harley M. Kilgore, Chairman), *Report on the Government's Wartime Research and Development, 1940–44*, 1945. Part I of this report presents detail, and part II summarizes data on funds for research and development for each of 45 Federal agencies and bureaus, with detail on the fiscal sources of funds and the major categories of recipients for fiscal years 1940 through 1944.

Vannevar Bush, *Science, The Endless Frontier, A Report to the President*, July 1945, appendix 3, "Report of the Committee on Science and Public Welfare" (Isaiah Bowman, Chairman). The Bowman Committee's report to Dr. Bush presents the first known national estimates of trends in scientific research and development expenditures in table I, p. 80. It also contains series on scientific research expenditures (based largely on performance of research) for the following major groups: (*a*) Industry—annual expenditures estimates for 1920-1940; (*b*) nonprofit industrial research institutes—annual expenditures estimates for 1930–1942; (*c*) Government (Federal and State)—annual estimates for 1923–1932, 1934–1938, and 1940–1944; (*d*) colleges and universities—biennial estimates, 1930, 1932, 1934, 1936, 1938, 1940, and 1942; (*e*) research institutes (not connected with any industry nor an integral part of any university)—annual estimates for 1930–1940; and (*f*) total scientific research expenditures—total of the foregoing five series for 1930, 1932, 1934, 1936, 1938, and 1940.

The President's Scientific Research Board (John R. Steelman, Chairman), *Science and Public Policy, A Report to the President*, vols. I, II, and IV, 1947. Based on data in Vannevar Bush, *Science, The Endless Frontier* (cited above), vol. I, *A Program for the Nation*, presents for the even years of 1930–1940 estimated expenditures by the Federal Government, industry, universities, and others. Estimates are also made of the average annual expenditures by major groups for 1941–1945 and of expenditures for 1947. Vol. II, *The Federal Research Program*, presents estimates of Federal "expenditures for research and development in the physical and biological sciences" in fiscal year 1947 based on project reports from the individual agencies. Vol. IV, *Manpower for Research*, presents annual estimates and forecasts of scientists and engineers in industrial research laboratories for 1929–1956.

Helen Wood, Robert Cain, and Joseph H. Schuster, *Scientific Research and Development in American Industry, A Study of Manpower and Costs*, Bulletin No. 1148,

Digitized by Google

Bureau of Labor Statistics, prepared in cooperation with the Department of Defense, 1953. Data in this publication are based on the first survey specifically designed to obtain research and development performance costs and personnel for private firms. This survey was sponsored by the Research and Development Board, Department of Defense. The report presents estimates of expenditures for research and development performed in 1951 by firms reporting. Personnel data cover research and development scientists and engineers employed by these firms in January 1951 and 1952.

Office of the Secretary of Defense, *The Growth of Scientific Research and Development*, 1953. This publication presents annual estimates on sources of research and development funds and on performance of research and development for 1941–1952 for the Federal Government, industry, and nonprofit institutions including colleges and universities. Estimates of the number of scientists and engineers employed in research and development by these broad sectors are also shown for the same years. No methodological notes accompany the estimates. They are known to be based on materials in Wood, Cain, and Schuster (cited above); U.S. Senate, Committee on Military Affairs, Subcommittee on War Mobilization (cited above); and other published and unpublished sources. The series on sources and uses of funds have been continued to 1958 in the Bureau of the Census, *Statistical Abstract of the United States*, 1959, table 696.

Office of Education, *Statistics of Higher Education: Receipts, Expenditures and Property, 1953–54*, 1957. This report presents estimates, biennially, on expenditures for performance of "Organized research" by institutions of higher education, 1930–1954. See series H 355 in this volume. This is the oldest known current series on research expenditures.

More recently, beginning with Bureau of the Budget, *The Budget of the United States Government, 1955*, the Federal budget documents have carried a special analysis of "Federal Research and Development Programs" summarizing expenditures for scientific research and development on an agency basis and by budget function. In *The Budget*, 1959, this was Special Analysis H and covered fiscal years 1957, 1958, and 1959.

W 79–94. Federal Government expenditures for scientific research and development, by agency, 1940–1957.

Source: 1940–1944, U.S. Senate, Committee on Military Affairs, Subcommittee on War Mobilization (Harley M. Kilgore, Chairman), *Report on the Government's Wartime Research and Development, 1940–1944*, parts I and II, 1945; 1945–1951, Bureau of the Budget, records; 1952–1957, National Science Foundation, *Federal Funds for Science, The Federal Research and Development Budget*, various annual issues.

The data for 1940–1944 have been adjusted by the National Science Foundation for comparability with later estimates. Funds for increase of research and development plant for this period are included in these data but are not separately identifiable.

Expenditures are here defined as the amounts of checks issued and cash payments made during a given period regardless of when the funds were appropriated. The definitions of research and development followed in the three portions of the series differed somewhat, but these differences do not impair the usefulness of the series as a general indicator of trend. The definitions used and the periods to which they apply were, respectively: 1940–1944—research and development includes all the activities from pure research to the experimental testing of new products, including all developmental work such as designing, engineering, the building and operation of pilot plants, etc.; 1945–1951—research and development consists of scientific research in the physical, mathematical, biological, medical, and engineering sciences; development of experimental models and prototypes; construction of research and development facilities and pilot plants; and experimental production; 1952–1957—scientific research is systematic and intensive study directed toward a fuller knowledge of the subject studied; and development is systematic use of that knowledge directed toward the production of useful materials, devices, systems, methods, or processes, exclusive of design and production engineering.

Routine testing activities, topographic and hydrographic surveys and mapping, collection of general purpose statistics, and routine production activities have been excluded from all portions of the series. Research in the social sciences was originally excluded from 1940–1951, but an estimate for research in those fields was added for these years by the National Science Foundation. The social sciences have been consistently included since 1952.

The major limitation of these data is that they are actually three rather than one series, each compiled at a different time and on a somewhat different basis. The first segment of the series (1940–1944) was based on a special retrospective study in which the data were examined and compiled after the period in question. Annual data for 1947–1951 were compiled by the Bureau of the Budget with interpolations for 1945 and 1946. In order to achieve as much chronological continuity as possible, the entire series has been reviewed by the National Science Foundation for consistency, and adjustments to improve comparability have been made wherever possible. The data represent estimates by informed persons, since Government accounting does not use research and development as a uniform expenditures bookkeeping category throughout all agencies and subdivisions.

A further limitation of the series is the exclusion of expenditures from Department of Defense production and procurement appropriations, which may be used by industrial firms for research and development purposes. The Department estimates that, in fiscal year 1958, $875 million was expended from these sources for engineering-type work in direct support of research and development, excluding quantity production of prototypes of weapons and equipment. It should be noted that the Department of Defense appropriation structure was revised in the Budget for 1960 to reflect a wider range of activities in the research and development appropriations. Subsequent data published later reflect this revision.

W 95–106. Federal Government obligations for scientific research and development, by agency, 1947–1957.

Source: 1947–1951, Bureau of the Budget, records; 1952–1957, see source for series W 79–94.

These series are based on budget data, and although they represent the best estimates of informed persons, some differences in the interpretation of terms and definitions have undoubtedly occurred. See also general note for series W 79–121 for other limitations.

Obligations are here defined as the amounts of orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds were appropriated, and when future payment of money is required. Conduct of research and development includes the salaries and expenses of scientists engaged in these activities and all indirect, incidental, or related costs resulting from or necessary to the conduct of such research and development, regardless of whether the work was done by a Government

Digitized by Google

agency, private individuals, or organizations under a contractual arrangement with the Government. It excludes routine testing, mapping, surveys, collections of general-purpose statistics, experimental production, and activities concerned primarily with dissemination of scientific information or the training of scientific manpower. Increase of research and development plant is a measure of funds made available for physical facilities, such as land, buildings, or equipment, where the primary intent is to enlarge the capital plant available for scientific research and development, regardless of whether the item is to be used by the Government or a private organization, and regardless of where title to the property may rest. Taken together, the conduct of research and development and increase of research and development plant are referred to as scientific research and development.

The difference in magnitude between the figure for the Federal conduct of research and development for fiscal year 1957 in this series and that presented for the Federal agencies as source in table I, p. 609, stems largely from the fact that data in table I were reported by organizations performing research and development for the Federal Government. Data in series W 95 were reported by the Federal agencies obligating the funds. In the case of the industry sector as a respondent in table I, a broader definition of research and development than the Federal definition resulted in the reporting of funds for research and development performed by industry under Federal production and procurement contracts which were not included in the Federal series W 95. This is the most significant cause of the difference.

W 107–121. Expenditures for research and development performed by private industrial firms, by major industry, 1953–1957.

Source: National Science Foundation, *Science and Engineering in American Industry, Final Report on a 1956 Survey*, 1959, and "Funds for Research and Development Performance in American Industry, 1957," *Reviews of Data on Research and Development*, No. 14, August 1959.

The report summarizing the results of the 1956 survey, conducted by the Bureau of Labor Statistics for the National Science Foundation, presents data on research and development expenditures by private firms during 1953–1956. The report for 1957, based on a survey conducted by the Bureau of the Census for the National Science Foundation, includes preliminary estimates of expenditures for 1956 and 1957. The Bureau of the Census survey reported total expenditures for research and development in 1956 approximately 4 percent lower than the comparable Bureau of Labor Statistics estimate for that year. Percentage differences for particular industries, however, were significantly larger than for the over-all total.

The differences between estimates of the Bureau of Labor Statistics and the Bureau of the Census for 1956 were due mainly to variation in methodology used by the two agencies in conducting these surveys and changes in reporting procedures by some respondents. The report on the 1956 survey, cited above, discusses in some detail the methodological differences between the two surveys.

Although Census data are not directly comparable to those of the Bureau of Labor Statistics, Census estimates for 1956 were included not only because of their comparability with 1957 estimates, but also because they mark the beginning of a series that will be continued through future annual surveys of expenditures for industrial research and development.

Research and development, as defined in these series, includes basic and applied research in the physical and life sciences (including medicine) and in engineering, and design and development of prototypes and processes. This definition excludes quality control, routine product testing, market exploration, research in the social sciences or psychology, or other nontechnological activities or technical services.

Expenditures, as defined in these series, include salaries of research and development scientists and engineers and their supporting personnel, other direct costs, service and supporting costs, plus attributable overhead expenses incurred in such items as administration, depreciation, and rent. Expenditures also include Federal funds for private industry performance of research and development ranging from about 40 percent of total expenditures in 1953 to about 50 percent in 1957. The totals exclude capital expenditures and patent expenses.

Series W 79–94. Federal Government Expenditures for Scientific Research and Development, by Agency: 1940 to 1957

[In millions of dollars. For years ending June 30. Includes expenditures for conduct of research and development and for increase of research and development plant]

chapter X

Banking and Finance

BANKING (Series X 1–265)

X 1–265. General note.

For general statistical purposes it may be said that a bank is a financial institution which accepts money from the general public for deposit in a common fund, subject to withdrawal or transfer by check on demand or on short notice, and makes loans to the general public. The historical series on assets and liabilities of banks reflect these activities and are the basic series on banking. Series X 1–128 on principal assets and liabilities of banks and on number and total assets by class of bank cover all banks and all commercial banks. Series X 129–265 provide information on selected aspects of banking: Insured banks, branch banking, suspension of banks, earnings and expenses, bank debits and clearings, savings deposits, and Federal Reserve Banks.

Collection and publication of banking and monetary statistics in the United States have been conditioned by the development of the banking and monetary system. Banks in this country have been in part under the jurisdiction of State governments and in part under the Federal Government. At the same time some banks operated before 1933 outside the jurisdiction of both governments, while other banks operated within the jurisdiction of both.

Supervision and regulation of banks have been a primary responsibility of the chartering authority. National banks, organized under Federal law enacted in 1863, are supervised by the Comptroller of the Currency, and State banks, by officials of the respective States.

Two other Federal entities with additional supervisory authority have been superimposed upon the existing banking structure: The Federal Reserve System, established in 1914 to exercise central banking functions, and the Federal Deposit Insurance Corporation, created in 1933 to insure bank deposits. The Federal Reserve System includes all national banks and such State banks as voluntarily join the System. Insurance of bank deposits was made obligatory for banks belonging to the Federal Reserve System and optional for others.

All the supervisory agencies have published some statistics for the banks under their jurisdiction, but there was no centralized collection of statistics for all classes of banks on a uniform basis until 1947. Prior to the National Banking Act of 1863, the only official collection of banking figures for the entire country was made by the Treasury Department under authority of a resolution of the House of Representatives passed in 1832. For 1833–1863, reporting by banks to the Secretary of the Treasury was voluntary. With the exception of some years, the Secretary of the Treasury included in his reports to Congress information regarding the number of State banks which reported to him. For 1863–1873, statistics of national banks only were published in the *Annual Report of the Comptroller of the Currency.*

The need for complete reporting was recognized in the act of 1873, which authorized the Comptroller to obtain balance-sheet data for nonnational banks from State banking authorities, Territorial authorities, or individual incorporated banks. Although coverage was improved, the data obtained were neither uniform nor complete because the various State and Territorial authorities did not request the same information from banks and some States had no department to collect the information. Moreover, in some States many so-called private or unincorporated banks operated outside the jurisdiction of State authority. The Comptroller annually requested that these banks report directly to him, but this procedure met with only limited success.

In spite of the difficulties of collecting statistics for all banks, the coverage and uniformity of the data became progressively better. This improvement came about principally because of greater uniformity in classification of balance-sheet information requested of banks, and because of the creation of banking departments in States that formerly had none, as well as more adequate collection and tabulation of data.

Efforts to promote uniformity in bank statistics culminated in 1938 when representatives of all Federal supervisory agencies worked out a standardized balance-sheet report form. This form was approved by the National Association of State Bank Supervisors and was adopted by the three Federal banking agencies and by many of the State banking departments. Nearly all States now use a form that is substantially consistent with the standard one.

In 1947, the Comptroller of the Currency, the Board of Governors of the Federal Reserve System, and the Federal Deposit Insurance Corporation, which compiled somewhat different balance-sheet data for all banks, worked out an arrangement for the Federal Deposit Insurance Corporation to compile semiannually a uniform series of statistics for all banking institutions.

To provide more adequate historical banking statistics comparable to those available beginning in 1947, the Board of Governors of the Federal Reserve System—with the cooperation of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the State bank supervisory authorities—recently compiled a revised series for all banks in continental United States as of June 30 of each year, 1896–1955. These data were published in 1959 in Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955.* The series cover number of banks and principal assets and liabilities for major classes of banks. The publication also includes similar data for individual States, and for the Territories and possessions, which are not included in U.S. totals. Revisions in the earlier data affect primarily the nonnational components, and are largest for figures before 1920.

Compilation of the revised series for national banks presented no major problems. Since 1864, the Comptroller of the Currency has collected condition reports from 3 to 6 times annually from national banks, and has tabulated and published summaries of these reports showing principal assets and liabilities. National bank balance-sheet data are published in detail in *Abstract of Reports of Condition of National Banks* (usually 3 or 4 times a year) and in summary form in the *Annual Report.*

Digitized by Google

Compilation of revised statistics for nonnational banks beginning in 1896 required extensive research into all types of available banking statistics. The main sources of information, other than the records of several large private banks, were the annual reports and statistical publications and records of the Comptroller of the Currency, the Bureau of Internal Revenue, the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and State banking departments, as well as compilations published in bankers' directories. Unofficial compilations of figures for banks in several States were also used.

Under the arrangements made for all-bank data beginning with 1947, the 1947–1955 data in Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955*, are based on compilations of the Federal Deposit Insurance Corporation, except that data for "other areas," that is, the Territories and possessions, have not been included in U.S. totals.

A financial institution is considered a bank in the revised all-bank series if it accepts deposits from the general public or if it conducts principally a fiduciary business. This is the definition used by the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Board of Governors of the Federal Reserve System in the all-bank statistics published beginning with 1947. For complete description of the types of institutions included and of those excluded, see Federal Deposit Insurance Corporation, *Annual Report, 1956*, pp. 88–89.

X 1–96. General note.

Assets and liabilities are defined here in their usual accounting meaning. Assets are the resources of banks, such as loans, investments, reserves, cash, and balances with other banks; liabilities are the obligations of banks, such as demand and time deposits and capital accounts.

X 1–5. State banks—number of banks and assets and liabilities, 1811–1830.

Source: *Writings of Albert Gallatin*, edited by Henry Adams, J. B. Lippincott and Company, Philadelphia, 1879, vol. III, pp. 286, 291, and 296.

These are believed to be the most consistent series for the period before 1834. The figures are reprinted in Comptroller of the Currency, *Annual Report, 1876*, p. xl, which also contains estimates derived from an unofficial source of the number of banks, specie holdings, banknote circulation, and capital of banks in the United States for selected years 1774–1804, and some discussion of early banking statistics. Figures in the Comptroller's report for 1876, together with some additional banking data for the period prior to 1834, are included in Comptroller of the Currency, *Annual Report, 1920*, vol. 2, p. 846.

X 6–19. Second Bank of the United States—assets, liabilities, and profits, 1817–1840.

Source: Series X 6–17, Comptroller of the Currency, *Annual Report, 1876*, app. p. lxxxiii (except series X 17 for 1818–1837, *Annual Report, 1916*, p. 912); series X 18–19, Ralph C. H. Catterall, *The Second Bank of the United States*, University of Chicago Press, Chicago, 1903, p. 504.

The Second Bank was chartered by Congress in 1816 for 20 years. Renewal of the charter was denied and reorganization of the bank was effected by the Legislature of the State of Pennsylvania. The bank failed in 1841 and was finally liquidated in 1856. See headnote, table 94, p. 912, Comptroller of the Currency, *Annual Report, 1916*, vol. II; that page also shows assets and liabilities of the First Bank of the United States in 1809 and 1811, the only two years for which data appear to be available.

X 20–41. All banks—number of banks and principal assets and liabilities, 1834–1957.

Source: 1834–1896, Comptroller of the Currency, *Annual Report, 1931*, pp. 1018–1025; 1896–1955, Board of Governors of the Federal Reserve System, *All-Bank Statistics, United States, 1896–1955*, pt. I, pp. 30–33; 1956–1957, Federal Deposit Insurance Corporation, records.

These series represent a combination of data on two different bases: For 1896–1957, on the revised all-bank series basis and for 1834–1896, on the basis published in annual reports of the Comptroller of the Currency, which is known to provide incomplete coverage, especially of nonnational banks.

The historical tables in the 1931 *Annual Report of the Comptroller of the Currency* provide summary statistics by single years beginning in 1834 for (*a*) all reporting banks, (*b*) national banks (beginning in 1863), and (*c*) all reporting State and private banks (that is, nonnational banks). For nonnational bank data prior to 1873 the sources are as follows: For 1834–1840, Executive Document No. 111, 26th Congress, 2d Session; for 1841–1850, Executive Document No. 68, 31st Congress, 1st session. For 1851–1863 (except 1852–1853), figures are from the report on the condition of banks for 1863. Those for 1853 are from Executive Document No. 66, 32d Congress, 2d session, and are incomplete. For 1852, the figures are estimates based on number of banks in 5 years, 1847–1851, and on assets and liabilities in 10 years, 1854–1863. For 1864–1872, all figures except number of banks and capital accounts are estimates based on data for the previous 10 years, 1854–1863.

Prior to 1896, figures shown here include all national banks and all State banks that voluntarily reported to State banking departments in the United States including mutual and stock savings banks, loan and trust companies, and private banks. A few banks in U.S. possessions are included. Data for nonnational banks for the earlier years are reported for dates other than June 30 and are known to be incomplete; many of the items have been estimated, as noted above. Where more reliable estimates prior to 1896 are available, they are included in alternate series X 86–90.

Beginning in 1896, more comprehensive data for nonnational banks than those included in the Comptroller's annual reports are available in *All-Bank Statistics, 1896–1955*, cited above. More detailed data than are shown here, by States and by class of banks, are available in this source, together with a description of the composition of the balance-sheet items, the methods by which the figures were compiled, and the classification of banks used.

The figures beginning in 1896 include national banks and chartered or incorporated State banks, loan and trust companies, stock savings banks, and mutual savings banks. In conformity with the definition of a bank adopted in 1947, they also include unincorporated financial institutions which meet the definition of "bank"; cooperative exchanges in Arkansas which receive deposits; cash depositories in South Carolina; and Morris Plan and industrial banks (unless engaged merely in making loans and investments). In 1933 and 1934 only licensed banks, that is, those operating on an unrestricted basis, are included.

X 25–28, investments. For the national bank component, 1863–1865, total investments exclude securities other than those of the U.S. Government, which are included in "other assets" in the source. U.S. Government obligations (series X 26) include all direct obligations and, since 1933, those fully

Digitized by Google

guaranteed as to interest and principal by the U.S. Government. Obligations of States and political subdivisions (series X 27) include securities issued by States, counties, and municipalities; by school, irrigation, drainage, and reclamation districts; and by local housing authorities. Other securities (series X 28) include primarily obligations of domestic corporations, those of Government agencies not guaranteed by the United States, and foreign securities.

X 34–38, deposits. Total deposits for national banks for 1863–1865 include State banknotes in circulation and for 1866–1868, bills payable and rediscounts. Beginning 1942, deposit figures exclude reciprocal balances.

X 39, banknotes. Prior to 1864, figures represent State banknotes only and beginning 1896, national banknotes only. In 1865, a prohibitive tax was imposed on State banknotes and as a result only a few such notes were in circulation thereafter. Data for 1870–1910 exclude comparatively small amounts of State banknotes outstanding for which national banks, converted from State banks or merged with State banks, assumed liability.

X 40, capital accounts. Capital accounts include capital, surplus, net undivided profits, reserves for contingencies, and certain other reserve accounts. Capital is here used to designate primarily the original contribution of bank owners to the bank and is ordinarily evidenced by bank stock certificates. Surplus is ordinarily the amount of bank earnings specifically set aside as capital funds. Net undivided profits are earnings not yet set aside for dividends or allocated to surplus. In addition to reserves for contingencies, capital accounts include reserves for undeclared dividends and for accrued interest on capital notes and debentures as well as reserves for retirement of preferred stock or capital notes and debentures. Valuation reserves set up in connection with prospective but undetermined losses on loans, securities, and other assets *are not included* but are deducted from these assets. Prior to 1873, figures for nonnational banks include capital only, and beginning 1933, the figures include preferred stock and capital notes and debentures.

X 42–63. National banks—number of banks and principal assets and liabilities, 1863–1957.

Source: See source for series X 20–41.

See also general note for series X 1–265.

National banks are those chartered by the Federal Government and are under the general supervision of the Comptroller of the Currency.

X 64–85. Nonnational banks—number of banks and principal assets and liabilities, 1863–1957.

Source: See source for series X 20–41.

Nonnational banks comprised all banks prior to 1863 (see general note for series X 1–265). These banks include State commercial banks, mutual and stock savings banks, private banks, loan and trust companies, and other institutions enumerated in the text for series X 20–41. For comment on incompleteness of nonnational bank data prior to 1896, see text for series X 20–41.

X 86–90. Nonnational banks—number of banks and selected assets and liabilities, alternate series, 1865–1896.

Source: **Series X 86–88**, 1875–1882, Comptroller of the Currency, *Annual Report, 1885*, pp. clxix–clxxiii (discussion of figures, p. lxviii). **Series X 88**, 1865–1866, Federal Deposit Insurance Corporation, *Annual Report, 1934*, pp. 103, 112–113; 1867–1876, James K. Kindahl, *Estimates of Nonnational Bank Deposits for the United States, 1867–1875*, unpublished doctoral dissertation on file at University of Chicago, 1954, and Federal Deposit Insurance Corporation, *Annual Report, 1934*, pp. 112–113. **Series X 89–90**, David I. Fand, *Banks in the Post-Civil War Period in the United States, 1875–1896*, unpublished doctoral dissertation on file at University of Chicago.

Data for all nonnational banks were compiled from tax returns submitted by banks during this period. Figures for capital accounts and total deposits (series X 87–88) are based on information included on semiannual tax returns and are monthly averages for 6 months ending May 31, 1876–1882, and for 6 months ending November 30, 1875.

The figures shown for total deposits (series X 88) for 1865–1876 are the sum of separate estimates for deposits of nonnational commercial banks and mutual savings banks. The methods of estimation are described in the sources cited above. The original source figures for commercial banks were adjusted for nonreporting banks but not for underreporting by banks.

X 89–90, adjusted deposits and vault cash. Adjusted deposits as used here are total deposits (with original source figures adjusted for nonreporting banks and for underreporting by banks) less cash items in process of collection. Data are as of August, 1875–1881, and June, 1882–1896. In the source volume, figures for nonnational commercial banks are shown separately from mutual savings banks.

X 91–96. Nonnational banks—number of banks and total assets, by class, 1875–1957.

Source: 1875–1896, Comptroller of the Currency, *Annual Report*, various issues; 1896–1955, see source for series X 20–41, pts. I and II; 1956–1957, see source for series X 20–41.

These series are a breakdown of number and total assets of nonnational banks shown in series X 64–65.

See also sources and text for series X 20–41.

State commercial banks are all banks other than national and mutual savings banks. The classification of banks as "commercial" is based on function or type of deposit business. Commercial banks are those banks the business of which includes the holding of checking accounts and other deposits subject to withdrawal on demand, and the making of short-term self-liquidating loans to commerce, agriculture, and industry. Mutual savings banks, on the other hand, carry only savings and other time deposits (with some unimportant exceptions) and they invest their funds mostly in mortgage loans and securities. While the distinction between mutual savings and commercial banks is not strictly functional, since the great majority of commercial banks also carry varying proportions of savings and time deposits, it serves to segregate from banks holding demand deposits the group of banks that hold a large amount of deposits which represent principally savings. See series X 97–118 for balance-sheet data for all commercial banks, that is, national and State commercial banks combined.

Private banks are unincorporated institutions that operate ordinarily without a charter from either State or Federal Government. The number and relative importance of these banks has declined over the past half century.

The differences for 1896 in the data compiled by the Federal Reserve Board and by the Comptroller of the Currency indicate the incompleteness of early compilations of banking data, particularly in the case of private banks. Balance-sheet data are available in the Comptroller's annual reports for those banks submitting information to that agency. For separate figures for number and deposits of mutual savings banks, 1865–1896, see Federal Deposit Insurance Corporation, *Annual Report, 1934*, pp. 112–113.

In the source volume for 1896–1955, principal assets and liabilities are available separately for State commercial and mutual savings banks, by States, and for private banks in 18

Digitized by Google

States; in the remaining States, private banks were not segregated from other banks.

X 97-128. General note.

The following quotation concerning the role of commercial banks in the economy is taken from Board of Governors of the Federal Reserve System, *Banking Studies*, 1941, p. 169:

> Commercial banks are part of the economic organization of the nation. They operate as business concerns and earn a living by rendering services to the public. By lending and investing money, they assist productive processes; by providing checking account services they facilitate and expedite the settlement of financial obligations. There are numerous other banking services, but most of them are related to the primary banking functions of making loans and investments and handling deposits. All these services and operations have to do with money, which may be viewed as the stock in trade of banks.

For further comment on commercial banks and the reason for their separate classification, see text for series X 91-96. See also text for series X 20-41 and general note for series X 1-265. The data presented in series X 97-128 are for continental United States.

X 97-118. All commercial banks—number of banks and principal assets and liabilities, 1896-1957.

Source: 1896-1955, see source for series X 20-41, pt. I, pp. 34-37; 1956-1957, see source for series X 20-41.

X 119-128. All commercial banks—number of banks and total assets, by Federal Reserve membership and class, 1896-1957.

Source: Series X 119-120 and series X 125-126, see source for series X 20-41; series X 121-122, Board of Governors of the Federal Reserve System, *Member Bank Call Report*, various issues (with adjustments to bring these data into conformity with the revised all-bank series); series X 123-124, derived by deducting from the totals for all commercial banks (series X 97-98) the figures for all member banks (series X 119-122); series X 127-128, are all commercial banks (series X 97-98) less national banks (series X 42-43).

State member commercial banks are those banks chartered by the various States which have voluntarily requested membership in the Federal Reserve System and met the necessary requirements. Nonmember commercial banks are all other State-chartered banks (other than mutual savings banks). See general note for series X 1-265 and text for series X 20-41 and series X 91-96.

X 129-154. General note.

The Federal Deposit Insurance Corporation was created in June 1933 to pay depositors of failed banks the amount of their insured deposits. All national banks and all other member banks of the Federal Reserve System are required by law to be members of the Federal Deposit Insurance Corporation. Banks that are not members of the Federal Reserve System may be admitted to Federal deposit insurance upon meeting certain prescribed conditions.

X 129-142. All banks—number of banks and total assets, by deposit insurance status and class, 1934-1957.

Source: 1934-1955, Board of Governors of the Federal Reserve System, records (data compiled in connection with *All-Bank Statistics, United States, 1896-1955*); 1956-1957, Federal Deposit Insurance Corporation, records.

See general note for series X 1-265 and text for series X 20-41.

Detailed statistics on assets and liabilities and earnings, expenses, and dividends of insured banks by class are available in Federal Deposit Insurance Corporation, *Annual Report*.

X 143-151. Number of banking offices, by deposit insurance status, 1900-1957.

Source: 1900-1941, Board of Governors of the Federal Reserve System, *Monetary Policy and the Management of the Public Debt*, Joint Committee on the Economic Report, 82d Congress, 2d session, pt. I, p. 553; 1942-1957, Federal Deposit Insurance Corporation, *Annual Report*, various issues.

Additional statistics on the number of banking offices are included in Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin* and *Annual Report*, and in Federal Deposit Insurance Corporation, *Annual Report*.

The figures for 1900-1932 comprise national and all State-chartered banks except (*a*) mutual savings banks (data for which are not available until 1933) and (*b*) unincorporated or private banks not reporting to State banking authorities, other than certain large private banks which began to report to State banking authorities in 1934 and for which data are extended back to 1928. Separate data for State member banks are not available until 1933 (see text for series X 155-164). Beginning in 1942, the figures include banking facilities at military and other Government establishments. See series X 164. See also text for series X 20-41 and X 155-164.

X 152-154. Proportion of total bank deposits insured by the Federal Deposit Insurance Corporation, 1934-1957.

Source: 1934-1955, series X 152, the sum of figures in series X 34 and deposits of banks in U.S. Territories and possessions, shown in Federal Deposit Insurance Corporation, *Assets, Liabilities, and Capital Accounts, Commercial and Mutual Savings Banks*, various issues; series X 153, Federal Deposit Insurance Corporation, *Annual Report, 1955*, p. 16; 1956-1957, series X 152 and X 153, FDIC, *Annual Report*, 1956 and 1957, and records; series X 154, FDIC computations (ratio of insured deposits to total deposits).

The Federal Deposit Insurance Corporation insured deposits in each account up to a maximum of $5,000 from 1934 to September 1950, and thereafter to a maximum of $10,000. Series X 153 shows the estimated portion of total deposits in all banks which was insured by the Corporation in each year.

X 155-164. Branch banking, 1900-1957.

Source: Number of banks and loans and investments or deposits, 1900-1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 297, 311 (for data on private and mutual savings banks, see also annual tables in the *Federal Reserve Bulletin*); number of branches, 1900-1951, see first source cited for series X 143-151, pt. I, p. 555; all series for all other years, *Federal Reserve Bulletin*, April, May, June, or July issues.

The figures for number of branches represent some revisions of data previously published in *Banking and Monetary Statistics*. Detailed statistics on branch banking by States, by class of bank, and by location of branches relative to the head office, for selected years since 1900, are available in the sources indicated.

Branch banking is defined as a type of multiple-office banking under which a bank as a single legal entity operates more than one banking office. If a bank operates a single branch office, irrespective of size or functions, other than a "facility" as defined below, it is included here.

The statistics on branches include all branches or additional offices in continental U.S. within the meaning of section 5155, United States Revised Statutes, which defines a branch as "any branch bank, branch office, branch agency, additional office, or any branch place of business . . . at which deposits are received, or checks paid, or money lent." Branch figures, however, do not include banking facilities at military and other Government establishments, which began in 1942 through

Digitized by Google

arrangements made by the Treasury Department with banks designated as depositaries and financial agents of the Government. The number of such facilities is shown separately in series X 164.

Branch banking is not to be confused with group and chain banking. Group and chain banking refers to types of multiple-office banking which differ from branch banking principally in legal form and type of control. For data on group and chain banking, see sources cited above.

For mutual savings banks, data are not available for banks operating branches and number of branches until 1933; deposits are available only for the years indicated. Branches of unincorporated (private) banks not reporting to State banking authorities are not included prior to 1934. Separate data for State member and nonmember banks of the Federal Reserve System are available only for the years shown.

Wherever available, figures on loans and investments or deposits of banks operating branches are shown. These figures include the combined deposits or loans and investments of banks and their branches. For 1900–1936, the figures present loans and investments; for 1937–1941 and 1949, they are deposits, except as noted.

X 165–179. Bank suspensions—number and deposits of suspended banks, 1864–1933.

Source: Series X 165 and X 172, summation of series X 166–169 and X 173–176. Series X 166–178 (except X 169 and X 176 for 1864–1920) 1864–1891, see first source cited for series X 20–41, p. 1040; 1892–1933, see first source cited for series X 155–164, pp. 283 and 292. Series X 169 and X 176, 1864–1920, Federal Deposit Insurance Corporation, *Annual Report, 1934*, pp. 112–113. Series X 179, FDIC, *Annual Report, 1940*, p. 66.

More detailed statistics for 1921–1941 are available in *Banking and Monetary Statistics*, including the number and deposits of suspended banks, by States and by class of bank, and in the *Federal Reserve Bulletin* for September 1937, pp. 866–910, and December 1937, pp. 1204–1224. The annual reports of the Comptroller of the Currency contain considerable material relating to national banks placed in receivership and losses sustained by depositors and stockholders of national banks.

Comprehensive and dependable statistics on bank suspensions are available only for comparatively recent years, that is, beginning with 1921. Prior to 1921, the figures are useful principally in showing the periods of abnormal banking mortality. Statistics for State banks prior to 1892 are fragmentary and incomplete. While figures for 1892–1920 are believed to be somewhat more reliable than for earlier years, they are not strictly comparable with the figures shown for 1921–1933.

Beginning with 1921, detailed data on the number and deposits of suspended banks were compiled from original reports on bank suspensions. The term "bank suspension" has been defined to comprise all banks closed to the public, either temporarily or permanently, by supervisory authorities or by the banks' boards of directors on account of financial difficulties, whether on a so-called moratorium basis or otherwise, unless the closing was under a special banking holiday declared by civil authorities. In the latter case, if the bank remained closed only during such holiday, it was not counted as a suspension. Banks which, without actually closing, merged with other banks or obtained agreements with depositors to waive or to defer withdrawal of a portion of their deposits likewise were not counted as suspended.

The figures for number of suspended banks for 1933 are not wholly comparable with those for other years. It was difficult in that year to determine the status of some banks because of the changes brought about by the State and national banking holidays and the subsequent reorganization of the banking system. The 1933 figures comprise banks suspended before the banking holiday, licensed banks suspended or placed on a restricted basis following the banking holiday, unlicensed banks placed in liquidation or receivership, and all other unlicensed banks which were not granted licenses to reopen by June 30, 1933. This date was selected because by that time supervisory authorities had completed their examination of practically all the banks not granted licenses immediately following the banking holiday, and had authorized the reopening of banks that could qualify for licenses. Since 1933, suspensions of insured banks have been handled by the Federal Deposit Insurance Corporation.

Deposits for suspended banks are as of the date of suspension for member banks of the Federal Reserve System and for nonmember banks, as of the date of suspension or latest available call date prior thereto, with the exception of unlicensed banks included for 1933. Deposits of unlicensed banks included in suspensions for 1933 are (*a*) for national banks, as of the date of conservatorship; (*b*) for State member banks, as of June 30, 1933, or the nearest call date prior to liquidation or receivership; and (*c*) for nonmember banks, the latest figures available at the time the banks were reported as having been placed in liquidation or receivership, or (for those which later reopened) as of the date license was granted to reopen.

Methods used in deriving the figures for losses borne by depositors (series X 179) for the periods 1865–1880, 1881–1900, and 1901–1920, are described in Federal Deposit Insurance Corporation, *Annual Report, 1940*, pp. 61–73.

X 180–191. Banks closed because of financial difficulties, 1934–1957.

Source: Federal Deposit Insurance Corporation, *Annual Report, 1957*, pp. 146, 150, and records.

The Federal Deposit Insurance Corporation has used two procedures in fulfilling its responsibility to protect bank depositors from loss. It has paid depositors of insured banks placed in receivership up to the maximum limit prescribed by law and it has made loans to, or purchased assets of, financially distressed banks, thereby facilitating assumption of their deposits by another insured bank. The assumption of deposits by another bank enables business to continue with little or no deviation from normal routine, whereas a receivership may disrupt the economic life of the community.

Deposit figures at date of closing are adjusted to reflect subsequent corrections. In the case of banks placed in receivership, deposits at date of closing may be changed to include deposits discovered or reclassified after that date.

Data for losses to depositors in noninsured banks are not available.

X 192–215. General note.

The earliest available bank earnings data on a nationwide basis are those for national banks beginning in 1869. National banks were required to make earnings reports for the years 1869–1871 whenever dividends were declared; for 1872–1916, at least semiannually whether dividends were declared or not declared; and beginning with 1917, for the periods ending in June and December. At first the report form included only cash dividends declared, net profits, and a few related items, but it became progressively more detailed and more comprehensive. Beginning with 1917 a breakdown as to the sources and disposition of earnings has been required.

X 192–199. National banks—earnings and expenses, 1869–1957.

Source: 1869–1941, see first source cited for series X 155–164, pp. 260–261; 1942–1957, Comptroller of the Currency, *Annual Report, 1943*, pp. 30–31; *1946*, pp. 98–99; *1949*,

pp. 100–102; *1952*, pp. 124–126; *1955*, pp. 150–152; *1958*, pp. 147–149.

More detailed data are available for 1919–1941 for all Federal Reserve member banks (national and State member banks combined) in *Banking and Monetary Statistics*, pp. 262–265, and thereafter in various issues of the *Federal Reserve Bulletin*. For example, earnings and expenses are available by type; recoveries and profits, losses and charge-offs, and transfers to and from valuation reserves (beginning in 1948) are shown by character of asset. Data are also available for banks grouped by Federal Reserve District, State, class of bank, and size of bank. Various earnings ratios are available for part of the period.

The figures for gross and net current earnings before 1927 include profits on securities sold; such profits during the second half of 1926, when first reported separately, were $17,388,000. The figures for gross and net earnings up to and including the fiscal year ending June 1919 also include recoveries on charged-off assets; such recoveries in the fiscal year ending June 30, 1919, were $21,066,000. Beginning in 1927 and 1919, respectively, these items are included in series X 196, which is the excess of total losses, charge-offs (including depreciation), and transfers to reserve accounts over total recoveries, profits, and transfers from reserve accounts, or vice versa.

X 200–215. Insured commercial banks—earnings and expenses, 1934–1957.

Source: 1934–1941, Federal Deposit Insurance Corporation, *Annual Report, 1941*, pp. 158–159 (except ratio of net profits to capital accounts which are from FDIC records); 1942–1957, *Annual Report, 1950*, pp. 250–251; *1955*, pp. 134–135; *1957*, pp. 118–120.

For a definition of commercial banks, see general note for series X 1–265 and especially text for series X 91–96 and X 97–118.

More detailed data than are shown here are available in the source. See description of additional data available for national and other Federal Reserve member banks in the text for series X 192–199.

Reports of earnings, expenses, and dividends are submitted to the Federal supervisory agencies on either a cash or an accrual basis. For national banks and for State banks in the District of Columbia, not members of the Federal Reserve System, the data are collected by the Comptroller of the Currency; for State bank members of the Federal Reserve System, by the Board of Governors of the Federal Reserve System; for other insured banks, by the Federal Deposit Insurance Corporation.

Earnings data are included for all insured banks operating at the end of the respective years, unless indicated otherwise. Appropriate adjustments have been made for banks in operation during part of the year but not at the end of the year.

Series X 211 is the excess of total losses, charge-offs, and transfers to reserve accounts over total recoveries, profits, and transfers from reserve accounts, or vice versa.

X 216–255. General note.

Deposits in commercial banks are the major portion of the current means of payment. The extent to which such deposits are used is measured by statistics of bank debits. In conjunction with deposit figures, debits figures are a means of determining the rate of turnover of deposits in commercial banks. While these two measurements throw light upon current economic developments, the data must be used with care to measure changes in business conditions. Since factors not related to business activity may affect debits and deposits, these data reflect changes in general business conditions only in a broad way.

X 216–219. Bank debits to deposit accounts, except interbank accounts, at reporting centers, 1919–1952.

Source: 1919–1941, see first source cited for series X 155–164, pp. 234–237; 1942–1952, *Federal Reserve Bulletin*, June 1946, p. 630; June 1951, p. 665; and June 1953, p. 612.

Data for individual reporting centers, by months, for 1919–1941, are available in *Banking and Monetary Statistics;* for 1942–1952, they are available upon request from the Board of Governors of the Federal Reserve System.

Figures represent debits or charges on books of reporting member and nonmember commercial banks to deposit accounts of individuals, partnerships, and corporations, the U.S. Government, and State, county, and municipal governments, including debits to time and savings accounts, payments from trust funds on deposit in the banking department, and payments of certificates of deposit. Debits to accounts of other banks or in settlement of clearinghouse balances, payment of certified and officers' checks, charges to expense and miscellaneous accounts, corrections, and similar charges are not included. For a more detailed description of the data, see *Banking and Monetary Statistics*, pp. 230–233, and George Garvy, *Development of Bank Debits and Clearings and Their Use in Economic Analysis*, published in 1952 by the Board of Governors of the Federal Reserve System, especially chap. III, pp. 27–48.

Satisfactory figures are available for New York City and 140 other reporting centers, but the number of other reporting centers, and consequently the total number of all reporting centers, increased substantially for 1919–1952. (For details, see *Banking and Monetary Statistics*, p. 231, and *Federal Reserve Bulletin*, May 1952, p. 514.)

Beginning with March 1953, the Board of Governors of the Federal Reserve System has published a revised monthly bank debits series comprising only debits to demand deposit accounts of individuals, partnerships, and corporations, and of States and political subdivisions. This series, which classifies reporting centers into 3 groups—New York City, 6 other centers, and 338 centers—is a better measure of the activity of checking accounts than the discontinued series presented here. Monthly data on debits and annual turnover for the period beginning in 1943 are available in the *Federal Reserve Bulletin*, including a seasonally adjusted series for turnover.

X 220–225. Bank debits and deposit turnover, at all commercial banks, 1919–1941.

Source: See first source cited for series X 155–164, p. 254.

For a definition of debits, see text for series X 216–219. The annual rate of turnover of deposits is obtained by dividing the total volume of debits for a year by the average amount of deposits during the same period. Figures shown here are in part estimated; for a description of these series, see source, p. 232.

X 226–229. Bank clearings at principal cities, 1854–1956.

Source: 1854–1881, Comptroller of the Currency, *Annual Report, 1920*, vol. 2, p. 849; 1882–1955 (except as noted below for series X 229), Department of Commerce, *Statistical Abstract of the United States, 1957*, p. 268; *1947*, p. 444; *1951*, p. 384; *1954*, p. 447; *1956*, p. 429. Series X 229, 1920–1936, *Statistical Abstract, 1938*, p. 275; 1956, *Commercial and Financial Chronicle*, New York, January 14, 1957.

The Comptroller of the Currency, *Annual Report, 1920*, vol. 2, p. 849, gives for New York the number of banks, capital, clearings, balances, average daily clearings, and average daily balances, for years ending September 30, 1854–1920.

Digitized by Google

For 1882–1919, figures are for all cities reporting to New York Clearing House Association and cover years ending September 30. Beginning 1920, all figures are for calendar years. For 1920–1935, series X 228 is for 146 identical cities. The comparability of figures over the years is affected by (*a*) changes in the number of cities reporting and (*b*) the tendency toward consolidation of banks, eliminating former clearings between two or more banks. The source volume suggests that bank debits, series X 216–219, are a better measure of volume of payment.

X 230–237. Number of depositors and savings deposits, by class of bank, 1910–1942.

Source: Bureau of the Census, *Statistical Abstract of the United States, 1946*, p. 404.

These data were originally furnished by the American Bankers Association, which discontinued this series after 1942. Savings and other time deposits include deposits evidenced by savings passbooks, time certificates of deposit payable in 30 days or over, time deposits (open account), postal savings redeposited in banks, and for some States, Christmas savings and similar accounts.

Series X 232 and 236 include commercial, stock savings, and private banks and trust companies. Data shown for some of the years for these banks are incomplete for some States or have been estimated for others. Figures exclude 6 States in 1926 and 1927, 4 in 1928–1930, 3 in 1931, 2 in 1932 and 1933, and 1 in 1934–1937. For 1929–1942, depositors at national banks are represented by the number of savings passbook accounts.

The amounts of savings and other time deposits shown in series X 234–237 differ from and are less reliable than similar figures shown in series X 36, X 58, and X 80. The series on time and savings deposits by class of bank, presented earlier, generally provide a more complete coverage of banks and probably are more consistent with respect to deposits included than the series shown here.

X 238–239. Number of depositors and savings deposits in savings banks, 1820–1910.

Source: 1820–1896, Comptroller of the Currency, *Annual Report, 1896*, vol. I, p. 720; 1897–1910, *Annual Report, 1920*, vol. 1, p. 241.

Data include both mutual and stock savings banks. Figures for savings deposits in series X 239 differ from those in series X 234–237; the latter are based on savings and other time deposits in national and State banks, whereas series X 239 covers mutual and stock savings banks only. Also series X 234–237 are based on reports voluntarily submitted by banks to the American Bankers Association. This may result in different coverage of banks and of deposit figures.

X 240–244. Postal Savings System, 1911–1957.

Source: Post Office Department, *Annual Report of the Postmaster General, 1957*, p. 142, and records.

Data are for fiscal years since the inception of the Postal Savings System.

X 245–265. General note.

For purposes of administering the Federal Reserve System, the country is divided into 12 districts. There is a Federal Reserve bank in each district and most have one or more branches. Federal Reserve banks are organized as Federal corporations with capital stock subscribed by member banks in the respective districts. Member banks include all national banks and those State banks which have voluntarily requested membership and have met the requirements for joining the System. The number and total assets of national and State member banks are shown separately in series X 119–122 and for the two groups combined in series X 133–134.

The Federal Reserve banks are the principal medium through which the credit policies and general supervisory powers of the Federal Reserve authorities are carried out; they hold the legal reserves of member banks and perform for member banks many services related to those that commercial banks perform for the public, such as furnishing currency for circulation, facilitating the collection and clearance of checks, and providing discount facilities. The Reserve banks also act as fiscal agents, depositaries, and custodians for the U.S. Treasury and other Government units and perform numerous other important functions. The Federal Reserve banks are coordinated and supervised by the Board of Governors of the Federal Reserve System.

X 245–254. Federal Reserve banks—principal assets and liabilities, 1914–1957.

Source: 1914–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 330–332; 1942–1957, *Annual Report*, various issues.

Complete and detailed balance sheets for all Federal Reserve banks combined and for each bank are included in the source.

Since 1934, the reserves of the Federal Reserve banks have consisted principally of the gold certificate account, which is backed dollar for dollar by gold in the Treasury. The supply of these reserves is dependent primarily upon the size of the monetary gold stock, or more precisely upon that part of the gold stock against which the Treasury has issued gold certificates or gold certificate credits. For a discussion of changes in the items affecting the reserves of Federal Reserve banks, 1914–1934, see *Banking and Monetary Statistics*, p. 325.

Deposits of Federal Reserve banks consist mainly of reserves of member banks, shown in series X 252. They also include the checking account of the U.S. Treasurer, deposits of foreign banks and governments, and other accounts, such as accounts of certain nonmember banks maintained for use in clearing and collecting checks and checking accounts of Government agencies. For further description of the items included in this table, see *Banking and Monetary Statistics*, pp. 324–329, and *Federal Reserve System—Purposes and Functions*, chap. XIII, pp. 173–190.

For statistical series presenting Federal Reserve balance-sheet items and monetary data related to member bank reserves, see *Banking and Monetary Statistics*, pp. 360–401; *Federal Reserve System—Purposes and Functions*, chap. VIII, pp. 107–119; and the opening pages of the tabular section of *Federal Reserve Bulletin*, for example, February 1958, pp. 147–149.

X 255–261. Federal Reserve banks—earnings and expenses, 1914–1957.

Source: Board of Governors of the Federal Reserve System, *Annual Report, 1957*, pp. 94–95.

Federal Reserve banks are not operated for profit but they are self-supporting. The nature and the amount of Reserve bank earnings depend largely upon the demand for Reserve bank credit on the part of the member banks and upon Federal Reserve policy as to open-market operations. Most of the expenses of the Reserve banks are incurred in collecting checks, supplying currency, and performing other services from which no earnings are derived.

Until 1933, the law required that the net earnings of the Federal Reserve banks, after deduction of the annual 6 percent cumulative dividend on paid-in capital stock, be allocated to surplus and to a franchise tax paid to the U.S. Government. In 1933, Congress abolished the franchise tax at a time when

Digitized by Google

Reserve bank earnings were small and after Congress had directed the Reserve banks to contribute half of their surplus to the capital of the Federal Deposit Insurance Corporation. In 1947, when Reserve bank earnings were once more large, the Federal Reserve adopted the procedure by which it pays to the Treasury nine-tenths of its earnings above expenses and dividends as interest on Federal Reserve notes. The remaining one-tenth is added to the surplus of the banks.

X 262–265. Federal Reserve banks—member bank reserve requirements, 1917–1957.

Source: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, January 1958, p. 34.

These data represent minimum reserve requirements as specified by law (amendment to the Federal Reserve Act effective June 21, 1917). Since 1935, the Board of Governors of the Federal Reserve System has been authorized to increase, at its discretion, the minimum statutory requirements up to double the percentages as authorized in the 1917 amendment to the Federal Reserve Act.

The Federal Reserve Act as approved December 23, 1913, provided for temporary reserve requirements for member banks to be effective for a period of approximately 3 years. These requirements authorized member banks to hold a part of their reserves as cash in their own vaults and a part on deposit with other banks. For a fuller discussion of these requirements and the 1917 amendment of the Federal Reserve Act, see *Federal Reserve Bulletin*, November 1938, pp. 957–959. Since June 21, 1917, only balances with Reserve banks have counted as legal reserves.

Net demand deposits are demand deposits subject to reserve requirements. In general, prior to April 24, 1917, net demand deposits were made up of (*a*) the gross amount of all demand deposits except those due to other banks, and (*b*) the net excess (if any) of demand deposits due to other banks over demand balances due from other banks and cash items in process of collection. From April 24, 1917, to August 23, 1935, the definition was substantially the same, except that U.S. Government deposits were exempt by law from all reserve requirements and were therefore excluded from net demand deposits. Beginning August 23, 1935, net demand deposits have been total demand deposits minus cash items in process of collection and demand balances due from domestic banks (also minus war loan and series E bond accounts during the period April 13, 1943–June 30, 1947).

A list of the cities classified as "central reserve" and "reserve" for 1914–1941, is shown in *Banking and Monetary Statistics*, p. 401, and thereafter in the *Member Bank Call Report*.

[1] Beginning 1948, figures for loan items are shown gross (i.e., before deduction of valuation reserves); they do not add to the total and are not entirely comparable with prior figures. Total loans continue to be shown as net.

[2] Comparable with later data.

[3] See series X 86–90 for supplementary figures for nonnational banks: Number of banks, 1875–1882; capital accounts, 1875–1882; vault cash, 1875–1896; deposits, 1865–1896.

[4] Comparable with earlier data.

[5] Number of nonnational banks estimated.

[6] For nonnational banks, all figures except number of banks and capital accounts are estimated; see footnote 5, series X 64–85.

[7] Incomplete.

[8] Estimates based on previous 5 years for number of banks and on 10 years 1854–1863 for assets and liabilities.

[9] Includes circulating notes of both State and national banks. For State banknotes in circulation chiefly for 1834–1872, see series X 83, and for more complete figures for this series, 1860–1878, see series X 290, and the source (see p. 645) for that series for figures from 1800–1859. For national banknotes in circulation, 1864–1935, see series X 61.

[1] Beginning 1948, figures for loan items are shown gross (i.e., before deduction of valuation reserves); they do not add to the total and are not entirely comparable with prior figures. Total loans continue to be shown net.

[2] Before 1903, includes securities borrowed.

[3] Comparable with later data.

[4] Comparable with earlier data.

[5] U. S. Government securities only.

[6] Includes State banknotes outstanding.

[1] Beginning 1948, figures for loan items are shown gross (i. e., before deduction of valuation reserves); they do not add to the total and are not entirely comparable with prior figures. Total loans continue to be shown net.
[2] Comparable with later data.
[3] See series X 86–90 for supplementary figures: Number of banks, 1875–1882; capital accounts, 1875–1882; vault cash, 1875–1896; deposits, 1865–1896.
[4] Comparable with earlier data.
[5] Revised from source publication.
[6] Estimated.
[7] All figures except number of banks and capital accounts are estimated, using as a basis the previous 10 years, 1854–1863, inclusive.
[8] For more complete estimates of State banknotes in circulation, 1860–1878, see series X 290, and the source (see p. 645) for that series for figures from 1800–1859.
[9] Less than $500,000.

[1] Figures for 1896–1946 are for private banks in 18 States only; private banks were not segregated from other banks in the remaining States in this period.

[2] Includes mutual and stock savings banks, 1875–1896; thereafter mutual savings banks only.

[3] Comparable with later years.

[4] Comparable with earlier years.

[5] The total of series X 91 and X 95 and the total of series X 92 and X 96 differ from series X 64 and X 65, respectively. The latter are revised data published in the *Annual Report of the Comptroller of the Currency, 1931*, without breakdown by class of bank.

[6] Revised data for number of mutual savings banks, 781 in 1876 and 771 in 1875, are included in *Annual Report of the Comptroller of the Currency, 1920*, vol. 1, p. 241, but total assets for these banks are not available.

[1] For 1925, 1926, and 1932–1957, figures are as of December; for earlier years they are as of different dates for banks and branches: For banks, 1927–1931 and 1923–1924, as of December; for 1915–1922, as of June; for branches, 1924 and 1927–1931, as of June; prior to 1924, not for any uniform month. Figures in this table prior to 1947 have not yet been revised to bring them into conformity with the revised all-bank data referred to in the text for series X 1–265.

[2] Federal deposit insurance is compulsory for member banks of the Federal Reserve System.

[3] Beginning in 1941, the member bank figures exclude and the insured mutual savings bank figures include 3 mutual savings banks which became members of the Federal Reserve System during 1941.

[4] In 1947, the series was revised. See footnote 6 to series X 155–164.

[5] Federal insurance of bank deposits did not become effective until Jan. 1, 1934, and the number of nonmember banking offices by insurance status is not available prior to 1935.

Series X 152–154. Proportion of Total Bank Deposits Insured by the Federal Deposit Insurance Corporation: 1934 to 1957

[Money figures in millions of dollars. As of June 30 or nearest available date. Includes data for U.S. Territories and possessions]

1928		20,068	7,840		12,228						

[1] For years prior to 1924, figures are not for any uniform month. For 1925, 1926, 1932–1948, and 1950–1957, figures are as of December; for 1924, 1927–1931, and 1949, as of June.

[2] Federal deposit insurance is compulsory for member banks of the Federal Reserve System.

[3] Figures for 1900–1932 comprise State-chartered commercial banks operating branches and their branches and those unincorporated (private) banks operating branches and their branches reporting to State banking authorities. Beginning in 1934, the proportion of private banks reporting was larger than in prior years.

[4] Banking facilities are provided at military and other Government establishments through arrangements made by the Treasury Department with banks. Some of these facilities are operated by banks that have no other type of branch or additional office.

[5] Not available.

[6] In 1947, the series was revised to conform (except that it excludes Territories and possessions) to the number of banks in the uniform all-bank series inaugurated in 1947 by the Federal bank supervisory authorities. The revision resulted in a net addition of 115 banks and 9 branches.

[7] Loans and investments 1900–1936, and deposits 1937–1941 and 1949, of banks operating branches, except for mutual savings banks for 1935 which are deposits. For other years data are not available. Prior to 1949, commercial bank figures exclude a small amount of deposits of private banks, data for which are available for selected years only as follows: 1935, $46 million; 1939, $102 million; 1941, $138 million.

Series X 165–179. Bank Suspensions—Number and Deposits of Suspended Banks: 1864 to 1933

1927	199	46	149	4		68	136	61									

[1] For 1864–1891, all series except mutual savings banks are for year ending June 30; for mutual savings banks the date is not specified in the source. For 1892–1920, for all banks other than private, figures are for calendar year; for private banks, figures vary in ending date of reporting year as follows: 1892, June 30; 1893 (14 months), Aug. 31; 1894–1899, Aug. 31; 1900–1919, June 30; and 1920 (18 months), Dec. 31. For 1921–1933, all series are for calendar year. Series X 165 is composite as to reporting period since it comprises the summation of series X 166-169.

[2] Figures not wholly comparable with earlier years; see text.

[3] Prior to 1892, the figures shown include all State commercial banks; separate figures for private bank suspensions are not available.

[4] In commercial banks only. Estimated losses to depositors in mutual savings banks were as follows: 1922, $213,000; 1928, $31,000; 1930, $6,530,000; 1931, $157,000; 1932, $4,738,000; 1933, $7,085,000. (See *Annual Report* of the Federal Deposit Insurance Corporation, *1934*, p. 113.)

[5] Figures not comparable with losses to depositors shown in footnote 4 because source data differ for these series.

[6] Less than $500,000.

Series X 180–191. Banks Closed Because of Financial Difficulties: 1934 to 1957

[Money figures in thousands of dollars]

1935	32	26	24	1	6	13,988	13,404	9,091	4,229	583	2,716	416
1934	62	9	9		53	37,332	1,968	1,968		35,364	207	20

[1] Includes the following banks not shown separately which reopened or had their deposits assumed by another insured bank without financial aid of the Federal Deposit Insurance Corporations: 1935, 1 bank with deposits of $85 thousand; 1937, 2 banks with deposits of $328 thousand; 1949, 1 bank with deposits of $1,190 thousand; 1953, 2 banks with deposits of $26,449 thousand; and 1957, 1 bank with deposits of $10,084 thousand. (See following *Annual Reports* of Federal Deposit Insurance Corporation, *1941*, pp. 99 and 101; *1949*, p. 191; *1953*, p. 80; *1957*, p. 8.)

[2] Banks placed in receivership with deposits paid, to insurance maximum, by Federal Deposit Insurance Corporation, adjusted to exclude: 1937, 1 bank in voluntary liquidation; 1938, 1 noninsured bank with insured deposits at date of suspension (insured status having been terminated prior to suspension); 1941, 1 foreign-owned bank closed by order of the Federal Government.

[3] Banks in financial difficulties with deposits assumed by other insured banks, with financial aid of Federal Deposit Insurance Corporation.

[4] Previously published data adjusted to add 4 cases in 1934; 1 in 1937; 1 in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and to exclude 1 case in 1935; and 1 case in 1938. Deposits not available for 1 bank in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and 1 in 1954.

[5] Includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed.

[6] Tabulated by Federal Deposit Insurance Corporation from receivership records. Includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed.

1870	1,612	56	43	9.9
1869 [6]	1,619	29	22	10.7

[1] All data except number of banks are for calendar year, 1919–1957; year ending June 30, 1907–1918; and year ending Aug. 31, 1869–1906. Number of banks are as of end of period.

[2] Income taxes have been treated as an expense throughout. Beginning in 1943, these figures differ from those shown in the source volume, because income taxes in the source volume are shown separately from other expenses and as a deduction from net current earnings.

[3] Licensed banks, i.e., those operating on an unrestricted basis.

[4] 10 months only.

[5] Annual basis.

[6] 6 months only.

[1] Prior to 1942, taxes on net income have been included with other expenses. Taxes on net income for insured nonmember commercial banks for 1936–1941 are available separately in *Annual Reports* of the Federal Deposit Insurance Corporation.

[2] Prior to 1942, represents net current earnings after deduction of income taxes; thereafter, net current earnings before deduction of income taxes. See footnote 1.

[1] Beginning in May 1942, 60 new reporting centers (affecting series X 216 and X 219) and a number of banks in previously included reporting centers (affecting all series) were added to those centers and banks included for the years prior to 1942. The figures for the period 1942–1952 are therefore not strictly comparable with those for the earlier years. The extent of the change in coverage is reflected for 1942 by comparing the figures shown above with those derived on the old basis, as follows: Series X 216, 607,071; series X 217, 210,961; series X 218, 342,430; series X 219, 53,679. (See *Federal Reserve Bulletin*, Aug. 1943, p. 717.)

[2] The number of centers in this group varied considerably; see text.

[3] Excludes interbank deposits and collection items.

[4] Partly estimated for first 4 months.

[5] 11 months only; data for Mar. 1933 not available because of bank holiday.

[1] Includes industrial advances not shown separately.
[2] Includes Federal Reserve notes held by the U.S. Treasury or by a Federal Reserve bank other than the issuing bank.
[3] Includes guaranteed obligations which were not issued until late in 1933. Reserve banks were first authorized to purchase them in 1934. The only holdings of such securities prior to 1939 were $181,000 at the end of 1935, which were included in "other securities."
[4] Figures not comparable with later years in part because prior to June 21, 1917, member banks were not required to keep all of their legal reserves with the Reserve banks; also, for 1914–1916, deferred availability accounts, subsequently shown separately in the source, are included in total deposits.

Series X 255–261. Federal Reserve Banks—Earnings and Expenses: 1914 to 1957

[In thousands of dollars]

chapter X

MONEY SUPPLY AND GOLD (Series X 266–304)

X 266–304. General note.

The supply of money, in the sense of a means of payment, is defined broadly to include bank deposits and currency. A more restricted definition of the active money supply includes demand deposits and currency held by the public. Time deposits, including funds deposited in the Postal Savings System, have occasionally been included in the definition of the money supply. Prior to 1934, gold was also a part of the means of payment but in January of that year it was withdrawn from circulation, and since then gold has served as a means of settlement of international accounts only and is purely reserve money domestically.

As used here, the term "currency" includes coin and paper money issued by the Government and by banks. All currency is now issued by the Federal Reserve banks and the U.S. Treasury. In the series in this section three types of currency figures are shown: (*a*) Total currency stock (series X 281); (*b*) currency in circulation (series X 284–298), defined as coin and paper money outside the Treasury and Federal Reserve banks; and (*c*) currency outside banks, that is, currency in circulation less cash in the vaults of banks (series X 269 and X 277).

Figures on currency in circulation have been compiled by the Treasury Department since 1800. They exclude currency held in the Treasury and Federal Reserve banks, gold and silver coin known to have been exported and, beginning with January 31, 1934, all gold coin. They include currency held by the public within the United States, cash in the vaults of banks, currency lost or destroyed, and currency carried abroad and not appearing in the official gold and silver export figures.

At one time gold was the basic form into which all other types of currency could generally be converted. At present, however, the gold stock in most countries is held largely or entirely by central banks and Government treasuries as legal reserves against note and deposit liabilities or for stabilizing exchange rates. All gold belonging to the United States is held by the Treasury Department. Private gold holdings are forbidden except in limited amounts for licensed purposes. Gold may be held by Federal Reserve banks for account of foreign central banks or governments. Such earmarked gold, however, is not a part of the monetary gold stock of this country.

Prior to 1934, when gold coin and gold certificates were a part of the means of payment, they are included in series X 282, "currency held in Treasury"; series X 283, "currency in Federal Reserve banks"; and series X 284, "currency in circulation"; as well as in series X 285 and X 286, "gold coin" and "gold certificates" in circulation.

X 266–274. Deposits adjusted and currency outside banks, 1892–1957.

Source: 1892–1941 (except series X 274, 1916–1947), Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 34–35; 1942–1947, *Federal Reserve Bulletin*, January 1949, p. 41; 1948–1957, September issues of *Bulletin*. Series X 274, 1916–1947, Board of Governors, records.

These figures provide an indication of the total volume of money, or the means of payment, outstanding in the country. They have been adjusted to show as nearly as possible the deposits and currency owned by the public. Currency held as vault cash has been deducted from the total amount of currency outside the Treasury and Federal Reserve banks. Deposit figures have been adjusted to exclude interbank deposits, which do not represent money available to the public, and items in process of collection, inclusion of which would represent a double counting of deposits. Deposits of the U.S. Government, which are not included in deposits adjusted, are shown separately. Deposit figures, which are partly estimated, include all deposits in banks in the United States and in the Postal Savings System. For a detailed description of the individual items comprising adjusted deposits and currency outside banks, see *Banking and Monetary Statistics*, pp. 11–12.

X 275–280. Deposits adjusted and currency outside banks, 1867–1896.

Source: National Bureau of Economic Research, records.

These figures are unpublished estimates by Milton Friedman and Anna Jacobson Schwartz. They supplement series X 266–274, but they differ in several important respects. Series X 275–280 are seasonally adjusted figures; figures without seasonal adjustment, such as shown in X 266–274, are not available for the earlier period. Series X 275 and X 276 are total deposits adjusted, i.e., total deposits less U.S. Government deposits, interbank deposits, and cash items in process of collection. A distribution showing demand and time deposits is not available for this period. Figures for vault cash (series X 278) are deducted from currency in circulation to arrive at currency outside banks.

Series X 275 is the sum of national bank figures, *Annual Report of the Comptroller of the Currency, 1918*, vol. 2, pp. 248–269, and nonnational commercial bank estimates: For 1867–1874, by James K. Kindahl (series X 88); for 1875–1896, by David Fand (series X 89). Figures for series X 276, 1867–1874, were derived from E. W. Keyes, *A History of Savings Banks in the United States* (New York, 1878), vol. 2, table facing p. 532; figures for 1875–1896 were estimated by Fand (series X 89). Series X 277 is the residual remaining after deducting series X 278 from published figures of currency in circulation corrected for a presumed error in the gold component, the omission of fractional currency, and national banknotes in vaults of issuing banks. Series X 278 is the sum of national bank figures, *Annual Report of the Comptroller of the Currency, 1918*, vol. 2, pp. 248–269, and nonnational bank estimates: For 1867–1874, for commercial banks, by James K. Kindahl; for mutual savings banks, derived from cash in New York mutual savings banks, *Annual Report of the Superintendent of the Banking Department Relative to Savings Banks and Trust Companies*, 1867–1875, and in Massachusetts savings banks, *Annual Report of the Massachusetts Savings Bank Commissioners*, 1867–1875; for 1875–1896, by David Fand. Series X 279 is derived from *Annual Report of the Secretary of the Treasury on the State of the Finances, 1928*, p. 550. Series X 280 is derived from *Annual Report of the Comptroller of the Currency, 1918*, vol. 2, pp. 248–269. For more detail, see the

Digitized by Google

forthcoming volume by Friedman and Schwartz, *The Stock of Money in the United States, 1867–1957*.

X 281–284. Currency stock and currency in circulation, 1800–1957.

Source: 1800–1859, Comptroller of the Currency, *Annual Report, 1896*, vol. I, p. 544; 1860–1957, Treasury Department, *Annual Report of the Secretary of the Treasury, 1928*, pp. 550–551; *1945*, p. 675; *1949*, p. 545; *1957*, p. 550.

See general note for series X 266–304.

Currency stock (series X 281) and the total of its components (series X 282–284) involve a duplication to the extent that U.S. notes, Federal Reserve notes, Federal Reserve banknotes, and national banknotes, all included in full, are in part secured by gold, also included in full. The duplication of gold certificates, silver certificates, and Treasury notes of 1890 resulting from the equal amounts of gold or silver held as security therefor has been eliminated. For a statement on this point, see footnotes to series X 281 and X 282. A description of security and reserves by type of currency is included in the text for series X 285–298, below. The text for series X 285–298 also describes more refined estimates of gold coin in circulation, 1873–1907 and 1913–1933, which, if incorporated into series X 281–284, would require similar adjustments in "total currency in the United States" and "currency in circulation."

The *Annual Report of the Secretary of the Treasury* for 1922 and subsequent years includes the following information concerning changes in the compilation of series X 281–284. The figures for 1860–1889 have been revised from the best data available in annual reports of the Secretary of the Treasury. The records are not complete and the figures for gold and silver in those years are only estimates. Beginning with 1890, the compilation is based on revised figures for June 30 of each year and therefore differs slightly from the monthly circulation statements issued by the Treasury. The compilation reflects revisions to take account of other changes in the circulation statement, chiefly in 1922 and 1927. These revisions are explained in the *Annual Report of the Secretary of the Treasury* as follows: *1922*, p. 433; *1928*, pp. 70–71 and 551.

X 285–298. Currency in circulation, by kind, 1860–1957.

Source: Treasury Department, *Annual Report of the Secretary of the Treasury, 1928*, pp. 554–555; *1949*, p. 547; *1958*, p. 584.

See general note for series X 266–304 and text for series X 281–284.

More detailed annual data on currency stock and circulation, by kind, are shown in the annual reports of the Secretary of the Treasury and the Comptroller of the Currency. For a continuation of series X 290 (State banknotes, 1860–1878), annually back to 1830, decennially to 1800, see *Annual Report of the Comptroller of the Currency, 1916*, vol. II, p. 45.

The security and reserve provisions for the different types of currency are described in the *Annual Report of the Secretary of the Treasury, 1957*, p. 551, as follows:

> A part of the gold and silver included in the stock of currency is held by the Treasury as a reserve against other kinds of currency as follows: (1) As a reserve for United States notes and Treasury notes of 1890—gold bullion (gold coin and bullion prior to gold conservation actions of 1933 and 1934), varying in amount from $150,000,000 to $156,039,431 during the years 1913–1957; (2) also as security for Treasury notes of 1890—an equal dollar amount in standard silver dollars (these notes are being cancelled and retired on receipt); (3) as security for outstanding silver certificates—silver in bullion and standard dollars of monetary value equal to the face amount of such silver certificates; and (4) as security for gold certificates—gold bullion (gold coin and bullion before gold actions of 1933 and 1934) of a value at legal standard equal to the face amount of such gold certificates. Federal Reserve notes are obligations of the United States and a first lien on all the assets of the issuing Federal Reserve Bank. Federal Reserve notes are secured by deposit with Federal Reserve agents of a like amount of gold certificates (gold prior to actions of 1933 and 1934) or of gold certificates and such discounted or purchased paper as are eligible under the terms of the Federal Reserve Act as amended, or (from February 27, 1932) of direct obligations of the United States. Federal Reserve Banks must maintain a reserve in gold certificates (gold for 1933 and prior years) of at least 25 percent (40 percent prior to passage of Act of June 12, 1945) including a redemption fund, which must be deposited with the Treasurer of the United States, against Federal Reserve notes in actual circulation. "Gold certificates," as herein used for 1934 and subsequent years include credits with the Treasurer of the United States payable in gold certificates. Federal Reserve Bank notes at time of issuance were secured by direct obligations of United States or commercial paper; however, lawful money has been deposited with the Treasurer for their redemption and they are in process of retirement. National bank notes at issuance were secured by direct obligations of the United States; lawful money has been deposited with the Treasurer for their redemption and they are being retired.

The monetary value of gold was changed from $20.67 per fine ounce to $35.00 per fine ounce on January 31, 1934. The weight of the gold dollar was reduced from 25.8 to 15-5/21 grains of gold, 0.9 fine.

More refined estimates of the amount of gold coin in circulation, 1873–1907, are contained in Bureau of the Mint, *Annual Report of the Director of the Mint, 1907*, p. 87; a discussion of the errors for which adjustments were made is given on pp. 66–95. For 1914–1933, the Board of Governors of the Federal Reserve System has published revised estimates of gold coin in circulation (see *Banking and Monetary Statistics*, p. 409), which exclude $287 million of gold coin reported in January 1934 as still in circulation because this amount is believed to have been largely lost or melted down, or otherwise to have disappeared from circulation over the years. The Federal Reserve series has been adjusted in this way for 1914–1933; no similar adjustment has been made in the data included in this volume for gold coin in circulation, total currency in circulation, or total currency stock.

X 299–304. Changes in gold stock, 1914–1957.

Source: 1914–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 536; 1942–1957 (except series X 304), *Federal Reserve Bulletin*, June 1949, p. 745, and April 1958, p. 503. Series X 304, 1942–1957, *Federal Reserve Bulletin*, January issues.

For a discussion of the items shown here, see *Banking and Monetary Statistics*, pp. 522–523. See also general note for series X 266–304.

Also available in *Banking and Monetary Statistics* are annual data on gold inflow into the United States and contributing factors, net gold imports to the United States by country, and gold production by country.

The data for domestic gold production (series X 301) are those reported by the Director of the Mint, adjusted through 1945 to exclude Philippine Islands production received in the United States. The data for net gold imports or exports (series X 302) are those compiled by the Department of Commerce. The figures for gold under earmark (series X 303–304) represent gold held by the Federal Reserve banks for foreign and international accounts; in the calculation of the changes in gold under earmark, however, consideration has also been given to gold held under earmark abroad for the account of the Federal Reserve banks in 1917–1933.

[1] For definition of deposits adjusted, see text.
[2] Excludes U.S. Treasurer's time deposits, open account, beginning with 1939, and postal savings redeposited in banks.
[3] Beginning with 1941, the commercial bank figures exclude and the mutual savings bank figures include 3 member mutual savings banks.
[4] Prior to 1947, includes a relatively small amount of demand deposits.
[5] Includes both amounts redeposited in banks and amounts not so redeposited; excludes amounts at banks in U.S. possessions.
[6] Includes Government deposits at commercial and savings banks and at Federal Reserve banks. Beginning with 1939, includes U.S. Treasurer's time deposits, open account.

[1] Excludes gold certificates, silver certificates, and Treasury notes of 1890, since the gold and silver held as security against them are included.

[2] Prior to 1860 consists of specie only; thereafter includes coin, bullion, and paper money. Includes the following categories of currency held in Treasury as published in the circulation statement: Reserves held against U.S. notes and Treasury notes of 1890, held for Federal Reserve banks and agents, and all other money. Excludes amount held as security against gold and silver certificates and Treasury notes of 1890 since the certificates and notes are included elsewhere; for 1860–1933 they are included as currency outside the Treasury, and beginning 1934 they are included either as currency outside the Treasury or as amounts held in the Treasury for Federal Reserve banks and agents, payable in gold certificates.

[3] Agrees with source; however, figures for components do not add to total shown.

[4] Prior to 1860 the exact date of the figures is not known.

[5] Includes total stock of silver dollars and subsidiary silver, 1860–1863; and of gold coin and bullion, 1862–1863. It is not practical to present the amounts in circulation separately for the years mentioned.

[6] Estimated.

Digitized by Google

Series X 285–298. Currency in Circulation, by Kind: 1860 to 1957

[In thousands of dollars. As of June 30]

chapter X

MONEY RATES AND SECURITY MARKETS (Series X 305–388)

X 305–388. General note.

Available statistics on interest rates and security prices indicate the cost of credit to borrowers—mainly business concerns and the Federal Government; and the income received by those who lend and invest—primarily individuals, trusts, endowments, banks, and other financial institutions. This section presents a variety of money rate and security market statistics, including principal short-term open-market rates in New York City, the discount rate of the Federal Reserve Bank of New York, commercial paper and bankers' acceptances outstanding, bank rates on short-term loans to business, bond and stock yields and prices, security issues, margin requirements, stock market credit, and the volume of stock exchange trading.

X 305–313. Short-term interest rates—open market rates in New York City and Federal Reserve Bank discount rate, 1890–1957.

Source: 1890–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 439–442, 448, 460; 1942–1957, March issues of *Federal Reserve Bulletin*, 1945–1958, and Federal Reserve Board, records.

The rates shown here cover the most important short-term open market instruments in New York City, which is the chief money market of the country. The New York money market is composed of a number of specialized markets for certain types of borrowing and there are usually differences in rates corresponding to differences in the supply of funds relative to the demand for particular types of short-term funds in which the market deals. These markets are called "open" markets since transactions in them are usually made on an impersonal basis with the borrower and lender dealing through agents, as distinct from a "customer" market where the borrower and lender deal directly with each other and where transactions are often made on a personal basis. As a result, lenders may sell paper held, call loans, or refrain from renewing credits upon maturity more freely in the case of open-market paper than in the case of customer loans. Monthly and weekly figures for most of the series shown here are given in the source.

Rates on stock exchange loans are no longer published by the Board of Governors of the Federal Reserve System but data for these series for 1942–1957 were supplied by that agency. For stock exchange call loans (series X 307–308), a single rate only is available beginning in 1957.

Government securities maturing within one year are represented prior to 1930 by the average yield on 3- to 6-month Treasury notes and certificates (series X 310); this series was discontinued after 1933. The figures for series X 310 are averages of daily yields published by the Treasury Department on all outstanding issues of these securities with periods to maturity from 3 to 6 months.

Beginning 1929, a new measure of short-term rates became available with the issuance by the Treasury of a new type of security—the Treasury bill, which differs from other types of Treasury marketable securities in that it is sold on a discount basis instead of being offered in the market with a fixed coupon rate. Maturities of Treasury bills have varied up to 9 months, but usually have been 3 months. A continuous series (X 311) is available beginning with 1931.

The Federal Reserve Bank of New York discount rates shown (series X 312–313) are the lowest and highest rates during the year on discounts for and advances to member banks under sections 13 and 13b of the Federal Reserve Act. Rates also apply to advances secured by obligations of Federal intermediate credit banks maturing in 6 months. For 1942–1946, the low rate shown is the preferential rate for advances secured by Government securities maturing or callable in one year or less. In this period the rate of 1 percent was continued for discounts of and advances secured by eligible paper. The discount rates at all Federal Reserve banks and a description of the series through 1941 is contained in *Banking and Monetary Statistics*, pp. 422–424, 439–442, and thereafter in the *Federal Reserve Bulletin*.

X 314–321. Commercial paper and bankers' acceptances outstanding, 1918–1957.

Source: 1918–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 465–467; 1942–1957, *Federal Reserve Bulletin*, February 1944, p. 170; January 1946, p. 59; February 1953, p. 146; May 1958, p. 572.

Figures for commercial paper represent the amount of paper outstanding as reported by the principal commercial paper dealers in the country. Some finance company paper sold in the open market is included. Figures for bankers' acceptances are amounts outstanding as reported by makers of bankers' acceptances, including banks and bankers in the United States and agencies of foreign banks in this country.

X 322–329. Bank rates on short-term business loans, 1919–1957.

Source: 1919–1938, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, pp. 463–464; 1939–1948, *Federal Reserve Bulletin*, March 1949, p. 233; 1949–1957, March issue of *Bulletin* in each year.

Data by months through 1938 and by quarters thereafter are available in the source volume. These data are compiled by the Board of Governors from reports submitted by member banks in leading cities throughout the country.

The reporting cities are representative financial centers having large loan markets. Interest rates charged by banks in these cities are more responsive to changes in general monetary conditions than are rates in other places. Because of the financial importance of the cities, their influence would predominate in any compilation designed to show movements of interest rates in large cities.

Figures for series X 326–329 represent averages of prevailing rates reported monthly by banks in a varying number of leading cities on commercial loans and time and demand security loans. These figures are not strictly comparable with those in series X 322–325 but they are believed to represent bank rates on business loans. For series X 322–325, the figures for 1928–1938 are averages of prevailing rates reported monthly by banks in 19 principal cities on business loans only; beginning in 1939, the figures are averages of interest rates charged by banks in the 19 cities on short-term business loans made during the first half of March, June, September, and December. For a description of the figures

Digitized by Google

prior to 1939, see *Banking and Monetary Statistics*, pp. 426–427, and beginning 1939, see *Federal Reserve Bulletin* for March 1949, pp. 228–237. Beginning 1939, the source publication includes data on average interest rates by size of loan.

X 330. Yields on U.S. Government bonds, 1919–1957.

Source: 1919–1941, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, May 1945, p. 483; 1942–1957, *Federal Reserve Bulletin*, October 1947, p. 1251; January 1950, p. 72; January 1951, p. 66; January 1954, p. 58; January 1958, p. 84.

Figures are unweighted averages of yields. For 1919–1925, yields cover all outstanding partially tax-exempt Government bonds due or callable after 8 years; for 1926–1934, all such bonds due or callable after 12 years; for 1935–1941, all such bonds due or callable after 15 years. For further description of series, see *Banking and Monetary Statistics*, p. 429, and *Federal Reserve Bulletin*, May 1945, pp. 483 and 490. Beginning 1942, the series is for fully taxable bonds. Yields cover 1942–March 31, 1952, the bonds due or callable after 15 years; April 1, 1952–March 31, 1953, due or callable after 12 years; April 1, 1953–1957, due or callable in 10 years or more.

X 331. Municipal high-grade bond yields, 1900–1957.

Source: 1900–1956, Standard and Poor's Corporation, Trade and Securities Statistics, *Security Price Index Record*, New York, 1957 edition, p. 172; 1957, same source, January 1959 Supplement, p. 22.

Prior to 1929, this series is an arithmetic average of the yield to maturity of 15 high-grade municipal bonds, based on the mean of monthly high-low prices. Beginning 1929, the series is an average of the 4 or 5 weekly indexes for the month. Annual figures are averages of monthly data. Monthly and weekly data are available in the source.

X 332. Unadjusted index number of yields of American railroad bonds, 1857–1936.

Source: Frederick R. Macauley, *Some Theoretical Problems Suggested by the Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856*, National Bureau of Economic Research, 1938, pp. A 142–161.

The railroad industry was selected as the basis for a long-time study of bond yields because no other industry had securities of comparable importance as early as 1857, and for many years no other industry had as high a credit rating. The series is available before and after adjustment to eliminate economic drift due to secular changes in the quality of the bonds included. The unadjusted series is more comparable with currently available series. The series is a chain index number based on the arithmetic average of yields on long-term high-grade railroad bonds. Yields for individual bonds are based on arithmetic averages of monthly high and low sale prices. With a few exceptions the index includes no bonds with maturities under 10 years, and since 1909 the minimum has been 14 years. The number of bonds on which the index is based was 13 in 1857 and increased gradually to 37 in 1900; it varied between 36 and 45 until 1930 and declined to about 28 in 1935. Annual figures are averages of monthly data.

X 333. Corporate Aaa bond yields, 1919–1957.

Source: Moody's Investors Service, *Moody's Industrial Manual*, New York, 1958 edition, p. a19.

This series is an unweighted arithmetic average of the yields for individual bonds, based on closing prices. Prior to 1928, yields are based on the average of the month's high and low sale price for each bond; for 1928 and 1929, on bi-weekly closing quotations; for 1930 through October 1931, on weekly quotations; beginning November 1931, on daily closing quotations. Annual figures are averages of monthly data.

X 334. Yields on preferred stocks, 1910–1957.

Source: See source for series X 331, 1957 edition, p. 97, and January 1959 Supplement, p. 19.

For January 1910–January 1928, this index is computed from the average of the monthly high and low prices of 20 high-grade issues. All prices are converted to a price equivalent to $100 par and a $7 annual dividend before averaging. The yield index is computed from the average price. Beginning February 1928, the index is based on an average of the weekly yields, which are based on Wednesday's closing quotations for 15 (currently 14) high-grade noncallable issues. The yield is determined for each issue and the average of the 9 (currently 8) median yields represents the group yield. Annual figures are averages of monthly data.

X 335–338. Yields on common stocks (Cowles Commission), 1871–1937.

Source: Alfred Cowles and Associates, *Common Stock Indexes, 1871–1937*, Principia Press Inc., Bloomington, Ind., 1939, pp. 372–373.

Yields are total actual dividends paid in each calendar year divided by total stock values as represented by an average of the monthly values for the year. The data employed in the construction of this index include, for 1871–1917, all industrial and public utility common stocks, and about 93 percent in market value of the railroad stocks traded on the New York Stock Exchange. The stocks and the periods of their inclusion are given in appendix II of the source volume. Subsequent to 1917 (in some cases 1926 or later) the stocks included in the Standard Statistics weekly indexes are used, which represent 90 percent of all common shares listed on the New York Stock Exchange. For further description of index, see source volume, pp. 1–50.

X 339–342. Yields on common stocks (Moody's), 1929–1957.

Source: Moody's Investors Service, *Moody's Industrial Manual*, New York, 1958 edition, p. a25.

Annual figures are averages of monthly data which are dividends at annual rates based on latest company declarations divided by end-of-month prices.

X 343–347. Basic yields of corporate bonds, by term to maturity, 1900–1957.

Source: 1900–1942, David Durand, *Basic Yields of Corporate Bonds, 1900–1942*, New York, 1942; 1943–1957, National Bureau of Economic Research, records.

Greater detail than is shown here as to yield by years to maturity appears in Durand's volume.

The basic yield series represents the yield estimated as prevailing in the first quarter of each year on the highest grade corporate issues, classified by term to maturity. This series is based on monthly high and low quotations of practically all the actively traded high-grade corporate issues outstanding since 1900.

X 348. U.S. Government bond prices, 1919–1957.

Source: 1919–1944, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, May 1945, p. 483; 1945–1957, *Federal Reserve Bulletin*, October 1947, p. 1251; January 1950, p. 73; January 1951, p. 67; January 1954, p. 58; May 1958, p. 612.

Prior to 1942, the prices are derived from average yields of partially tax-exempt bonds shown in series X 330 on basis

Digitized by Google

of a 4 percent 16-year bond through December 1930 and on the basis of a 2-3/4 percent 16-year bond 1931–1941. For further description of series, see *Banking and Monetary Statistics*, p. 429.

For 1942–March 31, 1952, figures for fully taxable issues are average prices of bonds due or first callable after 15 years; for April 1, 1952–March 31, 1953, average prices of fully taxable marketable 2-1/2 percent bonds first callable after 12 years; beginning April 1, 1953, prices are derived from average yields on basis of an assumed 3 percent 20-year bond. The yield averages used are those on bonds maturing or callable in 10 years or more.

X 349–350. Municipal and corporate high-grade bond prices, 1900–1957.

Source: See source for series X 331, 1957 edition, pp. 150 and 173, and January 1959 Supplement, p. 18.

The prices are a conversion of the yield indexes, assuming a 4-percent coupon with 20 years to maturity. For a description of the yield series for high-grade municipal bonds, see text for series X 331. The high-grade corporate bond series is based upon the following: For 1900–1928, the monthly high-low price of 45 high-grade corporate bonds; for 1929–March 1937, a varying group of A1+ bonds, one price monthly (first of month); beginning April 1937, the average of the weekly A1+ indexes. Annual data are averages of weekly figures.

X 351–354. Index of common stock prices, 1871–1957.

Source: See source for series X 331, 1957 edition, pp. 94–95, and January 1959 Supplement, pp. 18–22.

These indexes, which are based on the aggregate market value of the common stocks of all the companies in the sample, currently 500 stocks, express the observed market value as a percentage of the average market value during the base period. From January 1908 to date, these indexes are based on monthly averages of the Standard and Poor's stock price indexes. The indexes for earlier years have been converted to the 1941–43 base from the Cowles Commission stock price indexes, which are an extension of the Standard and Poor's indexes. The same method of construction was used for both, and, as far as possible, the same companies. The formula used for this index is generally defined as a "base-weighted aggregative" expressed in relatives with the average value for the base period (1941–43) equal to 10 and with adjustments for arbitrary price changes caused by the issuance of rights, stock dividends, splitups, etc.

X 355–365. Security issues and net change in outstanding corporate securities, 1934–1957.

Source: Series X 355–362, Securities and Exchange Commission, *Annual Report, 1952*, pp. 210–221, and *1958*, pp. 208–216; and *Statistical Bulletin*, May 1958, pp. 9–11. Series X 363–365, same agency, records.

The data for series X 355–362 cover substantially all new issues of securities offered for cash sale in the United States in amounts over $100,000 and with terms to maturity of more than one year. Figures include issues privately placed and publicly offered, whether unregistered or registered with the Securities and Exchange Commission.

The figures for privately placed issues include securities actually issued but exclude securities which institutions had contracted to purchase but had not actually taken during the period covered by the statistics. Also excluded are intercorporate transactions; U.S. Government "Special Series" issues, and other sales directly to Federal agencies and trust accounts; notes issued exclusively to commercial banks; and corporate issues sold through continuous offering, such as issues of open-end investment companies. Issues sold by competitive bidding directly to ultimate investors are classified as publicly offered issues. The figures for new capital include all issues other than those whose proceeds are intended to be used for retirement of securities already outstanding.

The figures for series X 363–365 on net change in outstanding corporate securities are derived by deducting from estimated gross proceeds received by corporations through the sale of securities the amount of estimated gross payments by corporations to investors for securities retired. Included in the latter figures are payments for issues retired with internal funds as well as with proceeds from new issues sold for refunding purposes. These series are based primarily on cash transactions but include conversions and exchanges of one type of security for another, e.g., bonds for stocks.

X 366–371. Corporate security issues, 1910–1934.

Source: 1910–1918, Bureau of Foreign and Domestic Commerce, *Statistical Abstract of the United States, 1932*, p. 292; 1919–1934, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 487.

The *Commercial and Financial Chronicle* data used for these series, for 1919–1934, include all security issues publicly offered for sale by companies incorporated in the United States. Securities sold privately are included when the compilers are aware of the sale. Issues of foreign companies sold in the United States are excluded. Data are based on the offering price for preferred stock of no par value and for common stock, and on par amounts for bonds, notes, and preferred stock with stated par value. The data prior to 1919 include offerings of foreign corporations.

These series differ from those compiled by the Securities and Exchange Commission (series X 355–362) in a number of respects. The latter include issues on the basis of gross and/or net proceeds, whereas the *Chronicle* series include issues on the basis noted above. The *Chronicle* series include issues for exchange purposes, while the SEC figures include only that portion of such an offering that is sold for cash. The SEC series also include foreign corporate security issues sold in the United States, while the *Chronicle* series exclude them except for the period noted. The basis for inclusion of privately sold securities also differs.

X 372. New State and municipal security issues, 1919–1957.

Source: 1919–1933, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 487; 1934–1951, Securities and Exchange Commission, *Annual Report, 1952*, part 3, p. 211; 1952–1957, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, February 1959, p. 182.

Data represent principal amounts of securities offered publicly for sale in the United States by all political subdivisions either for new money or for refunding, retiring, or otherwise acquiring existing securities. For 1919–1933, figures are as compiled and published by the *Commercial and Financial Chronicle*, and for 1934–1957, they are from totals published by the *Chronicle* and the *Bond Buyer*.

X 373–377. Volume of sales on New York Stock Exchange, 1900–1957.

Source: 1900–1909, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 485; 1910–1957, Department of Commerce, *Statistical Abstract of the United States, 1936*, p. 289; *1947*, p. 452; *1958*, p. 467.

These data are published currently in the *Commercial and Financial Chronicle*.

Digitized by Google

Data on stocks (series X 373) show the volume of share trading in round lots on the New York Stock Exchange, as reported by the Exchange ticker; this series excludes odd lots, stopped sales, private sales, split openings, crossed transactions, and errors of omission. Data on bonds are exclusive of stopped sales, and beginning in July 1947, include bonds of the International Bank for Reconstruction and Development.

Beginning 1935, the Securities and Exchange Commission has compiled statistics on the total volume sold and the money value of stock and bond sales on all registered exchanges. These are available in the source volumes.

X 378–380. Margin requirements, 1934–1957.

Source: 1934–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 504; 1942–1957, Federal Reserve Board, *Annual Report, 1948*, p. 77, and *1957*, p. 102.

Regulations T and U administered by the Federal Reserve Board, limit the amount of credit that may be extended on a security by prescribing a maximum loan value, which is a specified percentage of its market value at the time of extension; the "margin requirements" shown are the differences between the market value (100 percent) and the maximum loan value.

X 381–384. Stock market credit, 1931–1957.

Source: Series X 381–383, 1931–1941, Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 501; 1942–1952, Federal Reserve Board, records; 1953–1957, *Federal Reserve Bulletin*, January 1958, p. 50. Series X 384, 1938–1952, FRB, records; 1953–1957, *Federal Reserve Bulletin*, February 1958, p. 166.

Series X 381–383 relate to credit extended by stock brokers on the basis of reports made by a group of firms estimated to account for at least 90 percent of total credit extended by security brokers and dealers in the United States. Data for 1931–1934 are estimates based on data collected by the New York Stock Exchange, and for 1935–1957 are based on reports collected by the Federal Reserve Board. Customers' debit balances represent credit extended by brokers to their customers, and money borrowed represents most of the credit obtained by these brokers, including money borrowed against customer collateral as well as that for their own activities. Customers' free credit balances represent customers' funds held by brokers pending investment or pending remittances to customers.

Customer credit in the stock market (series X 384) is defined as the sum of customers' net debit balances of the reporting firms, exclusive of those secured by U.S. Government obligations, and bank loans to others than brokers and dealers for purchasing and carrying securities exclusive of U.S. Government securities. As a result of changes in reporting, this series is not continuous. Prior to 1955, customers' net debit balances include balances secured by U.S. Government obligations. Bank loans to others for purchasing and carrying securities are figures of weekly reporting member banks for the last Wednesday of the year, a series beginning in 1938. At the end of 1957 these banks accounted for about seven-tenths of all loans for this purpose. Loans for purchasing and carrying U.S. Government securities are excluded for all reporting banks for 1944–1952, and for reporting banks in New York City and Chicago for 1953–1957. For further details concerning the series, see *Banking and Monetary Statistics*, pp. 435 and 437–438, and *Federal Reserve Bulletin*, January 1958, p. 50.

X 385–388. Brokers' loans, by groups of lenders, 1918–1938.

Source: Board of Governors of the Federal Reserve System, *Banking and Monetary Statistics*, p. 494.

These data were assembled from various sources and where gaps occurred estimates were made. The figures represent loans to brokers by principal groups of lenders—New York City banks, outside banks, and others. Other lenders comprise foreign banking agencies, corporations, other brokers, and individuals. The figures cover primarily loans to brokers and dealers in New York City, most of whom are members of the New York Stock Exchange, but they include also loans to certain investment banking houses that do not have Stock Exchange seats and to brokers and dealers belonging to other stock exchanges. Comparable data are not available after 1938. For a more detailed description of the series, see *Banking and Monetary Statistics*, pp. 434–435.

chapter X

CREDIT AND OTHER FINANCE (Series X 389–434)

X 389–434. General note.

Financing institutions other than commercial banks provide credit by making loans and purchasing securities. Such agencies include—in addition to mutual savings banks—savings and loan associations, personal loan and other small-loan companies, credit unions, sales finance and commercial finance companies, mortgage companies, insurance companies, and credit agencies owned or sponsored by the Federal Government.

While the available data for most of these institutions are much less comprehensive than those for commercial banks, when used in conjunction with the data for commercial banks, they provide a broader view of finance in the United States. Historical series for institutions not included in other chapters are incorporated in this section.

Among the private noncommercial bank financing institutions included elsewhere in this volume are life insurance companies (series X 435–468), mutual savings banks (series X 95–96), and savings and loan associations (series N 156 and N 169). Included in this section (series X 389–434) are Federal agencies (both those owned and those sponsored by the Federal Government) that provide direct loans and underwrite, by insurance or guarantee, credit extended by privately owned agencies; and credit unions which make primarily short-term loans to consumers.

Other broad measures of finance relate to oustanding credit (or debt) which represents financing by all lenders and investors. This volume includes series on farm credit (series K 162–180), home mortgage debt (series N 150–178 and N 190–195), and in this section, short- and intermediate-term consumer credit and aggregate public and private debt.

X 389–402. Outstanding loans and loan insurance or guarantees of Federal and Federally sponsored agencies, by economic sector served, 1917–1953.

Source: R. J. Saulnier, Harold G. Halcrow, and Neil H. Jacoby, *Federal Lending and Loan Insurance*, Princeton University Press, 1958, appendix A, pp. 365–380.

These series are combinations of data shown separately in the source volume for Federal and Federally sponsored agencies; the source volume shows amount extended during the year as well as amount outstanding at year end. The economic sectors shown here are the major sectors shown in the source volume—agriculture, business, financial institutions, and housing—and an "other group" which combines minor governmental units and miscellaneous sectors. The coverage and classification are described in the source chapter I, pp. 3–27, the footnote on pp. 28–29, and in footnotes of tables A1 to A8. The following paragraphs are adapted from that text.

Federally sponsored agencies include all those having a special financial or administrative connection with the Federal Government, whether or not Federal funds are presently invested in them. Thus, they include agencies that are in some respects private or cooperative in ownership and organization but that operate in part with Federal funds; and agencies that, although no longer using Treasury funds, are specially connected with some Federal agency through the latter's power to appoint policymaking officers and in some cases to review policy decisions.

The Federal agencies represented under the various categories of loans, insurance or guarantees, and stock purchases are summarized in the source in footnotes to the economic sector tables (pp. 365–380) and are shown in greater detail in the source tables covering individual agencies (pp. 381–418). For example, among agencies making direct loans to the business sector are the Export-Import Bank of Washington, the Departments of Army and Navy, and the Public Works Administration, as well as the War Finance Corporation, the Reconstruction Finance Corporation, and the Smaller War Plants Corporation. Federal Reserve bank loans and participations in loans of private financing institutions to business under section 13b of the Federal Reserve Act are also included. Guarantees of loans to the business sector include guarantees by the Veterans Administration and by Federal agencies under Regulation V of the Board of Governors of the Federal Reserve System, as well as deferred participation commitments of the Reconstruction Finance Corporation. (For further details, see source, p. 374.)

Credit programs not covered by the tabulation shown here include loans to foreign governments, except the Export-Import Bank as noted here, direct and guaranteed loans by the Commodity Credit Corporation, and loans to State governments. Loans of the Export-Import Bank of Washington which could not be fully separated from lending to foreign concerns and to domestic concerns engaged in foreign trade are included in the business sector.

Outstanding amounts relate to three basic categories of Federal credit activities.

X 389–394, direct loans. These include (*a*) the full amounts of loans extended by specified Federal and Federally sponsored agencies; (*b*) the amounts disbursed to private lenders by Federal agencies in purchasing outstanding loans made under Federal insurance or guarantee; and (*c*) the amounts disbursed on loans made in participation with private lenders.

Loans exclude credit extended (usually on an accounts-receivable basis) incident to some other activity, as when the U.S. Commercial Company gave open book credit during World War II in connection with its sales of commodities. Grant-in-aid programs are also excluded. Loans made indirectly—as when the Federal intermediate credit banks discount paper for production credit associations, enabling the latter to make loans to farmers—are included, as well as loans going directly to the ultimate borrower; but there is no double counting that would result from interagency loans, such as purchase by the Treasury of debentures of the Reconstruction Finance Corporation.

X 395–399, loan insurance or guarantees. Loan insurance covers the full amounts of loans extended by private lenders and insured by Federal agencies. Loan guarantees cover (*a*) the amounts Federally guaranteed, ranging from 100 percent to seldom lower than 50 percent of a privately made loan; and (*b*) the amounts of the Federal shares authorized under deferred participations, where the Government stands ready to take up an agreed percentage of a privately made loan. Thus, credit actually extended under participation agreements with private lenders is included under direct loans; but during the time when there is merely a commitment outstanding to

488910 O - 60 - 43

Digitized by Google

take up all or some part of a loan at the option of the private lender, the amount of the obligation is included as a loan guarantee.

X 400–402, stock purchases. Such purchases are included if identifiable as primarily credit aid, and they cover the amount of Federal funds invested. Stock purchases represent purchases of, and loans on, preferred stocks of banks and insurance companies, and purchases of capital notes and debentures of banks, by the Reconstruction Finance Corporation; purchases of shares of savings and loan associations by the Home Owners' Loan Corporation and the Treasury Department; purchases of stock of agricultural cooperative associations by the Tennessee Valley Associated Cooperatives, Inc.; and purchases of Class A stock of production credit associations by the production credit corporations.

X 403–414. State and Federally chartered credit unions—number, share capital, loans, and total assets, 1931–1957.

Source: Bureau of Federal Credit Unions, *Report of Operations of Federal Credit Unions, 1957*, p. 1; *State-Chartered Credit Unions in 1957*, pp. 1 and 3; and records.

Annual data on operations of credit unions are also published in Bureau of Labor Statistics, *Monthly Labor Review*, 1936–1953 (usually in the latter part of the year), and in BLS Bulletin Nos. 797 and 850.

Data for Federal credit unions, which were authorized by legislation enacted in 1934, represent all operating unions. Data on State-chartered credit unions have been furnished annually by State officials charged with the supervision of such credit unions, to the Bureau of Federal Credit Unions since 1951, and to the Bureau of Labor Statistics prior to 1951. Figures for State credit unions represent reporting unions, which in recent years have included 97 percent or more of all active unions; prior to 1939, the proportion reporting was about 80 percent.

Loans of credit unions (series X 409–411) are principally short-term consumer loans, but they include some real estate mortgage loans and a small amount of business loans.

X 415–422. Short- and intermediate-term consumer credit, by major types, 1929–1957.

Source: Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, April 1953, pp. 346–347, 354; June 1955, p. 638; October 1956, pp. 1035–1036; and February 1960, p. 198.

Short- and intermediate-term consumer credit includes credit used to finance the purchase of commodities and services for personal consumption or to refinance debt originally incurred for such purposes. It also includes credit extended to individuals for the purchase of consumer goods that may be used in part for business. The installment component includes credit scheduled to be repaid in a number of installments. Noninstallment debt includes single-payment loans, charge accounts, and service credit.

Among types of installment credit, automobile and other consumer-goods paper includes credit extended for the purpose of purchasing such goods, in most cases secured by the item purchased. This credit may be extended to the consumer by a retail dealer, arranged by a retail dealer through a financing institution, or extended directly to the consumer by a financial institution. All other installment credit (series X 418) includes other consumer-goods paper, repair and modernization loans, and personal loans.

Estimates are described in the *Bulletin* for April 1953, pp. 336–345. They are based for the most part on sample reports submitted monthly and are adjusted periodically to more comprehensive data. Figures prior to 1940 are based largely on estimates of the Department of Commerce.

X 423–434. Net public and private debt, by major sectors, 1916–1957.

Source: Office of Business Economics, *Survey of Current Business*, September 1953, p. 14; May 1957, p. 17; and May 1959, pp. 12 and 14.

The source publications include details for the sectors shown here as well as data on gross debt.

Net debt for the public sectors of the economy represents total outstanding indebtedness minus intrasector holdings of such debt, e.g., total Federal debt minus such portions of that debt as are held by the Treasury and by Federal agencies. State and local debt includes State loans to local units. Net corporate debt represents total corporate debt minus intercompany debts of affiliated companies. Figures for the noncorporate private debt are gross, with no adjustment for intrasector holdings.

All sectors of both gross and net debt exclude (*a*) deposit liability of banks and banknotes in circulation, (*b*) value of outstanding policies and annuities of life insurance carriers, (*c*) short-term debt of individuals and unincorporated nonfinancial business concerns held by other individuals and unincorporated businesses, and (*d*) nominal corporate debt, such as bonds authorized but not issued, and issued but reacquired.

Series X 425 includes debt of Federal agencies. Figures for State and local debt (series X 426) beginning 1950 differ slightly from earlier years, because of changes in Bureau of Census classifications. Series X 433 represents agricultural loans to farmers and farmers' cooperatives by institutional lenders. Series X 434 comprises debt incurred for commercial (nonfarm), financial, and consumer purposes, and includes debt owed by farmers for financial and consumer purposes.

chapter X

PRIVATE INSURANCE (Series X 435–500)

X 435–468. General note.

There are three general sources of primary data about life insurance as a whole: The various State insurance departments through their reports of the life insurance companies operating within their jurisdictions; commercial publishers of life insurance company data; and the trade and other associations of the life insurance companies.

Probably the most widely used of the State insurance department reports are those published annually by the New York Insurance Department. For the approximate period 1860–1880 these reports, which give data on the companies domiciled in the State and the companies of other States authorized to transact business in the State, are most frequently made use of to exhibit the progress of life insurance. The data presented in these reports for this period represent a very high percentage of the total life insurance business. Other State reports often consulted by researchers are those of Massachusetts and Connecticut.

Of the commercial publications, the most frequently used to study the progress of life insurance as a whole is the *Spectator Insurance Year Book*, published annually since 1873 by the Spectator Company, Philadelphia. (For 1873–1937, the publication was known as *The Insurance Year Book*. There has been a separate "Life" volume since 1923.)

A number of the trade and other associations in the life insurance business prepare industrywide statistics on different aspects of life insurance. The Institute of Life Insurance, New York, a public relations organization formed by the life insurance companies, compiles a number of such statistics and publishes these, as well as data from other associations and from commercial publishers, annually in the *Life Insurance Fact Book*. Two major sources of insurance statistics included in the Institute compilations are the Life Insurance Association of America and the Life Insurance Agency Management Association.

To obtain a series of figures over a long period it is not necessary to consult each annual edition of the publications mentioned above. Many of the *New York Insurance Reports* (known also as the *Annual Report of the Superintendent of Insurance*) contain a chronology which gives some of the salient statistics over a long period (sometimes only for selected years). The annual *Spectator Insurance Year Book* often gives the aggregates for all available companies for the preceding 10 years and, for the early years of this publication, a summary of data was presented for the companies operating in New York State.

The most recent *Life Insurance Fact Book* will generally give most of the preceding statistics compiled, as well as historical statistics from other sources, as far back as 1890 for some series.

In addition to the *Life Insurance Fact Book*, there are two compilations of historical statistics which are often consulted: J. Owen Stalson, *Marketing Life Insurance, Its History in America*, Harvard University Press, Cambridge, 1942 (the appendixes give data on the number of companies, life insurance sales, life insurance in force, and income as well as many other items from earliest available figures to 1937); and Frederick L. Hoffman, "Fifty Years of American Life Insurance Progress," *Quarterly Publications of the American Statistical Association*, New Series, No. 95, vol. XII, Boston, 1911 (tables of salient statistics, 1860–1910). The statistics presented in these publications do not always agree with the figures given here because in some cases different sources have been used, and in some cases adjustments and corrections of the source material have been made by the Institute of Life Insurance.

Because it represents the exception rather than the rule, it may be of interest to note two instances in which data on life insurance were collected in the decennial census of the United States. *Statistics of the United States in 1860*, 1866, pp. 293–294, contains some statistics on the number of life insurance companies, the amount of life insurance, the number of persons insured, and the annual premium income for 1860. Data on the life insurance business are also shown in the *Report on Insurance Business in the United States at the Eleventh Census: 1890, Part 2, Life Insurance*, 1895. This report contains statistics on life insurance for the decade 1880–1890 for the companies in operation as of December 31, 1889. It does not, however, reflect the business in this decade of companies which ceased to do business before December 31, 1889.

The basic reporting form utilized by all three types of primary sources in preparing their statistics is the annual statement convention blank. This is the prescribed accounting statement which each company must submit to the insurance department of each State in which it is licensed to transact business, setting forth the company's balance sheet, income and disbursement accounts, policy exhibit, and many supporting schedules. The collecting agencies supplement the data from the annual statement form from time to time through mail questionnaires, mostly among the life insurance companies.

An understanding of the historical statistics of life insurance requires some knowledge of the annual statement convention blank—the accounting methods used in preparing the form and changes in the form and methods over the years—and some knowledge of the history of life insurance.

Uniformity in the annual statement convention blank required by the States has been achieved through the efforts of the National Association of Insurance Commissioners. This association is a national organization composed of the officials of the various States who have supervision of insurance affairs within their respective States. It was formed in 1871 (under the name of the National Convention of Insurance Commissioners) and adopted its first convention blank in 1874. This organization has also achieved a degree of uniformity in insurance legislation and departmental rulings among the different States.

The convention blank has undergone revisions from time to time. The most recent significant revision in the annual statement convention blank took place in the form used for reporting the operations for 1951. Where these changes have affected the statistics shown, they are discussed below in the text for the specific series. For a complete discussion of the annual statement form now in use, and a comparison with the superseded form, see E. C. Wightman, *Life Insurance Statements and Accounts*, Life Office Management Association, New York, 1952. For a detailed discussion of two of the earlier forms, see *Life Insurance Accounts*, 1935 and 1941, by the same author and publisher.

Digitized by Google

There are many nonstatistical histories of life insurance. A few that may be consulted are: Charles K. Knight, *The History of Life Insurance in the United States to 1870*, unpublished thesis, University of Pennsylvania, 1920; *Marketing Life Insurance, Its History in America* (cited above); and *The Bible of Life Insurance*, George W. Wadsworth, 1932.

The data presented here cover only life insurance as it relates to the insurance companies which are usually referred to as the legal reserve life insurance companies. These are life insurance companies operating under insurance laws specifying the minimum basis for the reserves a company must maintain on its policies. Other types of life insurance include fraternal life insurance which is provided by societies, lodges, and similar fellowship organizations; life insurance with assessment associations, mutual aid groups, and burial societies; life insurance available through savings banks in three States; and veterans life insurance (consisting of U.S. Government Life Insurance and National Service Life Insurance) issued by the Federal Government to members of the Armed Forces and veterans of World Wars I and II.

Though in very recent years the greatest part of all life insurance in force in the United States has been provided by the legal reserve life insurance companies, veterans insurance at its peaks during or immediately after the World Wars exceeded or nearly equaled the totals achieved by the life insurance companies. Fraternal and assessment life insurance combined for the period 1879–1928 was a significant proportion of the life insurance company total (actually exceeding it for a year or two in the 1890's and never amounting to less than 10 percent of the life insurance company total for the period stated).

For historical statistics of veterans, fraternal, and assessment life insurance, see Stalson, *Marketing Life Insurance*, cited above, pp. 806–808 and 816–819.

The data for legal reserve life insurance companies which are presented here are subject to three types of limitations: (*a*) Changes in the annual statement convention blank on which the companies report their operations; (*b*) incompleteness of the data in terms of the number of companies for which information is available; and (*c*) lack of uniformity among the companies in the allocation of certain items to the categories of the convention blank, changes in allocation, and changes made by the publishers of life insurance data in their reporting methods.

Changes in the annual statement blank over the years have been discussed previously. With regard to the completeness of the statistics available, it is extremely difficult to obtain data for any given period on the operations of *all* the life insurance companies operating in the United States. Theoretically, one should be able to compile complete statistics by consulting the insurance reports of each State and the District of Columbia, but in practice this is not feasible. State insurance reports began in the 1850's but it was not until 1919 that all States (and the District of Columbia) were issuing reports. (A list of the first reports on insurance companies by State departments of insurance is given in Stalson, *Marketing Life Insurance*, cited above, pp. 775–776.) Therefore, until 1919, there is no way of obtaining data from State reports for companies which operated in only those States for which reports were not available. Subsequent to 1919, the difficulties in compiling complete statistics arise from the lack of uniformity in the various reports with regard to the selection of items to be presented and the basis of reporting, and from the failure of some States to issue reports on a regular annual basis.

The life insurance companies omitted from the sources utilized are very small in size relative to those for which data are available. Therefore, even when a fairly large number of these very small companies are omitted, they account for a very small percentage of the total business. For example, in 1956, according to the Institute of Life Insurance, the 789 companies for which life insurance in force data were available accounted for 99.7 percent of the total which would have been obtained from the 1,189 companies in existence at the end of 1956. This percentage is doubtlessly lower for the earlier years and for some of the other categories, but it is highly probable that even the oldest figures presented here represent 90 percent or more of the total for all companies. This is true both with regard to the figures taken from sources, such as the *Spectator Insurance Year Book*, which collect data from all available companies, and for the figures for about 1860–1880 which are taken from the reports of the New York Insurance Department. (For a discussion of the percentage of total business accounted for by the New York Insurance Department reports, see Hoffman, "Fifty Years of American Life Insurance Progress," cited above, pp. 11–13.)

The third limitation with regard to the data of legal reserve life insurance companies pertains to the lack of uniformity in allocation of certain items to the categories of the convention blank and changes in allocation. There are many instances where neither the categories of the annual statement convention blank nor the instructions for filing the blank are detailed enough to specify clearly how a certain transaction is to be allocated, so that the treatment becomes a matter of the company's judgment. Thus, for example, of two companies writing monthly debit insurance (a form of life insurance with some of the features of both ordinary and industrial insurance), one may classify it as ordinary and one as industrial. Moreover, a company may decide to change the classification of an item; for the example just cited, a company may transfer at some point its monthly debit business from the industrial to the ordinary classification. Such problems can arise in all the series presented. Even when an accounting procedure tends to become widespread, it is often adopted by different companies at different times.

A further problem arises from the fact that the sources which compile industrywide statistics must often combine the many categories of the annual statement convention blank into broader classifications. From time to time, the manner of combining the categories may be altered or the manner of treating special categories, which are sometimes found in a few companies' convention blank, may be changed.

Related to the problems of changes in the annual statement convention blank and variations in the allocation of items is the problem of changes in method of valuation of policy reserves and assets. The amount of policy reserves reported in a company's convention blank is determined by the types of policies issued, the length of time they have been in force, and the age at issue. The policy reserves are also affected by the mortality table used, the interest assumption, and the reserve basis specified by the various States as the minimum basis for valuation. The assets of a company, and hence its surplus, are also affected by the method of valuation of assets. The problems of changes in valuation of assets and reserves do not appear to be factors of major significance, however, with regard to long-term historical trends of these series.

The general procedure used in preparing these statistics was to examine the various sources and compare the series available as to bases of reporting, completeness of coverage, etc. In those cases where alternative series were available, the selection was determined by completeness of coverage in

Digitized by Google

terms of the number of companies for which data were obtainable, and the basis of reporting most consistent with current practice, on two conditions: (*a*) That the series be available for a sufficiently long period to preserve the trend, and (*b*) that component items could be obtained on the same basis or level of coverage as the totals. An illustration might make this clear. For 1879–1887, total assets can be obtained for all the companies operating in New York State. For the same period, totals for a larger group of companies can be obtained from the 1888 *Spectator Insurance Year Book*. The distribution of assets, by type, however, is available only for the companies operating in New York State. Rather than estimate a distribution for the larger asset totals or report a distribution which would not add to the total shown, the New York State figures were used for the total and for the distribution by type. For the period under discussion, the assets of companies operating in New York State represented from 92 to 97 percent of the assets given by the *Spectator Insurance Year Book* for all available companies.

In most cases, the various sources were identical with regard to bases of reporting and completeness of coverage. In these cases, the procedure was to compare the various sources presenting the same data for the same period. Thus for the early period, comparisons were made among the individual *New York Insurance Reports* and the summaries of these reports given in various issues of the *Spectator Insurance Year Book*, *Marketing Life Insurance*, and "Fifty Years of American Life Insurance Progress." For later years, comparisons were made among the various issues of the *Spectator Insurance Year Book* which covered the same period (mainly the 10-year aggregates as compared with the aggregates given in each *Year Book*), *Marketing Life Insurance*, and the *Life Insurance Fact Book* (which utilizes a great deal of material from the *Spectator Insurance Year Book*).

Where the figures in the various sources were in agreement, the data presented were accepted unless some limitations were uncovered while making the comparisons. Where the sources were not in agreement, the reasons for the differences were investigated and the figures considered to be most accurate and complete were accepted.

Some of the figures presented here are original in the sense that they represent adjustments by the Institute of Life Insurance of existing figures for errors in addition or for omissions. Wherever possible, published material has been utilized.

X 435. Number of life insurance companies, 1759–1957.

Source: 1759–1936, J. Owen Stalson, *Marketing Life Insurance, Its History in America*, Harvard University Press, Cambridge, 1942, pp. 748–753; 1937–1939, Institute of Life Insurance estimates; 1940–1949, same agency, records; 1950–1957, same agency, *The Tally of Life Insurance Statistics*, September 1957, p. 2 and August 1958, p. 1 (data shown here are slightly revised figures of data given in these references).

The figures comprise the total number of companies in operation at the end of the year and domiciled in the United States. This number is larger than the number of companies for which life insurance in force data are available (see general note for series X 435–468). For 1941–1949, figures do not include companies which started and then ceased operations within this period. For data on the number of companies formed, discontinued, and in operation, classified by stock and mutual for 1759–1937, see Stalson, cited above, pp. 748–753.

X 436–440. General note.

For 1854–1894, the series were derived by deducting from the insurance in force figures of U.S. life insurance companies the amount of their Canadian and other foreign business, and adding thereto the U.S. business of Canadian and other foreign companies. Data for 1895–1948 were derived from the totals of individual State estimates given in the "Life Insurance in Force by States" section of each *Spectator Insurance Year Book*.

For ordinary life insurance, the figures for 1815–1850 are for all available companies; for 1854–1877, the figures are for life insurance companies reporting to the New York Insurance Department. Beginning with 1878, the data are for all available companies. All the data for group, industrial, and credit life insurance are for all available companies.

Life insurance in force is the sum total of the face amounts (plus additions purchased with dividends) of the life insurance outstanding at a given time. The additional amount of life insurance payable under accidental death provisions (providing for payment of an additional death benefit in case of death as a result of accidental means, often called double indemnity) is not included.

Life insurance in force figures have been adjusted to represent insurance in force on the lives of residents of the United States whether issued by U.S. or foreign companies. For statistics of life insurance in force with U.S. life insurance companies, whether the policyholders are residents of the United States or of some other country, and for the number of policies outstanding, for 1900–1957, see *Life Insurance Fact Book, 1958*, pp. 15, 25, 27, 31, 33. Estimates by States are available from the "Life Insurance in Force by States" section of the annual *Spectator Insurance Year Book* and the *Life Insurance Fact Book*. For information of life insurance in force by plan of insurance, 1950, 1954, and 1957, see *The Tally of Life Insurance Statistics*, January 1959, pp. 1 and 2.

For an alternative series of life insurance in force in the United States, for selected years, 1815–1937, see *Marketing Life Insurance*, cited above, pp. 816–817. The alternative series includes fraternal, assessment, and other types of life insurance, and is derived from aggregate figures of U.S., Canadian, and foreign companies, rather than as totals of State figures.

X 436. Total life insurance in force in the United States, 1815–1957.

Source: 1815–1850, see Stalson, cited above for series X 435, p. 787 (1850 estimate corrected for addition error); 1854–1899, a summation of series X 437 and X 439; 1900–1957, Institute of Life Insurance, *Life Insurance Fact Book, 1957*, p. 8, and *1958*, p. 10.

X 437. Ordinary life insurance in force in the United States, 1815–1957.

Source: 1815–1850, see Stalson, cited above for series X 435, p. 787; 1854–1894, Institute of Life Insurance, records; 1895–1957, same agency, *Life Insurance Fact Book, 1958*, p. 25.

The 1854–1894 figures were compiled from the following sources, using the method described in the general note for series X 436–440: Ordinary insurance in force of U.S. companies: 1854–1858, Spectator Company, *Spectator Insurance Year Book*, 1878, p. 71; 1859–1877, Stalson, cited above for series X 435, p. 820; 1878–1894, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made). Ordinary business of U.S. companies in Canada: 1869–1894, Stalson, cited above for series X 435, pp. 833–834 (1873 figure adjusted; 1885–1894, industrial business in Canada of U.S. companies subtracted to get ordinary business in Canada). Ordinary business of U.S. companies in foreign countries other than Canada: 1868–1885, Stalson, cited above for series X 435, p. 824; 1886–1888, Hoffman, "Fifty Years of American Life Insurance Progress," cited above in general note

Digitized by Google

for series X 435–468, p. 86; 1889–1894, *Spectator Insurance Year Book*, 1899, p. 466. Ordinary business of Canadian companies in the U.S.: 1889–1894, Stalson, cited above for series X 435, p. 839. Ordinary business of other foreign companies in the U.S.: 1854–1870, series for U.S. branches of British companies estimated by the Institute of Life Insurance; 1871–1881, 1885–1886, State of New York Insurance Department, *New York Insurance Report*, various issues; 1882–1884, data not available, but probably insignificant.

Ordinary life insurance refers to life insurance usually issued in amounts of $1,000 or more, with premiums payable on an annual, semiannual, quarterly, or monthly basis.

X 438. Group life insurance in force in the United States, 1911–1957.

Source: Institute of Life Insurance, *Life Insurance Fact Book, 1958*, p. 27, and records.

Group life insurance is life insurance issued, usually without medical examination, on a group of persons under a master policy. It is usually issued to an employer for the benefit of employees. The individual members of the group hold certificates as evidence of their insurance.

X 439. Industrial life insurance in force in the United States, 1876–1957.

Source: 1876–1894, Institute of Life Insurance, records; 1895–1957, see source for series X 438, p. 31.

The 1876–1894 figures were compiled from the following sources, using the method described in the general note for series X 436–440: Industrial insurance in force of U.S. companies: 1876–1894, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made). Industrial business of U.S. companies in Canada: 1885–1894, *Spectator Insurance Year Book*, various issues. Canadian and other foreign companies have never written industrial life insurance in the U.S., according to available information.

Industrial life insurance is life insurance issued in small amounts, usually not over $500. Premiums are payable on a weekly or monthly basis and are generally collected at the home by an agent of the company.

X 440. Credit life insurance in force in the United States, 1917–1957.

Source: See source for series X 438, p. 33.

Credit life insurance is term life insurance sold through a lender or lending agency to cover payment of a loan, installment purchase, or other obligation, in case of death. Lending agencies are defined to include agencies that sell merchandise on time and mortgage departments of life insurance companies, as well as banks, finance companies, and other institutions or agencies to or through which financial obligations are incurred.

X 441–444. General note.

Figures represent U.S. life insurance companies' sales (including reinsurance acquired) in the United States and in other countries. Credit life insurance is excluded.

Life insurance sales represent the sum total of the face amount of life insurance sold in a given period (in this case, one year). The additional amount of life insurance payable under accidental death provisions is not included. For definitions of ordinary, group, and industrial, see text for series X 437–439.

X 441. Total sales of life insurance by U.S. life insurance companies, 1854–1957.

Source: 1854–1920, a summation of series X 442–444; 1921–1957, see source for series X 438, p. 23.

Total life insurance sales in the United States, representing all sales to residents of the United States, whether issued by U.S. or foreign companies, are available, beginning with 1940, from the source, p. 20. These series give number of policies and amount of insurance, by type.

X 442. Sales of ordinary life insurance by U.S. life insurance companies, 1854–1957.

Source: 1854–1910, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1911–1920, Institute of Life Insurance, records (based on data from summary table of Spectator Company, *Spectator Compendium of Official Life Insurance Reports* for each year); 1921–1957, see source for series X 438, p. 23.

The estimates for 1854–1877 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies. Beginning 1888, the data are on a paid-for basis; beginning 1893, they exclude revivals, increases, and dividend additions.

Monthly sales and annual sales by States since 1923 are available in Life Insurance Agency Management Association, *Monthly Sales Survey*, various issues. See also *Life Insurance Fact Book*, 1947–1958 editions. For regional data, see Department of Commerce, *Business Statistics, 1957 Biennial Edition*.

X 443. Sales of group life insurance by U.S. life insurance companies, 1911–1957.

Source: 1911–1920, Institute of Life Insurance, records (1911–1918, estimated from a survey of companies writing group life insurance at that time; 1919–1920, compiled from Group Life Exhibit in Spectator Company, *Spectator Compendium of Official Life Insurance Reports*, various issues); 1921–1957, see source for series X 438, p. 23.

The group life insurance figures are on a paid-for basis. Figures for 1912–1918 may reflect increases in existing contracts to some extent. Beginning 1919, figures exclude revivals, increases, and dividend additions.

X 444. Sales of industrial life insurance by U.S. life insurance companies, 1873–1957.

Source: 1873–1910, Spectator Company, *Spectator Insurance Year Book*, various issues; 1911–1920, *Spectator Compendium of Official Life Insurance Reports*, various issues; 1921–1957, see source for series X 438, p. 23.

Beginning 1893, figures exclude revivals, increases, and dividend additions.

X 445–458. General note.

The data for 1854–1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

In general, before 1951, income and disbursement items were reported on a cash basis (in the accounting use of the term). Beginning 1951, income and disbursement items are reported on an accrual basis (reflecting earned income and incurred claims and expenses).

Before 1951, gross investment income (without deduction of investment expenses) was reported as income, and investment expenses were reported as disbursements (included with "Commissions, expenses, taxes, and other disbursements"). Beginning 1951, investment expenses are deducted from gross investment income and the resulting net figure is reported as income.

Digitized by Google

X 445–448. Income of life insurance companies, 1854–1957.

Source: 1854–1910, see first source for series X 444; 1911–1957, see source for series X 438, p. 53.

X 446, life insurance premiums. For 1911–1957, this series was obtained by subtracting from premium income as reported in the source, the annuity premium series (series X 447) described below. Since 1947, accident and health premiums have also been subtracted from premium income.

This series includes premiums for ordinary, group, industrial, and credit life insurance, including disability and accidental death provisions. A premium is defined as the payment, or one of the regular periodical payments, a policyholder is required to make for an insurance policy.

X 447, annuity premiums. For 1911–1931, data were obtained by subtracting from the "consideration for annuities" figures given in the aggregates of the *Spectator Compendium* each year, the amount of supplementary contracts involving life contingencies. The series on supplementary contracts involving life contingencies was compiled by the Institute of Life Insurance from data in the *New York Insurance Reports* and the annual editions of Alfred M. Best Co., *Best's Life Insurance Reports*, New York. For 1932–1951, data were obtained directly by summing annuity income items from *Spectator Compendium* aggregates each year. For 1952–1955, data were obtained by summing group and individual annuity data given in Institute of Life Insurance, *The Tally of Life Insurance Statistics*, August 1956, p. 1. For 1956, Institute of Life Insurance, records; for 1957, same agency, *Life Insurance Fact Book, 1958*, p. 54.

This category includes considerations for group and individual annuities. Before 1911, figures include considerations for supplementary contracts with life contingencies. An annuity is defined as a contract that provides an income for a specified period of time, such as a number of years or for life. A supplementary contract is an agreement by the company to retain the lump sum payable under an insurance policy and to make payments in accordance with the settlement option chosen.

X 448, investment and other income. For 1911–1957, figures include considerations for supplementary contracts both with and without life contingencies. Before 1911, figures include considerations for supplementary contracts without life contingencies.

X 449–458. Disbursements of U.S. life insurance companies, 1854–1957.

Source: 1854–1918, Spectator Company, *Spectator Insurance Year Book*, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1919–1951, *Spectator Compendium of Official Life Insurance Reports* for each year; 1952–1957, Institute of Life Insurance, records.

Annual additions to policy reserves are not included. These constitute the greatest portion of the difference between income and disbursements. For data on policy reserves, see series X 467.

Figures for life insurance benefit payments paid to residents of the United States, either by U.S. or foreign companies, may be obtained, for 1940–1957, from the *Life Insurance Fact Book, 1958*, p. 89. Death benefit payments in the United States by type of insurance, number of policies, and by State may also be obtained from the annual editions of the *Life Insurance Fact Book*. Monthly benefit figures and quarterly death benefits by States may be obtained from the *Tally of Life Insurance Statistics*. A summary of monthly data for several years may be obtained from Department of Commerce, *Business Statistics, 1957 Biennial Edition*, pp. 90, 243.

X 452, matured endowment payments. This series is defined as the proceeds paid under a policy which provides that a definite sum of money be paid to the policyholder after a specified number of years if he is then living. If the policyholder dies during the endowment period, payment is made to a beneficiary (such proceeds are included as death benefits).

X 454, policy dividends. A policy dividend is defined as a refund of part of the premium on a participating life insurance policy. It is a share of the surplus earnings apportioned for distribution and reflects the difference between the premium charged and actual experience.

X 455, surrender values. A surrender value payment is the amount paid to policyholders upon surrender, for cash, of a policy before it becomes payable by death or maturity.

X 456, disability and accidental death benefits. Disability benefits are payments under a feature added to a life insurance policy, providing for waiver of premium and sometimes payment of monthly income if the insured becomes totally and permanently disabled. For definition of accidental death benefits, see text for series X 436–440.

Disability provisions became general around 1910 and benefits under these were usually included with annuity payments until 1920. Accidental death benefit provisions became general around 1917 and benefits under these were usually included with death benefits until 1920.

X 457, commissions, expenses, taxes, and other disbursements. This series includes payments on supplementary contracts, with and without life contingencies, and payments of dividends which have been left on deposit.

X 458, dividends to stockholders. Dividends to stockholders were shown as a disbursement in the annual statement convention blank before 1951. For 1951–1957, dividends to stockholders have been shown as a deduction from surplus in the surplus account.

X 459–464. Assets of U.S. life insurance companies, 1854–1957.

Source: 1854–1889, see first source for series X 444; 1890–1957, see source for series X 438, pp. 64–91.

The data for 1854–1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

Assets are on an admitted asset value basis, which is the aggregate value of all the assets used for determination of a company's balance sheet in accord with principles adopted by the insurance departments of the various States. Until about 1909, stocks and bonds were reported at market value. Until 1906, this value was determined by each individual company and, since 1907, by the insurance commissioners. In 1909, New York State required amortization of amply secured bonds, and this soon became the general practice. Stocks and nonamortizable bonds are generally reported at market value. Assets include the assets, distributed by type, of the accident and health departments of life insurance companies.

Shares of Federal savings and loan associations are included with series X 461. Series X 463 includes real estate sold on contract but does not include real estate owned subject to redemption. Foreclosed liens subject to redemption are included in "mortgages" and not transferred to "real estate" until the redemption period is past.

X 465. Net rate of interest earned on assets, 1872–1957.

Source: 1872–1909, see first source for series X 444; 1910–1914, Institute of Life Insurance, records; 1915–1957, see source for series X 438, p. 59.

Digitized by Google

The net rate of interest earned is the ratio of the investment income for the year to the mean assets decreased by one-half the investment income. For 1872–1909, the investment income is gross investment income—i.e., there was no deduction of investment expenses. For 1910–1940, the investment income is net of investment expenses (including direct investment taxes) and the Federal income taxes treated as investment expenses. Beginning 1941, the investment income is net of investment expenses (including direct investment taxes) and all Federal income taxes. For 1872–1950, the assets used in the formula are ledger assets; beginning 1951, the assets are invested assets (including cash) and interest due and accrued.

For a discussion of the level of interest earnings before 1872, see Lester W. Zartman, *The Investments of Life Insurance Companies*, Henry Holt Company, 1906.

X 466. Total liabilities, 1859–1957.

Source: 1859–1917, see first source for series X 444; 1918–1951, see second source for series X 444; 1952–1957, Institute of Life Insurance, *Life Insurance Fact Book*, 1953–1958 editions.

Data include operations of accident and health departments of life insurance companies. The 1918–1931 figures were compiled by subtracting from total liabilities as given, the amount shown as "amounts set apart." The 1932–1942 figures were compiled by subtracting from total liabilities as given, the amounts shown as "special, voluntary, contingency, etc., reserves." The 1943–1951 figures are those shown as total liabilities. The 1952–1957 figures were compiled by adding all the reserve and obligation items shown, excluding only special surplus funds, unassigned surplus, and capital.

X 467. Policy reserves, 1860–1957.

Source: 1860–1864, State of New York Insurance Department, *New York Insurance Report*, 1865, pp. clxxv–clxxix; 1865–1889, see first source for series X 444 (for certain years, adjustments were made by Institute of Life Insurance); 1890–1957, see source for series X 438, p. 61.

This series includes life, annuity, supplementary contract, disability, and accidental death reserves and, beginning 1947, business of accident and health departments of life insurance companies.

Policy reserves are defined as the funds that an insurance company holds specifically for the fulfillment of its policy obligations. Reserves are so calculated that, together with future premiums and interest earnings, they will enable the company to pay all future claims.

X 468. Capital and surplus, 1859–1957.

Source: 1859–1917 (except 1868, 1869, 1870, 1879, and 1881 which are from various *New York Insurance Reports*), see first source for series X 444; 1918–1951, see second source for series X 444; 1952–1957, Institute of Life Insurance, *Life Insurance Fact Book*, 1953–1958 editions.

The 1919–1931 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "amounts set apart." The 1932–1950 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "special, voluntary, contingency, etc., reserves" (for 1932–1942, "special, voluntary, contingency, etc., reserves" are shown as "liabilities"; for 1943–1950, this item is shown separately). The 1951–1957 figures were compiled by adding the items "special surplus funds," "unassigned surplus," and "capital."

This series includes operations of accident and health departments of life insurance companies.

X 469–482. Estimated enrollment in medical care insurance and rate per 1,000, by type of insurance, 1939–1957.

Source: Social Security Administration, records; and Health Insurance Institute, *Source Book of Health Insurance Data*, New York, 1959.

The data for insurance companies (series X 470, X 471, X 475, X 476, X 480, and X 481) are from the *Source Book* and were developed from surveys of the Life Insurance Association of America, the Health Insurance Association, the U.S. Chamber of Commerce, and other trade organizations.

The data relating to Blue Cross hospitalization plans (series X 472) were furnished directly by the Blue Cross Commission. Similarly, data for the Blue Shield plans on surgical insurance (series X 477) were furnished by the Blue Shield Commission.

Data for "All other plans" under each type of insurance (series X 473, X 478, and X 482) were compiled by the Social Security Administration for 1947–1957. Data for earlier years were estimated from reports relating to some of those years.

There are many voluntary health insurance companies or plans in the United States. The benefits of one plan for the same expense may differ markedly from the benefits under another plan, so that there may be wide variation in the adequacy of the protection afforded for the same benefit. Such differences may be reflected in the premium rates but other factors also influence premiums, so that there is not necessarily any close correlation between size of premium and type of benefits.

Both life and property insurance companies write accident and health insurance. Some are mutual companies and others are stock companies. Any company may sell both group and individual policies.

Because one plan may provide only one type of benefit and because the benefits may be limited, families frequently carry several forms of health insurance simultaneously. For this reason, the enrollment under the different categories of insurers is not additive. It is not unusual for a family to have Blue Cross hospitalization insurance, Blue Shield surgical insurance, in-hospital medical expense insurance, and an insurance policy applicable to all three types of expenses.

In general, medical insurance relates to policies that pay benefits for physicians' visits in the hospital and a limited amount of outpatient diagnostic services such as X-rays. However, some of the independent plans provide services regardless of the location of the patient, whether in the hospital, in the doctor's office, or in the patient's home.

X 483–500. Private pension and deferred profit-sharing plans—estimated coverage, contributions, reserves, beneficiaries, and benefit payments, 1930–1957.

Source: Social Security Administration, *Social Security Bulletin*, March 1960, p. 3.

These series were compiled by the Social Security Administration from releases of the Institute of Life Insurance, Securities and Exchange Commission, Department of Labor, and Internal Revenue Service, supplemented by various other reports, such as those of nonprofit organizations and the annual statements of the leading life insurance companies writing group annuities. Information was also received from various industrial concerns. In addition, for the earlier years, M. W. Latimer's studies were utilized (see M. W. Latimer, *Industrial Pension Systems in the United States and Canada*, Industrial Relations Counselors, Inc., New York, 1932).

Digitized by Google

These series present estimates with respect to formal private pension and deferred profit-sharing plans. Included are plans covering employees of industrial and nonprofit organizations. Most of them are funded although some of the self-insured plans are on a pay-as-you-go basis. The majority are single-employer plans with (in recent years) an increasing number of multiemployer plans, industry- or area-wide.

Under insured plans, insurance carriers are the medium through which benefits are provided; sponsors of the plans pay premiums to these carriers. Under self-insured plans, the sponsors themselves perform the functions of insurance carriers.

Series X 483–485 exclude pensioners and potential members who have not yet met the entrance requirements (age and/or service). The latter applies particularly to plans underwritten by life insurance companies. For insured plans, the estimated number of beneficiaries was subtracted from total coverage as reported by the Institute of Life Insurance. The larger groups under insured plans are covered by group annuity contracts, whereas individual-policy pension trusts, often providing both life insurance and annuities, cover smaller groups.

Contributions to insured plans (series X 487 and X 490) are on a net basis with dividends and refunds deducted. Those of self-insured plans (series X 488 and X 491) are for the most part on a gross basis, refunds appearing as benefit payments. For pay-as-you-go plans, contributions have been assumed to equal benefit payments.

Reserves for insured plans (series X 493) were furnished by the Institute of Life Insurance. Reserves for self-insured plans (series X 494) include those of corporate pension plans, obtained from releases of the Securities and Exchange Commission; to these were added estimated reserves of self-insured nonprofit organization and multiemployer plans.

The number of beneficiaries (series X 495–497) relate to those in receipt of periodic payments at the end of the year, thus excluding those receiving lump sums during the year. Payments under insured plans (series X 499) are net amounts. Estimates of such payments and of the number of beneficiaries (series X 496) are based on data from the annual statements of the leading life insurance companies writing group annuities (filed with State insurance departments), with estimated additions for the other types of insured coverage, largely individual pension trusts. Payments for the self-insured plans (series X 500) were obtained by adding to the Securities and Exchange Commission data the estimated payments under formal pay-as-you-go plans and under noninsured multiemployer and nonprofit organization plans. The data from SEC include lump sums and refunds from corporate pension funds (types not segregated). Therefore, dividing the payments of the year by the mean number of beneficiaries results in an overstatement of the average annual periodic payment.

[1] Beginning 1947, includes data on operations of accident and health departments of U.S. life insurance companies, not shown separately, therefore components will not add to totals.

[2] Beginning 1947, includes policy dividends paid by accident and health departments of U.S. life insurance companies.

[3] Beginning 1951, accidental death benefits included with death benefits; figures for series X 456 are for disability benefits only. Accidental death benefits approximately $30 million in 1951.

[4] Matured endowments included with death benefits.

[5] Less than $50,000.

[6] Annuity premiums included with life insurance premiums.

[7] Matured endowments and annuity payments included with death benefits.

[1] Unduplicated total. Since 5 to 15 percent of the population with each type of insurance benefit had protection under more than 1 of the kinds of policies or plans appearing under the benefits, the number of persons insured and the rates per 1,000 are lower than the sum of the numbers appearing under the different categories of insurance underwriters. Data for 1939–1946 have not been adjusted for duplication since the extent of overlapping was not known; it was less important in the earlier years.

[2] Includes members of those Blue Shield plans that provide hospitalization benefits, and members of the independent plans (i.e., fraternal, community, consumer, employer-employee, union and physician-controlled plans) that provide hospitalization benefits.

[3] Excludes medical-society-sponsored plans that are not affiliated with the Blue Shield Commission.

[4] Includes members of those Blue Cross plans that provide surgical benefits and members of medical-society-sponsored plans not affiliated with the Blue Shield Commission and of the independent plans that provide surgical benefits.

[5] Includes insurance against the costs of (a) in-hospital, medical (nonsurgical), physicians' visits, (b) visits to the doctor's office, and (c) physician visits to the patient's home. Since about 1948 most of the increase in enrollment shown has been for insurance limited to (a) in-hospital medical care. Total estimated for 1939–1946; detail not available.

[6] For 1947–1957, includes members of Blue Shield plans, those Blue Cross plans that provide in-hospital medical benefits, and the medical-society-sponsored and all other independent plans.

[7] Not available.

[8] For 1939, based on total population; all other years based on civilian population as of July 1.

ELECTIONS AND POLITICS (Series Y 1–204)

Y 1–26. Methods of electing presidential electors, 1788–1836.

Source: Charles O. Paullin, *Atlas of the Historical Geography of the United States*, Carnegie Institution of Washington and American Geographical Society of New York, 1932, p. 89.

The presidential electors of each State, now chosen by popular vote in all States, are selected, according to the Constitution, "in such manner as the legislature thereof may direct." The development of political party direction of the electoral college was not anticipated in the Constitution, and during the early years of the Republic electors were chosen in the several States by a number of different devices. The principal methods were election by the State legislature itself, by State electors popularly chosen to elect presidential electors, and by direct popular vote for the electors. With few exceptions, presidential electors have been elected by popular vote since 1828. The Legislature of South Carolina, however, continued to elect presidential electors until 1860. Since the Civil War, legislatures have chosen electors only twice—in Florida in 1868 and in Colorado in 1876.

Y 27–128. General note.

The election of the President of the United States is provided for in the Constitution, article II, section 1, through the establishment of an electoral college in each State, for each presidential election. The method of casting the electoral vote was modified in 1804 by the adoption of the 12th amendment to the Constitution. The number of electors, and therefore of electoral votes, is "equal to the whole number of Senators and Representatives to which the State may be entitled in Congress." Because of the varied practices in choosing electors in earlier years, the record of popular votes is inadequate to explain the elections until after 1824.

In four elections the entire electoral vote of certain States remained uncast: (a) 1789—no electoral vote was cast in New York because the legislature failed to agree on electors; (b) 1864—no vote in Confederate States (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North and South Carolina, Tennessee, Texas, and Virginia); (c) 1868—no vote in Mississippi, Texas, and Virginia because these States had not yet been "readmitted" to the Union; (d) 1872—the vote of Arkansas was rejected, the count of the popular vote in Louisiana was disputed, and the votes of both sets of electors were rejected by Congress.

Variations in figures reported for some States account for small differences between the sum of State data and the total shown for the United States.

Y 129–138. Congressional bills, acts, and resolutions, 1789–1958.

Source: U.S. Congress, *Calendars of the U.S. House of Representatives and History of Legislation;* Library of Congress, Legislative Reference Service, unpublished (typewritten) tabulations; U.S. Congress, *Congressional Record*, various issues.

Some measure of the activities of the U.S. Congress can be gained from the number of bills and resolutions which have been introduced in Congress and from the number of public and private laws which have been passed. The abrupt reduction in the number of private bills enacted into law beginning with the 60th Congress was the result of combining many private bills, particularly pension bills, into omnibus enactments.

pp. 174–179, 70th to 74th Congresses); 75th to 85th Congresses, U.S. Congress, *Congressional Directory*, annual volumes.

It is generally recognized today that popular government operates only through the agency of organized political parties. During the early development of the United States, party alignments and the function of political parties were neither fully appreciated nor provided for. Party alignments developed during the formative period, but designations for the different groups were not firmly fixed.

In the classification by party, the titles of parties during early years have been so designated as to be recognizable in the records of the periods concerned, and also to show the thread of continuity which tends to run from early alignments into the present 2-party system. Inasmuch as the party of Thomas Jefferson (generally known at the time as the Republican party) has with a considerable measure of continuity survived to the present time as the Democratic party, the name later accepted by the Jeffersonian Republicans of "Democratic-Republican" is used in the tables to avoid any confusion of the early Jeffersonian Republican with the present-day Republican party. Opposed to the early Republican party was the Federalist party which was dominant in the first national administration and which, with interruptions, can be traced tenuously by elements of popular support through the National Republican, the Whig, and the Free Soil parties to the Republican party of today.

Y 146–149. Vote cast for Representatives, by political party, 1896–1956.

Source: Governmental Affairs Institute, Washington, D. C., records. (Figures adapted by Richard M. Scammon from Cortez A. M. Ewing, *Congressional Elections, 1896–1944*, University of Oklahoma Press, Norman, 1947, and from unpublished work sheets used in its preparation; the first and second editions of Governmental Affairs Institute, *America Votes*, Macmillan Company, New York, 1956 and 1958; and the biennial reports of the Clerk of the House of Representatives giving statistics of Congressional voting.)

Y 150–154. Apportionment of Representatives among the States, 1790–1950.

Source: Bureau of the Census, *U. S. Census of Population: 1950*, vol. I, p. xix, and records.

The number of members in the House of Representatives was fixed by the Congress at the time of each apportionment; since 1912 it has remained constant. The 14th amendment to the Constitution, in effect since 1868, provides that "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." At the time of the 1940 apportionment, it was determined that there were no longer any Indians who should be classed as "not taxed" under apportionment law.

Prior to the passage of the 14th amendment, Representatives were apportioned among the States "according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons." (Art. I, sec. 2.) The original assignment of Representatives for each State, to be in effect until after the first enumeration of the population, and the requirement that each State have at least one Representative, are also included in the Constitution.

Y 155–204. Apportionment of membership in House of Representatives, by States, from adoption of Constitution to 1950.

Source: Bureau of the Census, *Statistical Abstract of the United States, 1958*, p. 350.

Membership is shown as at the date of the fixing of the new House apportionment plus members added for new States admitted during the subsequent decade. No reapportionment was made following the 1920 Census, and no change in total House membership has been made since 1912. Major boundary changes affecting State representation in the House occurred in 1820, when Maine was separated from Massachusetts, and during the Civil War with the separation of West Virginia from Virginia.

Series Y 1–26. Methods of Electing Presidential Electors: 1788 to 1836

[L—by legislature; G T—by people, on general ticket; D—by people, in districts; A—by people, in the State at large; E—by electors. The number in parentheses following the symbol "D" is the number of districts into which the State was divided. As a rule, each district elected 1 elector. The number in parentheses following the symbol "A" is the number of electors elected at large]

[1] A majority of the popular vote was necessary for a choice. In case of a failure to elect, the legislature supplied the deficiency.

[2] A majority of votes was necessary for a choice. In case of a failure to elect 1 or more electors a second election was held by the people, at which choice was made from the candidates in the first election who had the most votes. The number of candidates in the second election was limited to twice the number of electors wanted.

[3] 1 district chose 6 electors; 1, 5 electors; 1, 4 electors; 2, 3 electors each; and 1, 1 elector.

[4] A majority of votes was necessary for a popular choice. Deficiencies were filled by the General Court, as in 1792. It also chose 2 electors at large. In 1796 it chose 9 electors, and the people, 7.

[5] 2 of the districts voted for 5 members each, and 2 for 3 members each. A majority of votes was necessary for a choice. In case of a failure to elect by popular vote the General Court supplied the deficiency. In the election of 1792, the people chose 5 electors and the General Court, 11.

[6] Each of the 8 districts chose 2 electors, from which the General Court (i.e., the egislature) selected 1. It also elected 2 electors at large.

[7] 1 district elected 3 electors; 2, 2 electors each; and 27, 1 elector each. The 34 electors thus elected chose 2 presidential electors.

[8] Each qualified voter voted for 1 elector. The 3 electors who received most votes in the State were elected.

[9] 1 district chose 4 electors; 1, 3 electors; 1, 2 electors; 1, 1 elector.

[10] During the years 1804–1828, Maryland chose 11 electors in 9 districts, 2 of the districts elected 2 members each.

[11] The State was divided into 4 districts, and the members of the legislature residing in each district chose 3 electors.

[12] 2 districts chose 5 electors each, and 1 chose 4 electors.

[13] Each district elected 4 electors.

[14] In 1796 and 1800, Tennessee chose 3 presidential electors—1 each for the districts of Washington, Hamilton, and Mero. 3 "electors" for each county in the State were appointed by the legislature, and the "electors" residing in each of the 3 districts chose 1 of the 3 presidential electors.

[1] 1 Democratic elector voted for Walter Jones.
[2] Includes a variety of joint tickets with People's Party electors committed to Bryan.
[3] Greeley died shortly after the election and presidential electors supporting him cast their votes as indicated, including 3 for Greeley, which were not counted.
[4] Whig tickets were pledged to various candidates in various States.
[5] No candidate having a majority in the electoral college, the election was decided in the House of Representatives.
[6] Prior to the election of 1804, each elector voted for 2 candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President, the next highest, Vice President. This provision was modified by adoption of the 12th amendment which was proposed by the 8th Congress, Dec. 12, 1803, and declared ratified by the legislatures of three-fourths of the States in a proclamation of the Secretary of State, Sept. 25, 1804.

Series Y 32–79. Electoral Vote Cast for President, by Political Party, for States: 1804 to 1956

[Electoral votes are given for the period following the revision of the method of election in 1804, using these letter symbols for the various political parties: A—American; AJ—Anti-Jackson; AM—Anti-Masonic; C—Coalition; CU—Constitutional Union; D—Democratic; DR—Democratic-Republican; F—Federalist; N—Nullification; NR—National Republican; PP—People's Party; PR—Progressive; R—Republican; SD—Southern Democratic; SR—States' Rights; W—Whig. In the 1824 election, party lines were so indistinct that names of the individual candidates have been used]

Series Y 32-79. Electoral Vote Cast for President, by Political Party, for States: 1804 to 1956—Con.

[Electoral votes are given for the period following the revision of the method of election in 1804, using these letter symbols for the various political parties: A—American; AJ—Anti-Jackson; AM—Anti-Masonic; C—Coalition; CU—Constitutional Union; D—Democratic; DR—Democratic-Republican; F—Federalist; N—Nullification; NR—National Republican; PP—People's Party; PR—Progressive; R—Republican; SD—Southern Democratic; SR—States' Rights; W—Whig. In the 1824 election, party lines were so indistinct that names of the individual candidates have been used]

[1] 1 elector voted for Walter Jones.
[2] Electors classed here as Democratic were elected in many States on joint Democratic and People's Party fusion tickets.
[3] Electoral votes from Arkansas and Louisiana were not counted. Due to the death of Greeley, Democratic electors divided their votes among Hendricks (42), Brown (18), Jenkins (2), and Davis (1).
[4] Mississippi, Texas, and Virginia did not participate in the election.
[5] Confederate States did not participate in the election.
[6] Excludes 3 votes for Greeley, which were not counted.
[7] 1 each for Republican, Democratic, and People's Party.
[8] Whig electors divided their votes among Harrison (73), White (26), and Webster (14).
[9] Vote was as follows: 2 for Crawford, 1 for Adams.
[10] 1 elector did not vote.
[11] Vote was as follows: 2 for Jackson, 1 for Adams.
[12] Vote was as follows: 3 for Jackson, 2 for Adams.
[13] 2 electors did not vote.
[14] Vote was as follows: 7 for Jackson, 3 for Adams, 1 for Crawford.
[15] 3 electors did not vote.
[16] 1 elector voted for John Quincy Adams.
[17] Vote was as follows: 26 for Adams, 5 for Crawford, 4 for Clay, 1 for Jackson.
[18] 6 electors voted for George Clinton.

[1] Excludes the population of the District of Columbia, the population of the Territories, the number of Indians not taxed, and (prior to 1870) two-fifths of the slave population.
[2] Actual number apportioned at the beginning of the decade.
[3] No apportionment was made after the Census of 1920.
[4] Amended by the act of May 30, 1872.
[5] Amended by the act of March 4, 1862.
[6] Amended by the act of July 30, 1852.
[7] The minimum ratio of population to Representatives stated in the Constitution (art. I, sec. 2).

Digitized by Google

Series Y 155–204. Apportionment of Membership in House of Representatives, by States, From Adoption of Constitution to 1950

[Population figures used for apportionment purposes are those determined for States by each decennial census. Until 1940, population for apportionment purposes excluded Indians not taxed and until 1870, excluded two-fifths of slaves. Until 1850, apportionment ratios were chosen arbitrarily; 1850 to 1900, ratios were apportionment population of U.S. divided by predetermined number of Representatives; from 1910 on, apportionment ratios shown were computed by dividing fixed number (435) of Representatives into apportionment population but were not used in the original calculations, which were based on priority lists. No reapportionment based on 1920 Population Census. For discussion of apportionment methods, see S. Doc. No. 304, 76th Cong. 3d sess., *A Survey of Methods of Apportionment in Congress*, by Edward V. Huntington]

[1] See headnote.
[2] Number of Representatives not to exceed 1 for each 30,000 inhabitants.
[3] Membership originally fixed at 283 but increased to 292 by act of May 30, 1872 (17 Stat. L. 192). One Member assigned to Colorado after apportionment.
[4] Membership increased from 233 to 241 by act of Mar. 4, 1862 (12 Stat. L. 353). See footnote 6.
[5] Membership increased from 233 to 234 by act of July 30, 1852 (10 Stat. L. 25). See footnote 6.
[6] Assigned after apportionment.
[7] Included in apportionment act in anticipation of statehood.
[8] Included in the 20 Members originally assigned to Massachusetts but credited to Maine after its admission as a State, Mar. 15, 1820 (3 Stat. L. 555).

GOVERNMENT EMPLOYMENT AND FINANCES (Series Y 205–714)

Y 205–714. General note.

Governmental services in the United States are provided through a complex organizational structure made up of numerous public bodies and agencies. In addition to the widely recognized pattern of Federal, State, county, municipal, and township governments, there exist many offshoots in the form of single-function and multiple-function districts, authorities, commissions, boards, and other entities that have varying degrees of autonomy. The basic pattern differs widely from State to State. Within a particular State, the various classes of local units may also differ in their characteristics.

Identification and enumeration of governmental units is, of course, a prerequisite to comprehensive reports on their activities. Thus, the report *U.S. Census of Governments: 1957*, vol. I, No. 1, *Governments in the United States*, provides information on numbers of governmental units by type, size, and location.

The summary historical table from the 1957 Census of Governments, reproduced below, presents the numbers of different types of governmental units, for 1942, 1952, and 1957.

Table I. Governmental Units, by Type: 1942, 1952, and 1957

Type of government	Number of units			Change in number	
	1957	1952	1942	1952 to 1957	1942 to 1957
Total	102,328	116,743	155,116	−14,415	−52,788
U. S. Government	1	1	1		
States	48	48	48		
Counties	3,047	3,049	3,050	−2	−3

[1] Corrected figure.

Comparable data for the number of governments are not available for earlier years, principally because definition of the concept of "a governmental unit" and enumeration of the units in existence are beset with many difficulties. Professor William Anderson of the University of Minnesota has done extensive work in this field, and the enumerations by the Bureau of the Census in 1942 and later reflect his contributions.

Anderson's classic monograph, *The Units of Government in the United States: An Enumeration and Analysis*, first published in 1934 and revised in 1936, was extensively revised in 1942 and finally republished in 1945 with an appendix comparing the author's enumeration of governments with that of the 1942 Census of Governments. (Public Administration Service, Chicago, 1945.) Anderson reported 175,418 governments in the United States in 1930–33 and 165,049 in 1941. The 1942 Census of Governments adopted a more selective definition, eliminating 9,729 school districts and 204 other units from enumeration as separate entities. Anderson reported that he had "good reason to believe that the Bureau's figures represent a more accurate enumeration." (Source cited above, p. 48.)

The comparative totals reported by Anderson, on the basis of his definitions and procedures, are summarized below.

Table II. Governmental Units, by Type: 1930–33 and 1941

Type of government	1941	1930–33	Change in number
Total	165,049	175,418	−10,369
U.S. Government	1	1	
States	48	48	
Counties	3,050	3,053	−3
Incorporated places (cities, villages, etc., and D.C.)	16,262	16,366	−104
Towns (as in New England) and organized townships (in a total of 23 States)	18,998	20,262	−1,264
School districts	118,308	127,108	−8,800
Other units	8,382	8,580	−198

The definition of a governmental unit employed in the 1957 Census of Governments (*Governments in the United States*, cited above, p. 9) is as follows:

> A government is an organized entity which, in addition to having governmental character, has sufficient discretion in the management of its own affairs to distinguish it as separate from the administration structure of any other governmental unit. To be defined as a government, any entity must possess all three of the attributes reflected in the foregoing definition: Existence as an organized entity, governmental character, and substantial autonomy.

Characteristics taken as evidence of the "essential attributes" of a separately existing governmental unit include organization, active operation, and the possession of specific corporate powers; the popular election or appointment of officers; the power to levy taxes or to issue debt that bears interest exempt from Federal taxation; responsibility for performing a function commonly regarded as governmental; public accountability; and considerable administrative and fiscal independence.

Despite the variety and apparent simplicity of these criteria, the proper classification of some local governmental entities remains doubtful, and in such cases, account has been taken of (*a*) local attitudes as to whether the type of unit involved is independent, and (*b*) the effect of the classification upon the collection and presentation of statistics of governmental finances and employment.

Two broad categories of governmental units may be distinguished—special-purpose organizations, such as school, park, and sanitary districts; and general-purpose governments, each with a broad spectrum of powers and duties, ranging in size from small village and town governments to the large metropolitan city, State, and Federal governments.

These diverse units can be represented by at least two kinds of measures that are universally applicable: (*a*) the number of persons serving in each governmental unit and their compensation, and (*b*) the broad financial aspects of the operations, as represented by revenues, expenditures, and indebtedness. The collection and reporting of such data are complicated by the large numbers and frequent changes of the governmental units to be covered, by changes (often unrecorded) in their internal structures and external relationships, and by the great diversity that exists in organizational forms, employment relationships, financial procedures, the adequacy and availability of records, and the categories and terminologies used in those records and in public reporting. For the most part, data for the Federal Government are derived from regular personnel and fiscal reports, published annually or

Digitized by Google

oftener. Those for the States and large cities are compiled from annual public reports or other official records of each unit and its component organizational subdivisions; and those of other local governments are derived from surveys based on similar reports and records of carefully selected samples of each type of government.

Complete censuses of governments, covering governmental structure, personnel, expenditures, revenues, debt, and other selected aspects of all governments in the United States, were conducted for 1932, 1942, and 1957. Earlier periodic censuses (for decennial years for 1850–1890 and for 1902, 1912, and 1922) were narrower in scope, particularly with reference to expenditures and personnel.

The various censuses of governments and also the annual reports on personnel and finances, differ not only in completeness, but also in some of the basic concepts and classifications. Consequently, the preparation of historically comparable data covering all governmental units is extremely difficult. As is evident in the historical series for the Federal Government, events and changing concepts greatly affect the comparability, over long periods, of data for a single government. The problem of continuity in concepts and classifications is greatly multiplied in summaries for all governmental entities.

For such reasons, the consolidated historical series now available are for selected years beginning with 1902. The data available for earlier years are either inadequate for classifications now used or require more extensive reworking than could be achieved with available resources.

State and local government data in this chapter relate to continental United States. They omit Alaska, Hawaii, and possessions outside the continental limits. The District of Columbia is classified as a local government.

For references to publications containing the original data and statistics for individual State and local governments, see text below for series Y 517–714.

For still another approach to the role of Government operations in the economy, see series F 81–86, reporting Government purchases of goods and services, in which the Federal Government totals for 1938–1957 are subdivided between national security and other purposes. For national income originating in "Government" as an industry, see series F 32; and for estimates of "Government product" in the national income accounts, see series F 48.

Y 205–253. General note.

Statistics on government employment and payrolls in the United States appear in the appendix to a comprehensive study by Solomon Fabricant, assisted by Robert E. Lipsey, *The Trend of Government Activity in the United States since 1900*, National Bureau of Economic Research, New York, 1952, pp. 161–203. Fabricant and Lipsey relate their figures to the government employment data for 1929–1949 and earlier periods published by the Office of Business Economics and predecessor agencies. The latter figures differ from the former chiefly in omitting, for national income accounts, all Federal Government employees abroad. Also differentiated are earlier estimates prepared for the National Bureau of Economic Research by Simon Kuznets in *National Income and Its Composition, 1919–1938*, New York, 1941, vol. II, pp. 811–826. This study did not have data from the Work Projects Administration-Bureau of Labor Statistics compilations noted below. For reference to other studies for earlier years, see text for series Y 251–253.

The WPA-BLS figures, mentioned above, cover 1929–1939. They were obtained as part of a larger survey of State and local governments conducted in 1938–1943 by the Bureau of Labor Statistics and financed and staffed by the Work Projects Administration. Annual estimates of employment and payrolls of State and local governments and the underlying detailed estimates of States, by classes of governments and major fields of employment, were published by the Bureau of Labor Statistics in *Employment and Pay Rolls of State and Local Governments*, January 1946 (processed).

Sample surveys by the Bureau of the Census began in 1940 on a quarterly basis, giving reports of January, April, July, and October data. After January 1955, the surveys were made annually for the month of October, except for 1957, the year of the detailed census of governments.

School data prior to 1946 were from the Office of Education and reported only in terms of State and local aggregates, so that detail by level and type of government relates only to the nonschool data.

Beginning with 1955, the Bureau of Labor Statistics assumed responsibility for providing monthly statistics on government employment and payrolls. Census publication of monthly data on a quarterly reporting basis ceased at that time. Comparability between the payroll series compiled by the two agencies was maintained, so that the payroll statistics are continuous. Monthly estimates of employment compiled by the Bureau of the Census include nominal employees of local governments and exclude, during the summer months, regular members of school faculties who were not paid for those months. The Bureau of Labor Statistics series excludes the nominal employees and includes school employees throughout the year. To this extent, it differs from the earlier Census Bureau series.

The BLS employment and payroll data for 1955–1957 were issued in a processed monthly release, *State and Local Government Employment and Payrolls*, with occasional issues carrying cumulative tabulations and explanatory notes. The employment estimates (but not the payroll series) were included also in the BLS monthly publication, *Employment and Earnings*, table A-5.

Both series Y 207–209 and Y 251–253 cover all types of special-purpose districts as well as general-purpose local governments and all branches of the State governments; and both include the employees of government utilities as well as of general government services and agencies. School employment includes noninstructional staff and the educational employees of State as well as local governments. Both tabulations omit military personnel and persons on work relief.

Federal Government employment and payrolls, series Y 206 and Y 224, respectively, are originally from the Civil Service Commission for 1952–1957. Prior to 1952 these data are basically the Bureau of Labor Statistics figures and, therefore, differ in coverage and date from the Civil Service Commission's historical tabulations for the Federal Government alone (series Y 241–250).

Differences from labor force data.—Data collected from the governmental employers, such as the Bureau of the Census and Bureau of Labor Statistics compilations on public employment referred to above, necessarily differ from government employment statistics derived from broad surveys of the labor force.

Data on the labor force, and therefore on government workers, are collected by the Bureau of the Census in monthly surveys and published in its *Current Population Reports*. These surveys involve direct personal interviews with selected samples of households throughout the Nation. Governments are listed as an industry group, and members of the labor force who report that they are government workers are so

Digitized by Google

classified. However, these compilations do not yield information on the employment and payroll totals of individual governments, types of governments, governments in specified geographic areas, or the functions of public employees. These aspects of public administration require the collection of information from employing governments.

Moreover, statistics resulting from the labor force surveys are affected by the shifts of individuals between jobs; by movements of individuals from government to nongovernment employment, or to unemployment or retirement from the labor force; and by multiple jobholding and other factors. The Fabricant-Lipsey study, cited above, compares the differing approaches to analyses of statistics of governmental employment and payrolls.

Y 205–240. Public employees and government monthly payrolls, by type of government, 1940–1957.

Source: 1940–1956, Bureau of the Census, *State Distribution of Public Employment in 1956*, 1957, p. 7; 1957, *U.S. Census of Governments: 1957*, vol. II, No. 1, *Summary of Public Employment*, p. 13.

Data on Federal employment and payrolls were obtained from the Bureau of Labor Statistics prior to 1952 and the Civil Service Commission since that time. BLS figures were based on Civil Service data. Substantially all basic data for State and local governments were collected by mail surveys of the Bureau of the Census. However, prior to 1946, data on school employment were obtained from Office of Education, *Biennial Survey of Education in the United States.*

Public employees, as defined for the purpose of the Bureau of the Census survey of government employment, include all paid officials and civilian employees of Federal, State, and local governmental units. Employees of contractors, other persons serving governments on a contract basis, and persons on work relief are not considered public employees. The term, however, does include fee officials, paid volunteer firemen, student help, and other persons serving on a part-time basis even though they may receive only nominal compensation for their services. Military personnel and their pay are omitted.

Full-time employees are those persons employed during the pay period for the number of hours per week prescribed for full-time work in the jurisdiction concerned. The term includes temporary and emergency employees working on a full-time basis during the pay period.

Payrolls, series Y 223–240, include salaries, wages, fees, and other compensation earned in the calendar month by officials and other employees. (Amounts reported for semimonthly, biweekly, weekly, or other nonmonthly periods are adjusted to monthly equivalents.) Amounts reported are gross pay before deductions for withholding taxes, retirement contributions, social security, and other purposes. Full-time payrolls, series Y 225–240, are amounts paid to full-time employees as defined above.

Figures for State governments include, in addition to data for the regular departments and agencies, data for boards, commissions, authorities, institutions of higher education, and other semiautonomous agencies of State government. State employees include all persons paid by the State government. Thus, employees of the public school system, usually a local government function, are classified in North Carolina as State government employees because their salaries are paid directly by the State government. Some public school system employees in Delaware and Maine and a scattering of such employees in a few other States are similarly treated.

Employees on paid vacations are included in the data for State and local employment. Those on extended unpaid absence are excluded.

Figures for cities (series Y 216–217, Y 234–235) are for city, borough, village, and—except in New England, New York, and Wisconsin—town governments. They include boards, commissions, and semiautonomous districts and authorities controlled by such governments, as well as the regular municipal departments and agencies. In a number of States, some or all of the public schools serving city areas are operated by city governments, and city figures include their employees.

Figures for counties (series Y 218–219, Y 236–237) include data for semiautonomous county agencies and for public schools or school facilities operated by county governments in a few of the States.

Data on school districts are restricted to independent districts operating public schools. They do not include data for school systems operated by State, city, county, or town governments. Between 76 and 81 percent of all local government education employees in October of each year, 1946–1956, were employees of independent school districts.

In addition to townships of the Midwestern States, which have limited governmental functions and play a minor role, township data include figures for New England, New York, and Wisconsin towns, and Pennsylvania and New Jersey townships, where town and township governments are important in the local government structure. The New England town figures include school information in five States (all except New Hampshire) in which town governments administer public schools. Data on special districts are for special-purpose units of local government set up to perform a specific service or services in a local area, but which are administratively and fiscally independent of the broader types of local government having jurisdiction in the area. These units range in size from drainage districts and other agricultural-resources districts having only intermittent activity or employment up to such entities as the Chicago Transit Authority, the Port of New York Authority, and other large-scale governmental employers.

Y 241–250. Paid civilian employment of the Federal Government, 1816–1957.

Source: Civil Service Commission, records.

The data for 1816–1891 were compiled by the Civil Service Commission from *Official Register of the United States;* for 1901–1911, from the *Annual Report* of the Civil Service Commission and *Official Register;* for 1908–1957, from the Civil Service Commission, *Annual Report* and *Monthly Report of Federal Employment,* and supplemented throughout by Civil Service Commission records.

Prior to 1938, the data are for employees on the rolls, with or without pay; for 1938–1942, the number on the payroll with pay; and for 1943–1957, the number in active duty status.

Employees and officials of the legislative, judicial, and executive branches are included throughout. Employees of the District of Columbia are not included; they are considered employees of a local government.

The figures exclude military personnel but include civilian employees of the military departments. However, mechanics and other workmen at army arsenals and navy yards are not included prior to 1881.

The data for the Post Office, series Y 247, exclude contractors but include substitutes, partly estimated.

Series Y 244 represents personnel employed under the act of January 16, 1883, establishing the Civil Service Commission

Digitized by Google

and the competitive (classified) service. This service includes all civilian positions in the executive branch of the Federal Government that are not specifically exempted by or pursuant to statute, or by the Civil Service Commission. It also includes all positions in the legislative and judicial branches which are specifically made subject to the civil service laws by statute. Figures represent positions prior to 1947; for 1948–1957, they represent employees serving under competitive appointment.

Y 251–253. State and local government employment, 1929–1957.

Source: Bureau of Labor Statistics, records.

Data for 1929–1939 are derived from a WPA-BLS survey (see general note for series Y 205–253). Figures for 1940–1954 are from Bureau of the Census reports on public employment (incorporating data for 1940–1945 from the *Biennial Survey of Education* of the Office of Education), and for 1955–1957, from the Bureau of Labor Statistics compilations.

These data differ from series Y 207–209 for 1940–1957 because they measure average monthly employment in each calendar year, whereas series Y 207–209 are for October 31 of each year (except for 1957, when the date is April 30). In the annual averages for 1929–1957, regular teachers are included for the summer vacation period, whether or not they were specifically paid in those months; and nominal employees are omitted.

For a discussion of studies conducted by Federal agencies, see general note for series Y 205–253. Estimates of employment and payrolls for the years 1909–1927 appear in Wilford I. King, *The National Income and Its Purchasing Power*, National Bureau of Economic Research, 1930, pp. 360–365; and for 1926, a study by William E. Mosher and Sophie Polah based on approximately 500 reports from State and local governments, published in "Public Employment in the United States," supplement to *National Municipal Review*, vol. XXI, No. 1, January 1932.

Relying heavily on the Mosher-Polah article and public employment data issued by the Bureau of Foreign and Domestic Commerce in connection with certain of its national income studies, Simon Kuznets, in *National Income and Its Composition, 1919–1938*, National Bureau of Economic Research, 1941, vol. II, pp. 811–826, published revised estimates of government employees and payrolls for 1919–1938.

Y 254–257. Summary of Federal Government finances, 1789–1957.

Source: Treasury Department, *Annual Report of the Secretary of the Treasury, 1958*, pp. 392–397 and 469–470.

Receipts and expenditures for 1789–1915 are based on warrants issued; for 1916–1952, on daily Treasury statements; for 1953–1957, on the Treasury's *Monthly Statement of Receipts and Expenditures of the United States Government.* Total gross debt is on the basis of public debt accounts for 1791–1915, and on the basis of daily Treasury statements for 1916–1957. For description of the *Daily* and *Monthly Statements of the Treasury*, explanation of "warrants issued," "public debt accounts," and other pertinent items, see the source, pp. 385–388.

The receipts and expenditures data exclude amounts received in trust and expended from trust accounts. They also exclude amounts borrowed through the sale of Government securities and amounts paid to retire public debt. Receipts include the proceeds of sales of some types of Government-owned assets, including land. For recent years, however, proceeds from the disposition of some categories of Government property (including sales of commodities and securities purchased and repayments received on account of loans made by the Government) are reported as deductions from expenditures, rather than as receipts. Postal receipts and expenditures are included net for each year throughout the series; that is, a postal surplus is included in receipts and a postal deficit in expenditures.

Subject to the foregoing qualifications, figures for Federal Government receipts (series Y 254) represent "total receipts" through 1930 and "net receipts" thereafter. In determining net receipts, the following items are deducted from total receipts:

Refunds of receipts, principally for the overpayment of taxes, 1931–1957. (For earlier years, such refunds are included in expenditures.)

Transfers of tax receipts to the Federal old-age and survivors insurance trust fund, 1937–1957; to the railroad retirement account, 1938–1957; to the Federal disability insurance trust fund and the highway trust fund, 1957.

Capital transfers, consisting of payments to the Treasury principally by wholly owned Government corporations for retirement of capital stock and for disposition of earnings. (Although the exclusion applies to all fiscal years for 1931–1957, the only transfer of this kind identified for 1931–1939 was an item of $250 thousand in 1937.)

Figures for expenditures for 1931–1957 likewise are net of refunds paid and of capital transfers, but include any such payments in earlier years. For 1951–1957, investments of wholly owned Government corporations in public debt securities are excluded.

The surplus or deficit (series Y 256) is the difference between receipts and expenditures in any fiscal year. The change in public debt during any year is usually determined in large part by the surplus or deficit; it is, however, affected also by the increase or decrease in the Treasury cash balance and by various other financial operations. Consequently, there is only an approximate relationship between series Y 256 and the year-to-year differences in the debt reported in series Y 257.

For comments on the total gross debt (series Y 257) and other aspects of the public debt, see text for series Y 368–379. For the differences between series Y 254–257 and the data on receipts from and payments to the public, see text for series Y 380–383.

In a statement on "Some Historical Aspects of Federal Fiscal Policy, 1790–1956" (in *Federal Expenditure Policy for Economic Growth and Stability*, papers submitted by panelists appearing before the Subcommittee on Fiscal Policy, Joint Economic Committee, 85th Congress, 1st sess., Nov. 5, 1957, Joint Committee Print, pp. 60–83), the official historical series on Federal receipts and expenditures—such as series Y 254 and Y 255—were characterized by Professor Paul B. Trescott as subject to "certain deficiencies for the economist" stemming in part from "capricious patterns of inclusion and exclusion." Important before 1870, according to Trescott, was lack of conformity between the accounts of the Treasury, which the official data summarize, and the accounts of the collecting and disbursing officers who actually dealt with the public. He reported that the payment of $28 million of surplus revenue to the States in 1837 was omitted from Treasury accounts; that more than $100 million reported in Treasury figures of expenditures in the Civil War years was accumulated in disbursing officers' balances; and that various other adjustments were desirable. In compiling alternative totals of receipts and expenditures on the basis of various official records additional

Digitized by Google

to Treasury accounts, Trescott has adopted special concepts, so that the resulting totals are designed primarily to measure money-flows. To some extent, his work incorporates a revised expenditure series compiled by M. Slade Kendrick in *A Century and a Half of Federal Expenditures*, National Bureau of Economic Research, New York, Occasional Paper 48, revised, 1955. Kendrick's data are as nearly as possible on a cash-payment basis for 1917–1952 (see Appendix B, especially p. 67).

Y 258–263. Federal Government receipts, 1789–1957.

Source: All series except Y 263, Treasury Department, *Annual Report of the Secretary of the Treasury, 1958*, pp. 392–396; series Y 263, 1796–1945, *Annual Report of the Secretary of the Treasury, 1946*, pp. 422–423, and 1946–1948, *Monthly Statement of Receipts and Expenditures of the United States Government.*

These data exclude receipts from borrowing. For the distinction between "total receipts" (series Y 259) and "net receipts" (series Y 258), see text for series Y 254–257. In recent years, these totals have been designated in the President's annual budget and in Treasury reports as "Gross budget receipts" and "Net budget receipts"; and the Bureau of the Budget, *Budget of the United States Government*, has included annually a special analysis giving detailed explanations and comparisons for the last-completed fiscal year, the current year, and the budget year.

In both the "total" and the "net" receipts, postal receipts are included net for each year when they exceeded postal expenditures, and they are included only to the extent of any such excess. For historical series relating to postal receipts and expenditures for 1789–1957, see the *Annual Report of the Secretary of the Treasury, 1946*, pp. 419–421, and *1958*, p. 461. (See also series Y 416, Y 460, and Y 496, below.)

Y 264–279. Internal revenue collections, 1863–1957.

Source: Treasury Department, *Annual Report of the Secretary of the Treasury, 1929*, pp. 419–424; *1946*, pp. 406–409; and *1958*, pp. 454–458.

The three *Annual Reports* overlap as to years covered. To the extent that they differ in the grouping of items in any given year, the tabulation shown here generally follows the later compilation; however, some exceptions are indicated below.

In *Historical Statistics of the United States, 1789–1945*, series P 109–119, the corresponding figures exclude trust fund receipts for 1935–1945. The data shown here for series Y 264–279 follow later Treasury practice by including, among internal revenue collections, all taxes collected by the Internal Revenue Service, whether assigned to general revenue or to trust funds.

These data are from Internal Revenue Service reports of collections. They differ from figures shown in other series, particularly series Y 261 (although the deviations in some years are small and the two series agree for 1904, 1909, 1955, and 1957). The variations reflect differences in the time or stage of operations when the receipts are recorded. Taxes are included in budget receipts when reported in the account of the Treasurer of the United States. Internal Revenue Service reports of collections through 1954 included taxes for which returns (and payments) had been received in internal revenue offices. Under arrangements begun in 1950 for withheld individual income tax and old-age and survivors insurance taxes, and later extended to railroad retirement taxes and many excises, these taxes are paid directly into Treasury depositaries. The depositary receipts, issued as evidence of such payment, are attached to quarterly returns submitted to the Internal Revenue Service by employers and taxpayers. Under this procedure, the amounts are included in budget receipts in the month and year when the depositary receipts are issued.

Effective July 1, 1954, this accounting practice was extended to Internal Revenue Service reports of collections, so that the reported collections after fiscal 1954 likewise include depositary receipts in the month when the depositary receipts are issued.

Excise taxes paid into depositaries cannot be fully classified in terms of specific taxes until the supporting returns are received. Consequently, the collections shown for designated excise taxes in fiscal years after 1954 are subject to an undistributed adjustment. (For the amounts involved, see *Annual Report of the Secretary of the Treasury, 1958*, p. 458.)

The principal taxes included in totals but not shown separately are as follows:

1863–1915. Income and profits, largely 1863–1874 and 1914–1915 (see comments below for series Y 265); corporation excise, 1910–1914; occupational (special) taxes, 1863–1871, 1898–1902, and 1915.

1916–1957. Occupational (special) taxes, 1916–1928; insurance, 1918–1922; soft drinks, 1918–1924; and agricultural adjustment taxes, 1934–1936.

Y 264, total collections. For items included in this series but not shown separately in series Y 264–279, see source publications.

Y 265, individual income taxes. Although not shown separately for 1863–1915, this was an important tax source under revenue legislation enacted during the Civil War. The first collections in 1863 and for other years are shown below as tabulated in the *Annual Report of the Secretary of the Treasury, 1929*, p. 419.

Table III. Individual Income Tax Collections: 1863 to 1895

[In thousands of dollars. For years ending June 30]

Year	Amount	Year	Amount	Year	Amount	Year	Amount
1895	77	1874	139	1870	37,776	1866	72,982
1884	56	1873	5,062	1869	84,792	1865	60,979
1881	3	1872	14,437	1868	41,456	1864	20,295
1876	1	1871	19,163	1867	66,014	1863	2,742

The income tax legislation of the Civil War period expired in 1871 (see text for series Y 292–311). The collections in 1895 were under an act of 1894 that was declared unconstitutional. This type of tax was not imposed in other years during 1872–1913. The amounts shown in table III for 1873, 1874, 1876, 1881, and 1884 were late collections.

Separate figures for the individual income tax collections are not available for 1914, 1915, and 1918–1924.

Since 1951, withheld income taxes and old-age and survivors insurance taxes on employees and employers, and since 1957, disability insurance taxes on employees and employers have been paid into the Treasury in combined amounts without separation as to type of tax. Similarly, for the same periods, the old-age and survivors insurance and the disability insurance taxes on self-employment incomes have been paid in combination with income tax other than that withheld. The distribution of these collections by type of tax is based on estimates made in accordance with section 201(a) of the Social Security Act (42 U.S.C. 401(a)). Included in income taxes withheld by employers for 1951–1956 are amounts subsequently transferred to the Government of Guam under an act approved August 1, 1950 (48 U.S.C. 1421h). For 1957, these amounts are excluded.

Digitized by Google

The relative importance of withholding by employers as a method of income tax collection is shown in table IV for the period since withholding was instituted.

Table IV. Individual Income Tax Collections, by Method of Collection: 1943 to 1957

[In millions of dollars. For years ending June 30]

Year	Total	Withheld by employers	Other collections	Year	Total	Withheld by employers	Other collections
1957	39,030	26,728	12,302	1949	18,052	10,056	7,996
1956	35,338	24,016	11,322	1948	20,998	11,534	9,464
1955	31,650	21,254	10,396	1947	19,343	9,842	9,501
1954	32,814	22,077	10,737	1946	18,705	9,858	8,847
1953	32,536	21,132	11,404	1945	19,034	10,264	8,770
1952	29,274	17,929	11,345	1944	18,261	7,823	10,438
1951	22,997	13,090	9,908	1943	6,630	686	5,944
1950	17,153	9,889	7,264				

Y 266, corporation income taxes. Includes excess profits tax, 1917 and 1934–1946; unjust enrichment tax, 1937–1946; and undistributed profits tax, 1937–1939.

The corporation income tax law, effective March 1, 1913, was preceded by a corporate excise tax enacted in 1909, under which collections were as shown in table V (see Treasury Department, *Annual Report of the Secretary of the Treasury, 1929*, p. 420).

Table V. Collections Under the Corporate Excise Tax Act of 1909: 1910 to 1914

[In thousands of dollars. For years ending June 30]

Year	Amount	Year	Amount
1914	10,671	1911	33,512
1913	35,006	1910	20,960
1912	28,583		

For 1914, 1915, and 1918–1924, the Treasury reports do not separate corporate income tax from individual income tax collections.

Collections shown for 1952–1957 include taxes on business income of exempt corporations. Also included is the income tax on the Alaska Railroad, which was repealed for taxable years after June 30, 1952.

Y 267, employment taxes. Comprises the employer, employee, and self-employed taxes for the Federal old-age, survivors, and disability insurance system; the Federal unemployment insurance tax on employers; and the railroad retirement tax on employers and employees. Collections are received in combination with individual income taxes and the distribution by type of tax is based on estimates, as noted above in text for series Y 265.

Omitted from this series are railroad unemployment insurance contributions, collected by the Railroad Retirement Board under the Railroad Unemployment Insurance Act of 1938, as amended (45 U.S.C. 360). Although based on payrolls, this levy is not considered an internal revenue tax.

State unemployment insurance taxes also are not internal revenue collections, although the proceeds are deposited in the unemployment trust fund in the Federal Treasury.

Y 268, estate and gift taxes. Comprises, for 1863–1871 and 1899–1907, taxes on legacies, successions, and inheritances. The estate and gift taxes are shown separately for 1917 and later in the Treasury reports cited above. The figures for 1917–1924 and 1927–1932, inclusive, are for estate tax only. As indicated below for series Y 333–342, estate tax rate increases under the Revenue Act of June 2, 1924, were repealed retroactively February 26, 1926. Gift tax rates levied in 1924 were also reduced retroactively by the act of 1926. Estate and gift tax collections reported for 1925 and 1926 may include amounts collected at the higher rates and subsequently refunded; the refunds were reported as expenditures rather than as deductions from revenue. (See Bureau of Internal Revenue, *Statistics of Income, 1946*, part 1 pp. 430–431; *Annual Report of the Secretary of the Treasury, 1926*, pp. 291 and 350; *1927*, pp. 965–966.)

Y 269–277 and Y 279, excise taxes. Series Y 269, excise taxes total, and series Y 272, manufacturers' excise tax subtotal, are shown for years in which these totals appear in the Treasury annual reports cited above. Taxes of these types were collected also in other years.

For the years for which they are shown, these totals include various taxes not specified in the table. The "manufacturers' excise taxes" include special taxes relating to manufacture and sale. For 1863–1868, the manufacturers' excise subtotal includes a tax on raw cotton. For 1916–1957, the series includes taxes on sales under the act of October 22, 1914; manufacturers', consumers', and dealers' excise taxes under war revenue and subsequent acts; and for 1932 and later, manufacturers' excises under the act of 1932, as amended. Excise taxes on soft drinks are in the total for series Y 269 but not in series Y 272.

Y 270, alcohol. Comprises taxes on distilled spirits, beer, wines, and other products and includes occupational taxes. Includes amounts collected by the customs service on imports of distilled spirits and beer. For 1954–1957, the reported amounts include taxes collected in Puerto Rico on alcohol products of Puerto Rican manufacture coming into the United States; for prior years, this is excluded.

Y 271, tobacco. Comprises taxes on cigarettes, cigars, and other tobacco products. Amounts reported for 1954–1957 include tax collected in Puerto Rico on Puerto Rican tobacco products coming into the United States; excluded prior to 1954.

Y 273, automobiles and accessories. Combines the Treasury series for "passenger automobiles and motorcycles," "automobile trucks and busses," and "parts and accessories for automobiles."

Y 276, admissions. Comprises "general admissions" and "cabarets," as shown separately in the *Annual Report of the Secretary of the Treasury, 1958*, p. 457, for 1929–1957.

Y 277, telephone, telegraph, radio, and cable facilities. Includes in all years the taxes on "telephone, telegraph, radio, and cable facilities," and also, for 1942 and later, the tax on "local telephone services."

Y 278, capital stock tax. This tax was not levied for years ending in the period July 1, 1926, through June 30, 1932, and for years ending after June 30, 1945. Collections after the fiscal year 1950 are included in excises, series Y 269.

Y 280–291. Corporation income tax returns, 1909–1956.

Source: 1909–1915, Bureau of Internal Revenue, *Annual Report of the Commissioner of Internal Revenue*, various issues; 1916–1956, Internal Revenue Service (and predecessor, Bureau of Internal Revenue), *Statistics of Income*, corporation income tax returns, annual issues.

Income tax returns are required annually of all corporations except those specifically exempt, such as fraternal, civic, and charitable organizations not operating for profit.

Data for 1916–1956 are for returns with accounting periods that ended between July 1 of the year specified and June 30 of the following year (for example, figures for 1916 are for accounting periods ending July 1, 1916, to June 30, 1917). A large proportion of the corporations' accounting periods coincide with the calendar year, and the calendar year is therefore

Digitized by Google

used to identify the "income year." For the "income year" 1956, for example, 50.7 percent of the returns were for accounting periods that ended in December 1956; 17.6 percent for periods that ended during July–November 1956; 26.4 percent for periods that ended in the first half of 1957; and 5.2 percent, part-year returns.

Data for 1909–1915 are from returns received during the fiscal year beginning July 1 of the year specified. The data for 1915 include information from approximately 32,000 returns received during the preceding fiscal year.

Data are based on returns as filed, prior to audit adjustments, carrybacks, renegotiation of war contracts, or other changes made after the returns were filed. For 1951–1956, data are based on a probability sample described in the annual *Statistics of Income*. Only the most important changes in law affecting historical comparability of the data can be noted here; others are specified in the annual *Statistics of Income*—for example, the varying provisions regarding life insurance company taxation.

Because of consolidated returns for affiliated corporations, the number of returns (series Y 280, Y 281, Y 285, and Y 291) is not the same as the number of corporations.

Total compiled receipts of the corporations (series Y 282 and Y 286) include gross sales and receipts from operations, interest less amortizable bond premium, rents, royalties, net gain from capital assets (as defined by law) and other property, dividends, and other taxable income—all before "compiled deductions." These series also include nontaxable dividends from domestic corporations for 1918–1935 and nontaxable interest, but exclude all other nontaxable income. The data for 1916–1922 represent gross income. This was smaller than the total compiled receipts by the amounts of wholly tax-exempt interest received on certain government obligations and, for 1918–1921, of nontaxable dividends.

Compiled deductions include the cost of goods sold and (beginning in 1932) the cost of operations, as well as other negative amounts reported under sources of income.

Net income (less deficit) (series Y 283 and Y 287) is gross taxable income less allowable current-year deductions, except statutory deductions for dividends and Western Hemisphere trade corporations. This category excludes tax-exempt interest on government obligations and, for 1918–1935, dividends from domestic corporations; these are included in total compiled receipts. Beginning in 1936, contributions or gifts were deductible in determining net income. A deduction for amortization of emergency facilities was first allowable in 1940; the deduction was later extended to grain facilities and other items.

Income tax (series Y 288), as shown for 1909–1915, represents tax collections. For 1909–1912, these amounts correspond to the corporate excise tax collections noted for the fiscal years 1910–1913 in the text for series Y 266, above. For the income year 1913, the amount represents income tax and excise tax. Beginning with 1916, "income tax" is the tax liability on the returns, but before deduction of credit for taxes paid to foreign countries or U.S. possessions. For 1936–1938, the amounts include surtax on undistributed profits, as well as normal tax. For 1940 and 1941, the series includes the income defense tax; for 1941–1956, normal tax and surtax; and for 1942–1956, alternative tax.

Excess profits tax (series Y 289) for 1917–1922 comprises war profits tax and excess profits tax, and for 1933–1945, a declared-value excess profits tax effective for tax years that ended before July 1, 1946. Data for 1940 include the declared-value excess profits defense tax, and for 1940–1946, the excess profits tax under the Second Revenue Act of 1940. Amounts for 1942–1944 are for tax liability on the excess profits tax returns less a credit for debt retirement and the net postwar refund. Deferments under section 710(a)(5) of the 1939 Internal Revenue Code (relating to abnormalities under section 722) are reflected in the data for 1942 but not for 1943–1946. Amounts for 1943–1946 are after adjustments under various other relief provisions. The data for 1950–1954 are for the excess profits tax effective with respect to tax years from July 1, 1950, to December 31, 1953. For all years, the tax shown is before credit for foreign taxes paid.

Dividends paid (series Y 284 and Y 290) exclude liquidating dividends. They include all other dividends. In including dividends paid in the corporation's own stock, this series differs from similar series published elsewhere (e.g., Bureau of the Census, *Statistical Abstract of the United States, 1958*, p. 381, and Internal Revenue Service, *Statistics of Income, 1956–57, Corporation Income Tax Returns*, p. 120). For selected years, the amounts paid in stock, as included in the historical table, are as shown in table VI.

Table VI. Stock Dividends Paid: 1935 to 1956

[In thousands of dollars]

Income year	Included in series Y 284	Included in series Y 290	Income year	Included in series Y 284	Included in series Y 290
1956	2,725,210	2,676,783	1950	1,292,460	1,278,908
1955	1,996,477	1,965,391	1940	139,989	130,578
1954	1,350,041	1,316,460	1935	135,851	112,162
1953	1,110,260	1,089,355			

Inactive corporation returns (series Y291) are those which show no items of income or deductions.

Y 292–311. Individual income tax returns, 1913–1957.

Source: Internal Revenue Service, *Statistics of Income*, individual income tax returns, annual issues.

The data represent returns of residents and citizens, including those with addresses outside Alaska, Hawaii, and continental United States. Detailed tabulations for each year, 1948–1957, with data by levels of gross income and by States, appear in *Statistics of Income, 1957, Individual Income Tax Returns*, 1959, pp. 60–67.

As noted above in the text for internal revenue collections (series Y 265), the individual income tax has been a continuing element of the revenue system since 1913, but was included in Federal revenue legislation in two earlier periods.

During the Civil War decade, this tax was included in the first revenue act of the war, in 1861, at a flat rate of 3 percent on incomes above $800. Before the initial rate took effect, it was superseded in 1862 by rates of 3 percent on up to $10,000, 5 percent above that amount of net income, and an individual exemption of $600. Rates were raised further in 1864. The highest rates, levied for a single year, were 10 percent on net income of $600 to $5,000, 12.5 percent on $5,000 to $10,000, and 15 percent above $15,000. In 1867, the rate became a flat 5 percent on income of more than $1,000; for 1870 and 1871, the rate was 2.5 percent and the exemption $2,000. The law expired at the end of 1871.

An individual income tax law adopted in 1894 was patterned generally after the law of 1867. It provided a 2 percent tax rate on individual and corporate net income, with a $4,000 exemption for individuals. Personal property received by gift or inheritance was to be included in net income. The act was declared unconstitutional in 1895 in a Supreme Court decision (Pollock v. Farmers' Loan and Trust Co., 157 U.S. 429, 158 U.S. 601). The personal income tax was not again levied until after adoption in 1913 of the Sixteenth Amendment to the Constitution.

Digitized by Google

The data for 1913–1957 relate to returns filed under the income tax laws of 1913 and subsequent years. A return is required of every citizen or resident with gross or net income above a specified minimum. The requirements for filing have changed from time to time and are summarized below.

Table VII. Requirements for Filing Individual Income Tax Returns: 1913 to 1957

Year	Return required if net or gross income equalled or exceeded amount specified	
	Single, or married and not living with spouse	Married couple, joint return [1]
1954–1957	Gross, $600 [2]	Gross, $600 each spouse [2]
1948–1953	Gross, $600	Gross, $600 each spouse
1944–1947	Gross, $500	Gross, $500 each spouse
1942–1943	Gross, $500 [3]	Gross, $1,200 [4]
1941	Gross, $750	Gross, $1,500
1940	Gross, $800	Gross, $2,000
1932–1939	Net, $1,000 or gross, $5,000	Net, $2,500 or gross, $5,000
1925–1931	Net, $1,500 or gross, $5,000	Net, $3,500 or gross, $5,000
1924	Net, $1,000 or gross, $5,000	Net, $2,500 or gross, $5,000
1921–1923	Net, $1,000 or gross, $5,000	Net, $2,000 or gross, $5,000
1917–1920	Net, $1,000	Net, $2,000
1913–1916	Net, $3,000	Net, $3,000

[1] Through 1943, amount shown is combined net or combined gross income.
[2] Gross income of $1,200 for each person aged 65 or older.
[3] Also, for 1943, required to file if liable for 1942 tax, regardless of 1943 gross income.
[4] Also, for 1943, required to file if gross income of either spouse exceeded $624 or f either was liable for 1942 tax, regardless of 1943 gross income.

A joint return could be filed by husband and wife if income of both was included or if one spouse had no income.

For 1951–1957, a return was required of any individual whose net earnings for self-employment tax were $400 or more, regardless of the gross income requirement for filing.

In addition, under the current tax payment system instituted in 1943, returns were filed to claim refunds of taxes overpaid, even though the individual was not otherwise required to file.

Fiduciary income of an estate or trust for 1913–1936 was reported on an individual return form when there remained in the hands of the fiduciary net income which was taxable to him and not distributed to beneficiaries. Such a return for net income taxable to the fiduciary was required under the same conditions as those stated above for single persons during this period.

Data for 1913–1915 were derived from annual reports of the Commissioner of Internal Revenue, net income being determined on the basis of number of returns filed and the average net income in each class. Subsequent data were taken from returns, unaudited except to insure proper execution. Data for 1916 were tabulated from each return, but for later years were compiled by sampling techniques to represent the universe of returns, Form 1040 and 1040A (replaced by W-2 for 1944–1947). Tabulated data cover individual and fiduciary returns with net income of $3,000 or more, 1913–1916; returns with net income of $1,000 or more, 1917–1920; all returns with net income, 1921–1927; all individual and fiduciary returns with net income, but only individual returns with no net income, 1928–1936; all individual returns with net income or no net income, 1937–1943; and all individual returns with adjusted gross income or no adjusted gross income, 1944–1957, except that returns with no information were excluded for 1953–1956.

In the great majority of cases, the returns are for the calendar year, although some returns are for accounting periods ended during the calendar year. Also, some returns cover income attributable to several tax years. Prior to 1957, the tabulations of adjusted gross income (series Y 297) included only income attributed to the current tax year. For 1957, adjusted gross income includes the whole amount received by the taxpayer within his tax year even if it was reported as income earned over a period of time that included prior tax years.

Adjusted gross income for 1944–1957 is total income reported for tax purposes less deductions for certain expenses generally related to the acquisition of income. These deductions include business and rental expenses, certain travel and transportation expenses of employees, depreciation allowed life tenants of property held in trust, allowable loss from the sale of capital assets and other property, adjustments for long-term capital gain, net operating loss deductions, and for 1954–1957, excludable sick pay, the limited exclusion of dividends, and expenses of salesmen.

Under the Internal Revenue Code of 1954, taxable income (series Y 298) for 1954–1957 is the base on which the tax is computed. It consists of adjusted gross income less nonbusiness deductions. These deductions are for taxes, contributions, interest, and other specified purposes, and also include all personal exemptions. The figures for taxable income embrace all returns, including those showing the so-called "optional tax," i.e., a tax determined by reference to a simplified tax table involving standardized deductions rather than itemized nonbusiness deductions.

During 1948–1957, personal exemptions were $600 a year for each person—the taxpayer, his spouse, and dependents. A taxpayer aged 65 or older was allowed an additional $600 exemption for himself and, if a joint return was filed, for his wife if she was 65 or older. Likewise, an additional $600 exemption was allowed a blind taxpayer or a blind spouse.

Total income (series Y 305 and Y 309) for 1913–1943 is the gross income reported for income tax purposes under the act in effect for the income year. It is the total income after deduction of business and rental expenses and allowable loss on sales of capital assets and other property. Capital gain is included to the extent provided under successive acts.

Net income (series Y 306) for 1913–1943 is total income less authorized deductions. However, in the *Statistics of Income* for 1922–1931 the allowable prior-year loss was not deducted, and for 1924–1933 a capital loss that gave rise to a tax credit was not deducted. In the case of fiduciary net income, distribution to the beneficiary was an authorized deduction for 1913–1936. Net income in all years is measured before deduction of personal exemptions; it is not the tax base. The series is not available after 1943.

The small amounts of tax reported for 1938–1941 for returns with no net income (series Y 311) are an alternative tax on a small number of returns which showed a long-term capital loss and, for 1940 and 1941, a defense tax. For 1943, a victory tax was due on 17,438 returns with no net income.

Y 312–318. Fiduciary income tax returns, 1937–1956.

Source: Internal Revenue Service, *Statistics of Income*, fiduciary income tax returns, annual issues.

For more detailed information for 1947–1956, and for data by levels of income, see 1959 issue of source, pp. 24–25.

These series were tabulated from returns (Form 1041) before official audit. All returns were used for 1937–1939, but only taxable returns were used for 1940–1951. Taxable and nontaxable data for 1952, 1954, and 1956 were compiled by sampling techniques to represent all returns filed. Data were not tabulated for 1953, 1955, and 1957.

Fiduciary returns show annual income from estates in process of settlement or any other trust for which the fiduciary acts as administrator. Only certain small trusts are excused from filing. For the period covered, returns were required if income equalled or exceeded the amounts specified for the following years:

Digitized by Google

Income of an estate—for 1937–1939, gross income of $5,000 or net income taxable to the fiduciary of $1,000; 1940, gross income of $800; 1941, gross income of $750; 1942–1947, gross income of $500; 1948–1956, gross income of $600.

Income of a trust—for 1937, gross income of $5,000 or net income taxable to the fiduciary of $1,000; 1938 and 1939, gross income of $5,000 or net income of $100; 1940, gross income of $800 or net income of $100; 1941, gross income of $750 or net income of $100; 1942–1947, gross income of $500 or net income of $100; 1948–1953, gross income of $600 or net income of $100; 1954–1956, gross income of $600 or any taxable income of the fiduciary.

For any tax year, a return was required if any beneficiary of the estate or trust was a nonresident alien.

Total income (series Y 313) is gross income reported in accordance with the law for each tax year. For 1937–1952, this is after business and rental expenses and allowable loss from sales of capital assets and other property, and it includes capital gains as required under the various acts. For 1954 and 1956, it includes gross profit from business, gross rents, and the entire capital gain without adjustment.

Net income or taxable income (series Y 314) as shown for 1954 and 1956 is less inclusive than the amounts shown for earlier years. For 1937–1952, this series represents total income less allowable nonbusiness deductions and the amount distributable to beneficiaries. For these years, it is not the amount taxed, since the exemption allowed to trusts and estates has not been deducted from the net income taxable to the fiduciary. For 1954 and 1956, the series shows income taxable to the fiduciary. This is total income after deduction of the exemption as well as all business and rental expenses, the authorized nonbusiness deductions, distributions to beneficiaries, and the fiduciary's share of dividend exclusions and of long-term capital gain.

Y 319–332. Individual income tax liability and effective rates, for selected income groups, 1913–1957.

Source: Treasury Department, records.

Maximum earned net income is assumed where it affects the amount of tax liability. In the case of the married couple (four exemptions), the computations assume prior to 1948 that only one spouse had income. Beginning with the income year 1948, all married couples have been permitted to combine their incomes in a joint return and to split the taxable income equally for purposes of the tax computation; a joint return on the split-income basis is therefore assumed for the married couple for the income years 1948–1957.

For the same years, persons of age 65 or older and blind persons were allowed additional exemptions; consequently, the illustrative data for 1948–1957 apply equally to any married couple claiming 4 exemptions, whether the additional exemptions were for dependents, age, or blindness.

The effective tax rate is the tax liability as a percentage of the amount of net income. The liability is the amount for income tax only, including the defense and victory taxes of 1940 and 1943; it does not include the self-employment tax for social security, applicable for 1951–1957.

Net income, as used here, is gross income (after 1943, adjusted gross income) minus nonbusiness deductions for contributions, interest, taxes, medical and dental expenses, and other allowable expenses, but before deduction of personal exemptions. Also excluded from net income (and from adjusted gross income) is tax-exempt interest on government obligations, excludable sick pay under the Revenue Act of 1954, certain expenses related to the acquisition of income, and other nontaxable income.

Statutory changes have been made from time to time in the allowable nonbusiness deductions. For example, the deduction for medical expenses was amended several times during 1944–1957. Another type of nonbusiness deduction, the amount allowed for contributions, was limited to 20 percent of adjusted gross income prior to 1954; for 1954–1957, taxpayers were allowed to deduct more than 20 percent to the extent that the excess (limited to 10 percent of adjusted gross income) was for contributions to hospitals, churches, or educational institutions.

In consequence of these and other changes, a given amount of net income could be associated with somewhat different amounts of gross income in different years. Even in any one year, a given amount of net income could be associated with different amounts of gross income for different taxpayers in accordance with their varying allowable deductions.

Beginning with the income year 1941, taxpayers with gross income of not more than $3,000 from specified sources were allowed to use a simplified return Form 1040A, with the tax determined by a table that allowed a standard percentage of earned income credit and deductions from income. Taxpayers who did not use the short form were required to itemize deductions. In either case, the 1943 victory tax had to be computed separately. Legislation simplifying the filing of tax returns made available (beginning in 1944) the option of a standard deduction of 10 percent of adjusted gross income, limited to $500 for 1944–1947. For 1948–1957, the limit was raised to $1,000 for single persons and for married persons filing joint returns. In general, this implies that, for 1944–1947, net incomes of $4,500 or less and, for 1948–1957, net incomes of $9,000 or less, as shown in the table, would represent adjusted gross incomes at least ten-ninths as large. (That is, $800 net represents at least $889 of adjusted gross income; $1,000 net, at least $1,111 gross; $4,500 net, at least $5,000 gross; etc.)

For some types of analysis, effective rates based on gross rather than net income might be more pertinent. Such rates can be computed by making uniform assumptions about the deductions associated with the several specified levels of net income. For example, if it is assumed that the standard deductions made up the whole difference between adjusted gross and net income in cases in which the standard deduction was available, the effective percentage rate of tax on adjusted gross income in these cases would be nine-tenths of the effective rates shown in series Y 319–332. For another type of computation of effective tax rates, see Internal Revenue Service, *Statistics of Income, 1957, Individual Income Tax Returns*, p. 38.

The history since 1913 of the personal exemptions (including credits for dependents) and of the range of tax rates applicable to taxable individual incomes is summarized below in table VIII, from the following publications: 1913–1950, Treasury Department, *Annual Report of the Secretary of the Treasury, 1940*, pp. 466–467, and *1950*, p. 251; and 1951–1957, Joint Economic Committee, *The Federal Revenue System: Facts and Problems, 1959*, 86th Congress, 1st session, p. 189.

Table VIII. Federal Individual Income Tax Exemptions, and First and Top Bracket Rates: 1913 to 1959

Income year	Personal exemptions					Tax rates			
	Single	Married				First bracket		Top bracket	
		Dependents				Rate	Amt. of income	Rate	Income over
		None	1	2	3				
1954–1959 [1]	$600	$1,200	$1,800	$2,400	$3,000	20	$2,000	[2] 91	$200,000
1952–1953 [1]	600	1,200	1,800	2,400	3,000	22.2	2,000	[2] 92	200,000
1951 [1]	600	1,200	1,800	2,400	3,000	20.4	2,000	[2] 91	200,000
1950 [1]	600	1,200	1,800	2,400	3,000	17.4	2,000	[2] 84.36	200,000
1948–1949 [1]	600	1,200	1,800	2,400	3,000	16.6	2,000	[2] 82.13	200,000
1946–1947	500	1,000	1,500	2,000	2,500	19	2,000	[2] 86.45	200,000
1944–1945	500	1,000	1,500	2,000	2,500	23	2,000	[2] 94	200,000
1942–1943 [3]	500	1,200	1,550	1,900	2,250	[4] 19	2,000	88	200,000
1941	750	1,500	1,900	2,300	2,700	[4] 10	2,000	81	5,000,000
1940	800	2,000	2,400	2,800	3,200	[4] 4.4	4,000	81.1	5,000,000
1936–1939	1,000	2,500	2,900	3,300	3,700	[4] 4	4,000	79	5,000,000
1934–1935	1,000	2,500	2,900	3,300	3,700	[4] 4	4,000	63	1,000,000
1932–1933	1,000	2,500	2,900	3,300	3,700	4	4,000	63	1,000,000
1930–1931	1,500	3,500	3,900	4,300	4,700	[5] 1½	4,000	25	100,000
1929	1,500	3,500	3,900	4,300	4,700	[5] ½	4,000	24	100,000
1925–1928	1,500	3,500	3,900	4,300	4,700	[5] 1½	4,000	25	100,000
1924	1,000	2,500	2,900	3,300	3,700	[5] 1½	4,000	46	500,000
1923	1,000	[6] 2,500	2,900	3,300	3,700	3	4,000	56	200,000
1922	1,000	[6] 2,500	2,900	3,300	3,700	4	4,000	56	200,000
1921	1,000	[6] 2,500	2,900	3,300	3,700	4	4,000	73	1,000,000
1919–1920	1,000	2,000	2,200	2,400	2,600	4	4,000	73	1,000,000
1918	1,000	2,000	2,200	2,400	2,600	6	4,000	77	1,000,000
1917	1,000	2,000	2,200	2,400	2,600	2	2,000	67	2,000,000
1916	3,000	4,000	4,000	4,000	4,000	2	20,000	15	2,000,000
1913–1915	3,000	4,000	4,000	4,000	4,000	1	20,000	7	500,000

[1] Additional exemptions of $600 are allowed to taxpayers and their spouses on account of blindness and/or age 65 or older.
[2] Subject to maximum effective rate limitation: 90 percent for 1944–45, 85.5 percent for 1946–47, 77 percent for 1948–49, 80 percent for 1950, 87.2 percent for 1951, 88 percent for 1952–53, and 87 percent for 1954–59.
[3] Exclusive of victory tax.
[4] Before earned income credit allowed as a deduction equal to 10 percent of earned net income.
[5] After earned income credit equal to 25 percent of tax on earned income.
[6] If net income exceeds $5,000, married person's exemption is $2,000.

Y 333–342. Federal estate tax returns, 1916–1957.

Source: Internal Revenue Service, *Statistics of Income*, estate tax returns, annual issues.

The Federal estate tax is a levy upon the transfer of property by a decedent. It differs from inheritance taxes, in which, generally, the tax is on the privilege of receiving property by inheritance and is levied upon the heirs.

The base of the tax is the value of the gross estate transferred, adjusted for exclusions, deductions, and exemptions. The tax is imposed at graduated rates, and certain credits are allowed against the tax so computed.

The estate tax in its present form became a permanent part of the Federal tax system in 1916, but four times earlier death taxes had been imposed by the Federal Government. During 1797–1802, a stamp tax applied to succession to personal property by inheritance. The Civil War Revenue Act of 1862 included an inheritance tax which was substantially increased in 1864; this tax was repealed in 1870. The income tax act of 1894 included an inheritance tax that was abandoned when the income tax was declared unconstitutional. The Revenue Act of 1898, for financing the Spanish-American War, included a short-lived tax applicable to all estates of over $10,000, except those inherited by spouses.

Table IX summarizes the history of Federal estate tax rates and exemptions for 1916–1957. An estate tax return was required if the value of the gross estate at the date of death exceeded the allowable specific exemption as shown in the table and footnote 1.

The estate of an individual who died in the period June 6, 1932, through August 16, 1954, was subject to two estate taxes—basic and additional. Basic tax was at the rates provided in the 1926 act; additional tax was the excess of a tentative tax at rates provided by the act in force at date of death, over the basic tax. Under the 1954 Code, these two taxes were combined and a single tax rate applied to the net taxable estate.

Table IX. Estate Tax Rates, Specific Exemption, and Insurance Exclusion: 1916 to 1957

Date of death	Tax rates range (percent)	Minimum rate applies to first—	Maximum rate applies above—	Specific exemption [1]	Insurance exclusion
Oct. 22, 1942–1957	3.0–77	$5,000	$10,000,000	$60,000	----------
Sept. 21, 1941–Oct. 21, 1942	3.0–77	5,000	10,000,000	40,000	$40,000
Aug. 31, 1935–Sept. 20, 1941	[2] 2.0–70	10,000	50,000,000	40,000	40,000
May 11, 1934–Aug. 30, 1935	1.0–60	10,000	10,000,000	50,000	40,000
June 6, 1932–May 10, 1934	1.0–45	10,000	10,000,000	50,000	40,000
Feb. 26, 1926–June 6, 1932	1.0–20	50,000	10,000,000	100,000	40,000
Feb. 24, 1919–Feb. 26, 1926	[3] 1.0–25	50,000	10,000,000	50,000	40,000
Oct. 4, 1917–Feb. 24, 1919	2.0–25	50,000	10,000,000	50,000	----------
Mar. 3–Oct. 3, 1917	1.5–15	50,000	5,0000,00	50,000	----------
Sept. 9, 1916–Mar. 2, 1917	1.0–10	50,000	5,000,000	50,000	----------

[1] For estate of resident citizen or alien. The same specific exemption was granted for estates of nonresident citizens dying after May 10, 1934. Exemptions were not granted to estates of nonresident aliens until Oct. 22, 1942, when a $2,000 exemption became available.
[2] For deaths from June 26, 1940, to Sept. 20, 1941, a defense tax was added equal to 10 percent of the net estate tax (computed at the rates of 2 to 70 percent) after deduction of credits for gift taxes and State death taxes.
[3] Higher rates, ranging from 1 percent to a top-bracket rate of 40 percent on the excess over $10,000,000, were provided in the Revenue Act of June 2, 1924, but the rates of the 1921 act were restored retroactively Feb. 26, 1926. Refunds were authorized for overpayments made at the higher rates. The net tax (series Y 338 and Y 342) was computed at the lower rates (*Statistics of Income, 1925*, pp. 70–71, 82).
Source: Adapted from Internal Revenue Service, *Statistics of Income*, various issues; Treasury Department, *Annual Report of the Secretary of the Treasury, 1940*, pp. 478–479, and *1950*, p. 258.

A marital deduction for bequests to the surviving spouse applied to the estates of persons who died after 1947. The deduction is limited to the smaller of either one-half the value of the adjusted gross estate or the value of the qualifying property interests which pass to the surviving spouse. The impact of this provision is reflected in the statistics.

Gross estate (series Y 335 and Y 340) includes all property possessed to the extent of the decedent's interest therein at death, including certain transfers made during life without full consideration, joint estates, tenancies by the entirety, dower and curtesy of surviving spouse, and life insurance on the life of the decedent if the estate was administered under the 1942 or subsequent acts. The value of the gross estate may be either the value at date of death or as of the date one year after death, whichever the executor elected in case death occurred on or after August 31, 1935.

Net taxable estate (series Y 336 and Y 341) is gross estate less the deductions and specific exemptions allowed under the act in effect at date of death. These have varied somewhat among the different acts.

Y 343–349. Federal gift tax returns, 1924–1956.

Source: Internal Revenue Service, *Statistics of Income*, gift tax returns, annual issues.

These data are from returns filed, before audit. Data for 1952, 1954, 1955, and 1957 were not tabulated.

The Federal gift tax, like the estate tax, is a levy upon transfers of property by gift. The tax is a liability of the person making the gift and is based upon the value of the transferred property.

The gift tax was first levied for 1924 and 1925. For these years, a return was required for gifts of property located in the United States, made by individuals, corporations, associations, partnerships, trusts, or estates, if total gifts exceeded the sum of authorized deductions for exemption, charitable gifts, and previously taxed property, and if the aggregate exceeded $500 to any one donee.

Digitized by Google

The present gift tax was introduced in 1932 in connection with substantial revisions in the estate tax. The rates were three-fourths of those in the estate tax, and this relationship was maintained through subsequent revisions (subject, however, to differences in the effective dates of rate and exemption changes). A return was required during 1932–1956 if aggregate gifts in the year to any donee exceeded the allowable annual exclusion per donee and for gifts of future interests regardless of value. Tax rates, specific exemptions, and annual exclusions are summarized in table X.

Table X. Gift Tax Rates, Exemptions, and Exclusions: 1924 to 1956

Calendar year of gift	Tax rates, range (percent)	Minimum rate applies to first—	Maximum rate applies above—	Specific exemption [1]	Annual exclusion per donee
1943–1956	2.25–57.75	$ 5,000	$10,000,000	$30,000	$3,000
1942	2.25–57.75	5,000	10,000,000	40,000	4,000
1939–1941	[2] 1.5–52.5	10,000	50,000,000	40,000	4,000
1936–1938	1.5–52.5	10,000	50,000,000	40,000	5,000
1935	.75–45	10,000	10,000,000	50,000	5,000
1932 [3]–1934	.75–33.5	10,000	10,000,000	50,000	5,000
1924 [4]–1925	1–25	50,000	10,000,000	50,000	500

[1] During 1924–1925, allowed in each calendar year; in later years, allowed only once.
[2] From June 26, 1940, through 1941, subject to additional defense tax equal to 10 percent of basic tax liability.
[3] In effect for gifts June 7, 1932, and later.
[4] In effect June 24, 1924.
Source: Adapted from Internal Revenue Service, *Statistics of Income*, various issues; Treasury Department, *Annual Report of the Secretary of the Treasury, 1940*, pp. 478–479, and *1950*, p. 258.

Since 1932 the tax has applied to individuals only (citizens, residents, or nonresident aliens) for transfer of property situated in the United States.

Gift tax rates are progressive in application; that is, current graduated rates are applied to (*a*) the aggregate net taxable gifts made after June 6, 1932, and to (*b*) the aggregate net gifts exclusive of those made in the current year—the excess of tax in (*a*) over (*b*) being the current tax liability.

As indicated in table X, the donor is allowed to exclude gifts of less than a specified amount to each recipient in each year. This annual exclusion was $3,000 for each donee for the years 1943–1956. In addition, a specific exemption ($30,000 during 1943–1956) is allowed each citizen or resident and may be taken, at his option, entirely in a single year or spread over a number of years. After April 2, 1948, a marital deduction of one-half of the value of gifts made between a husband and wife was allowed citizens and residents.

Total gifts (series Y 345 and Y 349) is the value of property (real property or tangible or intangible personal property) transferred without full consideration in money or money's worth, whether transferred in trust or otherwise, whether direct or indirect, or of future interests. Generally, gifts of less than the allowable annual exclusion for each donee are not reported, except that gifts of future interests must be included regardless of value (and, for 1939–1942, gifts in trust).

Net taxable gift (series Y 346) is the tax base. It is the value of total gifts minus the exclusion for each donee, deductions, and specific exemptions.

Y 350–356. Expenditures of the Federal Government, 1789–1957.

Source: Series Y 350–355, Treasury Department, *Annual Report of the Secretary of the Treasury, 1958*, pp. 393–397. Series Y 356, 1789–1946, Treasury Department, *Annual Report, 1946*, pp. 422–423, 1947–1957, Bureau of the Budget, *Budget of the United States Government*, annual issues, 1949–1959.

These series exclude amounts paid to retire public debt and expenditures from trust accounts. They include the transactions of all other Federal funds. In the case of public enterprise funds (including the postal service) and various intragovernmental funds, expenditures included in the total are on a *net* basis—that is, their collections are deducted from gross expenditures and the results are the net expenditures included in Federal Government expenditure accounts. In the case of the postal service, the net postal expenditure is included in the total and "other" (series Y 350 and Y 355) expenditures in the years in which there was a postal deficit. For a historical series showing gross postal expenditures in relation to postal receipts, see references in text for series Y 258–263.

Expenditures for 1789–1915 are based on warrants issued; for 1916–1952, on the *Daily Statement of the United States Treasury*; for 1953–1957, on the Treasury's *Monthly Statement of Receipts and Expenditures of the United States Government*.

In the *Monthly Statement*, expenditures are reported on the basis of checks issued by disbursing officers, except for interest on the public debt and payments made in cash. Where payment is made by the issuance of bonds or by an increase in their redemption value, instead of by the issuance of checks, such an issuance or increase is an expenditure. Interest on the public debt is reported on an accrual basis. For years prior to those reported in the *Monthly Statement*, interest on the public debt is reported on the same basis as other expenditures.

The figures for 1916–1952 were compiled from daily reports received by the Treasurer of the United States from Government depositaries and Treasury offices holding Government funds. On this basis, the expenditures include payments on checks outstanding at the beginning of the fiscal year and do not include checks unpaid at the end of the year. Beginning with the fiscal year 1947, expenditures of several departments and establishments were reported on the basis of checks issued, so that the detail in the daily statement was partly based on checks issued, partly on checks paid. The change to the monthly statement basis eliminated the necessity for showing an item of "adjustment to daily Treasury statement basis" in tabulations presenting components of the expenditure total.

Y 357–367. Budget expenditures of the Federal Government, by major function, 1900–1957.

Source: Bureau of the Budget, records.

Basic data are from the following:

1900–1914. Adapted from Bureau of the Budget compilation for 1900–1948 in U.S. Congress, *Congressional Record*, 80th Congress, 2d session, vol. 94, pt. 2, March 11, 1948, pp. 2576–2577. Series Y 360, veterans services and benefits supplied from the Treasury compilation in series Y 356 (see below). Tax refunds of $10 million a year deducted from 1913 and 1914 to conform to the *1959 Federal Budget Mid-year Review* (September 1958), p. 42, where budget receipt and expenditure totals are shown for each year, 1900–1959, with refunds excluded starting in 1913.

1915–1920. *Congressional Record*, cited above, but with tax refunds deducted.

1921–1938. Unpublished Bureau of the Budget table for 1920–1959, September 17, 1958; but with series Y 359, International affairs and finance, supplied from *Congressional Record*, cited above.

1939–1950. Unpublished Bureau of the Budget table for 1939–1950, February 1959.

1951–1957. Bureau of the Budget, *Federal Budget in Brief*, fiscal year 1960 (1959), p. 55, summarizing the *Budget* for 1960, special analysis L, pp. 1013–1014.

As Federal Government operations expanded in volume and variety, the limited classification of expenditures exemplified in series Y 350–356 (even when supplemented with additional

Digitized by Google

items and subdivided to give more specific categories) was inadequate to delineate the scope of Government programs and to focus attention on significant shifts in the purpose of expenditures.

A systematic classification of expenditures by major functional categories and more specific subfunctions was introduced in the *Budget* for the fiscal year 1948. Although each succeeding annual *Budget* modified some of the categories or shifted particular items from one classification to another, continuity of the series was maintained by explanatory statements and a revised historical special analysis included at the end of each year's *Budget* volume. See, for example, special analysis L, in the *Budget* for 1960, pp. 1013–1014, showing expenditures for each major function and subfunction for the fiscal years 1951–1957, using the classification system as revised for the 1960 *Budget*. The content of each functional category may be determined from the subfunctions listed in the special analysis, from the explanatory comments in the President's Budget Message, and by examination of the detailed *Budget*.

Series Y 360, veterans services and benefits, may be slightly understated for 1900–1914, as it comprises only the payments for veterans compensation and pensions, the same as series Y 356. Any such understatement in series Y 360 apparently would not exceed $12 million a year and is balanced by an equal overstatement in the residual series, Y 361–365, for "All other."

Refunds are excluded from series Y 357–367 since 1912. Consequently, total expenditures, series Y 357, for 1913–1930 deviate from those shown in series Y 255 and Y 350 by the amount of refunds.

As to series Y 367, adjustment to daily Treasury statement, see text for series Y 350–356.

Y 368–379. Public debt of the Federal Government, 1791–1957.

Source: **Series Y 368–372**, Treasury Department, *Annual Report of the Secretary of the Treasury, 1891*, p. xcii, *1946*, pp. 455–456, and *1958*, p. 470. **Series Y 373–374**, 1855 and 1892–1915, Bureau of Foreign and Domestic Commerce, *Statistical Abstract of the United States, 1921*, p. 829; 1856–1891 and 1916–1957, Treasury Department, *Annual Report, 1891*, p. XCIV, *1946*, p. 546, and *1958*, p. 563. **Series Y 375–379**, 1880–1915, Treasury Department, records; 1916–1957, *Annual Report, 1946*, p. 459, and *1958*, pp. 472–473.

The total gross debt (series Y 368) as reported at the end of each fiscal period is essentially the formal funded debt of the Federal Government, both long-term and short-term. It includes savings bonds at current redemption value. The total gross debt is also designated as "the public debt." Outside that total, but included in "total debt outstanding," are guaranteed obligations held outside the Treasury—comprising obligations issued by certain Government corporations and credit agencies, which are guaranteed by the United States as to both principal and interest. These were first authorized in 1932 but none were outstanding at the end of the fiscal years 1932 and 1933. (See the *Annual Report of the Secretary of the Treasury, 1958*, pp. 391, 471.)

Studies by Paul B. Trescott and others have suggested that the debt totals (series Y 368) as compiled by the Treasury Department for the early years of the Republic—1791 into the early 1800's—may omit obligations incurred otherwise than by the issuance of Treasury obligations and may include some contingent liabilities that would be excluded by the definitions adopted in later years. (Trescott, unpublished memoranda; see also Paul Studenski and Herman E. Krooss, *Financial History of the United States*, McGraw-Hill, New York, 1952, p. 3, footnote 1.) See also text for series Y 254–257.

Although nearly all the public debt is interest-bearing, the total includes some obligations that bear no interest and matured debt on which interest has ceased. In recent years, a substantial part of the public debt has been held in the trust funds and other Treasury investment accounts. (For the ownership of Federal public debt obligations at several dates for 1941–1958, see the *Annual Report of the Secretary of the Treasury, 1958*, pp. 34, 576.) Certain unfunded obligations of the Government are not counted in the public debt, for example, a potential obligation of the Government for unpaid employer contributions to the civil service retirement and disability fund.

The formal concept of "the public debt," as used in Federal fiscal reports, appears to have emerged following initial enactment of a statutory ceiling on the debt of the Federal Government. Such a ceiling was first provided in the Second Liberty Bond Act of 1917; prior to May 26, 1938, the limitation applied to particular segments of the debt, not to the total. The debt ceiling has been modified from time to time in subsequent legislation. For a tabular summary of the debt limit legislation, 1917–1958, see Marshall A. Robinson, *The National Debt Ceiling, An Experiment in Fiscal Policy*, The Brookings Institution, Washington, D.C., 1959, p. 3.

Despite the close relationship of "the public debt" or total gross debt (series Y 368) to the debt limitation, series Y 368 includes a relatively small amount of obligations not subject to statutory limitations. Robinson, cited above, points out (p. 8) that "the Federal debt is part of a larger structure of Federal Government obligations. . . . The legally defined gross Federal debt . . . is the debt that falls under the debt limitation, and it is what general usage calls the national debt." For a rough estimate of some additional obligations not included in "total gross debt," see a compilation by the Comptroller General of the United States, in *Investigation of the Financial Condition of the United States: Hearings before the Senate Committee on Finance*, 85th Congress, 1st session, vol. 1, June 26, 1957, pp. 81–82, 269.

Various writers, including Robinson, have contended that the most meaningful measure of the national debt in economic terms is "debt owed to the public." (See series Y 383, which shows yearly changes in terms of "net cash borrowing from the public or repayment.") It should be noted, however, that any such series is a subdivision of the total gross public debt and does not incorporate Federal Government obligations that are not counted in the formal public debt.

The computed annual interest charge (series Y 373) represents the amount of interest that would be paid if each interest-bearing issue outstanding at the end of the year should remain outstanding for a year at the applicable annual rate of interest. The charge is computed for each issue by applying the appropriate annual interest rate to the amount outstanding on that date. The aggregate charge is the total of the computed amounts for all interest-bearing issues. The average annual rate is computed by dividing the computed annual interest charge for the total of outstanding issues by the corresponding principal amount.

Y 380–383. Cash receipts from and payments to the public by the Federal Government, 1929–1957.

Bulletin, August 1948 and 1950; 1950–1957, *Annual Report of the Secretary of the Treasury, 1958*, p. 462.

The series summarize the flow of money between the public and the Federal Government as a whole. This type of compilation is often referred to as a consolidated-cash statement. The totals represent in effect a summation of all Federal transactions with the public—other than borrowing and debt repayment.

The public is defined to include individuals, banks, other private corporations and associations, unincorporated businesses, the Federal Reserve System, the Postal Savings System, State and local governments, foreign governments, and international organizations.

For the statistical procedures by which the data are derived, see *1957 Historical and Descriptive Supplement . . .*, pp. 72 and 74. For presentation and derivation of the annual data and reconciliations with the administrative budget totals and with Treasury accounts, see the annual *Budget of the United States Government* for 1949 and later fiscal years, special analysis A.

Federal Government transactions comprised within these totals include not only those receipts and expenditures counted in the administrative budget but also the transactions of trust and deposit funds held by the Government and certain transactions of Government-sponsored enterprises that are outside the conventional budget—mainly the Federal Deposit Insurance Corporation, Federal land banks, Federal home loan banks, and banks for cooperatives. Major intragovernmental and noncash transactions are eliminated in the consolidated summation of transactions with the public. A few items of expenditure that are made in the form of additions to the public debt (such as interest accruing on savings bonds) are counted as cash payments only when the actual disbursement is subsequently made, in contrast with the administrative budget totals in which such items are reported as a budget expenditure at the time when the increase in the public debt occurs.

The excess of Federal cash receipts from the public or payments to the public is often referred to as the "cash surplus or deficit." As the tabulated series indicate, the excess of receipts from or payments to the public is not necessarily the same as the Government's net cash borrowing from the public or repayment of debt owed to the public. The difference is accounted for mainly by increases or decreases in cash balances (both in the Treasury and outside it) and to a minor extent by receipts from the exercise of monetary authority. Net cash borrowing or repayment of borrowings from the public excludes Treasury borrowing from Federal trust accounts and Government-sponsored enterprises and also excludes certain types of public-debt transactions such as the issuance and redemption of Armed Forces leave bonds.

Because the cash accounts include receipts and payments of trust funds, exclude various intragovernmental and noncash transactions, and are affected by other types of adjustments, the amounts reported as receipts from several major sources and the expenditures reported for several major functions differ significantly from the amounts reported for the same sources or functions in Treasury and budget accounts that tie to the administrative budget totals.

In the case of tax receipts, the principal differences during 1948–1957 were in employment taxes, which were predominantly trust fund revenues; and, in 1957, certain excise taxes on motor fuel, tires, and vehicles that were earmarked, beginning in that year, for the highway trust fund. Also, the cash receipts accounts include other types of trust fund receipts (such as unemployment insurance deposits by States, and veterans life insurance premiums) that are not included in budget receipts. For Federal Government receipts from the public, by major sources, in the fiscal years 1948–1957, see the *Budget of the United States Government* for fiscal year 1960, p. 929.

The figures in the 1960 *Budget* are not the same, however, as those shown under similar headings in series Y 264–279, not only because there are conceptual differences between budget receipts and receipts from the public, but also because series Y 264–279 are in terms of internal revenue collections, so that the amounts are reported at a point in the flow of receipts different from the point at which they are reported in the annual budget total.

On the expenditure side, the functional categories most substantially affected for 1948–1957 by the differences between Federal payments to the public and budget expenditures were those for labor and welfare and for veterans services and benefits, both of which involve extensive payments from trust funds. In 1957, the commerce and housing category—which includes Federal expenditures for highway construction grants—also showed a substantial difference between budget expenditures and payments to the public.

The 1960 *Budget* (p. 929) reports Federal payments to the public for each major function for the fiscal years 1948–1957. The amounts shown there may be compared with budget expenditures for the same categories as reported in series Y 357–367.

Because the totals of receipts from and payments to the public are more comprehensive than the budget totals, they are widely used in assessing the impact of Government transactions on the economy. However, the magnitude of Government operations is understated somewhat, even in these totals, because they include only the net receipts or net expenditures of wholly owned and Government-sponsored enterprises. This procedure affects the totals of cash receipts and payments equally and therefore does not affect the excess of receipts from or payments to the public.

Similar data for State and local governments (and for the Federal Government for calendar years) are shown for 1946–1957 in the Council of Economic Advisers, *Economic Report of the President*, annual issues.

Y 384–714. General note.

The concepts and terms used in these series were originally developed for Census Bureau reporting on finances of State and local governments. These concepts have also been applied to Federal Government data to provide comparable comprehensive aggregates covering all levels of government.

For a full discussion of basic concepts and terminology and of the classifications of revenue and expenditure, see the source for series Y 384–445, pp. 1–9. A few of the more important items are discussed here.

General revenue and general expenditure, as used in these series, refer to all sources or purposes other than certain specifically defined utility, liquor store, and insurance trust operations.

Intergovernmental revenue and intergovernmental expenditure refer to transactions between the Federal, State, and local governments. To avoid double counting, such transactions are netted out of aggregates comprising the groups of governments concerned. Transactions with governments of other countries are not defined as intergovernmental. The value of intergovernmental aid "in kind" (for example, commodities or other property given by the Federal Government to State or local government agencies) is not included in either

Digitized by Google

intergovernmental or other revenue of the receiving government; the expenditures involved in granting such aid are included in direct expenditure of the granting government.

Besides intergovernmental aid "in kind," the following types of transactions between governments have not been isolated for special treatment as intergovernmental revenue or expenditure:

a. Contributions by local governments to State-administered retirement systems that cover their employees. These are included without distinction as part of the "current operation" expenditure of the local governments, and the receipts are included with State insurance trust revenue.

b. Interest paid or received on obligations of one government held by another government.

c. Transactions in which governments deal as ordinary suppliers and customers—e.g., in purchasing property, utility services, or supplies from one another.

Direct expenditure comprises all expenditure other than intergovernmental expenditure.

Since the data utilized for each individual government represent a consolidation of amounts from its various funds, payments between funds are eliminated for Census reporting. Thus, a government employer contribution to a retirement fund it administers is not counted as expenditure, nor is the receipt of this contribution by the retirement fund considered revenue; only the payment out of the fund for retirement benefits is classified in the Census tabulations as a governmental expenditure (in this particular illustration, an insurance trust expenditure).

The substantial amount of interest paid by the U.S. Treasury to the Federal insurance trust funds, which have all their reserves invested in Federal securities, is excluded from Federal interest expenditure and insurance trust revenue to avoid double counting in Federal financial aggregates. However, the principle of eliminating interfund transactions is not followed in the case of interest paid by a State or local government on any of its own securities held as an investment by insurance funds it administers—mainly because of the difficulty of identifying such transactions.

Y 384–445. Federal, State, and local government finances, 1902–1957.

Source: Bureau of the Census, *U.S. Census of Governments: 1957*, vol. IV, No. 3, *Historical Summary of Governmental Finances in the United States*, 1959.

These data are a consolidation of data for the Federal Government in series Y 446–516 and for State and local governments in series Y 517–574. The amounts in these series are net of intergovernmental transactions between the Federal, State, and local governments.

Y 446–516. Federal Government finances, 1902–1957.

Source: See source for series Y 384–445.

The 1957 Census of Governments classification of Federal fiscal data was applied in an annual *Summary of Governmental Finances* for the fiscal years 1952 through 1957. Derivation of the Federal Government data for earlier years is described on pp. 8–9 of the *Historical Summary*, cited above.

For the *Historical Summary* and the annual *Summary of Governmental Finances*, Federal budget data are recast into the Census framework which is used for reporting State and local government finances. Accordingly, Census figures on Federal revenue and expenditure differ from "budget receipts" and "budget expenditures" (series Y 254-367) as reported in the *Budget of the United States* and annual reports of the Secretary of the Treasury. The major differences are discussed in the following paragraphs.

In the 1957 Census of Governments report, the introductory text includes detail for 1942–1957 for the Census category, "National defense and international relations," showing how related items in Federal budget reports are regrouped in the census of governments classifications; and for 1902–1957, showing the Census treatment of items grouped in Federal budget reports under "Veterans services and benefits." Other functional categories also differ from those shown for the Federal Government in series Y 357–367.

Loans made by the Government are included in "budget expenditures" and receipts from the repayment of loans are included in "budget receipts." These transactions are excluded from revenue and expenditure as defined by the Bureau of the Census.

Financial transactions of government enterprises are included in Federal budget figures only to the extent of their net effect (plus or minus) upon "budget expenditures"; Census figures include gross revenue and expenditure of government enterprises (other than loan and investment transactions). Illustrative of this difference is the treatment of transactions of the Post Office Department in Census and Budget sources.

In series Y 416 and Y 496, postal service, expenditure for the Post Office Department is reported gross, without deduction for postal revenue. Gross postal receipts are included in series Y 392 and Y 460 as a category of general revenue. This treatment differs from the tabulations based on Treasury and budget accounts (series Y 254–367) which include only the difference between postal receipts and payments.

Federal "budget receipts" and "budget expenditures" omit the financial transactions of trust funds. These are included in Census reporting of Federal revenue and expenditure, except for trust funds handled on an agency basis for State and local governments (e.g., the State accounts in the unemployment compensation fund, and District of Columbia funds).

Certain kinds of reimbursements from non-Federal sources and receipts from charges for quarters and subsistence furnished to employees are treated in the Federal Budget as "appropriation credits" and result in the reduction of budget expenditures by the amount of such credits. For Census purposes, these amounts are counted as revenue and added to expenditure.

Federal budget receipts and expenditures include amounts transferred between general and special accounts, on the one hand, and enterprise and trust funds, on the other. Census figures exclude such interfund transfers.

Federal budget expenditures include interest on an accrual basis. Census data on interest expenditure are on a disbursement basis. Furthermore, interest paid to Federal insurance trust funds is included in Federal budget expenditures, while Census data exclude such interfund transfers.

Data on "cash receipts from and payments to the public" (series Y 380–383) also differ from the Census figures on Federal revenue and expenditure. Thus, that series treats the financial transactions of government enterprises on a net basis (as does the series on budget receipts and expenditures); it includes lending transactions to the extent that they are included in budget receipts and expenditures; and it handles "appropriation credits" the same way they are handled in budget receipts and expenditures. On the other hand, the data on "cash receipts from and payments to the public" differ from the budget series and more closely resemble the Census data in their treatment of trust funds, interfund transfers, and interest amounts.

Digitized by Google

Federal Government indebtedness and the change in debt outstanding (series Y 480–483) correspond with "public debt" as reported by the U.S. Treasury. Consequently, series Y 480 is the same as series Y 257.

Y 517–714. State and local government finances, 1902–1957.

Source: See source cited for series Y 384–445.

Periodic surveys of State and local government finance began in 1850; for that year and 1860 the data were published in conjunction with reports of the population census. For 1870–1922, the State and local government data were reported at approximately decennial intervals under the title, *Wealth, Debt, and Taxation;* for 1932, as *Financial Statistics of State and Local Governments;* and for 1942 and 1957, as the *Census of Governments.*

In all these reports and the specialized annual series mentioned below, concepts, classifications, and coverage have undergone frequent revisions significantly affecting historical continuity and comparability. For a historical resume of 10 decennial censuses of governments, 1850–1942, see Bureau of the Census, *Governmental Finances in the United States: 1942,* pp. 130–135. The *Historical Summary* for 1902–1957, the source for the series presented here, represents a reworking of summaries for all State governments and all local governments (and the Federal Government) on a comparable basis. Except for the Federal Government, it does not report individual units of government.

For financial statistics of the individual State and local governments in 1957, see the detailed reports of the *U.S. Census of Governments: 1957,* especially vol. VI, presenting a separate bulletin for each State area.

For financial statistics in detail for the individual State governments, see the annual compilation by the Bureau of the Census issued for 1942–1957, as *Compendium of State Government Finances;* and for 1915–1941, as *Financial Statistics of States.* There were no volumes for 1920 and for 1932–1936; partial data were published for 1921; and data for 1932 were collected for 41 States but were not compiled fully or published.

Reports for earlier years used systems different than those applied since 1951. Figures for individual States on the later reporting basis are available in Bureau of the Census, *Revised Summary of State Government Finances, 1942–1950* (State and Local Government Special Studies No. 32, 1953).

For detail for individual large city governments, and in many years for every city with population above 25,000 or 30,000, see the annual compilations published by the Department of Labor for 1898–1901 and by the Bureau of the Census for 1902–1941 (with gaps for the years 1914 and 1920), as *Financial Statistics of Cities* (with early variations in title), and for 1942–1957, as *Compendium of City Government Finances.* Prior to 1932, the city statistics covered cities of 30,000 inhabitants or more in the preceding decennial census. For 1932–1941, coverage was limited to cities of 100,000 or more, and beginning 1942, the compilation relates to cities of 25,000 inhabitants or more. Through 1940, the city series included data for overlying local governments as well as the city government itself (except that the county governments were included only for cities of 300,000 inhabitants or more). For 1941, basic data related only to city governments, but supplementary tables provided figures for overlying local governments other than counties. For 1941–1957, the compilation was limited to the city government, omitting the overlying county government, school and other special districts, or other local governments.

A series on county governments also was published for 1943–1946, following the inclusion of all county governments in the Census of Governments for 1942. The county series yielded nationwide aggregates of county transactions and individual statistics for large counties.

[1] Federal payroll figures represent pay for the number of working days in month specified. Thus, changes in amount of payroll reflect in part differences in number of working days covered. Prior to 1958, data are for the month of September.
[2] Data are for the month of April.
[3] Includes $10.9 million for employees of the National Guard not previously included.
[4] Not available.

In 1918–1924, railroads and other public utility corporations frequently reported only net income, resulting in understatements estimated at $5 billion in 1918 and 1919 and nearly twice that amount in 1920 and 1921; not estimated for 1922–1924.

[1] Excludes liquidating dividends.

[2] For 1941–1943, includes a small amount of surtax from returns with no net income but with partially tax-exempt interest from Government obligations. For 1941–1956, includes a small amount of tax from returns with no net income because of special provisions for insurance companies.

[3] Prior to 1927, included among those reporting no net income.

[4] The declared-value excess profits tax includes a small amount of tax from returns with no net income because the excess profits tax applied to interest on Government obligations exempt from income tax.

[5] Deficit.

[6] Gross income. "Total compiled receipts" is not available separately for returns with net income and returns with no net income.

[7] Not tabulated.

[8] Amount of deficit for returns with no net income is not available.

Series Y 292–301. Individual Income Tax Returns: 1944 to 1957

[1] Includes fiduciary returns with net income filed on Form 1040, 1913–1936.
[2] For 1941–1943, total income on Form 1040A was also used as net income.
[3] Tax for 1924–1931, after earned income credit and capital loss credit; 1932–1933, after capital loss credit only; 1943, after foreign tax credit and tax paid at source. Tax for 1940–1941 includes defense tax and for 1943, victory tax.
[4] Not available.
[5] Somewhat understated because net income was used also as total income on returns with income of $1,000 to $2,000.
[6] Data pertain to last 10 months of year.

Series Y 312–318. Fiduciary Income Tax Returns: 1937 to 1956

[Money figures in thousands of dollars]

Income year	Taxable returns				Nontaxable returns		
	Number of returns	Total income	Net income or taxable income [1]	Income tax (after credits) [2]	Number of returns [3]	Total income [4]	Deficit (reduced by net income)

[1] Prior to 1954, net income taxable to fiduciary before exemptions; thereafter, taxable income after exemptions.
[2] For 1937–1942 and 1944, income tax before credits. Tax for 1940–1941 includes defense tax, and for 1943, victory tax.
[3] For 1954–1956, excludes returns with no information.
[4] For 1952–1956, represents total income less deficit in total income.
[5] Not available.

[1] Actual tax liability on selected net incomes and necessary assumptions.
[2] Internal Revenue Code of 1954. [3] Excludes self-employment tax.
[4] Taking into account the following maximum effective rate limitations: For 1944–1945, 90 percent; 1946–1947, 85.5 percent; 1948–1949, 77 percent; 1950, 80 percent; 1951, 87.2 percent; 1952–1953, 88 percent; 1954–1957, 87 percent.
[5] Individual Income Tax Act of 1944.
[6] Tax liabilities unadjusted for transition to current payment basis.
[7] Includes net victory tax. Computed by assuming that deductions are 10 percent of victory tax net income; i.e., that victory tax net income is ten-ninths of selected net income.
[8] Includes defense tax.
[9] Rates and exemptions for 1936 and 1938 acts were identical and resulted in the same tax liabilities.
[10] Normal tax rates of 1928 act were reduced for 1929 only by Joint Resolution of Congress.
[11] Provisions of 1926 act were retroactive to 1925.
[12] Mar. 1, 1913–Dec. 31, 1915.
[13] Tax liability divided by stated net income. [14] Split income basis.

[1] Includes returns for nonresident citizens who died on or after May 11, 1934.
[2] Net taxable estate includes net estate for returns filed under 1926 and prior acts, net estate for additional tax for returns filed under 1932 through 1953 acts, and net taxable estate for returns filed under 1954 Code.
[3] Net estate tax is the combined basic tax and additional tax whenever applicable, and includes defense tax for returns filed under 1940 act.
[4] Includes returns for nonresident citizens who died prior to May 11, 1934.
[5] Sept. 9, 1916–Jan. 15, 1922.

[1] Figures for 1791 through 1852 are not entirely comparable with later figures.

[2] Includes old demand notes; U.S. notes (gold reserve deducted since 1900); postal currency and fractional currency less the amounts officially estimated to have been destroyed; and also the deposits held by the Treasury for the retirement of Federal Reserve banknotes, and for national banknotes of national banks failed, in liquidation, and reducing circulation, which prior to 1890 were not included in the published debt statements. Does not include gold, silver, or currency certificates, or Treasury notes of 1890 for redemption of which an exact equivalent of the respective kinds of money or bullion was held in the Treasury.

[3] Exclusive of the bonds issued to the Pacific Railways (provision having been made by law to secure the Treasury against both principal and interest) and the Navy pension fund (which was in no sense a debt, the principal being the property of the United States). The Statement of the Public Debt included the railroad bonds from issuance and the Navy fund from Sept. 1, 1896, until the Statement of June 30, 1890.

[4] Includes certificates of indebtedness. Also includes refunding certificates of deposit, 1880–1907, inclusive.

[5] Includes old Treasury (War) savings securities from 1918 through 1929.

[6] Comprises special issues to Government agencies and trust funds.

[7] Less than $500,000.

chapter Y

ARMED FORCES AND VETERANS (Series Y 715–854)

Y 715–762. Selected characteristics of the Armed Forces, by war.

Source: The President's Commission on Veterans Pensions, *Veterans' Benefits in the United States*, vol. I; Staff Report No. IV, "Veterans in our Society," House Committee Print 261, 84th Cong., 2d session; and revised estimates prepared by the Department of Defense.

The time coverage for a particular war may vary from series to series. See source for exact coverage.

The number of personnel serving in the Revolutionary War is not known, but estimates range from 184,000 to 250,000. In the War of 1812, it is estimated that 286,730 served and in the Mexican War, 78,718. In the Civil War, estimates for Confederate forces range from 600,000 to 1,500,000.

Y 763–775. Military personnel on active duty, 1789–1957.

Source: Department of Defense, reports and records.

Primary sources of Army data are as follows: 1789, 1794, and 1795, *American State Papers, Military Affairs*, vol. 1 (except for officers, 1789, Thomas H. S. Hamersly, *Complete Regular Army Register of the United States for One Hundred Years (1779–1879)*, Washington, D.C., 1880); 1801–1821, *American State Papers, Military Affairs*, vol. 2; 1822–1939, *War Department Annual Reports* (except as follows: Regular Army, 1847 and 1866, Francis B. Heitman, *Historical Register and Dictionary of the United States Army*, vol. 2, Washington, D.C., 1903; Army Nurse Corps, 1920, Army field clerks, 1917, and Quartermaster Corps field clerks, 1917 and 1918, *Special Report 196*, Revised, Statistics Branch, War Department, General Staff, 1927; 1919 and 1920, Quartermaster Corps field clerks, *Regular Report 189*, Statistics Branch, War Department, General Staff, 1922; 1940–1957, Office of The Adjutant General, *Strength of the Army*, monthly reports. For data on U.S. Military Academy cadets, 1802–1821, *American State Papers, Military Affairs*, vol. 2; 1822–1920, *Official Register of the Officers and Cadets at the United States Military Academy* (except as follows: 1871, 1910, 1913, 1915, 1917, and 1918, *War Department Annual Reports*); 1921–1941, *War Department Annual Reports;* 1942–1957, *Strength of the Army*, monthly reports.

Some of the figures for the Navy and Marine Corps appear in the following sources: Gordon R. Young (ed.), *Army Almanac*, Stackpole Company, Harrisburg, Pennsylvania, 1959; Bureau of Navy Personnel, *Navy and Marine Corps, Military Personnel Statistics*, June and December 1956; Navy Department, Bureau of Personnel, *Progress Report*, March 1948.

Officers include warrant officers, flight officers, nurses, medical specialists, and field clerks. Enlisted personnel includes U.S. Military Academy cadets, U.S. Naval Academy midshipmen, U.S. Air Force Academy cadets, and other officer candidates.

Army data (series Y 764–766) begin with 1789, the year in which the Department of War (now Department of the Army) was established. Although a "regular" Army has existed continuously from that time, the total strengths cannot be documented from available records, nor can reliable estimates be made for 1790–1793 and 1796–1800. Beginning 1861, the data include all military personnel on extended active duty with the Army (Regulars, volunteers, militia, inductees, Reserves, National Guardsmen, and reactivated retired Regular personnel) and U.S. Military Academy cadets. Data prior to 1861 are for Regular Army and cadets only, except for 1836–1840 (Seminole Indian War) and 1846–1848 (Mexican War). Source documents for other years do not contain adequate strength statistics on nonregular personnel called out during the War of 1812 or for short periods of service during the numerous Indian disturbances. For most years prior to 1878, data were compiled from the latest returns received; some of the reports used, especially those from the frontier garrisons, were weeks or months in transit.

The Army figures include the Army Nurse Corps beginning 1898; Army field clerks and field clerks in the Quartermaster Corps for 1917–1925; warrant officers beginning 1919; flight officers for 1943–1947; and the Women's Army Corps (formerly the Women's Army Auxiliary Corps) and the Women's Medical Specialist Corps (later redesignated the Army Medical Specialist Corps), beginning 1943. All data for these categories are as of June 30, except the 1898 figure for the Army Nurse Corps which is as of September 15.

The Army Nurse Corps became a part of the permanent Army military establishment in 1901. It traces its origin, however, to 1898, when authority was received to employ by contract as many nurses as needed during the war with Spain. For this reason, data on nurses have been included for 1898–1900.

The positions of Army field clerks and field clerks in the Quartermaster Corps were created by Act of Congress, August 29, 1916. Field clerks of both classes were subject to the rules and articles of war, and had the status of officers, although not commissioned officers. By Act of Congress, April 27, 1926, the Secretary of War was authorized and directed to appoint as warrant officers all field clerks then in active service.

The Army figures for 1908–1947 include strength of the Army Air Force and predecessor agencies. Those beginning with 1948 consist of military personnel under the command of the Army only, resulting from the establishment of the Department of the Air Force as an executive department by the National Security Act of 1947. Data for 1948 and 1949 include a small number of Department of the Air Force military personnel assigned for duty with Army commands, and data for 1948–1955 exclude a larger number of Department of the Army military personnel assigned for duty with Air Force commands.

Navy data for 1794, 1795, and 1798 are an approximation of the "on board" personnel authorized by Congress in conjunction with the construction of six frigates to reconstitute a Navy which had existed for 1775–1785 under the Continental Congress. A separate Navy Department was authorized and organized in 1798. Since the crews usually were obligated, during the early years of the Navy, for only a specific sailing or mission, rather than a continuous tour of duty, the strengths shown are more in the nature of averages and are therefore noted as estimated. Data exclude an unknown number of Naval militia, supplied by the States, who served during the War of 1812, the Mexican War, and the Spanish-American

Digitized by Google

War. Since 1916, Naval Reservist and retired personnel on extended active duty have been included.

The Marine Corps was founded in 1775 by the Continental Congress and served during the Revolutionary War, but ceased to exist in 1783. It was reactivated in 1794 when Congress authorized the building of the six frigates and a small number of Marines were used as guards. The data in series Y 773–775 begin with 1798, since reliable estimates are not available for prior years. Since 1917, Reservist and retired personnel on active duty have been included.

Y 776–786. Estimated number of veterans in civil life, by war, 1865–1955.

Source: Veterans Administration, estimates based primarily on Armed Forces records.

The estimates for the War of 1812 were derived by a backward chain computation involving the application of appropriate survival rates to the age distribution of the 165 living veterans of this war on the pension rolls in 1892. It was assumed that all living veterans of the War of 1812 were on the pension rolls after 1873.

Estimates for the Mexican War were computed by applying appropriate survival rates to the age distribution of the 2,195 living Mexican War veterans on the pension rolls in 1907. For 1890 and later years, the estimates were based on the assumption that 90 percent of the living Mexican War veterans were on the pension rolls. Estimates for years prior to 1890 were based on a backward chain computation.

The Civil War estimate for 1865 was based on Armed Forces data. Estimates for years after 1865 were computed from actuarial projections, based on the American Experience Mortality Table, 1868, applied to the age distribution of one million Civil War participants included in Surgeon General, *The Medical Department of the U. S. Army in the World War*, Vol. XV, *Statistics*, part I, 1921. The totals so obtained were modified by the assumptions that 75 percent of the living Civil War veterans were on the pension rolls in 1900–1915 and that practically all living Civil War veterans were on the rolls in 1920 and later years. The estimates pertain to Union forces only.

For the Spanish-American War, estimates for 1905 and later years were computed by application of appropriate survival rates to the 1902 age distribution of Spanish-American War participants (not shown here). For 1900, estimate is based on total participants, inservice deaths, and discharges to civil life.

Estimates for World War I were computed by applying appropriate survival rates to the 1918 distribution of World War I participants by year of age based on records of 3.7 million War Risk Insurance applications (*The Medical Department of the U. S. Army . . .*, cited above).

For World War II and the Korean conflict, the estimates were derived from Armed Forces data on the number of persons returned to civil life less Veterans Administration estimates of deaths and less the number who reenlisted from civil life.

Estimates for the Indian wars include only veterans on pension rolls of the Veterans Administration or predecessor agencies. Data on the Regular Establishment include only former members of the peacetime forces receiving disability compensation or pension from the Veterans Administration or predecessor agencies.

The following periods are covered by the above-mentioned wars for determining veterans status:

War of 1812—June 18, 1812, through February 17, 1815
Mexican War—April 25, 1846, through May 30, 1848
Indian wars—1860 through 1898 (approximately)
Civil War—April 15, 1861, through August 20, 1866
Spanish-American War—April 21, 1898, through July 4, 1902 (includes the war with Spain, Boxer Rebellion, and Philippine Insurrection. For persons serving in the Moro Province, hostilities ended July 15, 1903)
World War I—April 6, 1917, through November 11, 1918 (for persons serving in Russia, the war ended April 1, 1920)
World War II—September 16, 1940, through July 25, 1947
Korean conflict—June 27, 1950, through January 31, 1955

Y 787–800. Estimated number of veterans in civil life, by age, 1865–1955.

Source: Veterans Administration, estimates.

Age distribution for veterans of World War I, Spanish-American War, Civil War, Mexican War, and War of 1812 were obtained by procedures used in estimating the numbers of living veterans in civil life, as described in the text for series Y 776–786. The ages for veterans of Indian wars and Regular Establishment (peacetime service) were obtained from records of the Veterans Administration and predecessor agencies.

The ages of World War II veterans included in the total for 1945 were based on the ages of those veterans on the Veterans Administration disability compensation rolls on June 30, 1945. The estimated number of veterans by age, for 1950 and 1955, were derived by the application of appropriate survival rates to the male and female components of the potential World War II veteran population as of July 25, 1947. In this particular case, the potential World War II veteran population is defined as: (*a*) The estimated number of men and women who had served in World War II and who had returned to civil life prior to July 25, 1947, and (*b*) those still in the service as of July 25, 1947. The age distribution of this population was derived from the Veterans Administration's scientific sample of approximately 1 percent of the records of the men and women separated from the Armed Forces between September 16, 1940, and July 25, 1947, and from estimates provided by the Armed Forces for World War II participants who were still in service on the latter date.

The ages of Korean conflict veterans included for 1955 were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life between June 27, 1950, and June 30, 1955.

Y 801–811. Expenditures of Veterans Administration and predecessor agencies from appropriated funds, by war, 1790–1957.

Source: Veterans Administration, records.

Original data are taken from annual reports of the Administrator of Veterans Affairs, Veterans Bureau, Bureau of Pensions, National Home for Disabled Volunteer Soldiers, and records of the Veterans Administration.

The data pertain to expenditures from appropriated funds (see text for series Y 812–825) for veterans and their dependents through June 30, 1957. Thus, they include expenditures for pensions since 1790 and for care in the National Homes (now Veterans Administration domiciliaries) since 1867. Grants-in-aid for the care of veterans in State homes were first made in 1889 and are included thereafter.

Expenditures on behalf of World War I veterans, made originally as allowances for the dependents of enlisted men in the Armed Forces, compensation for death and disability, medical care and treatment, vocational rehabilitation and training, and insurance against death or permanent disability, are included since October 1917. Subsequent adjustments of benefits

Digitized by Google

for World War I veterans and for veterans of the earlier wars (e.g., extension of hospital benefits) are reflected in the ensuing years. Expenditures for World War II veterans began in 1941, and for veterans of the Korean conflict in 1951.

Trust and working fund expenditures (e.g., the U.S. Government Life and National Service Life Insurance Trust Funds, the Adjusted Service Certificate Trust Fund, and the General Post Fund) are excluded; transfers from appropriations to the insurance trust funds, however, are included. Also excluded are expenditures made by other Federal and State agencies (e.g., unemployment compensation paid to Korean conflict veterans by the Department of Labor, expenditures for retirement pay by the Department of Defense, and bonus payments made by State governments).

Of the $88.8 billion in total expenditures through 1957, $74.4 billion (84 percent) was directly allocated by war. The distribution of the remaining expenditures was estimated. Therefore, the figures are subject to a varying and unknown degree of error. For example, variations in average hospital costs between wars, or unusual administrative workloads are not reflected in the distribution factors used.

Y 812–825. Expenditures for veterans benefits and services by Veterans Administration and predecessor agencies, 1790–1957.

Source: Veterans Administration, records.

Data are based on checks paid through December 31, 1947, and on vouchers approved for payment thereafter. The data are gross, since they include expenditures made from amounts earned (in the form of reimbursements) by the various accounts. Expenditures from revolving funds are also gross, i.e., receipts have not been netted out of these funds except in minor instances noted elsewhere. Accordingly, these data do not agree with those reported in the statements of the Treasury Department and the Bureau of the Budget.

Y 812, total expenditures. This series measures the gross cost of benefits and services (including capital expenditures and administrative costs) provided veterans and their beneficiaries, irrespective of the source of funds. Included are expenditures from general and special funds appropriated by the Congress, revolving and management funds authorized to finance a continuing cycle of operations using receipts derived from these operations, trust funds held by the Government for the benefit of veterans and their beneficiaries, and veterans funds held on deposit by the Government. Transfers from appropriations to insurance trust funds, from which the actual expenditures are made, are not included in the total, in order to avoid duplication. Expenditures from the Veterans Administration Revolving Supply Fund, established July 1, 1954, also are excluded from the total, since these amounts generally duplicate expenditures made by Veterans Administration administrative appropriations for supplies, equipment, and certain services procured through the fund.

Y 813, compensation and pensions. Data represent total expenditures less refund of overpayments.

Y 814, insurance and servicemen's indemnities. Data include direct payments to beneficiaries from insurance appropriations, servicemen's indemnities, and benefits and dividends paid from insurance trust funds. Some noncash transactions (e.g., interest credited to dividends left on deposit) also are included as expenditures from the trust funds. Transfers from appropriations to the insurance trust funds, from which the benefit payments are made, are not included in these amounts. Beginning fiscal year 1949, the reporting of expenditures from the U.S. Government Life Insurance and National Service Life Insurance trust funds was changed from a net to a gross basis. This resulted in an understatement in varying amounts for prior years. The cumulative differences for the prior years between the net figures and what the figures would have been on a gross basis have been added in a lump sum to the 1948 figures. This adjustment amounted to $295,651,000.

Y 815, education and training. This series includes subsistence allowances, tuition, supplies, and equipment of veterans training under Public Law 346, education and training allowances of veterans training under Public Law 550, and war orphans educational assistance under Public Law 634.

Y 816, vocational rehabilitation. Data include subsistence allowances, tuition, supplies, and equipment of veterans training under Public Laws 16 and 894, and vocational rehabilitation allowances for World War I veterans.

Y 817, unemployment and self-employment allowances. Includes weekly and monthly allowances to World War II veterans to assist in their readjustment to civilian employment. Credit figures reflect the excess of overpayments refunded over expenditures during the various years. Similar allowances paid to Korean conflict veterans by the Department of Labor are excluded.

Y 818, loan guaranty. Includes 4 percent gratuity payments to veteran borrowers, payments on defaulted loans, and the cost of property and securities acquired. The amounts are gross and do not reflect the cost of the loan guaranty program to the Government. Refunds and recoveries on claims paid and returned to the general fund have amounted to $84 million through June 30, 1957. Other losses of the program are subject to further recovery from the liquidation of securities and repayments by borrowers.

Y 819, direct loans. Includes direct mortgage loans and advances to veterans, interest expenses on capital borrowed from the U.S. Treasury, and other expenses (excluding Veterans Administration administrative expenses) of the direct loan program. Expenditures are gross and do not reflect the cost of this program to the Government. Through June 30, 1957, receipts paid into the direct loan fund amounted to $225 million, bringing net expenditures to $492 million. This will be further reduced, as the program matures, by payments of interest and principal by borrowers.

Y 820, miscellaneous benefit payments. Includes statutory burial allowances; expenditures not classified as to purpose from the Compensation and Pensions appropriation; automobiles and other conveyances for disabled veterans; specially adapted homes for paraplegic veterans; payments to participants in the yellow fever experiments; military and naval family allowances of World War I veterans; marine and seamen's insurance in World War I; adjusted service compensation (World War I bonus); General Post Fund expenditures; withdrawals of the personal funds of patients held by the Veterans Administration as banker and funds due incompetent beneficiaries; soldiers' and sailors' civil relief; and the vocational rehabilitation revolving fund. These expenditures are gross with the exceptions of soldiers' and sailors' civil relief and the vocational rehabilitation revolving fund, which are on a net basis.

Y 821, medical, hospital, and domiciliary services. Figures include expenditures for hospital and domiciliary care, outpatient medical and dental treatment, medical research, and related costs; appropriations to the Canteen Service Revolving Fund; and grants to the Republic of the Philippines for medical care and treatment of veterans. Beginning 1921, the data are estimated. Prior to July 1, 1879, the fiscal year of the National Home for Disabled Volunteer Soldiers ended on various dates. For this period, the data have been proportionately adjusted by the Veterans Administration to reflect expenditures for years ending June 30.

Digitized by Google

Y 822, hospital and domiciliary facilities. These data include expenditures for the construction and equipping of hospitals and domiciliary facilities, and major alterations, improvements, and repairs thereof; grants to the Republic of the Philippines for the construction and equipping of a hospital; expenditures from funds allotted under the National Recovery Act of 1933 and Public Works Administration Act of 1938; and $436,623,692 transferred to the Department of the Army, Corps of Engineers, for the construction of hospitals.

Y 823, administration and other benefits. Includes expenses for vocational counseling of veterans, beneficiary travel for certain programs, reporting allowances paid schools for certifying the attendance of veteran trainees, private laws for relief, and all administrative salaries and expenses.

Y 824–825, expenditures from general and special fund appropriations. Series Y 824 represents expenditures from appropriations made by the Congress to finance the general and ordinary operations of the Veterans Administration and predecessor agencies. The figures differ from amounts shown under total expenditures (series Y 812) after 1917 in that they do not include expenditures from trust funds, working funds, and deposit funds. Transfers from appropriations to insurance trust funds (series Y 825) are included in the figures for series Y 824.

Y 826–837. Veterans pensions and compensation—number of veterans and expenditure, by type, 1866–1957.

Source: Veterans Administration, records. Data were compiled from various annual reports of the Administrator of Veterans Affairs, and of the Commissioner of Pensions.

The basic distinction between pension and compensation is that pension is a benefit payable for total and permanent disability or death which is not attributable to the veteran's military service. Compensation is payable for disability or death resulting from injury or disease incurred in, or aggravated by, military service. In the series relating to death benefits, the number of veterans refers to the number of deceased veterans whose dependents are receiving benefits, rather than to the number of dependents in receipt of such benefits; the data on expenditures refer to the amount received by these dependents. In the disability cases, the data refer to the number of veterans, and the amount of money paid to these veterans in the form of retirement pay administered by the Veterans Administration or its predecessor agencies.

For 1866–1890, separate data are not available for the death and disability series. Likewise, information is not available which would permit a separation of the data on the pensions and compensation earned for military service prior to 1904. As a result, all data on veterans of the Spanish-American and earlier wars have been arbitrarily included in the pension series.

The compensation data refer to (with the qualifications as noted above for the series on deaths) the number of, or expenditures paid to, veterans of the Regular Establishment, World War I, World War II, and the Korean conflict. Data on these veterans were first included in 1904, 1918, 1942, and 1951, respectively.

Y 838–850. Patients receiving hospital or domiciliary care authorized by Veterans Administration, 1921–1957.

Source: Veterans Administration, records.

These data do not in all cases agree with information previously published in some of the earlier annual reports of the Veterans Administration. Revisions were made to adjust some of the data for earlier years for comparability with current data.

The data for all veterans receiving hospital care (series Y 839) and veterans with service-connected disabilities (series Y 844) are identical prior to 1925. The act which made Veterans Administration hospital care available to veterans with nonservice-connected disability was passed in 1924, and it was not until 1925 that such patients were admitted to Veterans Administration hospitals.

Data for veterans receiving hospital care for service-connected disabilities (series Y 844–847) exclude those veterans with service-connected disabilities who are being treated for nonservice-connected ailments.

Series Y 843 shows the number of nonveteran patients in Veterans Administration hospitals. This group of patients is made up for the most part of persons still in the military service who have not yet attained veteran status, and cases admitted to Veterans Administration hospitals for humanitarian reasons.

Domiciliary care was provided by the National Homes for Disabled Volunteer Soldiers through July 30, 1930; later, it was provided by other agencies. However, the data for years prior to 1933 are not comparable with the 1933–1957 data. The number of veterans in State homes receiving domiciliary care (series Y 850) is shown because the Veterans Administration contributes to the support of veterans cared for in approved State homes, who would be eligible for admission to Veterans Administration domiciliaries.

Y 851–854. Government life insurance administered by Veterans Adminstration—number of policies, income received, and benefits paid, 1921–1957.

Source: Veterans Adminstration, records.

The U.S. Government, through the Veterans Administration, operates two life insurance programs for veterans and servicemen. The insurance program which had its origin in World War I is known as U.S. Government Life Insurance (USGLI); and the program which had its inception in 1940 is called National Service Life Insurance (NSLI). The administrative expenses of these programs are borne by the U.S. Government. All USGLI is participating (that is, entitled to dividends from any earnings). This program was closed to new issues effective April 25, 1951. All NSLI issued prior to April 25, 1951, with some minor exceptions, is participating and entitled to dividends. This type of insurance also was closed to new issues in 1951. Veterans separated from military service without a service-connected disability on or after April 25, 1951, and before January 1, 1957, could apply for nonparticipating NSLI on the 5-year nonconvertible term plan only. This insurance is known as veterans special term insurance. Those separated with a service-connected disability on or after April 25, 1951, are eligible to apply, within one year after service-connection is established, for permanent plan or term policies. This insurance is known as service-disabled veterans insurance. The maximum amount of all Government insurance for veterans is $10,000 on one life. Excluded from these series are data on the Servicemen's Indemnity program, which was in effect from June 27, 1950, to January 1, 1957. This program provided free life insurance in the amount of $10,000 (less any USGLI or NSLI in force) while in military service and for 120 days thereafter.

Income received (series Y 853) includes: (*a*) Premiums received from policy holders for insurance and disability income benefits, including premiums waived because of disability, (*b*) advances from Congressional appropriations to the service-disabled veterans insurance fund, (*c*) interest on investments in U.S. Treasury Certificates of Indebtedness and in U.S. Treasury notes, (*d*) interest on policy loans and on premiums

Digitized by Google

paid in arrears, (*e*) dividends credited to insureds or deposited to accumulate at interest, and (*f*) reimbursements from the U.S. Government as the Government's contribution for death and disability claims due to the extra hazards of military or naval service, for gratuitous insurance, and for other obligations.

Benefits paid (series Y 854) include: (*a*) The actual cash payments to beneficiaries of deceased insureds, (*b*) cash payments to insureds under the total and permanent disability provisions of USGLI policies, (*c*) monthly income payments under total disability income provisions of USGLI and NSLI policies issued before April 25, 1951, (*d*) premiums waived for total disability, (*e*) cash surrender values paid on contracts surrendered, (*f*) payments on matured endowment policies, (*g*) dividends paid and dividends previously credited or left on deposit and later withdrawn, (*h*) interest added on dividend credits and deposits, and (*i*) adjustments in policy liens, receivables, and overpayments waived.

[1] Largely includes payments from trust accounts.
[2] Detail does not add to total because of adjustments for overpayments collected and items written off as uncollectible under the readjustment benefits program. These amounted to $1,140,000 in 1956 and $647,000 in 1957.
[3] Credit. [4] Includes adjustments for prior years; see text.

Colonial Statistics

Z 1–405. General note.

It would have been possible to distribute these series for the colonial period among the chapters covering each of the appropriate subject fields. It was felt, however, that a separate chapter especially organized to cover this period would be more valuable in itself and would also provide a more suitable, less-exacting context for the statistics, many of which are relatively roughhewn.

In the past, statistics for the colonial period were largely dependent on compilations made during the 17th and 18th centuries by historians such as Whitworth and Macpherson. Present-day scholars, however, no longer solely rely upon such compilations. They are ferreting out statistical information from original records hitherto left unused in archives and reconstructing statistical series of their own from other sources.

Only five of the tables presented here might be said to be old standbys. Twenty-two are the work of modern scholars, half reprinted as originally published, and half supplemented by reference to other data.

Of those which never before have appeared in print, Stella H. Sutherland compiled series Z 1–19; Jacob M. Price, series Z 223–237 and part of series Z 238–240; J. R. House, series Z 267–273; Austin White, series Z 388–405; and Lawrence A. Harper (assisted by graduate students), the remainder.

The Public Records Office in London (sometimes hereafter abbreviated PRO) contains many collections of records which throw light on commerce between England and the colonies and to some extent on the development of agriculture and manufacturing in the colonies, particularly when considered with reference to the mercantilist laws passed by the mother country, as has been done here. The laws in question are cited at various points in the text below by reference to their regnal year and chapter numbers—for example, 5 Geo. II c 22 (the fifth year of the reign of King George II, chapter 22).

The collections in the Public Records Office in London, which are the original sources for much of the data presented here, are identified there by title and call numbers. For example, one collection is titled "American Inspector General's Ledgers" and is further identified as "PRO Customs 16/1." The most important of these collections or ledgers of imports and exports are the following: The English Inspector General's Ledgers (PRO Customs 3); the Scottish Inspector General's Ledgers (PRO Customs 14); the American Inspector General's Ledgers (PRO Customs 16/1); and the colonial naval office lists (usually found in C. O. 5).

The English, Scottish, and American Inspector Generals' Ledgers are conveniently arranged for statistical purposes, but are so voluminous that it is far more convenient to utilize contemporary tabulations drawn from them when such secondary sources are available. The lists kept by the naval officers of that period (for the purpose of helping to enforce the navigation laws) merely provide chronological data concerning the ships which entered and cleared port, together with their cargoes and destinations.

The task of using the naval office lists has in some instances been lightened by colonial newspapers, such as the *South Carolina Gazette*, which published data taken from customhouse records. Also of general assistance in the preparation of many series presented in this chapter are the compilations from naval office lists prepared by a Works Progress Administration project conducted at the University of California, entitled "Trade and Commerce of the English Colonies in America," and referred to below as WPA compilations.

Z 1–19. Estimated population of American Colonies, 1610–1780.

Source: Compiled by Stella H. Sutherland, Oakland City College, Oakland City, Indiana, chiefly from the following sources: B. J. Brawley, *A Short History of the American Negro*, MacMillan, 1913; Elizabeth Donnan (editor), *Documents Illustrative of the History of the Slave Trade to America*, 4 vols., Carnegie Institution of Washington, D.C., 1930–35; Evarts B. Greene and Virginia D. Harrington, *American Population Before the Federal Census of 1790*, Columbia University Press, New York, 1932; Stella H. Sutherland, *Population Distribution in Colonial America*, Columbia University Press, New York, 1936; E. R. Turner, "The Negro in Pennsylvania," *Prize Essays of the American Historical Association*, Washington, D.C., 1911; Bureau of the Census, *A Century of Population Growth*, 1909; Thomas J. Wertenbaker, *The Planters of Colonial Virginia*, Princeton, 1922; and George W. Williams, *The History of the Negro Race in America From 1619 to 1880*, 2 vols., New York, 1883. (Also, a wide variety of source material was consulted for general information.)

The original data were obtained from the reports of the colonial officials to the Lords Commissioners of Trade and Plantations. Not infrequently a census supplied sworn evidence of the number of inhabitants; for other reports, the militia or the tax lists or both were used, commonly accompanied by an estimate of the whole population as indicated by the rolls or lists. Estimates made by colonial officials and by other informed contemporaries who did not disclose the figures upon which their conclusions were based have occasionally been included in these series. However, such estimates were selected in accordance with the general pattern of population growth.

The ratio of the militia to the whole population was generally 1 to 5⅓, but there were many exceptions. In Massachusetts, it was 1 to 6 in 1751 and 1 to 4 in 1763; in Connecticut, 1 to 6 in 1722 and 1756 and 1 to 7 in 1749, 1761, and 1774; it was 1 to 6 in Virginia and 1 to 7 in South Carolina at various times. No generalization can safely be made as to the ratio borne by the northern polls and ratables and by the southern taxables and tithables to the whole population of the Colonies. In every Province the figure was different. In the North, it ranged from 1 to 4 to 1 to 5½; in Pennsylvania, it was 1 to 7 in the 1750's, but 1 to 5.8 was the more common figure; in Maryland and Virginia, where both male and female slaves appeared on the tax lists, the ratio was 1 to 3 or 3.5 in the 17th century and 1 to 2.4 or 2.6 in the 18th century. The North Carolina white taxables were multiplied by 4 and the Negro taxables by 2.

The figures for Negroes for the 17th century, which are doubtlessly too low, are largely estimates based upon references

488910 O - 60 - 49

Digitized by Google

to purchase and sale, to laws governing slavery, and occasionally to reports of more or less exact numbers.

Z 20. Percent distribution of the white population, by nationality, 1790.

Source: American Council of Learned Societies, "Report of Committee on Linguistic and National Stocks in the Population of the United States" (based on studies by Howard F. Barker and Marcus L. Hansen), Annual Report of the *American Historical Association, 1931*, vol. I, Washington, D.C., 1932, p. 124.

Distribution was made primarily on the basis of family names. For explanation of methods used, see source.

Z 21–34. Value of exports to and imports from England, by American Colonies, 1697–1776.

Source: 1697–1773, Charles Whitworth, *State of the Trade of Great Britain in Its Imports and Exports Progressively from the Year 1697*, G. Robinson, London, 1776; 1774–1776, David Macpherson, *Annals of Commerce, Manufactures, Fisheries and Navigation*, vol. III, Mundell & Son, Edinburgh, 1805, pp. 564, 585, and 599.

The English Inspector General's Ledgers (Public Records Office, London, Customs 2 and 3) provide the original source for these figures. Unfortunately, Whitworth's erroneous title has caused many to believe the figures relate to Britain rather than to England but otherwise his volume has much value. The source tables cover all countries and appear in two formats: One gives England's trade with any one country, annually; the other shows all the countries with which England traded each year. Those interested in studying broader trends will find value in the decennial averages in John Lord Sheffield, *Observations on the Commerce of the American States*, 6th edition, London, 1784. G. N. Clark's *Guide to English Commercial Statistics, 1696–1782* (Royal Historical Society Guides and Handbooks, No. 1, London, 1938) provides a valuable history and analysis of the basic statistics and a useful appendix which has a chronological list of statistical material for 1663–1783 and specifies where the data may be found.

Users of this material should note the basis on which the values rest. Smuggling (which so often attracts greater attention but which must always be considered commodity by commodity, country by country) does not constitute a material factor during the years under consideration. However, other difficulties arise with respect to the question of the volume of exports and the value of all the trade. The repeal of the export duties on woolen manufactures in 1701 (11 W. III c 20) and of the remaining export duties in 1721 (Geo. II c 15) removed the penalty for false entries on exports, and some merchants overstated their quantity for reasons of real or fancied prestige—a practice which may have injected an element of error of about 4 percent (Clark, cited above, pp. 16, 27, and 35).

Another problem arose in determining the value of the merchandise imported as well as exported. The authorities of the early 18th century were greatly interested in the balance of trade and at first tried to ascertain the real commercial value of merchandise. However, the difficulties of doing so, and the increasing recognition that there were intangible elements which the records could not disclose, led to the abandonment of attempts to keep the values current by the end of the second decade of the 18th century.

The so-called "official values" became stereotyped between 1705 and 1721 (Clark, cited above, pp. 17–23), a fact which diminished their value for use in striking a balance of trade but increased their usefulness as a rough-and-ready index of the relative increase or decrease of the volume of trade.

See also general note for series Z 1–405.

Z 35–42. Value of exports to and imports from England by New York, 1751–1775.

Source: Virginia D. Harrington, *The New York Merchant on the Eve of the Revolution*, Columbia University Press, New York, 1935, p. 354.

Foreign manufactures "In time" are those which could receive a drawback (refund) of duties; "Out of time" are those which could not. Outports are all ports in England other than London.

Z 43–55. Tonnage capacity of ships and value of exports and imports of American Colonies, by destination and origin, 1769 and 1770.

Source: David Macpherson, cited above in source for series Z 21–34, vol. III, pp. 571–572.

The tonnage figures shown are those used commercially—not those computed when the Royal Navy was purchasing vessels (see text for series Z 56–75). The statistics given by Macpherson are substantially the same as those given in Public Records Office, London, Customs 16/1, except that Macpherson put the 1769 inward-bound tonnage data for Southern Europe in the West Indies column (and vice versa)—an error which has been corrected here.

The value figures for 1769 provide only a rough-and-ready index of the relationship among the different trades. Totals include figures for the Islands of Newfoundland, Bahama, and Bermuda (a factor which statistically makes only a minor difference). These data are based on the official valuations used in the customhouse which, according to Macpherson, considerably understate the true amount. This defect, however serious for some purposes, does not destroy the value of the figures for comparative purposes. Also, it must be remembered that the value figures exclude the intercolonial coastwise trade which the tonnage figures show to have been as large as any other.

See also series Z 21–34, which provide a broader and more representative base for studying the relative relationship of the Thirteen Colonies' trade with England.

It should be noted that the use of these figures on volume of the traffic for the various trades for estimating the amount of shipping given full-time employment must allow for repeated voyages of the same vessel.

Z 56–75. Number and tonnage capacity of ships outward and inward bound, by destination and origin, 1714–1772.

Source: Compiled by Lawrence A. Harper, University of California, from photographic copies of the naval office lists in the British Public Records Office (C. O. 5), except for: 1714–1717, Boston, and 1715–18, New York City, E. B. O'Callaghen, ed., *Documents Relative to the Colonial History of the State of New York*, vol. V, Weed, Parsons, and Company, Albany, 1855, p. 618; 1733 and 1734, Philadelphia, *Pennsylvania Gazette* for those years; 1752, Port Hampton, Francis C. Huntley, "The Seaborne Trade of Virginia in Mid-Eighteenth Century: Port Hampton," *Virginia Magazine of History and Biography*, vol. LIX, No. 3, July 1951, pp. 302–303; 1763 and 1764, New York, and 1765 and 1766, New York, Boston, and Philadelphia, see source for series Z 35–42, pp. 356–358; and 1768–1772, all ports, American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Where the classification in *Documents Relative to the Colonial History* . . . did not correspond to that used here, the

Digitized by Google

necessary adjustments were made by reference to the Colonial Naval Office lists (PRO C.O.5).

The colonial naval officers appointed to enforce the English navigation laws as well as the collectors appointed by the English Commissioners of Customs under the act of 1673 (25 Car. II c 7) were charged with reporting the entry and clearance of ships as well as their cargoes. Many of the copies of the naval office lists have survived from the 18th century. When they have not, records of the names and destinations of the ships (but not their tonnages) may be obtained from the shipping news in the colonial newspapers. Such data of entries and clearances provide the best rough-and-ready index of the course of trade and its relative volume.

Although the figures concerning the entry of goods such as molasses might be distorted by illicit trade, the severity of the penalty (forfeiture) for failure to enter one's ship and the difficulty of concealing the offense help to warrant the accuracy of ship entry figures. Tonnage figures, however, present a special problem. Ralph Davis in "Organization and Finance of the English Shipping Industry in the Late Seventeenth Century" (doctoral thesis, University of London, 1955) states (pp. 476–479) that *the tonnage* as calculated when the English Navy was contracting *for the purchase* of a vessel was 25 to 33 percent greater than the *conventional "tons burden"* recorded in the customhouse books. Since the "tons burden" figures for the same ship remain constant in the passbooks and customs entries during the span of time here involved (although not necessarily for all periods), the difference between this purchase tonnage and the conventional tonnage will ordinarily not affect use of the data shown here.

See also general note for series Z 1–405.

Z 76. Value and quantity of articles exported from British Continental Colonies, by destination, 1770.

Source: David Macpherson, cited above in source for series Z 21–34, vol. III, pp. 572–573, supplemented by American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Data do not include coastwise shipments as do the figures in the American Inspector General's Ledgers (PRO Customs 16/1). Macpherson (see source for series Z 21–34) states that he omitted fractional parts of the quantities but their value is retained in the value column. Because of this and an error which Macpherson saw but had no means of correcting, the value column may not be entirely comparable with the quantity columns. The value figures are not the market values (which Macpherson believes to have been higher) but are the official customhouse values at the ports of exportation. Customs 16/1 presents the quantities in all cases for a longer time span, 1768–1772, but the data there are not so conveniently totaled as in Macpherson.

See also general note for series Z 1–405.

Z 77–86. Coal exported from James River ports in Virginia, by destination, 1758–1765.

Source: Howard N. Eavenson, *The First Century and a Quarter of American Coal Industry*, Waverly Press, Inc., Baltimore, 1942, pp. 32–34, and WPA compilations (see general note for series Z 1–405) of naval office lists at the University of California.

These figures were compiled from the colonial naval office lists by Eavenson. They represent only the years for which records are complete in the case of both the Upper and Lower James. Comparison with the colonial exports for 1768–1772 (compiled by Eavenson, p. 36, from PRO Customs 16/1) shows that the James River shipments constituted the great bulk of the exports from the Thirteen Colonies. Out of a total of 2,798 net tons recorded, 1,220 net tons were shipped from the Upper James, 180 from the Lower James, 1,100 from Nova Scotia, 117 from New Hampshire, and only minor quantities from other ports (which may have been used as ballast and originally may have come from Great Britain).

Chaldrons were not converted into tons at the Newcastle rate of 5,936 pounds equal to 2.97 net tons but on the measure used after the Revolutionary War, a chaldron equaling 36 bushels or 1.44 net tons.

Z 87–107. Coal imported, by American ports, 1768–1772.

Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Chaldrons and bushels were converted to net tons as described in text for series Z 77–86.

The WPA compilations (see general note for series Z 1–405) from the naval office lists show earlier entries of coal in the several ports, from time to time. The great bulk came from Britain, the remainder (except in the case of exports from James River ports) apparently were transshipments, but it is not until 1768 that records give a good cross section of the traffic.

Z 108–121. Value of furs exported to England, by British Continental Colonies, 1700–1775.

Source: Murray G. Lawson, "Fur—A study in English Mercantilism, 1700–1775," *University of Toronto Studies*, History and Economics Series, vol. IX, University of Toronto Press, Toronto, 1943, pp. 108–109.

As pointed out in the source, the fur trade is inextricably interwoven with the manufacture of beaver hats. Thus, the Hat Act of 1732 (5 Geo. II c 22) forbidding the exportation of hats by any colony, combined with the enumeration of beaver skins and furs in 1722 (8 Geo. I c 15), sought to protect the English hat manufacturers. These series show the importance to the English of their colonial supply of fur. Comparison of these figures with those shown in series Z 21–34 will demonstrate the relative unimportance of fur in the colonial balance of trade.

The source also specifies the different kinds and quantity of fur England imported from the colonies and elsewhere, as well as the quantity and value of the different markets of the world—data given in even greater detail in the original tables which Lawson has left with the WPA compilations at the University of California in Berkeley.

See also general note for series Z 1–405.

Z 122–125. Indigo and silk exported from South Carolina and Georgia, 1747–1775.

Source: Series Z 122–124, Lewis C. Gray, *History of Agriculture in the Southern United States to 1860*, vol. II, Carnegie Institution of Washington, D.C., 1933, p. 1024 (except 1766, WPA compilations of colonial naval office lists, Public Records Office, London, C. O. 5; and 1768–1772, photographic copies of the American Inspector General's Ledgers, Public Records Office, London, Customs 16/1). Series Z 125, Lewis C. Gray, cited above, vol. I, p. 187.

See also general note for series Z 1–405.

The data on indigo are reasonably complete. Although South Carolina contemplated the production of indigo as early as 1672 little came of it, presumably because of the competition from the British West Indies. When the British Islands began to emphasize sugar rather than indigo, England had to depend upon the French West Indies for her supplies of indigo until South Carolina (thanks to the enterprise of Eliza Lucas) again entered the field. The first successful crop in 1744 was

Digitized by Google

largely devoted to seed but South Carolina was soon exporting in quantity. In due course, Georgia became a competitor but British Florida did not enter the picture until late. Even during the last 5 years of the colonial period British Florida's production ranged only between 20,000 and 60,000 pounds (Gray, cited above, vol. I, pp. 54 and 291–295).

The great bulk of indigo went to Britain (which wanted it as a source of blue dye), not only because of its enumeration in the act of 1660 (12 Charles II c 18), but also because of the bounty England paid of 6 pence per pound (21 Charles II c 30). However, Customs 16/1 and the WPA compilations (see general note for series Z 1–405) show that minor quantities went to other Continental Colonies. Gray's Carolina figures, which were taken by him from an English source, apparently do not include coastwise shipments. This omission is relatively unimportant since the coastwise figures for 1768–1773 (as shown in Customs 16/1) represented only 1.6 percent of the total exports. The figures for Georgia (compiled by an American customs official) include shipments coastwise as well as to England—a matter of statistical significance as they constituted 5.1 percent of Georgia's total for 1768–1773.

Comparison of Gray's figures for 1747–1765 with those for 1768–1773 in Customs 16/1 suggests that Gray's figures are not for Charleston and Savannah alone, as shown by his headings, but for South Carolina and Georgia. In the case of South Carolina, the two series agree exactly in 1768, the one year when we have figures from both sources. Since Gray's source (British Museum, Kings Manuscripts, 206, f. 29) is the same for the earlier years, 1747–1765, it seems probable that the figures for these years also refer to South Carolina as a whole.

Customs 16/1 does not conclusively answer the problem in the case of Savannah. It shows for 1768–1772 that Savannah was the only Georgia port exporting indigo except in 1772. For this year, Gray's figures differ slightly from those shown in Customs 16/1 for Savannah alone and also those for Georgia as a whole. The decision to change the heading from Savannah to Georgia rests upon the fact that Bernard Romans (*A Concise Natural History of East and West Florida*, vol. I, New York, 1775, p. 104) specifies Georgia rather than Savannah.

Whether or not the figures are for Savannah or Georgia seems statistically insignificant. In South Carolina, however, ports other than Charleston provided 7.8 percent of that colony's exports to England for 1768–1773. Whatever may be true of Gray's figures, those given for 1768–1773 from Customs 16/1 do include all South Carolina ports and all of Georgia, but the only figure available for South Carolina for 1766 (from the WPA compilations) is for Charleston alone.

The figures on silk are from records compiled by the Georgia Comptroller of Customs (Gray, cited above, vol. I, p. 187). See also text for series Z 126–130.

Z 126–130. Silk exported and imported by North and South Carolina, 1731–1755.

Source: Chapman J. Milling, ed., *Colonial South Carolina*, University of South Carolina Press, Columbia, 1951, p. 104.

Despite vigorous efforts to encourage colonial silk production by both British and colonial governments, more silk moved west than east across the Atlantic. Early figures gathered by Gray (cited above for series Z 122–125, vol. I, pp. 184–187) show that in 1654 Virginia reported the production of only 8 pounds; in 1656, 10 pounds (wound silk); in 1668, 300 pounds (sent to Charles II, type unspecified); in 1730, 300 pounds (raw), and that the Carolinas sent "several bales" to London in 1710 and again in 1716. Georgia's first efforts succeeded in sending only 20 pounds of silk to England in 1739. In 1741, she produced 600 pounds of cocoons (of which 16 pounds made 1 pound of silk) as against 37 pounds of wound silk in all the previous years of the colony. In 1749, the Salzburgers (a religious colony of industrious peasants and artisans) alone produced 762 pounds of cocoons and 50 pounds, 13 ounces, of spun silk. In 1764, the Colonies' total product amounted to 15,212 pounds of cocoons. See also text for series Z 122–125.

The figures for the Carolinas (1731–1755) were taken from British records and appear in Governor James Glen's *Description of South Carolina* (Milling, cited above, p. 104).

Z 131–222. General note.

Iron was listed in colonial commerce as "pig iron" which derived its name from the shape assumed by the molten iron when poured from the furnace, after being separated from the ore, and "bar iron" which consisted of malleable iron produced in bloomeries or at the forge. Iron manufactures not specifically described by name, such as anchors, axes, pots, nails, scythes, etc., were listed as "cast iron" if poured into forms and "wrought iron" if forged from malleable iron except in the English Inspector General's records (PRO Customs 3) where the term "wrought iron" seems to have included both cast and malleable iron products.

The statistical picture of iron in the colonies can be reconstructed in part from data concerning iron works in the colonies and in part from the records of colonial trade. The beginning of this industry came early in the various American colonies—in Virginia in 1622, Massachusetts in 1645, Connecticut in 1657, New Jersey in 1680, Maryland in 1715, Pennsylvania in 1716, and New York shortly before 1750. By 1775, the colonies had at least 82 charcoal furnaces which produced about 300 tons each, or a total of 24,600 tons, of pig iron and more than 175 iron forges, some being bloomeries which made bar iron directly from the ore. Most of them, however, were refinery forges which used pig iron. Each of the 175 forges produced an average of 150 tons of bar iron a year, or 26,250 tons in all. In addition, there were slitting mills and other iron works.

Arthur C. Bining, in *British Regulation of the Colonial Iron Industry*, cited below for series Z 131–135, p. 134, provides a table comparing American production with the world total (see text table I). These estimates include pig iron, cast iron wares made at blast furnaces, and bar iron produced at bloomeries directly from the ore.

Table I. Iron Production of American Colonies and the World

[In tons]

Year	American Colonies	World
1800	45,000	400,000
1790	38,000	325,000
1775	30,000	210,000
1750	10,000	150,000
1700	1,500	100,000

The figures shown in series Z 131–222 for the movement of the various types of iron in commerce throw light on England's efforts to encourage Americans to produce pig and bar iron by freeing those products from import duties in England, and to limit further manufacture by prohibiting the erection of any new slitting or rolling mills, tilt hammer forges, or steel furnaces (23 Geo. II c 29; 30 Geo. II c 16). Iron was not added to the list of enumerated products which could only be shipped to Britain (or another colony) until 1764 (4 Geo. III c 15), and even then the law only forbade shipments to Europe.

Digitized by Google

Comparisons of colonial production with export figures will help provide estimates of the home market, which can be reduced to an approximate *per capita* base by reference to series Z 1-19.

See also general note for series Z 1-405.

Z 131-135. Pig iron exported to England, by colony, 1723-1776.

Source: 1723-1755, and, series Z 131 only, 1761-1776, Arthur Cecil Bining, *British Regulation of the Colonial Iron Industry*, University of Pennsylvania Press, Philadelphia, 1933, pp. 126-133; 1756-1760, and series Z 132-135, 1761-1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Basically, all the figures come from the Inspector General's accounts although Bining obtained his from House of Lords MSS., No. 185, and Harry Scrivenor, *Comprehensive History of the Iron Trade*, Longman, Brown, Green, and Longmans, London, 1841.

J. L. Bishop, *A History of American Manufactures . . .*, cited below for series Z 153-158, p. 625, gives an earlier figure when he states that the first iron sent to England from America was from Nevis and St. Christopher, followed in 1718 by 3½ tons from Virginia and Maryland. Series Z 131 is that of Bining and, where possible, footnotes explain the reasons for differences between his totals and those of the extended figures. The customs records were stated in terms of tons, hundredweights, quarters, and pounds, but they have here been rounded to tons.

Z 136-142. Pig iron exported from American Colonies, by destination and colony, 1768-1772.

Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

The difference in total exports given in series Z 136 for Great Britain and that in series Z 131 for England should reflect trade with Scotland except for the variation in terminal dates and the lapse of time required to cross the Atlantic. The trade, however, seems to have been minor. J. L. Bishop, *A History of American Manufactures . . .*, cited below for series Z 153-158, p. 628, gives figures showing that the pig iron exported to Scotland totaled only 264 tons in the 10 years from 1739 to 1749 and 229 tons in the 6 years from 1750 to 1756.

No figures are available for pig iron imported from England by the colonies. Such imports were probably negligible.

Z 143-152. Pig iron imported by American Colonies from other Continental Colonies, 1768-1772.

Source: See source for series Z 136-142.

In addition to the colonies shown, these series also cover New Hampshire, New Jersey, Georgia, and Florida. However, these colonies imported no pig iron for 1768-1772.

Z 153-158. Bar iron imported from England, by American Colonies, 1710-1750.

Source: 1710-1735, J. L. Bishop, *A History of American Manufactures From 1608 to 1860*, vol. I, Edward Young & Co., Philadelphia, 1861, p. 629; 1750, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Shipments of bar iron from England to the Colonies declined sharply in the last quarter century before the Revolution. Figures are not available for 1736-1749 to determine when the decline first became evident.

Imports were relatively few after 1750. The English and American Inspector Generals' Ledgers show that New England imported 6 tons in 1764, and again in 1769, and 1,053 bars in 1773. South Carolina imported 19 bars in 1770 and 3 hundredweight in 1773.

Z 159-164. Bar iron exported to England, by colony, 1718-1776.

Source: 1718-1755, and series Z 159, 1761-1776, Bining, cited above for series Z 131-135, pp. 128-133; 1756-1760, and series Z 160-164, 1761-1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

The original sources show data in tons, hundredweights, quarters, and pounds, but they have here been rounded by Lawrence A. Harper (University of California) to the nearest ton.

The source indicates that no bar iron was exported during 1710-1717 and for years which have been omitted in these series.

Z 165-178. Bar iron imported by American Colonies from other Continental Colonies, 1768-1772.

Source: See source for series Z 136-142.

Z 179-188. Bar iron exported by American Colonies, by destination and colony, 1768-1772.

Source: See source for series Z 136-142.

The difference in total exports given in series Z 179 for Great Britain and those in series Z 159 for England should reflect exports to Scotland, except for the variation in terminal dates and the lapse of time required to cross the Atlantic. According to J. L. Bishop, these exports were minor—only 11 tons from 1739 to 1749 (see text for series Z 136-142).

Z 189-202. Cast iron imported and exported by American Colonies, by origin and destination, 1768-1772.

Source: See source for series Z 136-142.

Additional information may be obtained concerning imports from England in the English Inspector General's Ledgers (PRO Customs 3) and in the WPA compilations (see general note for series Z 1-405) of the colonial naval office lists. English exports to the Colonies list, in addition to the generic heading "cast iron," such items as ordnance, iron pots, melting pots, and Flemish iron pots. The WPA compilations show an active coastal trade in pots as well as a surprisingly large quantity of sugar pots and sugar molds going to Kingston, Jamaica, especially from Philadelphia.

The figures for 1769-1771 may include some shipments from Scotland but the amounts probably are negligible.

Source also indicates additional minor quantities of cast iron exported to Southern Europe, Wine Islands, and West Indies.

Z 203-210. Wrought iron imported from England by American Colonies, 1710-1773.

Source: 1710-1735, Bishop, cited above for series Z 153-158, p. 629; 1750-1764, and 1773, English Inspector General's Ledgers, Public Records Office, London, Customs 3; 1769-1771, see source for series Z 136-142.

The figures for 1769-1771 may include some shipments from Scotland but the amounts probably are negligible.

The American Inspector General's figures for 1768-1772 (PRO Customs 16/1) disclose no exports of wrought iron from the Colonies to England, but the figures do show some shipments to the West Indies.

Z 211-222. Selected iron products imported and exported by American Colonies, 1768-1772.

Source: See source for series Z 136-142.

Figures are probably underestimated since the items included may have been listed under more general designations. The colonists were not necessarily dependent upon importation

Digitized by Google

but may have manufactured their own nails and other articles from bar iron which was either home-produced or imported.

Since colonial imports of axes and scythes came so predominantly from the other colonies, and steel and nails from Great Britain, no note has been taken of the negligible importations of these items from other sources.

Z 223–253. General note.

Colonial statistics concerning production and consumption of tobacco have not been developed yet, and perhaps they can never advance beyond the rough estimate stage. For the present, only general deductions from export statistics and other evidence can be made.

Figures for trans-Atlantic shipments of tobacco in the 17th century leave much to be desired (see text for series Z 238–240) but those for the 18th century are reasonably satisfactory. The 18th century statistics of English imports rest upon contemporary compilations from customhouse entries. The figures for Scotland are less exact and in the early years they do not rise above mere estimates. However, Scotland's tobacco imports were relatively minor in those years. Fortunately, as their relative importance grew, the Scottish statistics became more reliable.

British imports represented virtually all the colonial exports. The figures given in series Z 223–229 and Z 230–237 give the landed weight in Britain. Due to the tobacco's loss of moisture while crossing the Atlantic, the landed weight in Britain is about 5 percent less than the shipping weight in America (Arthur P. Middleton, *Tobacco Coast*, the Mariners' Museum, Newport News, Va., 1953, p. 104; Rupert C. Jarvis, *Customs Letter-Books of the Port of Liverpool, 1711-1813*, the Chetham Society, Manchester, 1954).

Unfortunately, the English Inspector General's Ledgers of Imports and Exports (PRO Customs 3) do not differentiate between shipments from Virginia and Maryland as do the Scottish (PRO Customs 14) and the American (PRO Customs 16/1).

The validity of British statistics as a reflection of the American tobacco trade depends, of course, upon colonial obedience to the regulations requiring shipment (with minor exceptions) of colonial tobacco to England (Britain after 1707)—at first by royal order and after 1660 by the Navigation Act of 12 Car. II, c 18.

Until the English drove the Dutch from New Netherland (first in 1664 and finally in 1674) great opportunities existed for illicit trade in America. The rules also appear not to have been consistently enforced in Europe (see text for series Z 238–240). In the 1680's there was a flareup of illegal shipments to Ireland but it reflected a sudden change in the law. The offending vessels were apprehended and the great bulk of the Irish trade thereafter seems to have followed legal channels. There were lurid accounts of smuggling to Scotland at the turn of the century but the quantity of tobacco involved should be viewed in proportion to the trade as a whole. One cannot reasonably expect the illegal shipments at that time to exceed the shipments made a decade later with full sanction of the law. In fact, the illegal shipments presumably were much less because Scotland as a whole at the end of the 17th century had only one-fourth of the shipping it had within 5 years after direct trade was permitted. The Clyde ports, which were most concerned with the American trade, had only one-tenth of their later shipping (L. A. Harper, *The English Navigation Laws*, Columbia University Press, New York, 1939, pp. 260–261). In view of this difference in the shipping available, the volume of illegal trade would seem not to have been more than 250,000 pounds, and a comparison with series Z 223–229 shows that it represented at most 1 percent of the tobacco crossing the Atlantic lawfully.

During the 18th century there was undoubtedly some smuggling of tobacco but it does not seem likely to impair the validity of the colonial import statistics. The illicit trader's greatest profit did not lie in evading the provisions of the Navigation Act but in escaping the high taxes laid on tobacco in England. The most effective technique consisted in importing the tobacco and reexporting it legally to a nearby port (such as the Isle of Man) whence small craft could "run" it ashore again duty-free (for details, see Jacob M. Price, *The Tobacco Trade and the Treasury, 1685–1733: British Mercantilism in its Fiscal Aspects*, unpublished doctoral dissertation, Harvard University, 1954).

American historians have pointed to the small amount of the "plantation duties" collected on intercolonial trade as evidence of the breakdown of the laws. If the American colonists consumed the 5 pounds per capita of the Bermudians in the early 18th century, the 2 pounds of the English at the beginning of the 18th century, or even their 1 pound per capita at the end of the 18th century (Alfred Rive, "The Consumption of Tobacco Since 1600," *Economic Journal Supplement, Economic History Series*, vol. I, Jan. 1926, p. 63; H. C. Wilkinson, *Bermuda in the Old Empire*), Oxford University Press, London, 1950, p. 14), the colonies would have provided a sizable market of 2,000,000 to 10,000,000 pounds at the time of the Revolution. But that is a figure which can and must be greatly discounted. In the first place, it should be cut in half because the southern colonies had about half the population and provided their own source of supply. Similarly, allowance must be made for tobacco produced in the northern colonies. Pennsylvania, Delaware, New York, Rhode Island, Connecticut, and Massachusetts all at one time or another grew tobacco (George L. Beer, *The Origins of the British Colonial System, 1578–1660*, Macmillan, New York, 1908, p. 88; J. B. Killebrew, *Report on the Culture and Curing of Tobacco in the United States*, Department of the Interior, Census Office, Washington, D.C., 1884, pp. 147 and 237; Vertrees J. Wyckoff, *Tobacco Regulation in Colonial Maryland*, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 37, 38, and 65). Philadelphia, Lewes, and New Castle appear in the WPA compilations (see general note for series Z 1–405) as suppliers to other ports like New York and Boston. New York itself exported tobacco (and even more snuff) coastwise as well as to England, and the exports from New England continued large even into the 1750's. In the 1760's, Rhode Island tobacco crops provided surpluses sufficient to warrant shipping 200,000 pounds to Surinam, a colony in South America (James B. Hedges, *The Browns of Providence Plantations*, Harvard University Press, Cambridge, 1952, pp. 30–40).

It need not be assumed that the colonists were averse to violating the law. It may be that violations on a significant scale were not good business. The fact that the 200,000 pounds of Rhode Island tobacco sent to Surinam went there illegally means little. It was a type of tobacco not in general demand and constituted less than one-third of one percent of the annual legal trade.

Z 223–229. Tobacco imported by England, by origin, 1697–1775.

Source: Compiled by Jacob M. Price, the University of Michigan.

The basic sources used by Price are the same as those used by him for his doctoral dissertation (see below).

The English Inspector General's Ledgers (PRO Customs 3), which are the original source of the data, distinguish between entries in London and in the rest of the Kingdom (the outports) but Price has combined them in the interest of saving space.

Z 230–237. American tobacco imported and reexported by Great Britain, 1697–1775.

Source: Jacob M. Price, *The Tobacco Trade and the Treasury, 1685–1733: British Mercantilism in its Fiscal Aspects*, unpublished doctoral dissertation, Harvard University, 1954.

The basic sources of the data for England in Price's doctoral dissertation were the Inspector General's Ledgers of Imports and Exports (PRO Customs 2 and 3) except as follows (see general note for series Z 1–405 for an explanation of the call numbers which follow): 1703–1722, from PRO CO 390/5/47; 1717–1722, confirmed in PRO T. 1/281/18, BM Add. MS. 33,038 fol. 159; 1722 (London import only), from PRO T 64/276B/327; 1763–1769 (import only), from PRO T. 64/276B/328; 1770–1773 (import only), from PRO T. 64/276B/332; 1770–1771 (export), from PRO T. 64/276/330; 1772, 1774–1775 (import and export), from PRO T. 17/1,3,4; 1773–1775 (export), from Adam Anderson, *An Historical and Chronological Deduction of the Origin of Commerce*, vol. IV, J. Walter, London, 1707–1709, p. 447.

For Scotland, Price's data came from the Scottish Ledgers of Imports and Exports (PRO Customs 14), except as follows: 1707–1711 (import and export), from PRO T. 1/39/29; 1715–1717 (import and export), from PRO CO 390/5/13; 1721–1724 (import and export), from PRO T. 1/282/23; 1725–1731, 1752–1754, 1763, 1769 (import and export), from PRO T. 36/13; 1738–1747 (import and export), from PRO T. 1/329 fol. 125.

Total imports and reexports for 1708–1731 and 1752–1754 were obtained by adding figures not strictly comparable with each other. Scottish imports and reexports for 1708–1717 are averages of estimates for several years.

Z 238–240. American tobacco imported by England, 1616–1693.

Source: 1616–1621, Vertrees J. Wyckoff, *Tobacco Regulation in Colonial Maryland*, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 20–36; 1622–1631, Neville Williams, "England's Tobacco Trade in the Reign of Charles I," *The Virginia Magazine of History and Biography*, October 1957, pp. 403–449; 1637–1640, Stanley Gray and V. J. Wyckoff, "The International Tobacco Trade in the Seventeenth Century," *Southern Economic Journal*, VII, July 1940, pp. 18–25; 1663–1693, compiled by J. M. Price from PRO CO 388/2 ff.7,13 (1663, 1669), B. M. Sloane MS.1815 ff.34–7 (1683–1689), PRO T.1/36/9 fo.50 (1689–1693), and Gray and Wyckoff, cited above (1672–1682).

The figures here are not as satisfactory as those given in series Z 223–229 and Z 230–237. The total imports for 1686 and 1688 were obtained by adding figures not strictly comparable with each other. Imports of the outports (English ports other than London) for 1682–1688 are averages of estimates for several years. In a few instances the figures from Gray and Wyckoff include minor quantities of Spanish and Brazilian tobacco.

As indicated in the general note for series Z 223–253, the figures shown prior to the time when the Dutch were driven from New Netherland should not be relied upon too greatly. Rive (cited in source above, pp. 57–75) suggests that the doubling of the London import figures between 1637 and 1638 may have been due to better patrolling of the Channel. There is much evidence to show that the laws restricting tobacco importations to London and excluding Spanish tobacco were disregarded at least in part (Beer, cited above in general note for series Z 223–253, pp. 197 ff; Williams, cited in source above, pp. 419–420; Wyckoff, cited in source above, pp. 32–34).

An alternate approach to studying the import figures is to consider the estimates of tobacco which might be produced or purchased. English proposals for limitations on tobacco importation included the following: 55,000 pounds in 1620; 200,000 pounds in 1625 and 1626; 250,000 pounds in 1627; 600,000 pounds in 1635; and 1,600,000 pounds in 1638 (Beer, cited above in general note for series Z 223–253, pp. 120, 138, 154, and 158). Virginia meantime wanted the King in 1628 to take at least 500,000 pounds annually and by 1639 sought to reduce the tobacco crop to 1,500,000 that year and 1,300,000 pounds for each of the next two years (Killebrew, cited above in general note for series Z 223–253, pp. 215–216).

Another weakness of the figures for these series lies in their failure to show which colonies supplied the tobacco; however, other data provide some opportunities to estimate the quantity which the various colonies contributed. Virginia and Bermuda ran neck and neck in 1620 at 50,000 to 55,000 pounds each. In 1628, Virginia's shipments were twice those of Bermuda, and thereafter Virginia drew far ahead (Beer, cited above in general note for series Z 223–253, p. 120; and Williams, cited in source above, pp. 421–449). Her production had risen from 20,000 pounds in 1619 and went on to 18,150,000 in 1688 and 18,295,000 pounds in 1704 (R. A. Brock, "A Succinct Account of Tobacco in Virginia, 1607–1790," in J. B. Killebrew, cited above in general note for series Z 223–253, p. 224). Bermuda's production increased to 500,000 pounds at the most in the 1680's (George L. Beer, *The Old Colonial System, 1660–1754*, vol. II, Macmillan, New York, 1912, p. 91). At the end of the century, Bermuda's exports to England became negligible, and by the first quarter of the 18th century Bermuda was importing from Virginia some of the 20,000 pounds consumed by her population, which was estimated at 3,600 whites and 5,000 slaves in the 1680's (H. C. Wilkinson, *Bermuda in the Old Empire*, Oxford University Press, London, 1950, p. 14).

The West Indies were said to have begun growing tobacco as early as 1625; by 1628, reports show the shipment of about 100,000 pounds, but by the middle of the century sugar began to take over as the predominant crop (Beer, *The Origins . . .*, cited above in general note for series Z 223–253, pp. 89–90).

Meanwhile Maryland, which probably had produced no more than 100,000 pounds annually by 1639 (Wyckoff, cited in source above, p. 49), so increased her output that she contributed about 36 percent of the combined Virginia-Maryland total in 1688—a percentage she approximated at the turn of the 17th century (Margaret Shove Morriss, *Colonial Trade of Maryland, 1689–1715*, Johns Hopkins University Studies in Historical and Political Science, Series XXXII, No. 3, Baltimore, 1914, pp. 31–36) and during the period 1768 to 1773 (see series Z 248–249).

In the Colonies further south, North Carolina was said to be growing about 2,000 hogsheads, or 1,000,000 pounds, of tobacco in the 1670's—an estimate which seems more generous than the subsequent pattern of exports justifies (Beer, *The Old Colonial System, 1660–1754*, cited above, vol. II, p. 195).

Z 241–253. American tobacco exported and imported, by origin and destination, 1768–1772.

Source: Compiled by Lawrence A. Harper, University of California, from American Inspector General's Ledger of Imports and Exports, Public Records Office, London, Customs 16/1.

Although they cover only a few years, these series provide the only known comprehensive data which permit a complete analysis of the pre-Revolutionary colonial tobacco trade.

In the source, some export figures for 1768 and 1770 for Virginia, North Carolina, and South Carolina were shown in hogsheads or barrels. When the weights of these units were not indicated, they were converted to pounds by Harper, by using the average weights of these units as reflected in the shipments to Great Britain from the respective colonies for 1768–1772.

Also, the source shows the South Carolina export to Great Britain for 1771 as 433 hogsheads totaling 40,333 pounds. This obviously is an erroneous ratio. Since the hogshead figure is more comparable to other data shown here than the pounds figure, the former is assumed to be correct. It has been converted to pounds in the same manner as the 1770 export figures mentioned above.

Z 254–261. Tea imported from England by American Colonies, 1761–1775.

Source: Compiled by Lawrence A. Harper, University of California, from the English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Figures for tea imports shown in the American Inspector General's Ledgers (PRO Customs 16/1) for 1768–1772 closely approximate those shown here for the corresponding years (O. M. Dickerson, *The Navigation Acts and the American Revolution*, University of Pennsylvania Press, Philadelphia, 1951, pp. 99–100).

Z 262–280. General note.

Information on rice in the colonial period is limited primarily to the material on the clean rice which entered commercial trading. Presumably, the weight of this rice bore approximately the same ratio to the rough rice of the plantation at that time as it does now, that is, 100/162. There are no known satisfactory statistics on rice production and only scattered data concerning domestic consumption. Lord Carteret told the Board of Trade in 1715 that South Carolina "spent in the country" one-third of the 3,000 tons of rice she was producing at that time. By the pre-Revolutionary period, comparison of total exports with net imports for 1769–1772 indicates that only 3 percent of total exports was consumed in the nonrice-producing colonies.

The basic sources of statistics on clean rice in commerce are the records of importations in the British Public Records Office kept by the English Inspector General of Imports and Exports (Customs 2 and 3, since 1696), by the Scottish Inspector General (Customs 14, since 1755), by the American Inspector General (Customs 16/1, 1768–1772), and the records kept by the colonial naval officers (supplemented by those kept by the deputies of the London Commissioners of Customs for the comparatively few instances when these records have survived).

Data from these basic sources appear in: Gray, *History of Agriculture . . .*, cited above for series Z 122–125, pp. 1020–1023; Francis Yonge, *A View of the Trade of South Carolina*, London, 1722; C. J. Gayle, "The Nature and Volume of Exports From Charleston, 1724–1774," *The Proceedings of the South Carolina Historical Association*, Columbia, 1937, pp. 30–31; G. K. Holmes, *Rice Crop of the United States, 1712–1911* (Circular 34, Department of Agriculture, Bureau of Statistics, 1912); Francis Yonge, *Narratives of the Proceedings of the People of South Carolina*, in B. R. Carroll, *Historical Collections of South Carolina*, vol. II, Harper & Bros., New York, 1836, p. 156; *The Case of the Province of South Carolina* (Carroll, vol. II, p. 265); Gov. James Glen, *Description of South Carolina* (Carroll, vol. II, p. 26); "An Account of Sundry Goods Imported and . . . Exported . . . From the First of November 1738 to the First of November 1739" (printed as a broadside by P. Timothy, Charleston, 1739), Bernard Romans, *Natural History of East and West Florida*, New York, 1775; and WPA compilations from the Charleston Naval Office lists (see general note for series Z 1–405).

Fortunately, the British records measure the quantities imported in hundredweights, but the American statistics usually give only the number of barrels and other containers exported. Where half-barrels were reported, the number was divided by two and the result included in the barrel totals.

Miscellaneous units in the American figures have been converted to barrels. The term "cask" has been considered synonymous with "barrel," following the usage of the American Inspector General's Accounts for 1768, but the remaining figures are rough approximations suggested by the weights of other commodities as given in M. Postlethwayt, *The Universal Dictionary of Trade and Commerce*, W. Strahan, London, 1774; J. H. Alexander, *Universal Dictionary of Weights and Measures*, D. Van Nostrand, New York, 1867, and the *Oxford English Dictionary*. A tierce has been considered to equal 1⅓ barrels; a hogshead, 2 barrels; a puncheon, 2⅔ barrels; a butt, 4 barrels; small barrels and small casks, ½ of a barrel; seroons, boxes, and bags, ⅔ of a barrel; kegs, ⅙; and bushels, ⅛. Colonial containers varied so greatly that these estimates seldom, if ever, represented the exact relationship. When discussing weights and measures for other uses, additional information should be obtained and corrections, as may be necessary, should be made in the formulas employed here. For present purposes, these maverick units constitute such a negligible part of the whole that errors in estimating their weight seem unlikely to exceed those involved in rounding.

The significant problem lies in determining the weight of the barrel, the principal unit. Holmes (cited above, p. 4) stated that it weighed 350 pounds in 1717; 400 pounds, 1718–1729; and 500 pounds, 1730–1788, but as Gray (cited above, vol. II, p. 1020) points out, these figures conflict with those given by others. Although Governor Johnson of South Carolina stated in 1719 that the average barrel contained about 350 pounds, Francis Yonge, the collector at Charleston, gave the figure of 400 pounds for 1719–1721; a Savannah Rice Association study declared it to be 325 pounds for 1720–1729; a contemporary report in 1731 and Governor Glen of South Carolina in 1749 said the barrel contained 500 pounds, but other documents say that it was 500–600 pounds in 1763; "something over 600 pounds in 1768–1769"; 550 pounds for 1764–1772; and 540 pounds net in 1772. O. M. Dickerson, *The Navigation Acts and the American Revolution* (cited above in text for series Z 254–261, p. 59) states that the formula used by the customs service for converting barrels to hundredweight had each barrel containing 4½ hundredweight, or 504 pounds (but the records do not disclose when the formula was calculated nor how often it was revised).

Fortunately, an examination of the surviving official statistics enables one to obtain averages calculated on broad bases. The decennial totals for 1720–1729 and 1730–1739 (Gov. James Glen, cited above) give both the number of barrels and the

Digitized by Google

total weight shipped, showing the average barrel to weigh 373 pounds during the first decade and 448 pounds during the second. Similarly, the naval office lists for 1756–1767, which record both the number of barrels and pound weights shipped to Southern Europe and the West Indies, give a weighted average of about 525 pounds each for some 20,000 barrels.

Comparisons of the number of barrels shipped to Britain from America with the weight recorded for the rice arriving there provide another means of estimating the average weight of the rice barrel. For present purposes, it can be assumed to have been 350 pounds until 1720, and then to have risen 10 pounds a year until 1730, when it remained at a plateau of 450 pounds until after 1740; then it began to ascend at the rate of 5 pounds a year until it reached its pre-Revolutionary peak of 525 pounds in 1755. It must be remembered, however, that the weight of the barrels might vary radically. New York's Naval Office list for 1764 shows one shipment averaging 183½ pounds a barrel and another 698 pounds.

Z 262–266. Rice exported from producing areas, 1698–1774.

Source: Compiled by Lawrence A. Harper, University of California, from references discussed below.

These series attempt to provide a comprehensive statistical summary comparable to those available for the postcolonial period. Barrels have been converted to pounds on the bases described in the general note for series Z 262–280.

There was the problem of totaling the exports from the three South Carolina ports (Charleston, Beaufort-Port Royal, and Georgetown-Wynyaw) and those of Georgia. Shipments from other colonies can be considered as having originated in South Carolina and Georgia, except possibly those of North Carolina, and even in this case most of the exports probably went through South Carolina. In any event, North Carolina's exports are grouped with South Carolina's shipments in the English import figures, under the generic heading, "Carolinas." Shipments to Scotland seem to have been infrequent and insignificant until the French and Indian War (1754–1763).

The Charleston figures, with the exceptions noted below, are those compiled by Gayle (cited above in general note for series Z 262–280) from the *South Carolina Gazette*, although his figures for less than 12 months have been extended to full year bases for 1750, 1756, 1757, 1763, and 1767. For 1698–1724, the figures have been calculated on the assumption that all American rice imports recorded in the English Inspector General's Ledgers were equal to ⅞ of Charleston's total exports, as suggested in 1719 by Francis Yonge, the customs collector at Charleston, a conclusion corroborated by a comparison of the WPA compilations of Charleston exports with the English imports for 1717, 1718, 1719, and 1724, and by Edward Randolph's remark in 1700 that 1/10 of Charleston's exports went to the West Indies alone (Carroll, cited above in general note for series Z 262–280). For 1731, the figures come from the WPA compilations of the Charleston Naval Office list (see general note for series Z 1–405), and for 1734 and 1758, directly from the *South Carolina Gazette;* for 1765, from the *Charleston Year Book* (1880) as copied by Holmes (cited above in general note for series Z 262–280); for 1766, from photographic copies of the Charleston Naval Office list (PRO C. O. 5); for 1768–1772, from the American Inspector General's Ledgers (PRO Customs 16/1); for 1773 and 1774, from Gray (cited above for series Z 122–125, p. 1022), although his partial figure for 1773 has been extended to complete the year. The years terminate October 31 except 1698 (September 28); 1699–1724, 1731 (December 24); and 1768-1773 (January 4 of the following year).

Neither Beaufort-Port Royal nor Georgetown-Wynyaw (South Carolina) seem to have had much importance until 1732. Although the former had its first collector in 1729, there was a lapse of 2½ years before his successor took over (PRO AO 1/804/1038, AO 1/805/1039); and the latter appears to have had its first collector in June 1732 (*South Carolina Gazette*, June 24, 1732). Scattered naval office records show Georgetown exporting 385 barrels for the year 1734 and 509 for the first quarter in 1735; and Beaufort, 342 during the first half of 1736. In 1739, Georgetown exported 2,202 barrels and Beaufort, 2,165 barrels (broadside, cited above, general note for series Z 262–280), an approximate equality which also existed in the period 1768–1772 (PRO Customs 16/1). For lack of a better basis, their exports will be considered for present purposes to have been equal from 1733 to 1768, when exact figures are available and were used. In 1739, the exports of the two together equalled 6½ percent of South Carolina's exports—a percentage which dropped by 1769–1772 to 4.4 percent. Thus, from 1739 to 1768, the Beaufort and Georgetown contributions have been assumed to be 5 percent of the total South Carolina exports. A different formula was used for the years prior to 1739, when their percentage was growing from the 2½ percent which they enjoyed in 1734 (calculated by doubling the Georgetown figures which have survived for that year). On the necessarily arbitrary assumption that the rate of increase was uniform, the two ports each year from 1734 to 1739 added 0.7 percent to their share of South Carolina's exports. Extending the same formula backwards, their share of the Carolina total was 1.8 percent in 1733 and 1.1 percent in 1732.

Romans, cited above, general note for series Z 262–280, provides figures for Georgia for 1756–1767. A comparison of his figures for Georgia's total exports with those of receipts from Georgia in England (see series Z 274–280) for the decade 1756–1765 shows a ratio of one barrel exported for every 2.07 hundredweight received; and for 1740, 1742, 1750, and 1753–1755, the barrels shipped from Georgia have been computed in accordance with that formula, on the basis of English receipts (series Z 274–280). Figures for 1768–1772 come from PRO Customs 16/1. In 1773 and 1774, Georgia is assumed to have contributed 13.9 percent of the total exports, as it did from 1768 to 1772. Years end January 4 of the year following, except for the years for which figures are calculated, as noted above. For those years, no exact date can be assigned and the data are therefore not strictly comparable.

The figures for 1768–1772 provide the best basis for the later period, but for present purposes the 1768 list was not included in the basic calculations described above because it lacks data for coastwise exports; however, it provides the best base for estimating the imports for that year. All that need be assumed is that the ratio of the coastwise exports to the other exports was the same in 1768 as the average of the other four years.

The coastwise entries for 1769–1773 show both inward and outward entries. Thus, to avoid duplications in the Carolina and Georgia entries, only the net exports coastwise have been included. This adjustment cannot be made prior to 1769, but samples from the WPA compilations (see general note for series Z 1–405) indicate that it is very minor.

The data for the various colonies are shown here, not because the individual details are necessarily accurate, but in order that scholars possessing more complete information may adjust the figures wherever possible.

The object of presenting these series is to provide the best possible pattern of the over-all development. The errors in detail are as likely as not to offset one another. Except for

Digitized by Google

1713–1731, when the estimates of the size of the barrels varied radically, the totals shown here should be within 5 percent of the true figure.

Z 267–273. Rice exported from Charleston, S.C., by destination, 1717–1766.

Source: Compiled by J. R. House from the WPA compilations of naval office lists at the University of California, Berkeley (see general note for series Z 1–405).

The differences in totals here and in series Z 262–266 may result in part from the differences in year-ending dates, as shown in the tabular headnotes.

Z 274–280. Rice exported to England, by origin, 1698–1776.

Source: Compiled by Lawrence A. Harper, University of California, from English Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 3 (except 1727, from PRO T.64/276B/323).

A large proportion of the exported rice was reexported by England, not only to Northern but also to Southern Europe.

Z 281–303. General note.

The two basic sources for the study of the colonial Negro are population statistics (see series Z 1–19) and commercial statistics concerning slave importations. Although direct knowledge of the colonial Negro's natural increase is scarce, available evidence indicates that this increase must have been considerable. It is reported in 1708 that about half of Boston's 400 Negro servants were born there, and Governor James Glen of South Carolina stated in 1749 that the number of Negroes in his colony increased rather than diminished during the nine years when prohibitive taxes and war "prevented any from being imported" (Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, Carnegie Institution of Washington, D.C., 1935, vols. III and IV, pp. 24 and 303, respectively). Otherwise, discrepancies between import and population figures (especially in later years) would call for the existence of an illegal trade in Negroes of an extent to which other evidence gives little support.

Donnan's *Documents . . .*, cited above, provides the greatest single source on the subject of the slave trade. She supplies references to many of the varied sources which provide such knowledge as we have of the 17th century, most helpful of which are the statistical reports prepared to help settle disputes between the Royal African Company and the separate traders.

After the first quarter of the 18th century, data on the slave trade usually rest upon the colonial naval office lists (PRO C. O. 5). Colonial newspapers sometimes reported the tallies which had been made in the customhouse; Donnan, *Documents . . .*, cited above, reproduces the individual entries for most of the lists which have survived, and the WPA compilations (see general note for series Z 1–405) give annual totals. In preparing the series on slaves, photographic copies of the naval office lists (PRO C. O. 5) were used when the Donnan entries and the WPA compilations did not agree. It is important to note, however, that the naval office lists report importations by sea rather than overland movements of slaves. Also, it is not always known how many of the Negroes survived after their entry was recorded. The Virginia statistics for 1710–1718 (Donnan, cited above, vol. IV, pp. 175–181) show that of 4,415 Negro slaves entered, 231 died within the time allowed to recover the duty and 103 were drawn back for exportation—7.5 percent of the total importations.

In the case of the southern colonies, the statistics for Virginia and South Carolina are reasonably complete; those for Maryland and Georgia are spotty; and those for North Carolina are virtually nonexistent.

In New England the Negro population appears to have been due to natural increase rather than extensive importations. Governor Dudley of Massachusetts reported in 1708 that about one-half of Boston's Negro servants were born there (Donnan, cited above, vol. III, p. 24), and a comparison of the 1768–1773 trade figures (series Z 281–293) with the population figures (series Z 1–19) suggests that natural increase had become even more important than importations by the revolutionary era.

In the middle colonies the first Negroes were probably brought to New York from Spanish or Dutch prizes in 1625 or 1626. Dutch records are meager but show a consignment of 5 in 1660 and another of 300 in 1664. After the English conquest, New York for a time had an indeterminate trade in slaves with the pirates of Madagascar (Donnan, cited above, vol. III, pp. 405–406, 420, and 423). In Pennsylvania, the number of slaves was always small and their entry often discouraged by high taxes. Donnan (cited above, vol. III, pp. 408–409) believes that data about the slave trade there must be sought in merchant's account books, newspaper advertisements, and items of ship news, some of which appear in Edward R. Turner, "The Negro in Pennsylvania," *Prize Essays of American Historical Association*, Washington, D.C., 1911. In New Jersey, the slave trade centered in the eastern part of the colony, but here too the number of slaves imported was relatively small.

Z 281–293. Slave trade, by origin and destination, 1768–1772.

Source: Compiled by Lawrence A. Harper, University of California, from the American Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 16/1.

Z 294–297. Slave trade in Virginia, 1619–1767.

Source: 1619–1699, Elizabeth Donnan, ed., *Documents Illustrative of the History of the Slave Trade to America*, Carnegie Institution of Washington, D.C., 1935, vol. IV, pp. 4–6, 49–65, and Philip A. Bruce, *Economic History of Virginia in the Seventeenth Century*, vol. II, Macmillan, New York, 1895, pp. 66–85; 1700–1726, Donnan, *Documents Illustrative . . .*, vol. IV, pp. 173–187; 1727–1767, Donnan, vol. IV, pp. 187–234, and WPA compilations of colonial naval office lists (see general note for series Z 1–405).

The title of these series refers to "slaves" because that was the status of most Negroes listed, but it should be remembered that until the middle of the 17th century Negroes came as servants, not as slaves. Unless otherwise noted, these figures show the total trade at all Virginia ports. When one or more quarters of a port's naval office lists are missing, the total for the full year has been estimated, the calculations resting upon a chronological or geographic extension—whichever involved the least element of conjecture. The totals depend upon such estimates in all years after 1726 except 1737–1740, 1743–1745, 1750, 1758, 1761–1762, and 1764, when full records exist for all the ports except Accomack, which can be disregarded because of its lack of direct participation in the slave trade. No figure is given in which the total includes more than 20 percent estimate.

In the case of slaves exported, the highly variable nature of this trade did not warrant estimative totals. Of the slaves exported, 1,055 went to Maryland, 12 to North Carolina, 9 to Rhode Island, 8 and a shipment (number unspecified) to Barbados, 3 to Madeira, 2 to Great Britain, 2 to Georgia, and 1 to Boston.

Z 298–302. Slave trade in New York, 1701–1764.

Source: 1701–1718, E. B. O'Callaghan, ed., *Documents Relative to the Colonial History of the State of New York*, vol. V, Weed, Parsons & Co., Albany, 1855, p. 814; 1719–1764, Donnan, cited above for series Z 294–297, vol. III, pp. 462–509, and WPA compilations of colonial naval office lists (see general note for series Z 1–405).

Figures for New York for 1731 were partially estimated, for missing quarters, by Lawrence A. Harper, University of California. The estimates were derived by obtaining the ratio of the number of slaves imported for each quarter to the number annually imported. This ratio was based on figures covering a period of eight years in which quarterly data were available.

Z 303. Slaves imported into Charleston, S.C., 1706–1773.

Source: 1706–1726, 1749–1751, Donnan, cited above for series Z 294–297, vol. IV, pp. 255, 267, and 301–302; 1727–1739, WPA compilations of the colonial naval office lists (see general note for series Z 1–405); 1752, *South Carolina Gazette*, Charleston, S.C., October 30, 1752; 1753–1772, O. M. Dickerson, *The Navigation Acts and the American Revolution*, University of Pennsylvania Press, Philadelphia, 1951, p. 62; 1773, Leila Sellers, *Charleston Business on the Eve of the American Revolution*, University of North Carolina Press, Chapel Hill, 1934, p. 132.

Z 304–307. Pitch, tar, and turpentine exported from Charleston, S.C., 1725–1774.

Source: 1725–1755, 1760–1764, 1767–1771, Charles J. Gayle, "The Nature and Volume of Exports from Charleston, 1724–1774," *The Proceedings of the South Carolina Historical Association*, Columbia, 1937, p. 31; 1756–1759, 1765, 1772–1774, *South Carolina Gazette*, Charleston, S.C., various issues.

The basic source for these series has been the *South Carolina Gazette*, which obtained the figures from the customhouse books and ran them as cumulative totals from November 1st of most years. The editorial policy of the *Gazette* was not consistent, however; it did not always list the same commodities each year, and sometimes it discontinued the cumulative totals before October 31st.

The WPA compilations (see general note for series Z 1–405) from the English copies of these same records (PRO C. O. 5) provide an alternate source for some years. They also distinguish in detail the destination of the various shipments.

Z 308–313. Timber and timber products exported from Charleston (S.C.) and Savannah, 1754–1774.

Source: **Series Z 308–310**, 1754–1755, 1760–1764, 1767–1771, Gayle, cited above for series Z 304–307, p. 31; 1756–1759, 1765, 1772–1774, *South Carolina Gazette*, Charleston, S.C., various issues. **Series Z 311–313**, Oliver M. Dickerson, cited above for series Z 303, pp. 26–27.

The original figures for Savannah were compiled by the Comptroller at that port. For discussion of Charleston figures, see text for series Z 304–307.

Z 314–317. Number of vessels engaged in whaling, and quantity and value of oil acquired, Nantucket, Mass., 1715–1789.

Source: 1715–1785, Obed Macy, *The History of Nantucket*, Hilliard, Gray & Co., Boston, 1835, pp. 54–55 and 232–233; 1787–1789, U.S. Congress, *American State Papers*, Class 4, "Commerce and Navigation" (two volumes), vol. I, Gales and Seaton, Washington, D.C., 1832, p. 16.

The figures shown on pp. 232–233 of the source are stated to be from the Massachusetts Historical Society's Collections. Those on pp. 54–55 cite no authority; however, the Macy family descended from the first settlers and Obed Macy's data, which are generally consistent with information from other sources, provide the best figures now available.

The development of whaling in Nantucket followed the process typical of all the colonies [Walter S. Tower, *A History of the American Whale Fishery* (publications of the University of Pennsylvania, series in Political Economy and Public Law, No. 20), Philadelphia, 1907]. The early settlers first processed drift whales, then they engaged in the offshore fisheries which probably reached their height at Nantucket in 1726 when 86 whales were taken (Alexander Starbuck, *The History of Nantucket*, C. E. Goodspeed & Co., Boston, 1924, p. 356). The first deep-sea venture occurred about 1712 when a strong wind blew an offshore vessel to sea where it caught a spermaceti whale (Macy, cited above, p. 36). By 1746, Nantucket whalers were making their way to Davis Straits and by 1774 they were sailing as far away as the coast of Brazil (Macy, cited above, p. 54).

The figures for Nantucket may be viewed in better perspective by noting that in 1730 the New England whaling fleet totaled 1,300 tons, and in 1763 that of Massachusetts consisted of 180 sailing vessels. (Raymond McFarland, *A History of the New England Fisheries*, D. Appleton and Company, New York, 1911, p. 86.) At the time of the Revolution, New England had 304 whalers totaling 27,840 tons out of an estimated American fleet of 360 vessels (Tower, cited above, p. 45; Starbuck, cited above, p. 176).

Z 318–329. Daily wages of selected types of workmen, by area, 1621–1781.

Source: 1621–1670 and 1776–1781, Richard B. Morris, *Government and Labor in Early America*, Columbia University Press, New York, 1946; 1710, Richard Walsh, *The Charleston Sons of Liberty*, University of South Carolina Press, Columbia, 1959.

The figures do not represent actual payments, which may have been higher, but they represent what the lawmakers believed was the proper maximum wage rate. Figures are payments to master craftsmen; journeymen received less (for example, 20 pence instead of 2 shillings in 1641).

For New Haven there were two wage rates—one for the summer, which is shown in these series, and one for the winter. For each occupation the winter rate was 6 shillings less in 1640 and 4 shillings less in 1641. Apparently the lower rate for the winter was paid because of the shorter workday.

The legislative rates also throw light on other labor facts. When New Haven set the rate for mowers in 1640, correlation of the daily wage (2 s. 6 d.) with the rate for mowing an acre of fresh marsh shows that they considered it a day's work, although they believed that mowing a salt marsh would take longer and be worth 3 shillings. The next year they confessed the ratio was inadequate when they lowered the daily wages without board to 20 d. and raised the rate for mowing to 3 s. per acre for fresh marsh and 3 s. 6 d. for salt marsh (Morris, cited above, pp. 79–80).

For discussion of the working day, see text for series Z 330–335.

Z 330–335. Daily and monthly wages of agricultural laborers in Maryland, 1638–1676.

Source: Manfred Jonas, "Wages in Early Colonial Maryland," *Maryland Historical Magazine*, vol. LI, March 1956, pp. 27–38.

The source also gives additional information on the cost of living. Its basic data come from scattered items in the *Archives of Maryland* (a series of annual volumes published by the Maryland Historical Society, Baltimore).

Digitized by Google

In Maryland, during the first half of the 17th century, the working month seems to have extended from 23 to 25 days and the working day from 10 to 12 hours. The 3 winter months were generally not included within the terms of labor contracts. Persons hired by the day worked the same hours and did not get lodging, but received at least 2 meals at the job (Jonas, cited above, pp. 30 and 34–35). In the other colonies the working day was probably much the same. New Haven, for example, specified in 1640 that a day's work was from 10 to 12 hours in summer and 8 hours in winter (Morris, *Government and Labor . . .*, cited above for series Z 318–329, pp. 59, 79, and 84).

Z 336. Index of wholesale prices estimated for the United States, 1720–1789.

Source: U.S. Congress, *Hearings Before the Joint Economic Committee*, 86th Congress, 1st session, Part II, *Historical and Comparative Rates of Production, Productivity, and Prices* (statement presented by Ethel D. Hoover, Bureau of Labor Statistics).

This index (which extends to 1958 in the source) was obtained by combining and splicing index numbers constructed by various investigators for different markets, to approximate a continuous series. The annual indexes were calculated by working forward and backward from the selected base period, 1850–59. No adjustments were made to the original series for differences in coverage or in methods of calculation. However, when wholesale prices in two or more markets were combined, the necessary conversions to a common base period were made, and occasional estimates, as noted in other parts of the source, were used.

For this series, weighted combinations were made of the available index series for three major markets (Philadelphia, New York, and Charleston), except for the years prior to 1732 and the Revolutionary War years. For these years, the estimates were based on Philadelphia prices only. The weights used to combine markets were rough approximations, based chiefly on estimates of the population and trade for each area and on the representative character and adequacy of the available indexes.

Z 337–356. Average annual wholesale prices of selected commodities in Philadelphia, 1720–1775.

Source: Anne Bezanson, Robert D. Gray, and Miriam Hussey, *Prices in Colonial Pennsylvania*, University of Pennsylvania Press, Philadelphia, 1935, pp. 422–424.

The primary source of the original data was the list of "prices current" which first appeared in 1719 in the *American Mercury* and which was continued in that and other newspapers. Gaps were usually filled by reference to merchants' account books and letterbooks (as discussed and listed in the source cited, pp. 3–5, 351–354, and 434–438). The annual averages were computed "by taking the arithmetic mean of the 12 average monthly prices in each year. When any monthly price was missing the available data were averaged quarterly and the annual figure derived from the quarterly averages. . . . In some cases it was necessary to estimate a quarterly price by averaging the last monthly quotation in the previous quarter with the first monthly quotation in the following quarter. No annual price was estimated completely. . . ."

The source volume was sponsored by the International Scientific Committee in Price History, as were a number of other studies of colonial prices drawn together in A. H. Cole, *Wholesale Commodity Prices in the United States: 1700–1861*, Harvard University Press, Cambridge, 1938. In addition to discussion and analyses of prices, this publication offers a statistical supplement of monthly prices for the principal commercial centers. The tables in it, however, rest primarily upon the Philadelphia prices until the 1750's. Prior to 1750, Boston has only two series, wheat and molasses, which begin in 1720. Although there are gaps in the data, Charleston has series for bread, corn, rice, rum, wine, molasses, and staves beginning 1732; sugar beginning 1744; beef, pork, and indigo in 1747; and coffee, leather, and lumber in 1749. New York has series for flour, bread, rice, sugar, salt, rum, and molasses beginning 1748; and for wheat, beef, and pork beginning 1749.

Price series for the following Philadelphia commodities are shown in the source (not included here because of space limitations): Brown bread, white bread, London loaf sugar, Pennsylvania loaf sugar, indigo, bar iron, pig iron, hogshead staves, pipe staves, turpentine, and gunpowder. In addition to the annual averages, the source contains average monthly prices and monthly and annual indexes (both arithmetic and geometric) of 20 commodities in Philadelphia.

The unit of measure of Madeira wine (pipe) consists of 110 gallons and hundredweights equal 112 pounds, except for tobacco where it equals 100 pounds. Barrels, in the case of beef and pork, consist of 31.5 gallons.

Z 357. Annual rate of exchange on London for Pennsylvania currency, 1720–1775.

Source: See source for series Z 337–356, p. 432.

This series is derived from data in papers of Pennsylvania merchants and the Minutes of the Provincial Council (1739), supplemented in some years by Victor S. Clark, *History of Manufactures in the United States, 1893–1928*, vol. III, Carnegie Institution of Washington, D.C., 1916–1949, pp. 361–362. Bezanson et al., in *Prices . . .*, cited above, p. 431, also give monthly rates of exchanges during the same period.

Z 358. Annual price of an ounce of silver at Boston, 1700–1749.

Source: A. H. Cole, *Wholesale Commodity Prices in the United States: 1700–1861*, Harvard University Press, Cambridge, 1938, p. 119.

The original shilling prices were taken from the Suffolk files by A. M. Davis, *Currency and Banking in the Province of Massachusetts Bay*, vol. I, Macmillan, New York, 1901, pp. 368 and 370. Where more than one price was given for a year, the high and low figures were averaged to determine the price for that year.

Z 359–370. Partial list of bills of credit and Treasury notes issued by American Colonies, 1703–1775.

Source: B. U. Ratchford, *American State Debts*, Duke University Press, Durham, 1941, pp. 26–27.

These series attempt to show the issues of bills of credit and treasury notes emitted by the Colonies between 1703 and 1775. The £82,000 in bills issued by Massachusetts between 1690 and 1702 are not included, nor are the issues of Georgia, which never had a large debt. Under the trustees, the principal circulating medium in Georgia was the "sola" bills, issued only in the original by the trustees. A total of £135,000 of these bills of exchange were issued but only £1,149 remained unredeemed in 1752. Thereafter, Georgia emitted at least two issues of bills: One of £3,000 in 1756 and one of £7,410 in 1761 (Ratchford, cited above, p. 19).

Ratchford concedes that the list may be incomplete and that many of the issues listed were not made at the time nor in the exact amount stated. Sometimes the law authorizing the issue constitutes the only evidence, and nothing indicates "how, when, or to what extent the issue was actually made."

Digitized by Google

The original source for 1737–1748 for Massachusetts is A. M. Davis, cited above in text for series Z 358. Davis expressed all issues in the terms of old tenor (the form of bills which existed in February 1737). Ratchford did not follow this procedure because he did not feel sufficiently acquainted with the circumstances in each case to make the conversion with assurance. For all other years, the data rest upon a variety of sources cited in the footnotes of Ratchford's first chapter, which provide a helpful bibliography for further reference.

The footnotes to these series indicate the principal purposes for which the larger issues were made. For years when several issues appeared for different purposes, the footnotes indicate the purpose for issuing the majority of the bills.

Z 371–382. Paper money outstanding in American Colonies, 1705–1775.

Source: See source for series Z 359–370, p. 28.

The original sources of the data are various monographs cited in Ratchford's first chapter. Unfortunately, the authors of these monographs did not always attempt to find or to make estimates themselves. Some of the estimates are those of legislative committees or public officials and, less frequently, of contemporary writers. Many of the estimates for 1739 and 1748 come from William Douglass whose work is discussed in Charles Bullock, Introduction, *Economic Studies of the American Economic Association*, vol. II, No. 1. Georgia did not warrant a separate series, the only estimate being one for £5,500 for 1761.

For approximately a fifth of the figures, the actual year of issuance differs from that indicated in this table by one or two years; for exact year of issuance, see source.

Z 383–387. Tax collections in America under the different revenue laws, 1765–1774.

Source: O. M. Dickerson, cited above for series Z 303, p. 201.

Tax records have long been an untapped source of economic data. Dickerson has gathered figures from the English Treasury Papers for both the revenues collected under the Navigation Act of 1673 (25 Car. II c 7) and the new revenue measures which followed the French and Indian War (1763). He estimates (p. 202) that seizures (often highly technical) under the new revenue program cost the Americans not less than £60,956 "exclusive of fees, direct plunder, and costs of defending suits in the admiralty courts."

Z 388–405. Basic weekly diets in Britain and America, 1622–1790.

Source: Compiled by Austin White (graduate student, University of California) based on the following: **Series Z 388**, M. S. Rose, *A Laboratory Handbook for Dietetics*, Macmillan, New York, 1937. **Series Z 389–405**, 1622, see source for series Z 43–55, vol. II, p. 318; 1632, E. M. Leonard, *The Early History of English Poor Relief*, Cambridge University Press, Cambridge, 1900, pp. 198–199; 1638, John Josselyn, "An Account of Two Voyages to New England Made During the Years 1638–1663," *Massachusetts Historical Society Collections*, Third Series, III, 1833, pp. 220–221; 1676, Philip A. Bruce, *Institutional History of Virginia in the Seventeenth Century . . .*, vol. II, Putnam, New York, 1910, p. 87; first half of 18th century, William Douglass, *A Summary, Historical and Political, of the First Planting, Progressive Improvement, and Present State of the British Settlements in North America*, vol. I, R & J Dodsley, London, 1760, p. 536; 1735, Abbot Smith, *Colonists in Bondage*, University of North Carolina Press, Chapel Hill, 1947, p. 212; 1744–1746, Howard Chapin, *The Tartar, the Armed Sloop of the Colony of Rhode Island in King George's War*, Providence, 1922, p. 17; 1747, Isabel M. Calder, *Colonial Captivities, Marches, and Journeys*, Macmillan, New York, 1935, p. 40; 1755, Basil Sollers, "The Acadians (French Neutrals) Transported to Maryland," *Maryland Historical Magazine*, vol. III, March 1908, pp. 8–10; 1757, John Fitzpatrick, ed., *The Writings of George Washington*, vol. II, U.S. Government Printing Office, Washington, D.C., 1931, p. 72; 1761, "Brigade Order Books, Montreal, September 29, 1761," *Journals of the Hon. William Hervey, from 1755 to 1814*, Paul and Mathew, Bury St. Edmunds, England, 1906, p. 154; about 1770, Walter Besant, *London in the Eighteenth Century*, A & C Black, London, 1903, p. 556; 1775, Fitzpatrick, cited above, vol. III, p. 409; 1776, "Journal of the Committees of Observation of the Middle District of Frederick County, Maryland," *Maryland Historical Magazine*, vol. XI, December 1916, p. 310; 1780 (Continental Army), John W. Wright, "Some Notes on the Continental Army," *William and Mary Quarterly*, vol. XI, 1931, p. 105; 1780 (French prisoners), Rupert C. Jarvis, ed., *Customs Letter-Book of the Port of Liverpool*, Manchester, 1954, p. 106; about 1790, Fitzpatrick, cited above, vol. XXXI, pp. 186–187; before 1861 (majority of slaves), Kenneth Stampp, *The Peculiar Institution*, Alfred A. Knopf, New York, 1956, p. 282.

The caloric contents of the weekly diet have been divided by 7 for greater ease in comparing them with modern charts which are usually stated in daily terms.

The data from *The Writings of George Washington* have been calculated on the basis of the ratio for an adult male. Women slaves referred to in Washington's diary were assumed to require ⅝ of that of a man; children, ⅓. A barrel of corn was calculated as weighing 196 pounds; a barrel of fish, 290 pounds.

[1] Ending date of year unknown. For Boston, figures given in source for trade with the remainder of Massachusetts do not follow pattern of other entries and are, therefore, not a component of total. Totals were not taken from source but represent sum of detail as shown in source.

[2] Annual averages for years ending June 23. For Boston, the sum of the detail does not equal the total shown since the total includes entries for unknown ports.

[3] Not available.

[4] For year ending January 4 of following year.

[1] Imported from Great Britain. [2] No listing.
[3] Plus 36 to West Indies. [4] Plus, from Great Britain, 15 in 1771.
[5] Plus, from Great Britain, 129 bundles in 1771 and 46 bundles and 1 dozen in 1769.
[6] 30 dozen to West Indies.
[7] Wrought iron entry coastwise in source includes 43 cwt. of anchors which may not have been included in number of anchors. Also, 27 anchors were imported from Great Britain.
[8] Plus 1,993 casks in 1770 and 84 casks in 1769 from Great Britain and 102 barrels in 1770 from other colonies.
[9] Plus 4,030 bars, 12.5 faggots, and 36 long steel in 1770, and 1 bundle and 41 faggots in 1769.
[10] Includes 110 cwt of anchors which have also been included in the number of anchors.
[11] Wrought iron entry coastwise included 363 cwt. of anchors which may not have been included in the number of anchors.
[12] Anchors only.
[13] 15 anchors to Africa. All the wrought iron entries this year consisted of anchors.
[14] In addition to coastwise exports listed under wrought iron, 1 anchor went to the West Indies.

Series Z 223–229. Tobacco Imported by England, by Origin: 1697 to 1775

[1] Information lacking or too incomplete to calculate.
[2] Figures have been extended on basis of partial data.
[3] Annual average. Source also shows 72 Indian slaves imported; 231 slaves died and 103 drawn back for exportation during the 9 years.
[4] Number of headrights granted.
[5] Number of Negroes shipped, not those actually arrived.
