Legend:

Three dots (...) instead of a figure means that the data has not (yet) been gathered or calculated.

A dash (-) instead of a figure is used for the value absolute zero.

A figure indicated with a superior "p" means that this figure is provisional.

Abbreviations for names of cantons:

These are explained in the table on page 4.

Rounded figures:

In general, figures are rounded up or down, which may cause the sum of rounded figures to differ from the end total.

Since 1997 the pocket statistics “Statistical Data on Switzerland” has complemented the full-size Statistical Yearbook of Switzerland. Information from the 21 different topics covered by federal statistics is presented in the form of tables, graphs and texts. The pocket statistics is a valued and useful reference work for decision makers in politics, business and the government administration, as well as for the general public.

The Statistical Data on Switzerland 2012 documents a milestone in the modernisation and future orientation of official statistics. For the first time it contains initial findings from the new population census. In 2011 the full census that took place every ten years was replaced by a system of four annual surveys, each focusing on a different subject: the register-based survey with data from the harmonised cantonal and communal population registers as well as the main federal registers, the structural survey of 200 000 persons as well as random sample surveys on recurring and current topics. I would like to thank everyone who took part in these surveys for their commitment. The new system makes it possible to provide data on the population, on households as well as on buildings and dwellings in a way that meets today’s expectations.

The chapter on “Regional Disparities” has been revised for the 2012 edition and now presents some of the results from the “Urban Audit”, a European comparison of towns and urban agglomerations in the areas of unemployment, population and the number of museums.

We hope you will find it interesting.

Dr Jürg Marti

Director General
Federal Statistical Office (FSO)

Lausanne	127.8	10.5	336.4	12.8
Winterthur	101.3	13.7	139.9	14.6

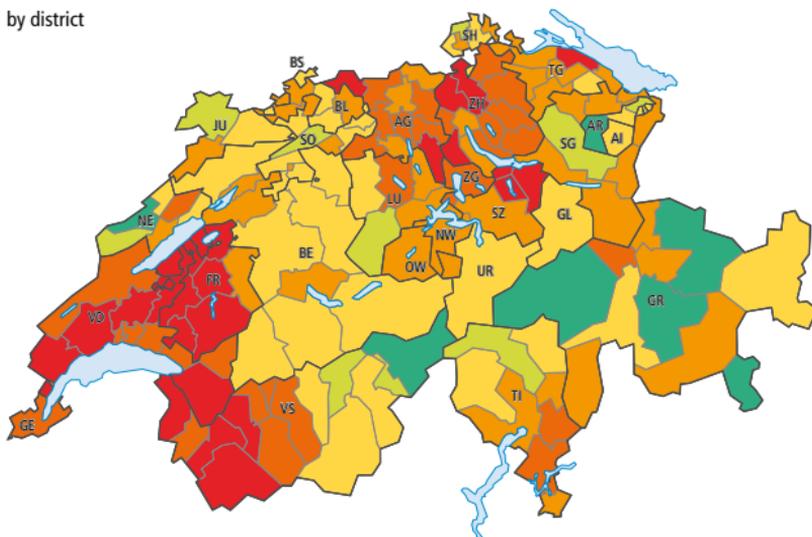

The population is mostly urban

74% of the population now (2010) live in urban areas; in 1930 the urban population was only 36%. About half of the urban population lives in the agglomerations of the five major cities of Zurich, Basel, Geneva, Bern and Lausanne.

Since 2000, population growth has been higher in urban areas than in rural areas (2010: +1.1% compared with +0.9%).

by district

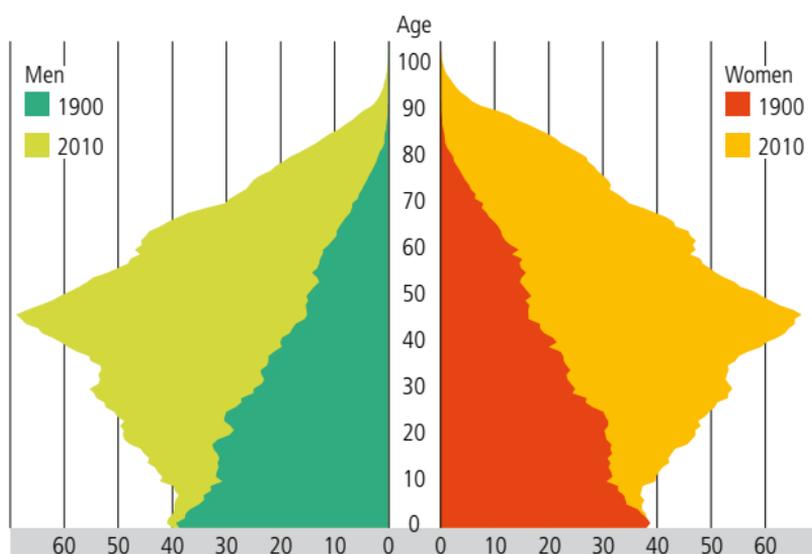

Changes of the permanent resident population, in %

CH: +9.2 %

Age structure of the population

Number of persons in '000

Ageing society

During the course of the 20th century, the proportion of elderly people increased, while that of young people (under age 20) and people of working age (aged 20–64) declined. As a result of this process, the shape of the “age pyramid” (1900) has been transformed into one of a “fir tree” (2010) in which the baby boom generation (born between 1959 and 1971) predominates. The ageing of the population will continue. The proportion of persons aged 65 and over is expected to rise from 17% (2010) to 28% in 2060. Switzerland’s population growth in recent years is mainly attributable to net immigration and to a lesser extent to an excess of births over deaths.

¹ Includes adjustment

Foreign permanent resident population by nationality, 2010

Acquisition of Swiss citizenship

¹ Number of citizenship acquisitions as a percentage of the foreign permanent resident population

Foreign population: more than half were born in Switzerland or have been residents for more than 15 years

Foreigners account for 22% of the permanent resident population. More than half of the residents without a Swiss passport (51%) have been living in Switzerland for more than 15 years or were born here. In 2010, 39 300 persons (2.3% of the foreign resident population) obtained Swiss citizenship. The foreign population is young: for every 100 foreigners of working age (aged 20–64) there are only 11 aged 65 and over (compared with 33 among the Swiss). 26% of children born in Switzerland in 2010 had foreign citizenship. In 2010, the number of immigrations increased by 0.9% compared with the previous year. Of these immigrants, 66% came from the EU/EFTA area.

Changing living patterns

Increasingly fewer people live in a family household with children. In 1970, it was 65%; today (2010) it is 47%. More and more people live alone (1970: 7%; 2010: 17%) or as couples without children (1970: 18%; 2010: 27%).

The decision to get married and start a family is being made increasingly late in life: The age at first marriage for women rose from 24 (1970) to 29 (2010) and for men from 26 to 31 years; the average age of mothers at first birth rose from 25 to 30 years.

Today the traditional middle-class family model of "father as sole breadwinner and mother at home" has become the exception: two-thirds of mothers living in a couple and whose youngest child is under 7 (69%) are in employment, but most often part-time, because in most families it is still the case that fathers tend to do more paid work (generally full-time) and mothers are mainly responsible for domestic and family work (cf. p. 48).

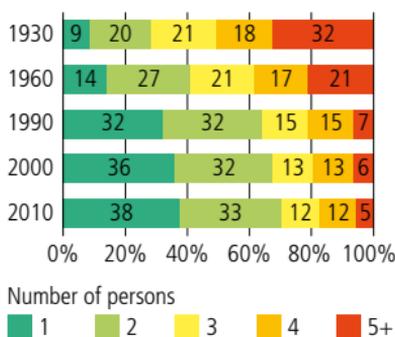

A growing number of children live with only one parent. This proportion is particularly high among 15–19-year-olds (2009: 17%; 1980: 11%).

**Greenhouse gas emissions**

Index 1990=100

**Climate Change**

Since the middle of the 20th century, global warming of the atmosphere that cannot be explained by natural influences alone has been observed. The greenhouse effect plays a central role in this change. This phenomenon, which is natural in itself, is amplified by human activity, particularly through the burning of fossil fuels and the resulting emission of the greenhouse gas carbon-dioxide (CO₂). The main sources of these emissions are transport (especially road transport), households (building heating systems and hot water) and industry.

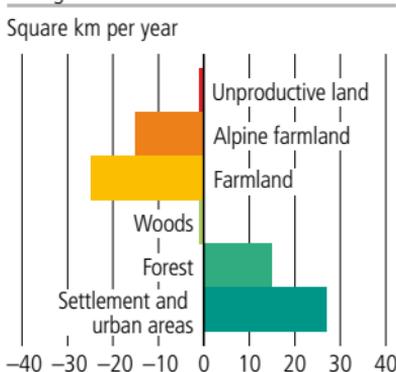

Land use

2 GDP / Total material requirement

3 GDP / Final energy consumption

Public expenditure for environmental protection, 2009

Total: CHF 4.0 billion

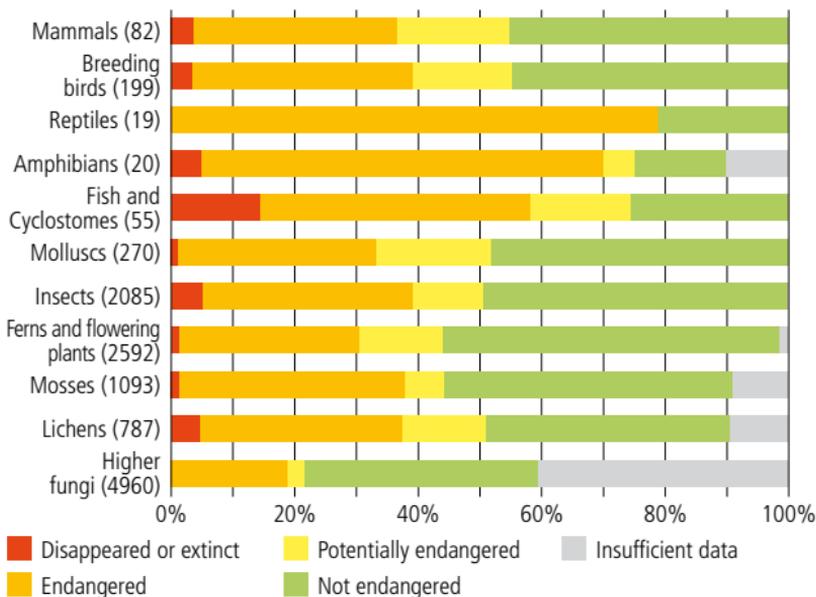

1 Incl. direct payments to the agricultural industry for environmental performance

Eco-efficiency

An increase in eco-efficiency is achieved when the economic value produced increases in relation to environmental pollution, such as the amount of CO₂ emissions, energy consumption or the global material requirement. An increase in domestic eco-efficiency can have several explanations: on the one hand the use of technologies that are environmentally friendlier; on the other hand structural changes, such as the growing importance of the services sector or the relocation of environmentally harmful production processes abroad.

Biodiversity – Threatened native species

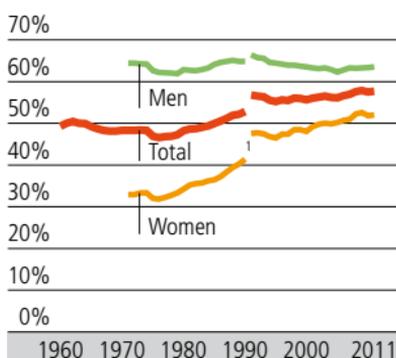

Status 1994–2010, by species groups

**Biodiversity**

The variety of types of landscape found in Switzerland provides a multitude of different habitats for flora and fauna, thus creating favourable conditions for a rich biodiversity. Human activity puts strain on the variety of species, however. While landscape modification can certainly create habitats for new species as well, the standardisation and intensive use of the landscape is leading to a decline in populations and to the loss of some species.

Large increase in number of employed women

Between 2006 and 2011 the number of women in employment (+10.3% to 2.121 million) grew more than that of men in employment (+8.6% to 2.587 million). Women are increasingly combining career and family life and mainly work part-time. In 2011, 57.4% of women worked part-time (2006: 56.5%). In contrast, only 13.5% of men work part-time, although this percentage has also increased slightly since 2006 (+1.5 percentage points). The tertiarisation of the economy has also contributed to the increased number of women in employment, as 86.4% of working women work in the tertiary sector in 2011 (men: 63.8%).

Foreign labour force

The foreign labour force is an important element of the Swiss labour market. The strong growth experienced in the second half of the 20th century would not have been possible without the input of foreign labour and the "guest worker". Since the sixties, their share has always exceeded 20%, and comprises 27.9% of the workforce (2011). Foreign workers are particularly present in the industrial sector (2011: 36.8%; services sector: 26.1%).

Two-thirds of employed persons of foreign nationality (2011: 68.4%) are EU or EFTA nationals. Roughly half of them come from either Germany (26.5%) or Italy (23.0%).

Of foreign workers who immigrated to Switzerland during the past ten years, more than four fifths (82.9%) have obtained educational qualifications at the secondary level II, or at tertiary level. In the case of earlier immigrants, this proportion reaches only 58.0%.

Broad-based growth of the Swiss economy in 2010

After a gloomy 2009 for the Swiss economy in the wake of the financial crisis, economic activity in Switzerland, measured by gross domestic product (GDP), recorded a significant increase of 2.7%. The export sectors benefited from a much more favourable international economic climate. The machinery and equipment goods industry was also kept buoyant by the sharp rise in investments in Switzerland. The financial intermediaries, however, continued to suffer from the effects of the financial crisis, but regained modest growth.

On the demand side, all areas saw growth. After the slump of 2009, investments in goods equipment in particular once again showed a positive trend, which can be explained by the increase in orders and a promising outlook for Swiss industry. Furthermore, investments in construction continue to be favoured by the prevailing low mortgage rates. As far as foreign trade was concerned, the improvement in the economic situation of Switzerland's main trade partners resulted in growth both of exports and imports and once again in a trade surplus. Gross national income (GNI) grew by 6.9% in 2010 after growth of 9.1% in 2009. This trend is largely due to an improvement in the results posted by the subsidiaries of Swiss businesses abroad coupled with the fall in investment income paid abroad. Thus, in 2010 the balance of foreign income reached CHF 42.5 billion, surpassing for the first time the surplus registered before the financial crisis (CHF 37 billion in 2006).

Balance of trade tending towards a surplus

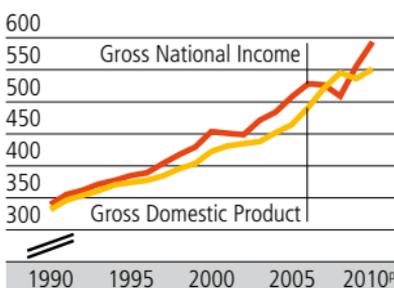

Foreign trade has been a driving force for the Swiss economy since 1997. In fact, the periods of strong growth have coincided with booming foreign trade. Exports are the component of gross domestic product (GDP) which made the largest contribution to growth during the lean years (1997 to 2000 and 2004 to 2007). One of the consequences of the dynamism of exports has been the increase in the trade balance share (balance between exports and imports) in GDP, showing the growing significance of the rest of the world to the Swiss economy. In 2009, however, Switzerland suffered the brunt of the slowdown in the global economy, resulting in a trade deficit and thus contributing significantly to the decline in GDP. In 2010 the trade balance once again showed a trade surplus (+1.3 percentage points), contributing positively to the GDP. The increasingly significant role of the rest of the world is also evident in the income earned abroad, which has also been an increasingly important factor in determining gross national income (GNI), which is generally more dynamic than GDP.

The years 2007 and 2008 stand out because GNI was, exceptionally, less dynamic due to losses posted by Swiss bank branches abroad.

Share of the external sector in GDP
at current prices

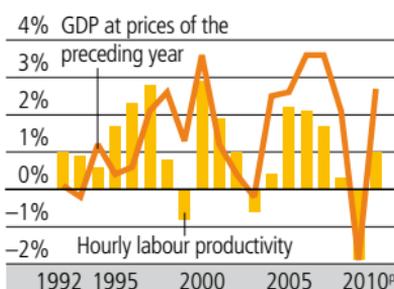

GDP and GNI at current prices
in CHF billion

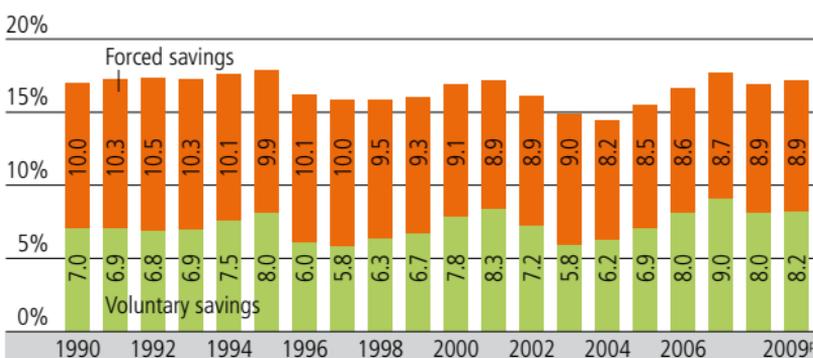

Once economic activity measured by GDP is known, one can investigate the efficiency with which productive resources (labour and capital) are utilised. Labour efficiency is measured by hourly labour productivity, i.e. the value added created per hour worked. The graph represents the development of hourly labour productivity and GDP. Generally speaking, we find similar tendencies for both trends. During an expansion phase (GDP growth), hourly labour productivity also tends to grow, while during an economic slow-down phase (stagnating or falling GDP), productivity declines.

Continuing structural change and lasting dominance of SMEs

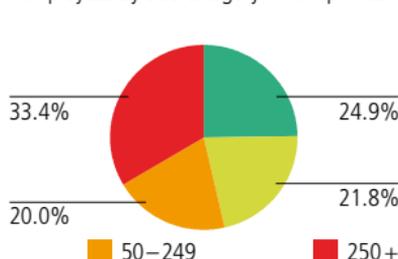

The share of total employment represented by the tertiary sector grew from 68.5% to 69.6% between 2001 and 2008 (only market-oriented companies). Overall, approximately 280 000 new jobs were created: 51 000 in the secondary and 229 000 in the tertiary sector (i.e. a growth of 5.0% and 10.4% respectively). The biggest growth was registered in «health and social services» (approx. +89 000 or +29.6%) and in «professional, scientific and technical services» (approx. +39 000 or +17.2%); individual branches of the economy experienced falls in employment levels: most markedly, the «paper and printing industry» (–9500 or –18.7%) and the «textile, apparel and leather industries» (–4800 or –20.8%). The dominance of small and medium-sized enterprises (SMEs), i.e. companies with fewer than 250 employees, continued unabated. SMEs represented 99.6% of market-oriented companies and employed two-thirds of the working population in such companies (2008).

Production in the secondary sector

Indexed change in the quarterly results
Annual average 1995=100

Overall production in the secondary sector (excluding the construction industry) grew by 48% between 1990 and 2010. The trend is highly cyclical. Thus, production dropped in the recessionary years 2002 and 2003 and picked up again during the good economic situation in 2004. But it plummeted again during the financial crisis at the end of 2008. However in 2010 the situation started to improve.

Labour costs

Labour costs include all costs incurred by the employer in employing the labour force. In general they represent the largest part of production costs. In Switzerland, they are composed as follows: 83.4% wages and salaries, 15.0% social security contributions on the part of the employer, and 1.6% vocational training and staff recruitment costs as well as other costs (2008, total sectors II and III).

Labour costs are a key indicator for making comparisons between business locations, varying widely from country to country. With average labour costs of € 35.1 per man-hour in industry and in large parts of the service sector (2008), Switzerland, together with Belgium (€33.7), Luxembourg (€ 33.6), France (€31.8), Denmark and Sweden (€34.7 and €33.3 respectively in 2007) belongs to the top group.

Foreign trade: our key partners, 2010

in CHF billion

Foreign trade represents a high proportion of gross domestic product (GDP) in Switzerland. Its most important trading partners are the industrialised countries which accounted in 2010 for 75% of Swiss exports and 85.8% of imports. The EU plays a particularly important role in this respect (58.6% of exports and 77.5% of imports).

Agricultural land and forests account for 37% and 31%, respectively, of Switzerland's territory. The landscape is therefore in large measure shaped by agriculture and forestry. These two sectors are important not only for food production, construction materials and renewable energy, but also for maintaining decentralised economic activity and for protecting landscape diversity and biodiversity. In 2010, the combined contribution of these two sectors to the gross value added of Switzerland's economy amounted to 1.1%.

Logging

Total energy use and final consumption, 2010

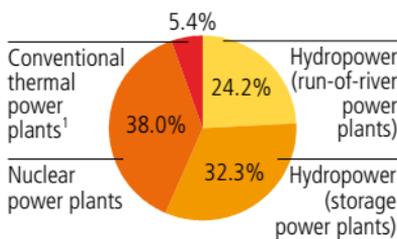

Increased consumption

Final energy consumption is closely linked to economic development and population growth. More residents, larger homes, greater production, rising consumption, heavier motor vehicles and so on, all lead to increased energy consumption in spite of improved energy efficiency. The largest energy consumption group is transport, accounting for around one-third of final energy consumption.

Over two thirds of final energy consumption are covered for by fossil fuels. 19.4% comes from renewable energy sources, hydropower being the main source.

¹ As of 1 June following year

² As of 2009 the housing stock is calculated on the basis of the Buildings and Dwellings Statistic (BDS)

Trend towards larger apartments ...

The number of apartments is growing faster than the population. Between 1990 and 2000, apartments increased by 8% and the population by 6%, bringing the average number of persons per inhabited apartment down from 2.4 to 2.3. At the same time, the average per capita living space increased from 39 m² to 44 m².

... and single-family houses

Single-family houses as a percentage of total building stock rose from 40% to 58% between 1970 and 2010. 64% of newly constructed buildings for housing purposes are single-family homes in 2010, despite the efforts of town and country planners to counter this trend and the fact that building land is becoming increasingly scarce.

High-rise buildings are the exception

Two thirds (66%) of all multi-family houses and residential buildings with ancillary use have less than four storeys. Only 6% of residential buildings under consideration in Switzerland can be described as large buildings, i.e. buildings that have more than five storeys as well as more than six apartments. These buildings are mainly found in urban areas (96%) and the majority (64%) of them are located in one of the five largest larger urban zones in Switzerland. If high-rise buildings are defined as multi-family buildings or residential buildings with ancillary use which have more than nine stories as well as more than nine apartments, the proportion of high-rise buildings is only 0.4% of residential buildings under consideration. Consequently, high-rise buildings are an exception in Switzerland. In rural areas there are virtually no high-rise buildings.

Infrastructure

Transport infrastructure covers a third of the settlement and urban areas in Switzerland (according to the Land use statistics from 1992/97).

In 2010 the length of national highways was 1790 km (of which motorways comprise 1406 km), cantonal roads 18 040 km and municipal roads 51 622 km (as at 1984). The railway network covers 5124 km.

Transport costs

The economic cost of transport, that is the actual sums paid by causers, the state or third parties, as well as the non-monetary costs such as damage to the environment and noise, amounted to over CHF 82 billion in 2005. Mobility thus costs us more than, for instance, the health care service or the public education system. And road transport accounts for six times more of these costs than rail transport. In the case of personal road vehicles (private cars) the cost per person kilometre is CHF 0.54. The cost per person kilometre for rail in contrast, is CHF 0.40. In goods transport the costs per tonne kilometre for heavy road vehicles reaches CHF 0.57, whereas for transport by rail it is CHF 0.24. Around 7.9 of the CHF 82 billion relates to external costs, which are borne by persons other than the causers (i.e. non-internalised externalities – in particular, resulting costs incurred by damage to the environment and health, as well as damage to buildings and loss of value).

The three tiers of the social security system

Social security in Switzerland is based on a three-tier system:

- In addition to individual means of subsistence (remuneration from work, fortune etc), the first tier includes the coverage of basic needs. It is available to everyone and includes the education and legal system as well as public security.
- The second tier includes all social insurances and is intended to cover risks such as old-age, illness, disability, unemployment and maternity.
- The third tier includes all means-tested social benefits, with social assistance from the state providing the last safety net and guaranteeing the right to a minimum standard of living. This comes into effect when none of the other social security provisions apply (principle of subsidiarity).

Before social assistance is called upon, a series of other benefits are available in the third tier, aimed at avoiding dependence on social assistance. These can be divided into benefits which guarantee the basic existence needs (e.g. grants or free legal aid) and complementary benefits which supplement insufficient or expired social insurance provisions or lack of private insurance.

Total expenditure on social security

In 2008, total expenditure on social security amounted to 144 billion francs. 135 billion can be attributed to actual social benefits. About four fifths of these are spent on social insurances (the second tier of the social security system).

¹ The basis of the calculation was revised in 2011. New results for the years 2009 and 2010 will be available as of mid-2012.

Social insurance: expenditure and revenue

Health insurance

The average annual cantonal premiums per insured person for the compulsory health insurance rose from CHF 1850 (2000) to 2834 (2010). In 2010 the average annual premium was CHF 3377 for adults, CHF 2689 for young persons and CHF 870 for children. Great differences can, however, be observed between cantons. In 2010 the average annual premium was CHF 3964 in Basel Stadt and CHF 1959 in Appenzell Innerrhoden. The average gross annual amount of services provided per insured person (i.e. including the insured person's participation towards costs) rose from CHF 2131 (2000) to CHF 3123 (2010): in 2010 this amount was CHF 3909 per year for adults, CHF 1339 for young persons and CHF 962 for children. The average net annual amount of services provided per insured person (i.e. excluding the insured person's participation towards costs) rose from CHF 1816 (2000) to CHF 2684 (2010): in 2010 this amount was CHF 3367 per year for adults, CHF 1008 for young persons and CHF 868 for children.

Level of social assistance, 2010

by canton

Social assistance

In 2010, 231 406 persons, 3% of the total population, were supported by social assistance. There are considerable regional differences: the highest rates are found in larger towns with a distinct inner-city character. Groups of persons who are to a greater degree dependent on social assistance are over-represented in these towns. This includes for example, single parents, foreigners and the unemployed.

The risk of becoming reliant on social assistance varies greatly depending on a person's age, family structure and nationality.

Social assistance rates are highest among children and young people under 18. In general, rates tend to diminish with increasing age.

Single parents in particular are more likely to receive social assistance benefits. In Switzerland almost one household in six with a single parent receives social assistance benefits.

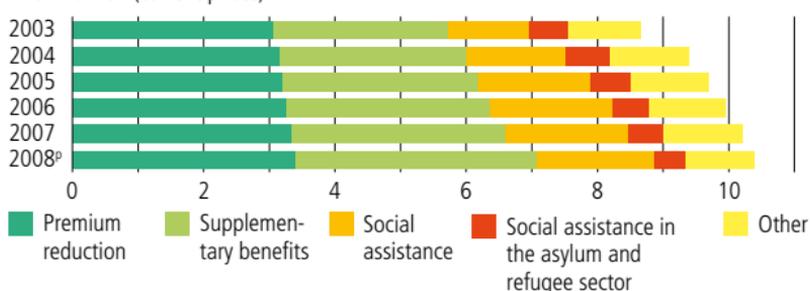

Representing around 46% of all social assistance recipients, the presence of foreigners in social assistance figures is greater than that in the total population (their share in the resident population is 22%).

Net expenditure on means-tested social benefits

In CHF billion (current prices)

Means-tested social benefits

Means-test social benefits are the last level in the social security system. They are only called upon when benefits from other social insurances are unavailable or are exhausted. Furthermore recipients must be in a situation of need: They are only paid to persons in modest financial situations.

Life expectancy

Life expectancy has shot up during the last century, largely as a result of falling infant and child mortality. Life expectancy has also continued to increase in recent years. Since 1990 it has risen for women by 3.8 years and for men by 6.2 years (2010). Men tend to die earlier (before the age of 70), mainly due to ischemic heart disease, accidents and violence, as well as lung cancer.

State of health

In 2007, 88% of men and 85% of women described their health as good or very good and only 3% of men and women qualified it as bad or very bad. However, temporary physical and mental problems seem to affect work and everyday life. On average, Swiss inhabitants are unfit for work due to illness or accident on 9 days a year.

Consumption of alcohol, tobacco and illegal drugs, 2007

Illegal drugs are mainly used by teenagers and young adults, usually just a few times or occasionally. In 2007, approximately 7% of 15–39 year-olds consumed cannabis; in 1992, only 4% did. Much more serious from the public health angle is the consumption of tobacco and alcohol. In all, approximately 28% of the population smoke, 24% of women and 32% of men. The percentages have fallen slightly compared to 1992, the most noticeably for 35–44 year olds and in particular for men (35–44 year old men: from 41% to 32%; women: from 31% to 27%). For alcohol, the percentage of those drinking alcohol daily has decreased to 14% (1992: 21%).

Health care costs

In 2009, 11.4% of the GDP went on health (1990: 8.1%). Development of supply is a fundamental factor in this increase: e.g. expanded facilities, growing specialisation and greater use of technology, and greater comfort. The impact of the ageing population is not so significant.

Moving towards a Swiss educational system

The educational system in Switzerland is characterised distinctly by federalism. The wide variety of educational systems in place is particularly apparent in schools falling under compulsory education. Depending on the canton in question, there are for example, at Secondary level one, two, three or even four different types of schools, differing in their levels of requirements. During the nine compulsory school years the total number of hours of tuition ranges from 7100 to 8900 hours per pupil.

The Swiss education system is changing. In addition to the implementation of HarmoS (Intercantonal agreement on harmonisation of compulsory education) in some cantons, in recent years the cantons have also reformed their education systems beyond compulsory education. National structures have been extended, the vocational matura and universities of applied sciences have been introduced and the Bologna reforms implemented. The demand for education has risen and the general education schools have gained in importance.

Increased participation in education

Over the past thirty years the participation in education at upper secondary level and especially at tertiary level has risen considerably. Educational courses giving access to universities are particularly concerned. Since 1990 the number of vocational and general matriculation certificates has increased by almost three-quarters. The number of university degrees has also more than doubled between 1997 and 2009. This is in no small part due to the establishment of the universities of applied sciences.

In accordance with this development the educational level of the Swiss population is expected to rise considerably in the coming years. The percentage of persons with a tertiary-level qualification in the population groups aged 25–64 is expected to rise from 35% in 2009 to 50% by 2025.

The gender gap has narrowed

Women have been the main beneficiaries of the educational boom in recent decades. Today almost as many women as men undertake and complete post-compulsory education or vocational training. But men continue to pursue longer studies; their rate of entry into tertiary level education is also higher than that of women. Conversely, girls are more successful in compulsory education: they repeat a class less frequently, they are transferred to a special class less frequently and at the lower secondary level they attend schools with higher educational requirements.

Particularly striking differences still exist in the choice of subject area. This applies to both vocational training and university. Job sectors are dominated by either men or women, not least due to traditional role models. In the industry and handicrafts sector, men predominate; in the retail, health and personal care sectors, women are in the majority. At the university level men still tend to opt for technical, scientific and business fields, while women choose the humanities, social work and the arts.

Further education

A distinction is made here between two types of further education – non-formal education (such as attending courses, seminars, private tuition and conferences and informal study (includes specialised literature, study with aid of CD-ROM or from family members). The majority of the population in Switzerland (nearly 80% of the permanent population between 25 and 64 years of age or 83% of employed aged between 25 and 64) undertook further education in one form or another in 2009. Informal study is markedly more common than non-formal education (74% of the permanent population and 78% of employed, compared with 50% and 55% respectively for non-formal study).

Focus on research

Research and development (R&D) is an important factor for a national economy. With 3.01% of its GDP being spent in this area (2008), Switzerland is one of the most R&D-oriented countries in the world.

In 2008 around CHF 16.3 billion was spent on domestic R&D. Of this, around 73% was in the private sector, 24% in universities and the remaining 2.5% was divided between the Confederation and various private, non-profit organisations.

Private sector expenditure abroad amounted to CHF 15.8 billion in 2008 and is slightly higher than the inland expenditure of CHF 12 billion.

The Swiss press in upheaval

The market for daily newspapers has changed fundamentally since the turn of the century. In German-speaking Switzerland the free-of-charge commuters' newspaper "20 Minuten" has become the largest daily with over 1.4 million readers per edition¹. With the establishment of the "Le Matin Bleu"² newspaper (with 559 000 readers) in 2005 in French-speaking Switzerland, together with the French-language edition of "20 Minuten" (with 526 000 readers), the two free newspapers are in the top three ranking of the most-read dailies.

1 Source: WEMF MACH Basic (2009/II; population aged 14 and over, readers per edition)

2 The publication of "Le Matin Bleu" was stopped in September 2009.

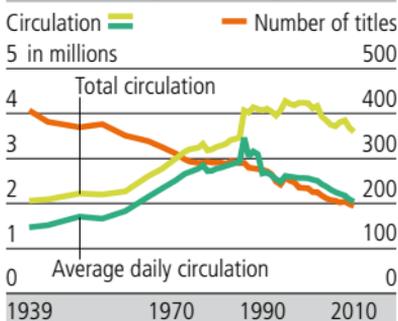

Widespread use of the internet and mobile phones

The number of regular internet users (defined as more than once a week) rose from 0.7 million (1998) to 4.8 million in the third quarter of 2010. Over four fifth of households have a PC and as of the end of 2009, there were 2.7 million broadband internet connections (ADSL or cable modem). Mobile telephony has grown similarly fast. The number of mobile phone connections rose from 125 000 (1990) to 1.7 million (1998) to 9.3 million (2009), which corresponds to 120 mobile phone connections per 100 inhabitants.

Reading is still very popular

In Switzerland in 2008, a majority of the population read newspapers (97%), books (81%) and magazines (79%). Some 20% of the population read comic books. Although readers' age, sex, education have little influence on newspaper and magazine readership, they have a greater impact on the reading of books and comic books. These last two are more likely to be read by persons under thirty, university graduates, persons with a high household income and town and suburb dwellers.

Cultural behaviour

Visiting concerts, monuments and cinemas were among the most popular cultural activities in 2008. The most popular styles of music are pop and rock, followed by classical music. People also spend much time listening to music privately. Radio but also television remain the most frequently used media to listen to music. Young listeners use a lot MP3 players for this purpose. People with a high level of education and a good income are the most likely to avail themselves of cultural offerings; gender and nationality play a marginal role in this respect. Cultural activities are pursued more often in cities and urban agglomerations than in rural areas.

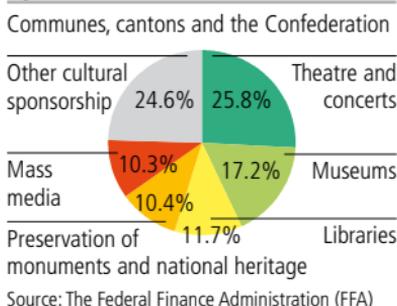

Participation rates, 2008

Spending on culture

In 2007, a quarter of total public spending on culture by the Confederation, cantons and communes, i.e. CHF 579 million, went to the sector "Theater and Concerts". Some CHF 384 million was spent on the "Museums" sector. This was followed by the sectors "Libraries", "Mass Media" (print media, cinema, television, radio etc.) and "Preservation of Monuments and National Heritage" with contributions ranging from CHF 230 and 260 million.

Use of public spending by cultural sector, 2007

Cinema: A wide variety of available choices

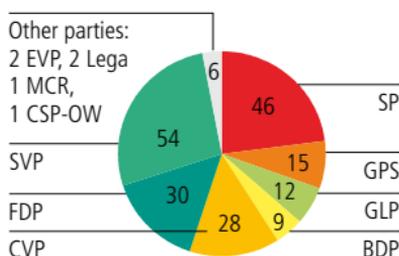

After the peak of popularity in 1964–65 (646 cinemas, approximately 40 million tickets), the number of spectators decreased continuously until the beginning of the 1990s. The lowest point was reached in 1992–93, with 302 cinemas and 15 million spectators. Since the introduction of cinema complexes and multiplex cinemas in 1993, the number of cinema screens has increased again, but not the number of spectators (2010: 558 screens and 14.8 million tickets). The choice of films has also changed significantly. At the beginning of the 1980s, approximately 3000 films were shown every year in Switzerland. Today this number is about 1400. In contrast, the number of premieres has risen continuously since 2004 (to approximately 400 per year).

The political system

The Swiss Confederation, today made up of 26 cantons, has been in existence since 1848. The Government (Federal Council) is a collegial body consisting of 7 members (from 2009: 2 FDP, 2 SP, 1 CVP, 1 SVP, 1 BDP). They are elected by both chambers in parliament: the National Council (representing the people, 200 seats) and the Council of States (representing the cantons, 46 seats). The Swiss political system is also characterised by far-reaching democratic rights (initiatives and referendums) and popular votes.

National elections, 2011

The party system of the past decades underwent a change in the 2011 National Council Elections. The weakening of the traditional centre-right parties, the FDP and the CVP has continued but for the first time in years it was not the SVP who benefitted from these losses but the new GLP and BDP parties.

These parties were the clear and only winners of the National Council Elections 2011. Almost all other parties belonged to a greater or lesser extent to the losers. Hardest hit were the centre-right parties, the CVP, FDP and the SVP as well as the Greens.

Participation rate in national elections and referendums

The strongest decline in voter turnout in national elections started after 1967, a trend which is not least of all attributable to the introduction of the women's right to vote. The decline in voter turnout in popular votes is subject to strong fluctuation, depending on the subject of the referendum. Since the 1990s, voter turnout fluctuated between the extremes of a minimum participation of 28% and a maximum of 79%. From the turn of the century on, voter turnout has somewhat stabilised, both for national elections, as for referendums; and is currently slightly rising.

Public debt

The public spending ratio measures the expenditures of public authorities expressed as a percentage of gross domestic product (GDP). It includes expenditures by the Confederation, the cantons and municipalities as well as public social insurance funds (old age and survivors' insurance, disability insurance, maternity insurance and unemployment insurance).

Public spending ratio in % of GDP

Despite a considerable increase since 1970, in international comparison Switzerland is in a good position: it has one of the lowest public spending ratios of all OECD countries. Most European countries register markedly higher public expenditure.

Switzerland's public debt ratio is also relatively low compared with other OECD countries; between 1990 and 2003, however, it rose continuously. Thanks to a strong economic recovery until 2008, together with the shedding of surplus gold reserves of the Swiss National Bank as well as various structural measures (i.e. relief programmes, debt and expenditure brakes) it has been possible to reduce continuously gross public debt since 2005. By the end of 2010, the debt ratio dropped to 38.4%.

Crime figures offer only a limited reflection of the reality of criminal behaviour: On the one hand, criminal standards and sanctions are affected by changes in society and on the other, crime figures are also strongly influenced by manpower resources, prosecution priorities, the efficiency of the police and justice system and the population's readiness to report crime. It is generally hard to determine which causes are responsible for changes in crime figures and to what extent.

Crime reporting

In 2010 a total of 429 324 criminal cases with 656 858 offences were registered. Of these offences, 80% came under the Swiss Criminal Code (SCC), 14% under the Narcotics Act (NarcA), 4% under the Foreign Nationals Act (FNA) and 2% under other federal legislation. The detection rate for homicides was 91%, for property offences 19%.

Offences according to Criminal Code titles 2010

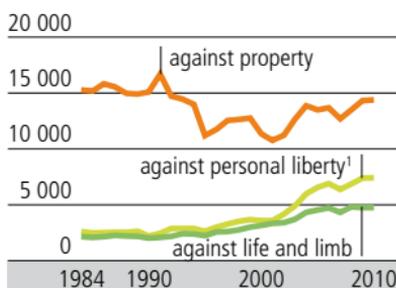

The breakdown by nationality and residence status shows that offenders were of Swiss nationality in 51% of Criminal Code offences, 58% of Narcotics Act offences and 61% of offences against other federal legislation. Foreigners with residence constituted 30%, 22% and 22% of offenders. This means that a substantial part of foreign delinquency is "imported", namely 19% (Criminal Code), 20% (Narcotics Act) and 17% (other). For offences against the Foreign Nationals Act, 82% of offenders were non-residents.

Convictions

In the mid-1980s slightly more than 45 000 convictions against adults were registered overall. This number has doubled and is around 98 000 in 2010. Depending on the law under which the conviction is made, the trend varies greatly.

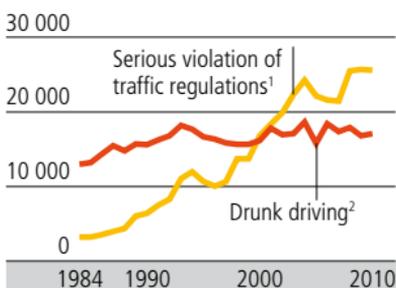

The number of convictions for offences against the Criminal Code has remained stable whereas ever increasing road traffic checks have led to more cases with convictions against the Road Traffic Act (RTA) when considered over a longer period. The number of convictions against the Narcotics Act has been stable for several years as have convictions for offences against the Foreign Nationals Act.

Selected offences SCC

1 Threat, coercion, trafficking in human beings, deprivation of liberty and abduction, hostage taking, unlawful entry

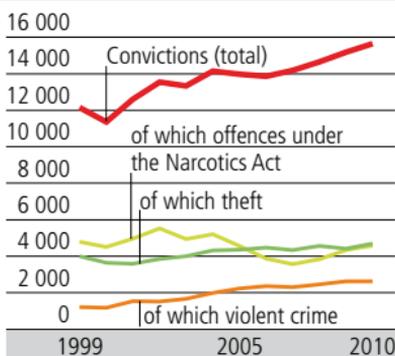

Selected offences RTA

1 Art. 90.2 RTA
2 Over the legal alcohol limit (Art. 91 Para. 1, Part 2 RTA)

Juvenile convictions

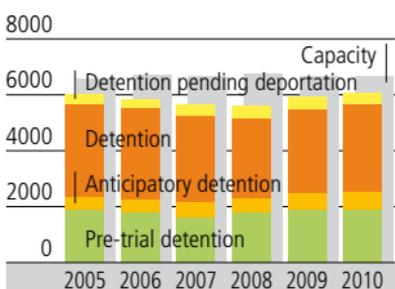

The trend for convictions of minors shows a rising trend in numbers (1999 to 2010: +29%), with the number of illegal drug offences being stable and those for theft and less serious violent crime are on the increase. It can also be assumed here that the increase in the number of cases is due rather to stronger checks than to an increase in juvenile delinquency.

Deprivation of liberty and execution of sentences

In Switzerland in 2010 there were 114 (mostly small) prison establishments with a total of 6683 detention places. On the reference day, 1 September 2010, 6181 persons were detained. Thus, the total occupancy rate was 93%. Of the 6181 inmates, 61% were serving prison sentences, 31% were in pre-trial detention, 6% were in detention subject to coercive measures under the Foreign Nationals Act and the remaining 2% were detained for other reasons. With a few exceptions, prison establishments in Switzerland were not overpopulated.

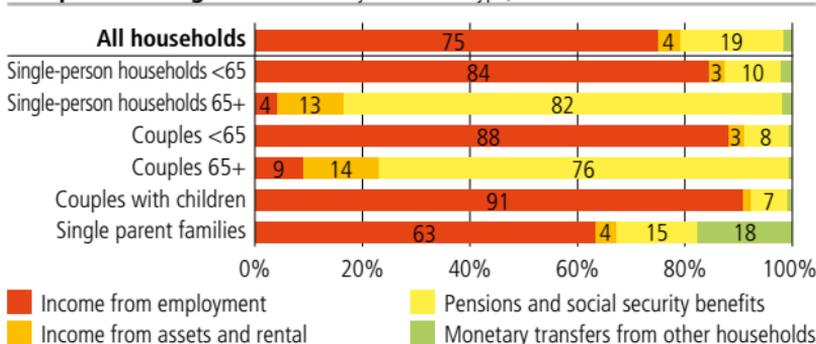

Prison population by sentence type

Recidivism

The reconviction rates of adults convicted in 2006 for crimes and less serious offences, over an observation period of 3 years (i.e. until 2009) were 25%, for minors 34%. The highest reconviction rates are for persons with two or more previous convictions: for adults 64% and for minors 66%.

Composition of gross income by household type, 2006–2008

Household budgets: Income

Averaged out over all households, income from employment at 75% represents the main component of household income. The second important component consists of pensions from the first and second pillars of the Swiss pension system and other social security benefits at more than 19%. The remainder of household income is made up of income from assets and transfers from other households.

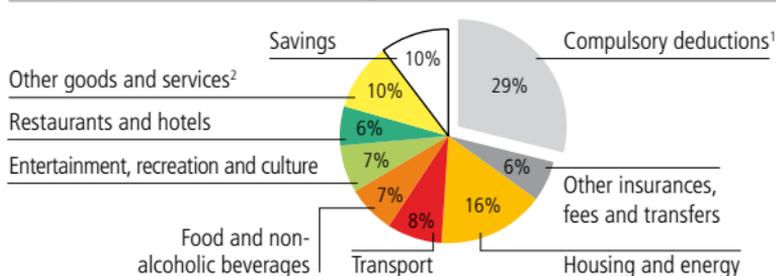

The picture becomes more differentiated when the composition of household income is considered by household type. This shows, for example, that in households aged 65 and over, pensions represent the major part of the household income, but income from employment and, in particular, income from assets play a relatively important role. Transfers from other households represent an important source of income only in specific types of households, such as single-parent families, where the average amounts to almost 18%.

Household budgets: Expenditure

The variations in the composition of spending are less pronounced. Compulsory deductions, which comprise almost 29% of gross income, are the largest item. In the area of consumer expenditure, the largest item is expenditure on housing at 16%. Other large items include expenditure on food and non-alcoholic drinks, on transport and on entertainment, recreation and culture.

After all expenditure has been deducted, on average 10% of the gross income is left for saving. There are significant differences in this area depending on household type. Households over the age of 65 on average save less than younger households. Sometimes this figure is even a minus, which means that these households are living on their capital, among other things.

Composition of household budget, 2006–2008

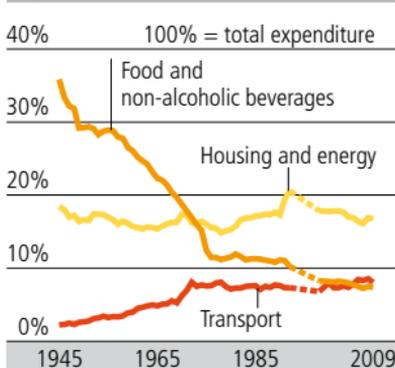

¹ Taxes, social insurance contributions, basic health insurance premiums, transfers to other households
² Less sporadic income

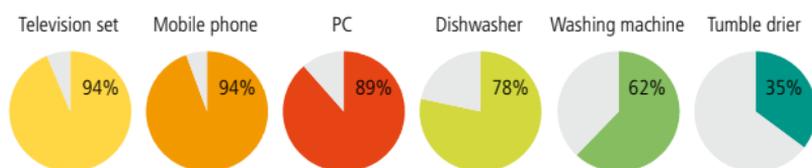

Household expenditure over time

The composition of household expenditure has changed significantly over time. These changes are considerably larger than the differences between households today. For example, the share of total expenditure represented by expenditure on food and non-alcoholic drinks in 1945 was 35%, but nowadays this has fallen to 8%. In contrast the proportion of other expenditure has increased, such as expenditure on transport, which has risen from around 2% to over 8%.

Trends in selected household expenditure items

Availability of selected consumer goods, 2009

Availability of consumer goods

Information about the availability of a selection of durable consumer goods shows that households in Switzerland are very well-equipped with IT hardware. A total of 89% of people live in a household with a computer and 94% in a household with a mobile phone. These proportions are continuing to rise: in 1998 only 55% of people lived in a household with a computer.

In the case of household appliances, such as dishwashers, washing machines and tumble dryers, there has also been an increase. In 2009 more than 78% of the population lived in a household with a dishwasher, while in 1998 the figure was only 61%.

Material deprivation

The reasons for not owning a durable good are not necessarily financial. In 2010, only 1% of people living in Switzerland went without a computer for financial reasons. As far as owning a car for private use is concerned, this percentage rises to 4%. Material deprivation is most often associated with a lack of financial reserves. 21% of persons living in a private household do not have the means to meet unexpected expenses of CHF 2000. This is followed by deprivation associated with living conditions: 17% of the population live in a neighbourhood that is too noisy, 14% in a neighbourhood with problems of delinquency and 10% in a neighbourhood with pollution problems. Furthermore, 10% of the population cannot afford to take a week's holiday away from home.

Unequal distribution of income

Inequalities in the distribution of income are assessed on the basis of equivalent disposable income. The latter is calculated by deducting compulsory expenditure from the household's gross income and by dividing the disposable income thus obtained by the equivalent size of the household. Thus the equivalent disposable income is an indication of people's standard of living, regardless of the type of household in which they live.

In 2010, the average disposable income of the wealthiest persons (20% of the population) was 4.3 times greater than that of the poorest persons (20%).

Risk of monetary poverty

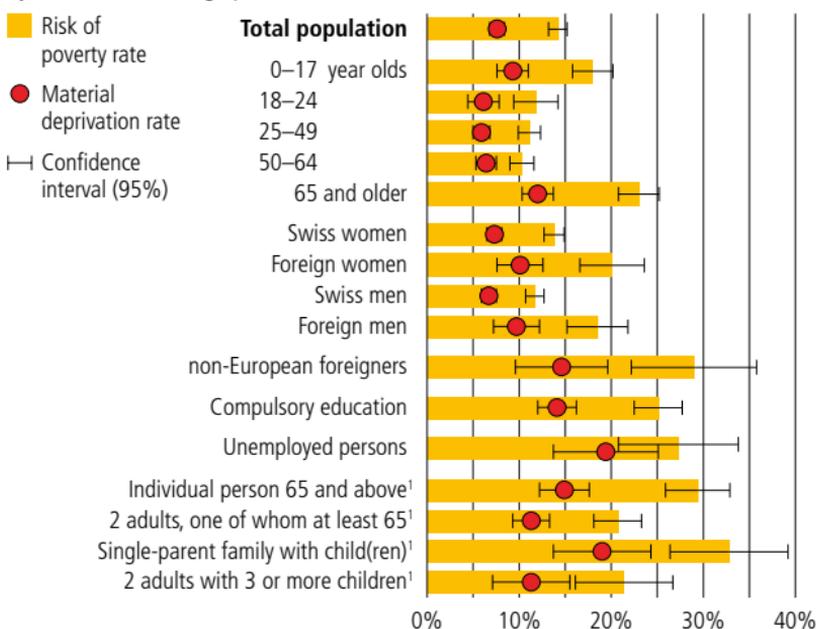

The European Union has fixed the threshold for risk of poverty at 60% of the median equivalised household income. Poverty is, therefore, seen as a form of inequality: the fact of being considered at risk of poverty depends not only on a person's own economic situation but also on the economic situation of the other persons in the corresponding country.

For example, the threshold of risk of poverty was CHF 28 540 per year for a single person in 2010 and CHF 59 935 per year for two adults with two children aged under 14.

In 2010, 14.2% of Switzerland's resident population were at risk of poverty, i.e. almost one in seven. The social groups most at risk of monetary poverty are persons in one-parent or large families, 65 year olds or older, in particular those who live alone, adults without post-compulsory education, and also children aged from 0 to 17 years.

► www.statistics.admin.ch → Topics → Economic and social situation of the population

Are we on the road to sustainable development?

1 Meeting needs – how well do we live?

Life expectancy in good health is improving	✓	Convictions for offences of serious violent crime are increasing	✗
Income is not rising	≈	Unemployment is increasing	✗

2 Fairness – how well are resources distributed?

Official development assistance is rising	✓	Men's and women's wage gap is being narrowed	✓
---	---	--	---

3 Preservation of resources – what are we leaving behind for our children?

Young people's reading skills are improving	✓	The number of employees in science and technology is rising	✓
After rising, the debt ratio is at the level of 1992 again	≈	The number of breeding birds is increasing	✓
The share of investment in gross domestic product is increasing	✓	Developed land is encroaching upon the landscape	✗

4 Decoupling – how efficiently are we using our resources?

Freight transport is growing faster than the economy	✗	Per capita final energy consumption is decreasing	✓
The public to total transport ratio is increasing	✓	Material intensity is decreasing	✓

Assessment of trends since 1992:

- ✓ Positive (towards greater sustainability)
- ≈ No significant change
- ✗ Negative (towards lesser sustainability)

In most areas of life, beginnings for sustainable development have been assessed, but opposite trends can be identified as well. Thus, improvements made in eco-efficiency have often been compensated by an increase in consumption.

Fairness between generations is a current topic – the relatively positive assessment of the current situation could be at the expense of future generations. For example, around 17% of teenagers today do not have even basic reading skills. Furthermore, growth of developed land is largely at the expense of valuable agricultural land.

The **ecological footprint** measures the use of natural resources and illustrates the scarcity of environmental capital. The Swiss per-capita footprint is currently three times larger than the world average per capita biocapacity. The main reason for the large footprint is energy consumption.

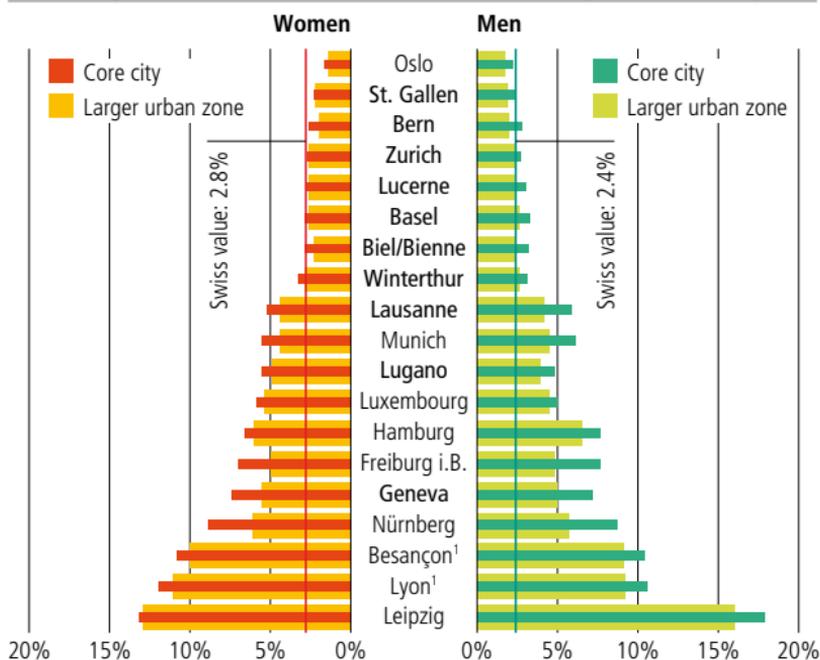

From a global perspective, economic development is still dependent on growing consumption of environmental assets and resources, which means that the higher a country's national income, the larger is its ecological footprint. The Swiss footprint is around the average of most Western European countries. North America, together with a few European countries, uses up to 4.5 times the amount of resources per person as that available per person worldwide. South-East Asia and Africa consume considerably less than the global average per person.

A European project: the Urban Audit

The European "Urban Audit" project enables the comparison of living conditions in European towns at three geographical levels: the larger urban zone, the core city and the sub-city district. Here are three examples of indicators for a selection of towns.

Statistical Yearbook of Switzerland 2012 incl. DVD

The Statistical Yearbook of Switzerland is the standard reference work on Swiss statistics. It provides a comprehensive picture of Switzerland's social and economic situation and contains, along with numerous tables, illustrated overviews of all themes of public statistics. The whole yearbook is published in German and French; in addition, a cross-section summary with the most important statistical information is available in English and Italian. The DVD that accompanies the Statistical Yearbook includes the contents of the Yearbook 2012, complemented by numerous regional statistical and additional tables, as well as tree interactive statistical atlases: the Stat@tlas of Switzerland, the Stat@tlas of Europe and the Election Atlas 2011.

Published by the Federal Statistical Office. 576 pages (hardback), CHF 130 (incl. DVD). Available from bookshops or directly from NZZ Libro, the publishing house of the Neue Zürcher Zeitung. Email: nzz.libro@nzz.ch

The screenshot shows the Swiss Statistical Portal (www.statistics.admin.ch) in German. The header includes the Swiss flag and the text 'Schweizerische Eidgenossenschaft / Confédération suisse / Confederazione Svizzera / Confederaziun svizra'. The navigation menu includes 'News', 'Topics', 'Regional Data', 'World Data', 'Data Library', 'Services', and 'Institutions'. The main content area features a 'What's new?' section with several bullet points: 'Mobility and transport: Freight transport 2010 - Freight transport recovers slowly from the economic crisis (FSO, 19.01.2012 09:15) - Press release', 'Territory and environment: Omnibus Survey 2011: Environmental quality and behaviour - The quality of the residential environment receives good marks from the population (FSO, 17.01.2012 09:15) - Press release', 'Tourism: Statistics on tourist accommodation in November 2011 - Slight decline in overnight stays (FSO, 16.01.2012 09:15) - Press release', 'Prices: Producer and Import Price Index in December and throughout 2011 - Rising prices in December - average inflation of 0.9% (FSO, 16.01.2012 09:15) - Press release', and 'Employment and income: Labour Market Accounts (LMA) 2010 (FSO, 12.01.2012 09:15) - New results'. A central graphic highlights 'Wages and gender equality' with a '4.6 x' multiplier and the text 'more women than men do the laundry and iron'. The right sidebar contains 'Data and Maps', 'RSS Feeds', and 'Contact' information.

The **Swiss Statistical Portal** (www.statistics.admin.ch) is the comprehensive online service for Swiss public statistics. The portal makes available press releases and publications from the Federal Statistical Office (FSO) and other public statistical offices, as well as continually updated detailed results presented in the form of indicators and downloadable tables. Attractive maps and atlases are included in the "Regional" and "International" chapters. By subscribing to the NewsMail service or to automatic RSS feeds, users can keep up to date about our wide range of offerings. As of 2011, in addition to the four languages already present on the statistics portal (German, French, English and Italian), there are also some pages in Romansh.

The Mini Statistics Portal <http://mobile.bfs.admin.ch>, a new service introduced by the Federal Statistical Office (FSO) in 2010, provides the most important statistical figures also for mobile devices.
